7. integers How many positive two-digit integers have exactly 8 positive factors?

8. units In right $\triangle ABC$, shown here, $AC = 24$ units and $BC = 7$ units. Point D lies on \overline{AB} so that $\overline{CD} \perp \overline{AB}$. The bisector of the smallest angle of $\triangle ABC$ intersects \overline{CD} at point E . What is the length of \overline{ED} ? Express your answer as a common fraction.

■ State Competition ■
Team Round
Problems 1–10

School _____
Chapter _____
Team _____
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____

The single-digit prime numbers 2, 3, 5 and 7 are used to replace a , b , c and d in the multiplication table shown here. The four products are found and then added together. What is the greatest possible value of this sum?

| | | | |
|-----|----------|-----|-----|
| | \times | a | b |
| c | | | |
| d | | | |

2. _____ pieces

The circular pizza, shown here, is cut 5 times with straight line cuts before being removed from the pan. What is the maximum number of pieces that can be made which contain none of the pizza's outer crust, located around its circumference?

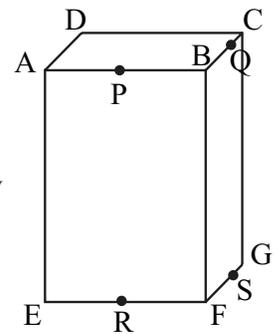

3. _____ equations

After tossing a red, then a green and, finally, a white standard six-faced die, Patrick used the numbers showing on the upper faces of each die, in order, to create the incorrect equation below, such that red – green = white. By rotating each die a quarter turn in some direction so that the number on the top face moves to a lateral face, he finds that he can make a correct equation. Given that the opposite faces of a die have a sum of 7, how many correct equations are possible?

$$4 - 3 = 2$$

4. _____ ft^3

A square prism has dimensions $5' \times 5' \times 10'$, where ABCD is a square. $AP = ER = 2$ ft and $QC = SG = 1$ ft. The plane containing \overline{PQ} and \overline{RS} slices the original prism into two new prisms. What is the volume of the larger of these two prisms?

5. _____

What is the sum of all real numbers x such that $4^x - 6 \times 2^x + 8 = 0$?

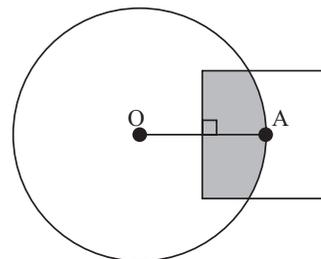

6. _____ units² In square units, what is the area of the region bounded by the graph of $|x - y| + |x + y| = 6$?

7. _____ collections How many collections of six positive, odd integers have a sum of 18? Note that $1 + 1 + 1 + 3 + 3 + 9$ and $9 + 1 + 3 + 1 + 3 + 1$ are considered to be the same collection.

8. _____ ways In how many different ways can 15,015 be represented as the sum of two or more consecutive positive integers written in ascending order?

9. _____ Call a positive integer *squarish* if it contains the digits of the squares of its digits in order but not necessarily contiguous. For example, 14,263 contains $1^2 = 1$, $4^2 = 16$ and $2^2 = 4$. However, it is not squarish because it does not contain $3^2 = 9$, and $6^2 = 36$ is not in order. What is the smallest squarish number that includes at least one digit greater than 1?

10. _____ in² A square of side length 1 inch is drawn with its center A on a circle O of radius 1 inch such that a side of the square is perpendicular to \overline{OA} , as shown. What is the area of the shaded region? Express your answer as a decimal to the nearest hundredth.

03-S13CDR

1. (\$) At Rocket Dogs, four hot dogs and three orders of fries cost \$9. Six hot dogs and five orders of fries cost \$14. What is the total cost of one hot dog and one order of fries?
2. If $a + b - 4z = 500$ and $a + b + 6z = 1200$, what is the value of $a + b$?
3. What is the value of $1^0 + 2^0 + 3^0 + \dots + 2013^0 - (1 + 2 + 3 + \dots + 2013)^0$?
4. What is the positive difference between the median and the mean of 18, 21, 24, 27, 31, 35 and 40?
5. (calories) If one bar of chocolate squares is 210 calories, and there are 15 squares in a bar, how many calories are in 1 chocolate square?
6. (minutes) How many minutes will it take to drive 30 miles at an average rate of 40 miles per hour?
7. (days) If three painters can paint three houses in three days, how many days does it take one painter to paint two houses?
8. What is the units digit of the sum $1^2 + 2^2 + 3^2 + \dots + 10^2$?
9. Equilateral triangles ABC and DEF are inscribed in a circle with their corresponding vertices at diametrically opposite points, as shown. What fraction of the area of $\triangle ABC$ is gray? Express your answer as a common fraction.
10. What is the value of $(1^{-1} + 2^{-1})^{-1}$? Express your answer as a common fraction.
11. The eighth term of an arithmetic sequence is ten times the first term, and the third term of the sequence is 50. What is the first term of the sequence?
12. (factors) How many positive integer factors does 108 have?
13. (dimes) Twelve coins, consisting of dimes and nickels, are worth 85 cents. What is the number of dimes?

14. _____ If $\frac{5}{m} \geq \frac{2}{3}$, what is the largest possible value of m ? Express your answer as a decimal to the nearest tenth.

15. _____ (in²) Two 30-60-90 triangles, each with hypotenuse 12 inches, overlap so that they share a vertex and part of a side, as shown. What is the total area, in square inches, of the resulting figure? Express your answer in simplest radical form.

16. _____ If $x^2 - 45b^2 = 4xb$, what is the largest possible ratio of b to x ? Express your answer as a common fraction.

17. _____ (integers) How many positive two-digit integers are multiples of 6?

18. _____ Both p and q are positive integers. Each of the numbers 29, 84 and 128 leaves a remainder of p when divided by q . What is the sum of $p + q$?

19. _____ (marbles) A bag contains only red and black marbles. Originally the ratio of the black marbles to red marbles was 4:5. After 18 black marbles were added, the ratio of black marbles to red marbles became 5:4. How many marbles were in the bag originally?

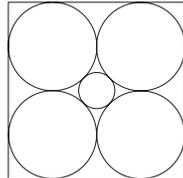

20. _____ (points) If Consuela has a mean score of 84 out of 100 points for five tests, what is the lowest possible test score she could have received?

21. _____ In the sequence 1, 2, 2, 3, 3, 3, 4, 4, 4, 4, ..., each positive integer k appears k times. If the integer 12 first appears in the sequence as the n th term, what is the value of n ?

22. _____ (inches) The legs of a right triangle measure $1\frac{2}{3}$ inches and 4 inches. In inches, what is the length of the hypotenuse? Express your answer as a mixed number.

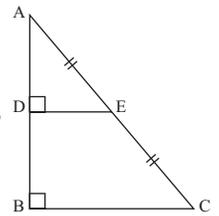

23. _____ What is the greatest single-digit positive integer n for which $n!$ leaves no remainder when divided by 2^{n-1} ?

24. _____ What is the value of $1313^2 - 1212^2$?

25. _____ (minutes) Sam glances at the clock and notices that the minute hand is 55° behind the hour hand. In how many minutes will the hands overlap?
26. _____ For what positive integer n is $2^n < 100 < 2^{n+1}$?
27. _____ What is the least value of n , such that $n > 1$ and the value of $\sqrt{1+2+3+\dots+n}$ is an integer?
28. _____ (zeros) How many zeros are to the right of the last nonzero digit of $78!$?
29. _____ (units²) A triangle is bounded by the lines $x = 3$, $y = 10$ and $y = -x + 11$. What is its area, in square units?
30. _____ (students) All but two students in the algebra class took a test, and the mean score was 84. When the scores of 100 and 94 for the missing two students were included, the average increased by 1. How many students are in the class?
31. _____ (units) In the figure, each of the four large circles is tangent to two of the other large circles, the small circle, and two sides of the square. If the radius of each of the large circles is 1 unit, what is the radius of the small circle, in units? Express your answer in simplest radical form.
- 
32. _____ For what positive integer n is the mean of the first n positive integers equal to 2013?
33. _____ For positive integers a and b , $\frac{2}{7}$ of the product ab is 60, and $\frac{3}{5}$ of the quotient $\frac{a}{b}$ is $\frac{9}{14}$. What is the value of a ?
34. _____ An arithmetic progression has 20 as its 12th term and 12 as its 20th term. What is the 2013th term?
35. _____ What number is 10% of one-third of 750?
36. _____ (points) During the basketball season, Cara scored 25 points more than Annika, and Maria scored 37 points less than Annika. What is the positive difference between the average number of points scored by the three players and the number of points that Annika scored?

37. _____ The quadratic equation $x^2 + bx + c = 0$ has real roots 4 and -6 . What is the value of $b + c$?

38. _____ If a randomly thrown dart hits the interior of $\triangle ABC$, shown here, what is the probability that it also hits the interior trapezoid $BDEC$? Express your answer as a common fraction.

39. _____ (mm) The diagonals of rhombus $MNOP$, have lengths of 12 mm and 16 mm. What is the perimeter, in millimeters, of rhombus $MNOP$?

40. _____ What is the sum of the positive factors of 45?

41. _____ (cm) An isosceles trapezoid with one base twice as long as the other has a height of 12 cm. The shorter base is 18 cm. In centimeters, what is the perimeter of this trapezoid?

42. _____ What is the largest three-digit positive integer with exactly three positive factors?

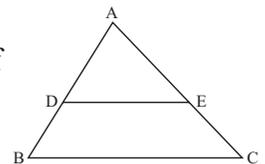

43. _____ (dollars) A fuel tank holds 200 gallons of gasoline when full. The tank is currently $\frac{4}{5}$ full. If fuel costs \$5.50 per gallon, how many dollars worth of fuel are needed to fill the rest of the tank?

44. _____ (odd numbers) Using four of the five digits 1, 5, 6, 8 and 9, how many four-digit odd numbers can be formed, with no repeated digits?

45. _____ (inches) In a right triangle, the longer leg and the hypotenuse have consecutive integer lengths whose sum is 121 inches. In inches, what is the perimeter of the triangle?

46. _____ What is the units digit of the product $1 \times 3 \times 5 \times 7 \times 9 \times \dots \times 2013$?

47. _____ (cm²) In the figure, the area of trapezoid $DBCE$ is 80 cm². The ratio of the bases DE to BC is 3:5. What is the area of triangle ADE , in square centimeters?

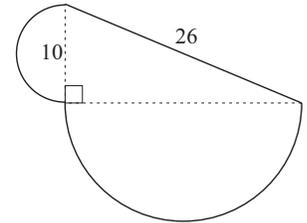

48. _____ What is the units digit of the product 2×4^{130} ?

49. _____ If $\frac{2}{x} = w$ and $x \neq 0$, what is the value of $(wx)^{-3}$? Express your answer as a common fraction.

50. _____ What is the value of $133^2 + (2)(67)(133) + 67^2$?

51. _____ (mm) The figure shown is composed of two semi-circles and one right triangle with a leg of 10 mm and a hypotenuse of 26 mm. What is the perimeter of the figure, in millimeters? Express your answer in terms of π .

52. _____ If 25% of 16 is x , what is $x\%$ of 200?

53. _____

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| X | | | | | | | | |
| X | | | | | X | X | | |
| X | | | | | X | X | X | |
| X | X | X | X | X | X | X | X | X |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

What is the mean of the data represented in the frequency distribution shown?

54. _____ (dollars) Dianna's weekly paycheck is 15% less than Barbara's paycheck. Dianna's and Barbara's paychecks have a combined total \$740. How much is Dianna's paycheck, in dollars?

55. _____ What is the least positive integer n , for which there are positive integers x and y such that $x^2 + y^3 = n$ and $n > 60$?

56. _____ (dots) On the number line shown, there are dots at every integer and three dots between each pair of consecutive integers. If all of the dots are evenly spaced, how many dots lie strictly between a (not shown) and \sqrt{a} ?

57. _____ (cm²) A square has a diagonal of length a cm. In square centimeters, what is twice the area of the square in terms of a ?

58. _____ (integers) How many positive integers are a factor of 7! but not a factor of 6!?

59. _____ If $k = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \dots + \frac{1}{20}$, and $a < k < a + 1$ where a is an integer, what is the value of a ?

60. _____ If k is a constant, and $2x + 5 = 3kx + 5$ for all values of x , what is the value of k ? Express your answer as a common fraction.

61. _____ If $\frac{1}{c^2} = b^2 + 4b + 4$, where b and c are positive, then what is the value of c in terms of b ? Express your answer as a common fraction.

62. _____ What is $\frac{2}{3}$ of 30% of 362,970?

63. _____ If $f(x) = \frac{x+3}{3x-1}$ and $g(x) = \sqrt{2x^3}$, what is the value of $f\left(\frac{1}{2}\right) + g(2)$?

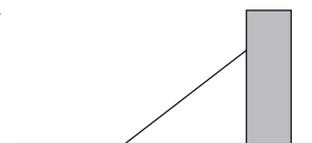

64. _____ What is the maximum integer value of x for which 2^x is less than each of the numbers: 4^{13} , 8^9 and 16^7 ?

65. _____ (points) Anne was absent for the last algebra test. Her 19 classmates had a class average of exactly 77 points on this test. How many points must Anne score on this test to raise the class average by exactly one point?

66. _____ If $f(x) = x - 11$ and $g(x) = 2x^2 + 3x - 2$, what is the value of $g[f(10)]$?

67. _____ (degrees) Three angles of a convex pentagon measure 88° , 124° and 92° . The remaining two angles are congruent. What is the degree measure of each of the remaining angles?

68. _____ (feet) The top of a pole rests 8 ft above the ground along a wall. If the bottom of the pole is moved another 2 ft from the wall, the entire pole will lie on the ground with the top of the pole touching the wall. In feet, how long is the pole?

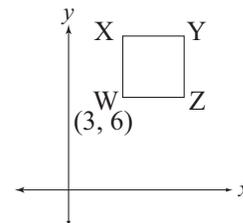

69. _____ (integers) How many integers x satisfy $|13\pi x| < -\pi$?

70. _____ What is the closest integer to 10.01^3 ?

71. _____ In the equation $(x - 8)(x - k) = x^2 - 5kx + m$, k and m are positive integers. If the equation is true for all values of x , what is the value of m ?

72. _____ If $3^x + 3^x = 3^n$, what is the value of n , in terms of x ?

73. _____ Square WXYZ is located in the first quadrant so that segments WX and YZ are parallel to the y -axis. The coordinates of W are $(3, 6)$, and the square has area 16 units². If square WXYZ is translated 2 units up and 6 units to the right, what is the sum of the coordinates of the image of Y?

74. _____ If $4 + \sqrt{b} = 7.2$, what is the value of $4 - \sqrt{b}$? Express your answer as a decimal to the nearest tenth.

75. _____ (days) A chef spends c hours each day at her restaurant, $\frac{c}{3}$ hours of which she spends preparing desserts. At this rate, after how many days will the chef have spent 24 hours preparing desserts? Express your answer as a common fraction in terms of c .

76. _____ The points $(6, 1)$ and $(8, 1)$ lie on the graph of $y = f(x)$, where $f(x) = |x - k|$ and k is a constant. What is the value of $f(0)$?

77. _____ (ways) Four sets of lights surround a baseball field. The field is sufficiently lit when at least two of the sets are on. In how many different ways can lights be turned on so that the field is sufficiently lit?

78. _____ If $(m + n)^{k-3} = m^6 + 6m^5n + 15m^4n^2 + 20m^3n^3 + 15m^2n^4 + 6mn^5 + n^6$, what is the value of k ?

79. _____ (turns) Bart played a game in which he could score either 9 or 14 points on each turn. If Bart scored exactly 100 points, on how many turns did he score 9 points?

80. _____ (boys) In January 2013, b boys and g girls belonged to a math club. Three girls and some boys joined the math club in February 2013 and the ratio of boys to girls remained the same. In terms of b and g , how many boys joined the math club in February 2013? Express your answer as a common fraction.

MATHCOUNTS

2013 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Team Round problem with less than 10 sheets of scratch paper?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2013 MATHCOUNTS® State Competition. Though these solutions provide creative and concise ways of solving the problems from the competition, there are certainly numerous other solutions that also lead to the correct answer, and may even be more creative or more concise! We encourage you to find numerous solutions and representations for these MATHCOUNTS problems.

Special thanks to volunteer author Mady Bauer for sharing these solutions with us and the rest of the MATHCOUNTS community!

2013 State Competition

Sprint Round

1. The sum of 2 numbers is 4. Their difference is 2. What is their product?

Let x and y be the two numbers.

$$x + y = 4$$

$$x - y = 2$$

$$2x = 4 + 2 = 6$$

$$x = 3$$

$$3 + y = 4$$

$$y = 1$$

$$3 \times 1 = 3 \text{ Ans.}$$

2. Mary and Ann ride their bikes to meet somewhere between their two houses. At 11 a.m. Mary has traveled half the distance between the two houses. Ann has only covered $3/8$ of the distance. They are still one mile apart. What is the distance between their two houses?

Let d represent the distance between their two houses. Then we have

$$d = (1/2)d + (3/8)d + 1. \text{ Solving for } d$$

$$\text{yields } d = (7/8)d + 1 \rightarrow (1/8)d = 1 \rightarrow$$

$$d = 8 \text{ Ans.}$$

3. A bag contains 8 blue marbles, 4 red marbles and 3 green marbles. What is the probability of not drawing a green marble?

There are a total of $8 + 4 + 3 = 15$ marbles. Of those, $8 + 4 = 12$ marbles are not green. That's a probability of $12/15 = 4/5$ Ans.

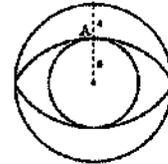

4. The arithmetic mean of 11 numbers is 78. If 1 is subtracted from the first number, 2 from the second, and so on, what is the arithmetic mean of the resulting numbers?

With a mean of 78, the sum of the 11

original numbers is $11 \times 78 = 858$. The total amount being subtracted from this sum is $1 + 2 + 3 + \dots + 9 + 10 + 11 = 12 \times (11/2) = 66$. The sum of the 11 numbers that result after subtracting 66 is $858 - 66 = 792$, and their mean is $792 \div 11 = 72$ Ans.

5. The logo contains a center circle with area 36π in². The circle is tangent to each crescent at its widest point (A and B). The shortest distance from A to the outer circle is $1/3$ the diameter of the smaller circle. What is the area of the larger circle?

First, let's find the radius of the smaller circle. We know that the area is 36π , so $\pi r^2 = 36\pi$, and $r = 6$ in. The diameter, then, is 12 in. It follows that shortest distance from A to the outer circle, which is $1/3$ the diameter of the smaller circle, is $(1/3) \times 12 = 4$ in.

That means the radius of the larger circle is $6 + 4 = 10$ in, and its area, in square inches, is $(10^2)\pi = 100\pi$ Ans.

6. Doris buys a DVD originally priced at \$12 and now on sale for 20% off. How much will Doris save?
20% of 12 is $0.20 \times 12 = \$2.40$ Ans.

7. What is the value of $\frac{444^2 - 111^2}{444 - 111}$?

$$444^2 - 111^2 = (444 + 111)(444 - 111),$$

$$\text{so we have } \frac{g}{r} = 444 + 111 = 555 \text{ Ans.}$$

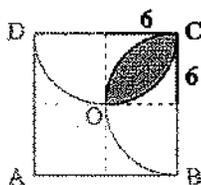

8. The digits of positive integer n have a product of 20 and a sum of 13. What is the smallest possible value of n ?

First, let's determine the digits of n , then we can arrange them to yield the smallest value.

Suppose n is a 2-digit integer, AB , where A is the tens digit and B is the units digit. We need $A \times B = 20$ and $A + B = 13$. The only pair of 1-digit integers with a product of 20 is 5×4 , but $5 + 4 \neq 13$. So, n has more than 2 digits. Now suppose that n is a 3-digit integer, ABC . Again, we need $A \times B \times C = 20$ and $A + B + C = 13$. The 1-digit triples with a product of 20 are $5 \times 4 \times 1$, but $5 + 4 + 1 \neq 13$, and $5 \times 2 \times 2$, but $5 + 2 + 2 \neq 13$. So, n must have more than 3 digits. Let's now assume n is a 4-digit integer, $ABCD$.

Again, we need $A \times B \times C \times D = 20$ and $A + B + C + D = 13$. There are two groups of 4 integers with a product of 20: $5 \times 4 \times 1 \times 1$, but $5 + 4 + 1 + 1 \neq 13$, and $5 \times 2 \times 2 \times 1$, but $5 + 2 + 2 + 1 \neq 13$. Notice that $5 + 4 + 1 + 1 = 11$ is just 2 less than 13, and $5 + 2 + 2 + 1 = 10$ is 3 less than 13. Adding 2 more 1s to the first sum will yield a 6-digit integer, while adding 3 more 1s to the second sum yields a 7-digit integer. We want the smallest integer, so $n = 111145$ **Ans.**

9. In square $ABCD$ $BC = 12$. BOC and DOC are semicircles. What is the area of the shaded region?

We know the two semicircles intersect at the center of square $ABCD$. We can divide it into four smaller squares, as shown.

Focusing on the smaller square with a vertex at C , notice that the area of each of the two unshaded regions is the difference between the

area of the smaller square and the area of one quarter of a circle with radius 6 cm (since the diameter $BC = 12$ cm). With side length 6 cm, the area of this smaller square is 36 cm^2 . The area of the quarter-circle is $(1/4)\pi(6^2) = 9\pi \text{ cm}^2$, and the area of the two unshaded regions is $2(36 - 9\pi) = 72 - 18\pi \text{ cm}^2$. So, in square centimeters, the area of the shaded region is $36 - (72 - 18\pi) = -36 + 18\pi$ or $18\pi - 36$ **Ans.**

10. Real numbers a and b satisfy

$$b = \frac{2a-4}{5} + \frac{3a+1}{5}. \text{ What is } a - b?$$

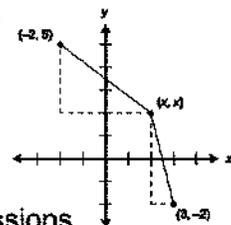

Let's manipulate the equation to isolate the expression $a - b$ on one side:

$$2a - 4 + 3a + 1 = 5b \rightarrow 5a - 3 = 5b \rightarrow 5a - 5b = 3 \rightarrow a - b = 3/5 \text{ **Ans.**}$$

11. The point (x, x) is equidistant from $(-2, 5)$ and $(3, -2)$. What is x ?

As shown, the distances from (x, x) to $(-2, 5)$ and to $(3, -2)$ are the lengths of the hypotenuses of the two right triangles. We can write expressions for these distances using the Pythagorean Theorem. Then we set them equal to each other and solve:

$$\begin{aligned} (x+2)^2 + (3-x)^2 &= (5-x)^2 + (x+2)^2 \\ (3-x)^2 &= (5-x)^2 \\ 9 - 6x + x^2 &= 25 - 10x + x^2 \\ 9 - 6x &= 25 - 10x \\ 4x &= 16 \\ x &= 4 \text{ **Ans.**}$$

12. In a bag of marbles, $2/5$ are red, $3/10$ are white marbles and $1/10$ are blue. The remaining 10 marbles are green. How many marbles are in the bag? We know that $(2/5) + (3/10) + (1/10) = 8/10 = 4/5$ of the marbles in the bag are not green. Then the 10 green marbles

represent $\frac{1}{5}$ of the marbles in the bag. It follows that the number of marbles in the bag is $10 \times 5 = 50$ **Ans.**

13. t is 40% greater than p . p is 40% less than 600. What is $t - p$?
40% less than 600 is the same as 60% of 600. So $p = 0.6 \times 600 = 360$. 10% of 360 is $0.1 \times 360 = 36$. So 40% of 360 = $4 \times 10\%$ of 360 = $4 \times 36 = 144$.
Therefore, t , which is 40% greater than p is $360 + 144 = 504$. It follows that $t - p = 504 - 360 = 144$ **Ans.**

14. How many ways can all six numbers in the set $\{4, 3, 2, 12, 1, 6\}$ be ordered so that a comes before b whenever a is a divisor of b ?
Since 1 is a divisor of all the other numbers, it must always be first. Since all the other numbers are divisors of 12, it must always be last. For the remaining numbers we know that 2 must be before 4 and 6, but can be after 3; 3 must be before 6, but can be either before or after 2 and 4; 4 must be after 2, but can be before or after 3 and 6. The following orders are possible: 1, 2, 3, 4, 6, 12; 1, 2, 3, 6, 4, 12; 1, 2, 4, 3, 6, 12; 1, 3, 2, 4, 6, 12; 1, 3, 2, 6, 4, 12. The number of ways to order the numbers is 5 **Ans.**

15. What is the units digit of the product $7^{23} \times 8^{105} \times 3^{18}$?
First let's look at the pattern of powers of 7. We have $7^1 = 7$, $7^2 = 49$, $7^3 = 343$, $7^4 = 2401$ and $7^5 = 16,807$. So the units digits 7, 9, 3 and 1 repeat every four powers of 7. In other words, when 7 is raised to a power for which the remainder is 1 when divided by 4, the result will end in 7. When raised to a power that yields a remainder of 2 when divided by 4, the result will end in 9, and

so on. Since $23/4 = 5$ r3, the units digit of 7^{23} will be 3.

Now look at the pattern of powers of 8. We have $8^1 = 8$, $8^2 = 64$, $8^3 = 512$, $8^4 = 4096$ and $8^5 = 32,768$. So the units digits 8, 4, 2 and 6 and will repeat every four powers of 8. Since $105/4 = 26$ r1, the units digit of 8^{105} will be 8.

Finally, let's find the pattern for powers of 3. We have $3^1 = 3$, $3^2 = 9$, $3^3 = 27$, $3^4 = 81$ and $3^5 = 243$. The units digits 3, 9, 7 and 1 will repeat every four powers of 3. Since $18/4 = 4$ r2, 3^{18} will have a units digit of 9. Multiplying $3 \times 8 \times 9 = 216$, we conclude that the units digits of the product $7^{23} \times 8^{105} \times 3^{18}$ will be 6 **Ans.**

16. If $4(a - 3) - 2(b + 5) = 0$ and $5b - a = 0$, what is $a + b$?

Rewriting the second equation, we see that $a = 5b$. When we substitute this into the first equation and solve, the result is

$$4(5b - 3) - 2(b + 5) = 14$$

$$20b - 12 - 2b - 10 = 14$$

$$18b - 22 = 14$$

$$18b = 36$$

$$b = 2$$

$$a = 5 \times 2 = 10$$

So, $a + b = 10 + 2 = 12$ **Ans.**

17. The two cones have parallel bases and common apex T. $TW = 32$ m, $WV = 8$ m and $ZY = 5$ m. What is the volume of the frustum with circles W and Z as its bases?

The cone has height 32 m and the radius of the base is 8 m. The volume of the larger cone is $(\frac{1}{3})\pi r^2 h = (\frac{1}{3})\pi(8^2)(32) = (2048/3)\pi$ m³. If we find the volume of the smaller cone, we can subtract that value from the volume of the larger cone to get the volume of the frustum. We know the radius of the smaller cone's base is 5 m, but we need

to find its height. Triangle TXY is similar to Triangle TUV, so $ZY/WV = TZ/TW \rightarrow 5/8 = TZ/32 \rightarrow TZ = (32 \times 5)/8 = 20$ m. The volume of the smaller cone, then, is $(1/3)\pi(5^2)(20) = (500/3)\pi$ m³. It follows that the area of the frustum, in cubic meters, is $(2048/3)\pi - (500/3)\pi = (1548/3)\pi = 516\pi$ **Ans.**

18. A coin is flipped until it either lands heads two times or tails two times but not necessarily in a row. If the first flip lands heads, what is the probability that a second head occurs before two tails? Let's just list the ways this can occur: HH, HTH. Anything more either gives us two tails or more than two heads. The probability of getting one more H is 1/2. The probability of getting a TH is $(1/2) \times (1/2) = 1/4$. Therefore, the probability of getting HH or HTH is $(1/2) + (1/4) = 3/4$ **Ans.**

19. The product of two consecutive integers is five more than their sum. What is the smallest possible sum of two such consecutive integers? Let x represent the first integer. We can write the following equation:

$$x(x + 1) = x + x + 1 + 5$$

$$x^2 + x = 2x + 6$$

$$x^2 - x - 6 = 0$$

$$(x - 3)(x + 2) = 0$$

$$x = 3 \text{ or } x = -2$$
 If $x = 3$ then $x + x + 1 = 3 + 4 = 7$
 If $x = -2$ then $x + x + 1 = -2 - 1 = -3$ **Ans.**

20. 4 nickels, 1 penny and 1 dime are divided among 3 piggy banks. Each bank received two coins. Labels indicating the amount in each bank were made. These are 6¢, 10¢ and 15¢. The wrong labels were put on each bank.

There was at least one penny in the bank labeled as 15¢. What was the actual combined value of the two coins contained in the piggy bank that was labeled 6¢?

Let's first look at the combinations we need to make 6¢, 10¢ and 15¢:

$$6 = 5 + 1$$

$$10 = 5 + 5$$

$$15 = 10 + 5$$

(Remember, we need two coins in each bank.) The bank marked as 15¢ has a penny in it. Since we know the total value of the coins inside the bank does not match its label, it must also contain a nickel. That leaves the banks labeled 10¢ and 6¢. Since they too are labeled incorrectly, the bank labeled 10¢ must contain a dime and a nickel, and the bank labeled 6¢ must contain two nickels, with a combined value of 10 **Ans.**

21. A 9×9 multiplication grid was filled in completely. What is the sum of the 81 products.

Written out, the sum is:

$$1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 +$$

$$2 \times (1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9) +$$

$$3 \times (1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9) +$$

$$\dots +$$

$$9 \times (1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9)$$

You could multiple everything and add but that is time consuming. Let $x = 1 +$

$$2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 \rightarrow x = 45$$

We can rewrite the original sum as

$$x + 2x + 3x + \dots + 9x = 45x.$$

The sum of the products is $45 \times 45 = 2025$ **Ans.**

22. How many seven-letter words can be made from the word MAKALA if each consonant must be followed by a vowel? Let's start having only one A follow a consonant.

Consider permutations of A__A__A__A, where the blanks are filled with the consonants M, K and L. There are 6 such permutations. Similarly, consider permutations of __AA__A__A, __A__AA__A and __A__A__AA, where the blanks are filled with the M, K and L. Again, there are 6 permutations of each. Permutations with 3 adjacent As won't work. Therefore, number of permutations that meet the stated criteria is $6 \times 4 = 24$ **Ans.**

23. Given $f(x) = 3x^2$, what is the x-coordinate of the point of intersection of the graphs of $y = f(x)$ and $y = f(x - 4)$? These two functions intersect when $f(x) = f(x - 4)$. Substituting and solving for x, we have

$$3x^2 = 3(x - 4)^2$$

$$3x^2 = 3(x^2 - 8x + 16)$$

$$x^2 = x^2 - 8x + 16$$

$$8x - 16 = 0$$

$$8x = 16$$

$$x = 2 \text{ **Ans.**}$$

24. In isosceles trapezoid ABCD, $AB = 4$, $CD = 10$. Points E and F are on CD and BE is parallel to AD. AF is parallel to BC. AF and BE intersect at point G. What is the ratio of the area of triangle EFG to the area of trapezoid ABCD? Given that segments BE and AD are parallel, it follows that ABED is a parallelogram, with $DE = 4$. Similarly, since segments AF and BC are parallel, it follows that ABCE is a parallelogram, with $FC = 4$. Therefore, $EF = 10 - 8 = 2$. Notice that $\triangle ABG \sim \triangle EFG$ (Angle-Angle), and the ratio $EF/AB = 2/4 = 1/2$. Since these two triangles are similar, if we let x represent the height of $\triangle EFG$, the height of $\triangle ABG$ must be $2x$. Therefore, the height of the trapezoid is

$x + 2x = 3x$. Recall, the area of a trapezoid is given by $(1/2) \times \text{height} \times (\text{base}_1 + \text{base}_2)$. So the area of trapezoid ABCD is $(1/2) \times 3x \times (4 + 10) = 21x$. The area of $\triangle EFG$ is $(1/2) \times 2 \times x = x$. Therefore, the ratio of the area of $\triangle EFG$ to the area of the trapezoid ABCD is $x/(21x) = 1/21$ **Ans.**

25. The sum of five consecutive positive even integers is a perfect square. What is the smallest possible integer that could be the least of the five integers? Let the five consecutive even integers be represented by $(n - 4)$, $(n - 2)$, n , $(n + 2)$, $(n + 4)$, with sum $n - 4 + n - 2 + n + n + 2 + n + 4 = 5n$. Since we are told that the sum is a perfect square, we need to find a perfect square that is a multiple of 5. Start with 25, in which case we have $5n = 25 \rightarrow n = 5$. Since 5 is not even, we move on to the next perfect square that is a multiple of 5: 100. We have $5n = 100 \rightarrow n = 20$, and the smallest of the five consecutive even integers is $n - 4 = 16$ **Ans.**

26. If $12_3 + 12_5 + 12_7 + 12_9 + 12_x = 101110_2$, what is the value of x?

Let's begin by finding the value of each term in base 10. We have

$$12_3 = (1 \times 3^1) + (2 \times 3^0) = 3 + 2 = 5$$

$$12_5 = (1 \times 5^1) + (2 \times 5^0) = 5 + 2 = 7$$

$$12_7 = (1 \times 7^1) + (2 \times 7^0) = 7 + 2 = 9$$

$$12_9 = (1 \times 9^1) + (2 \times 9^0) = 9 + 2 = 11$$

$$12_x = (1 \times x^1) + (2 \times x^0) = x + 2$$

$$101110_2 = (1 \times 2^5) + (1 \times 2^3) + (1 \times 2^2) + (1 \times 2^1) = 32 + 8 + 4 + 2 = 46$$

Now we can rewrite the equation and solve:

$$5 + 7 + 9 + 11 + x + 2 = 46$$

$$34 + x = 46$$

$$x = 12 \text{ **Ans.**}$$

27. A box contains r red balls and g green balls. When r more red balls are added, the probability of drawing a red ball increases by 25%. Find the probability of randomly drawing a red ball from the box before the extra red balls were added.

The probability of drawing a red ball before more red balls are added is

$\frac{r}{g+r}$. The probability of drawing a red ball

after more red balls are added is

$\frac{2r}{g+2r}$, which is 25% larger than

$\frac{r}{g+r}$. We can write the equation

$$\frac{2r}{g+2r} = \frac{5}{4} \times \frac{r}{g+r}$$

$$\frac{2r}{g+2r} = \frac{5r}{4(g+r)}$$

$$2r \times 4(g+r) = 5r \times (g+2r)$$

$$8rg + 8r^2 = 5rg + 10r^2$$

$$3rg = 2r^2$$

$$3g = 2r$$

$$\frac{g}{r} = \frac{2}{3}$$

So the ratio of green balls to red balls in the box is $\frac{2}{3}$. Thus, the probability of randomly drawing a red ball is $\frac{3}{5}$ **Ans.**

28. Connex contains one 4-unit piece, two 3-unit pieces, three 2-unit pieces and four 1-unit pieces. How many different 10-unit pieces (where order matters) can be arranged?

Let's start by creating 10-unit pieces using the 4-unit piece. Our arrangements are:

4-3-3 (3 permutations)

4-3-2-1 ($4! = 24$ permutations)

4-3-1-1-1 ($5 \times [4!/(3!1!)] = 5 \times 4 = 20$ permutations)

4-2-2-2 (4 permutations)

4-2-2-1-1 ($5 \times [4!/(2!2!)] = 5 \times 6 = 30$ permutations)

4-2-1-1-1-1 ($6 \times [5!/(4!1!)] = 6 \times 5 = 30$ permutations)

Let's look at arrangements using one or more 3-unit pieces and no 4-unit piece:

3-3-2-2 ($4!/(2!2!)$)

3-3-2-1-1 ($5 \times (4!/(2!2!)) = 5 \times 6 = 30$ permutations)

3-3-1-1-1-1 ($6!/(4!2!) =$ permutations)

3-2-2-2-1 ($5 \times 4!/(3!1!) = 5 \times 4 = 20$ permutations)

3-2-2-1-1-1 ($6 \times 5!/(3!2!) = 6 \times 10 = 60$ permutations)

Finally we'll consider arrangements using only 1- and 2-unit pieces:

2-2-2-1-1-1-1 ($7!/(4!3!) = 35$ permutations)

Let's add them all up:

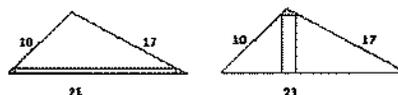

$$(3 + 24 + 20 + 4) + (30 + 30 + 6 + 30) +$$

$$(15 + 20 + 60 + 35) =$$

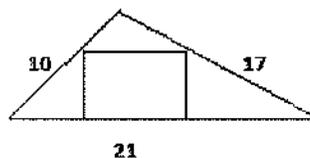

$$51 + 96 + 130 = 277 \text{ **Ans.**}$$

29. What is the largest possible area a rectangle inscribed in this triangle can have?

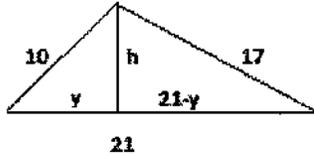

We could look at very wide rectangles or we could look at very high rectangles.

But to maximize the area means to find the rectangle that is as close to being a square as possible.

First, let's figure out the height of the triangle.

For the two right triangles, we can write the following equations using the Pythagorean Theorem:

$$h^2 + y^2 = 10^2 \quad [\text{Eq. 1}]$$

$$h^2 + y^2 = 100$$

$$h^2 + (21 - y)^2 = 17^2 \quad [\text{Eq. 2}]$$

$$h^2 + 441 - 42y + y^2 = 289$$

Substituting for $h^2 + y^2$, we get

$$100 + 441 - 42y = 289$$

$$42y = 252$$

$$y = 6$$

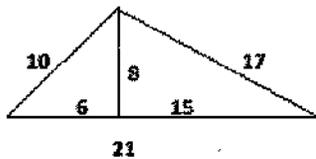

Substituting this for y in Eq. 1 and solving for h , we get

$$h^2 + 6^2 = 100$$

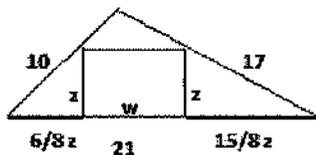

$$h^2 = 64$$

$$h = 8$$

So, we know the following measurements for the triangle.

The ratio of y to h is $6/8$. The ratio of $21 - y$ to h is $15/8$.

Back to the rectangle, let w and z represent our rectangle's width and height, respectively. The triangle created on the left side is similar to the 6-8-10 triangle from the previous figure. So if the height is z , the side corresponding to 6 has length $(6/8)z$. Similarly, on the right, we have a triangle similar to the 8-15-17 right

triangle, and the side corresponding to 15 has length $(15/8)z$. We can write the equation:

$$(6/8)z + w + (15/8)z = 21$$

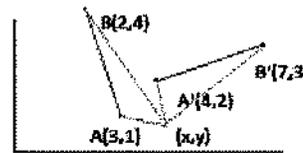

$$(21/8)z + w = 168/8$$

$$w = (168/8) - (21/8)z.$$

Now suppose $z = 8/2 = 4$. It follows that $w = (168/8) - ((21/8) \times 4) = (168/8) - 84/8 = 84/8$. The rectangle has an area of $wz = 4 \times (84/8) = 84/2 = 42$. When we check for $z = 3$ and $z = 5$, we get an area of $315/8$, which is less than the maximum area of 42. **Ans.**

Notice that the area of the original triangle is $(1/2) \times 21 \times 8 = 84$, which is twice the area of the rectangle. In fact, the maximum area of a rectangle inscribed in a triangle is always half the area of the triangle.

30. A line segments with endpoints $A(3, 1)$ and $B(2, 4)$ is rotated about a point in the plane so that its endpoints are moved to $A'(4, 2)$ and $B'(7, 3)$. What are the coordinates of the center of rotation?

Let the point (x, y) be the center of rotation. Then the distance between (x, y) and $(3, 1)$ is the same as the distance between (x, y) and $(4, 2)$. So we have

$$(x - 3)^2 + (y - 1)^2 = (x - 4)^2 + (y - 2)^2$$

$$x^2 - 6x + 9 + y^2 - 2y + 1 =$$

$$x^2 - 8x + 16 + y^2 - 4y + 4$$

$$-6x + 9 - 2y + 1 = -8x + 16 - 4y + 4$$

$$-6x - 2y + 10 = -8x - 4y + 20$$

$$2x + 2y = 10$$

$$x + y = 5 \quad (\text{Eq. 1})$$

Similarly, the distance between (x, y) and $(2, 4)$ is the same as the distance between (x, y) and $(7, 3)$.

$$(x - 2)^2 + (y - 4)^2 = (x - 7)^2 + (y - 3)^2$$

$$x^2 - 4x + 4 + y^2 - 8y + 16 =$$

$$x^2 - 14x + 49 + y^2 - 6y + 9$$

$$-4x + 4 - 8y + 16 = -14x + 49 - 6y + 9$$

$$-4x - 8y + 20 = -14x - 6y + 58$$

$$10x - 2y = 38$$

$$5x - y = 19 \quad (\text{Eq. 2})$$

Adding Eq. 1 and Eq. 2, we have:

$$x + y + 5x - y = 5 + 19$$

$$6x = 24$$

$$x = 4$$

Substituting this into Eq. 1, we get

$$4 + y = 5$$

$$y = 1$$

Thus, the ordered pair of the center of rotation is (4,1) **Ans.**

Target Round

- Jonas scored 88 points prior to the last game. He scored 23 points in the last game. This made his season average 18.5 points per game. Find the number of games he played.

$$88 + 23 = 111$$

Let x represent the number of games played. We can write $111/x = 18.5 \rightarrow x = 111/18.5 \rightarrow x = 6$ **Ans.**

- The dart board contains 20 uniquely numbered sectors. Malaika hits a number she aims for only half the time. The other half, she randomly is an adjacent number on either side. Malaika aims for the same number for 20 throws. To get the highest possible score, which number should she aim for?

The numbers are in the following order from the top and going clockwise:

20, 1, 18, 4, 13, 6, 10, 15, 2, 17, 3, 19, 7, 16, 8, 11, 14, 9, 12, 5

It may be ugly but there are several minutes to solve this – so...

Let's just look at 20, 1, 18.

When Malaika aims for the 1 she will hit it 10 of the 20 times; she will hit 20 only 5 times and 18 only 5 times. That's a score of $(1 \times 10) + (20 \times 5) + (18 \times 5) = 200$. We can generalize this by writing $10b + 5(a + c)$, where $a = 20$, $b = 1$ and $c = 18$. Let's create a table the possible values:

| b | $a + c$ | $10b$ | $5(a+c)$ | Total |
|-----|---------|-------|----------|-------|
| 20 | 6 | 200 | 30 | 230 |
| 1 | 38 | 10 | 190 | 200 |
| 18 | 5 | 180 | 25 | 205 |
| 4 | 31 | 40 | 155 | 195 |
| 13 | 10 | 130 | 50 | 180 |
| 6 | 23 | 60 | 115 | 175 |
| 10 | 21 | 100 | 105 | 205 |
| 15 | 12 | 150 | 60 | 210 |
| 2 | 32 | 20 | 160 | 180 |
| 17 | 5 | 170 | 25 | 195 |
| 3 | 36 | 30 | 180 | 210 |
| 19 | 10 | 190 | 50 | 240 |
| 7 | 35 | 70 | 175 | 245 |
| 16 | 15 | 160 | 75 | 235 |
| 8 | 27 | 80 | 135 | 215 |
| 11 | 22 | 110 | 110 | 220 |
| 14 | 20 | 140 | 100 | 240 |
| 9 | 26 | 90 | 130 | 220 |
| 12 | 14 | 120 | 70 | 190 |
| 5 | 32 | 50 | 160 | 210 |

To get the highest possible score, Malaika should aim for the 7 **Ans.**

- Joy rides her bike up the hill passing Greg after 3 km. Greg is walking down at 1 m/s. Joy rides another 7 km up the hill and then doubles her speed going down the hill. Joy and Greg arrive at Joy's starting point at the same time. What is Joy's average speed going downhill?

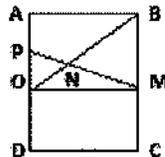

Greg walked downhill for 3 km at 1 m/s. $3 \text{ km} = 3000 \text{ m}$. It would take Greg 3000 seconds to travel 3000 m.

Let s represent the average speed that

Joy was going uphill, in meters per second. Joy rode 7 km, or 7000 m, at this speed and then $7 + 3 = 10$ km, or 10,000 m, down at twice the speed or $2s$. Joy did this in 3000 seconds. We can write the following equation:
 $(7000/s) + (10,000/2s) = 3000 \rightarrow$
 $(7000/s) + (5000/s) = 3000 \rightarrow$
 $12,000/s = 3000 \rightarrow 3000s = 12,000 \rightarrow$
 $s = 4$ and $2s = 2 \times 4 = 8$ **Ans.**

4. In rectangle ABCD, $BC = 2AB$, points O and M are midpoints of segments AD and BC, respectively. Point P bisects segment AO, and $OB = 6\sqrt{2}$. What is the area of $\triangle NOP$?

Since $BC = AD = 2AB$ and O is the midpoint of side AD, it follows that $AO = AB$. Let x represent the length of segment AO. Using the Pythagorean Theorem, we can write $x^2 + x^2 = (6\sqrt{2})^2 \rightarrow 2x^2 = 72 \rightarrow x^2 = 36 \rightarrow x = 6$. So $AO = AB = 6$. Since P bisects AO, it follows that $PO = 3$. Constructing segment OM

parallel to side AB, as shown, creates square, ABMO. The area of triangle MOP is $(1/2) \times 3 \times 6 = 9$. The area of triangle MOB is $(1/2) \times 6 \times 6 = 18$. By the Angle-Angle Postulate, we know that triangles NOP and NBM are similar. We also know that $PO = 3$ and $BM = 6$, so the sides of triangle MOB are twice the sides of triangle MOP. Let h represent the height of triangle MOB. Then the area of MOB is $(1/2) \times h \times 6 = 3h$. Since the height of triangle MOP is $(1/2)h$, it follows that its area is $(1/2) \times (1/2)h \times 3 = (3/4)h$. Thus, the area of triangle MNB is 4 times the area of triangle NOP. So if x is the area of triangle NOP, and y is the area of triangle ONM, then the

area of triangle MOP is the sum of the areas of triangles NOP and ONM. In other words, $x + y = 9$. The area of triangle MOB is the area of triangle MNB plus the area of triangle ONM, so $4x + y = 18 \rightarrow 3x = 9 \rightarrow x = 3$ **Ans.**

5. If $40q = p + (p/3) + (p/9) + (p/27)$, what is the ratio q/p ?

Let's begin by simplifying the equation and isolating one of the variables:

$$40q = p + (p/3) + (p/9) + (p/27)$$

$$40q = (27p + 9p + 3p + p)/27$$

$$40q = 40p/27$$

$$q = p/27$$

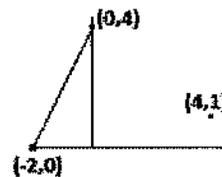

$$q/p = 1/27$$
 Ans.

6. What is the length of the shortest segment that can be drawn from the point $(4, 1)$ to $2x - y + 4 = 0$?

$$2x - y + 4 = 0$$

$$y = 2x + 4$$

Let's just plot it to see what it looks like.

$(-2, 0)$ and $(0, 4)$ are points on the graph of $y = 2x + 4$

The shortest segment between $(4, 1)$ and the line will be on a line perpendicular to $y = 2x + 4$

The slope, m , of the line is 2.

The slope for the perpendicular line is

$$-\frac{1}{m} = -\frac{1}{2}$$

Thus, the equation for the perpendicular line is

$$y = -\frac{1}{2}x + b$$

$(4, 1)$ is a point on this line.

$$1 = -\frac{1}{2} \times 4 + b = -2 + b$$

$$b = 3$$

So the equation is $y = -\frac{1}{2}x + 3$

The point that we need to find is when

$$-\frac{1}{2}x + 3 = 2x + 4$$

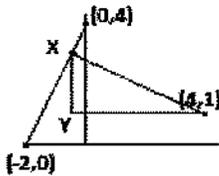

$$-\frac{1}{2}x = 2x + 1$$

$$\frac{5}{2}x = -1$$

$$x = -\frac{2}{5}$$

$$y = -\frac{1}{2} \times \frac{2}{5} + 3 = 3\frac{1}{5}$$

Therefore, we must determine the length of the line connecting $(4, 1)$ and $(-\frac{2}{5}, 3\frac{1}{5})$.

Let X be the point $(-\frac{2}{5}, 3\frac{1}{5})$

Then Y is the point $(-\frac{2}{5}, 1)$

The length of XY is

$$\frac{16}{5} - \frac{5}{5} = \frac{11}{5}$$

The length of Y to $(4, 1)$ is:

$$4 - (-\frac{2}{5}) = 4\frac{2}{5}$$

The length from X to $(4, 1)$ is:

$$\sqrt{\left(\frac{11}{5}\right)^2 + \left(\frac{22}{5}\right)^2} =$$

$$\sqrt{4.84 + 19.36} = \sqrt{24.2} \approx 4.9193495 \approx$$

4.92 Ans.

7. How many positive two-digit integers have exactly 8 positive factors?
1 and the number itself are 2 factors. There are 6 other factors. We could look at every two-digit integer and brute force it but let's see if there isn't a simple way to figure it out.

Let a, b, and c be the three factors.

If a, b, and c are prime then the factors would be:

1, a, b, c, ab, bc, ab, abc

1: $2 \times 3 \times 5 = 30$

$30 = 1 \times 30, 2 \times 15, 3 \times 10$ and 5×6 .

2: $2 \times 3 \times 7 = 42$

$42 = 1 \times 42, 2 \times 21, 3 \times 14$ and 6×7

3: $2 \times 3 \times 11 = 66$

$66 = 1 \times 66, 2 \times 33, 3 \times 22$ and 6×11

4: $2 \times 3 \times 13 = 78$

$78 = 1 \times 78, 2 \times 39, 3 \times 26$ and 6×13

5: $2 \times 3 \times 17 = 102$ so

$2 \times 5 \times 7 = 70$

$70 = 1 \times 70, 2 \times 35, 5 \times 14$ and 7×10 .

6: $2 \times 5 \times 11 = 110$

$2 \times 7 \times 11 = 140$

$3 \times 5 \times 7 = 105$

We are done with primes. Now let's look at relatively prime. Let's try 3 factors of the form: a, a², b so the other three factors are a³, a²b and ab

$2 \times 4 \times 3 = 24$

$24 = 1 \times 24, 2 \times 12, 3 \times 8$ and 4×6

7: $2 \times 4 \times 5 = 40$

$40 = 1 \times 40, 2 \times 20, 4 \times 10$ and 5×8

8: $2 \times 4 \times 7 = 56$

$56 = 1 \times 56, 2 \times 28, 4 \times 14$ and 7×8

9: $2 \times 4 \times 11 = 88$

$88 = 1 \times 88, 2 \times 44, 4 \times 22$ and 8×11

10: $2 \times 4 \times 13 = 104$

So let's deal with 3.

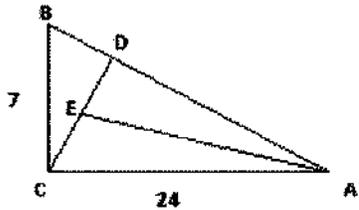

$3 \times 9 \times 2 = 54$

$54 = 1 \times 54, 2 \times 27, 3 \times 18$ and 6×9

At this point, no matter what other combination we try, we'll be over 100.

10 Ans.

8. In triangle ABC, AC = 24 and BC = 7. CD is perpendicular to AB. The bisector of the smallest angle of triangle ABC intersects CD at point E. Find the length of ED.

Given that $AC = 24$ and $BC = 7$, that means that BA must be 25.

Let $x =$ the length of BD .

Then the length of $AD = 25 - x$.

Let $h =$ the length of DC .

We can create two equations.

$$h^2 + x^2 = 7^2 = 49$$

$$h^2 + (25 - x)^2 = 24^2 = 576$$

$$h^2 = 49 - x^2$$

$$h^2 = 576 - (25 - x)^2$$

$$49 - x^2 = 576 - (25 - x)^2$$

$$49 - x^2 = 576 - (625 - 50x + x^2)$$

$$49 - x^2 = 576 - 625 + 50x - x^2$$

$$49 = -49 + 50x$$

$$50x = 98$$

$$x = \frac{98}{50} = \frac{49}{25}$$

$$h^2 + x^2 = 49$$

$$h^2 + \left(\frac{49}{25}\right)^2 = 49 = \frac{1225}{25}$$

$$h^2 + \frac{2401}{625} = \frac{30625}{625}$$

$$h^2 = \frac{30625}{625} - \frac{2401}{625} = \frac{28224}{625}$$

$$h = \sqrt{\frac{28224}{625}} = \sqrt{45.1584} = 6.72 = 6\frac{18}{25}$$

The length of AD is $25 - \frac{49}{25} = 23\frac{1}{25}$.

Now, from the bisector theorem:

$$\frac{DE}{EC} = \frac{AD}{AC} = \frac{23\frac{1}{25}}{24} = \frac{\frac{576}{25}}{24} = \frac{576}{25 \times 24} = \frac{576}{600}$$

$$\frac{DE}{EC} = \frac{576}{600}$$

Let $DE = y$.

Let $EC = z$.

$$\text{Then } \frac{DE}{EC} = \frac{y}{z} = \frac{576}{600}$$

$$z = \frac{600}{576}y$$

$$h = 6\frac{18}{25} = y + z$$

$$\frac{168}{25} = y + \frac{600}{576}y$$

$$\frac{168}{25} = \frac{576}{576}y + \frac{600}{576}y = \frac{1176}{576}y$$

$$y = \frac{168 \times 576}{1176 \times 25} = \frac{21 \times 576}{147 \times 25} = \frac{3 \times 576}{21 \times 25} =$$

$$\frac{576}{7 \times 25} = \frac{576}{175} \text{ Ans.}$$

Team Round

- Prime numbers 2, 3, 5 and 7 are used to replace a , b , c , and d in the multiplication table. The four products are found and then added together. Find the greatest possible value of the sum.

| | | |
|----------|-----|-----|
| \times | a | b |
| c | | |
| d | | |

The products of combinations of the 4 numbers, two at a time are:

$$2 \times 3 = 6$$

$$2 \times 5 = 10$$

$$2 \times 7 = 14$$

$$3 \times 5 = 15$$

$$3 \times 7 = 21$$

$$5 \times 7 = 35$$

Clearly, we would want to get rid of the lowest two, but we can't. If $a = 2$, then we must have ac and ad as products.

So we can place 2 and 3 together as a and b and not have to deal with ab . But that means c and d would be 5 and 7

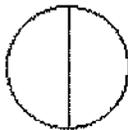

and we would then lose cd or 35. If we put 2 and 7 together and 3 and 5 together we'll at least remove two of the lower products. Let's try that.

| | | |
|---|----|----|
| × | 2 | 7 |
| 3 | 6 | 21 |
| 5 | 10 | 35 |

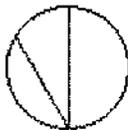

The sum of the products are:
 $6 + 21 + 10 + 35 = 72$ **Ans.**

2. A pizza is cut 5 times before being removed from the pan. What is the maximum number of pieces that can be made which contain none of the pizza's outer crust?

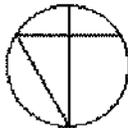

The first cut won't create any pieces that don't have crust.

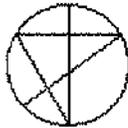

Neither will the second cut.

The third cut can create 1 piece without crust.

The fourth cut can add two more pieces.

And finally, the fifth piece can add 3 more pieces (each successive cut adds one more than the previous cut did).

$1 + 2 + 3 = 6$ **Ans.**

3. There are 3 die, one red, one green and one white. Patrick tosses each and

creates equations, that may or may not be correct, of the form:

red die value – green die value = white die value

Patrick rolls and creates $4 - 3 = 2$

If you rotate each die a quarter turn, the equation can be made correct. How many correct equations are possible?

When 4 is on top of the red die, turning the die one turn gives you access to: {1, 2, 5, 6}.

When 3 is on top of the green die, turning the die one turn gives you access to {1, 2, 5, 6}.

When 2 is on top of the white die, turning the die one turn gives you access to {1, 3, 4, 6}.

(Uh, no, I wasn't going to turn that last set white...)

The first value, for the red die, can't be a 1 since we can't have a result that's 0 or less. So let's start with 2.

$$2 - 1 = 1$$

Now let's use 5 for the red die.

$$5 - 1 = 4$$

$$5 - 2 = 3$$

Finally, let's use 6 for the red die.

$$6 - 2 = 4$$

$$6 - 5 = 1$$

That's a total of 5. **Ans.**

4. A square prism has dimensions $5' \times 5' \times 10'$, where ABCD is a square. $AP = ER = 2$ and $QC = SG = 1$. The plane containing PQ and RS slices the original prism into two new prisms. We must find the volume of the larger of these two prisms.

2 ones

$$1 + 1 + 3 + 3 + 3 + 7 = 18$$

$$1 + 1 + 3 + 3 + 5 + 5 = 18$$

1 one

$$1 + 3 + 3 + 3 + 3 + 5 = 18$$

Finally we can do all 6 integers as 3:

$$3 + 3 + 3 + 3 + 3 + 3 = 18$$

Any higher number and we won't be able to have six odd integers to sum to 18. We are done.

$$1 + 3 + 3 + 2 + 1 + 1 = 11 \text{ Ans.}$$

8. In how many ways can 15,015 be represented as the sum of two or more consecutive positive integers written in ascending order?

First, let's determine the maximum number of consecutive integers we can have. The equation for determining the largest number of consecutive integers is to start from 1 or:

$$\frac{n \times (n + 1)}{2} = 15015$$

$$n^2 + n - 30030 = 0$$

If m is the solution to this equation we would have:

$$(n + m)(n + m - 1) = 30030$$

The value for m will be pretty close to the square root of 30030 or approximately 173.

Therefore, we can't have more than 173 consecutive numbers to sum to 15015.

Now let's look at odd numbers of consecutive positive integers.

If there are 3 integers we could call them $x - 1$, x and $x + 1$. Then

$$x - 1 + x + x + 1 = 15015$$

$$3x = 15015$$

And if there were 5 integers we could call them $x - 2$, $x - 1$, x , $x + 1$ and $x + 2$.

$$\text{Then } x - 2 + x - 1 + x + x + 1 + x + 2 =$$

$$5x = 15015$$

You can now see the pattern. When n is an odd integer, we get

$$nx = 15015$$

x can only have an integral value when n is a factor of 15015.

Let's factor 15015.

$$15015 = 3 \times 5005 =$$

$$3 \times 5 \times 1001 =$$

$$3 \times 5 \times 7 \times 143 =$$

$$3 \times 5 \times 7 \times 11 \times 13$$

Remember that any factor of 15015 no greater than 173 would work.

One single factor:

$$3, 5, 7, 11, 13$$

Combinations of two factors:

$$15, 21, 33, 39, 35, 55, 65, 77, 91, 143$$

Combinations of three factors:

$$105, 165 \text{ only}$$

Combinations of four factors:

None – every combination is bigger than 173. So far we have $5 + 10 + 2 = 17$ sets of consecutive integers.

Now, let's look at even values.

If $n = 2$, then

$$x + x + 1 = 15015$$

$$2x + 1 = 15015$$

$$2x = 15014$$

$$x = 7507 \text{ \#18}$$

If $n = 4$, then let's try and get as many additions to cancel out:

$$x - 1 + x + x + 1 + x + 2 = 15015$$

$$4x + 2 = 15015$$

$$4x = 15013$$

This won't work and no multiple of 4 will work. (When $n = 2$, we had $2x + 1$; and when $n = 4$, we had $4x + 2$ and when $n = 3$ we will have $6x + 3$ – we must have an odd number to subtract from 15015 to make an even number).

If $n = 6$, then $6x + 3 = 15015$

$$6x = 15012$$

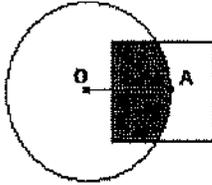

$$x = 2502 \text{ (That's \#19 and } 6 = 3 \times 2)$$

$n = 10$:

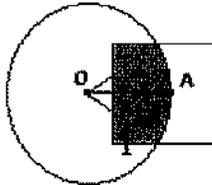

$$10x + 5 = 15015$$

$$10x = 15010$$

$$x = 1501 \text{ (That's \#20 and } 10 = 5 \times 2)$$

We can create an equilateral triangle by drawing two radii from O to the points of the circle that intersect with the square.

The height of the triangle is $\frac{\sqrt{3}}{2}$ and the portion of that height that is in the grey colored area in the triangle is $\frac{\sqrt{3}}{2} - \frac{1}{2}$.

This makes the area of the rectangular portion of the grey area

$$\left(\frac{\sqrt{3}}{2} - \frac{1}{2}\right) \times 1 = \frac{\sqrt{3}}{2} - \frac{1}{2} = 0.3660254$$

Now for the area of the chord:

The triangle that was drawn is an equilateral triangle making the angle at O to be 60° . Therefore, the area of the sector is $\frac{1}{6}\pi r^2 = \frac{\pi}{6}$.

The area of the equilateral triangle is

$$\frac{1}{2} \times \frac{\sqrt{3}}{2} \times 1 = \frac{\sqrt{3}}{4}$$

Thus, the area of the chord is:

$$\frac{\pi}{6} - \frac{\sqrt{3}}{4} \approx 0.5235983 - 0.433012701 \approx 0.0905855$$

Adding the area of the rectangular portion of the grey area to the chord gives:

$$0.3660254 + 0.0905855 \approx 0.45661099 \approx 0.46 \text{ Ans.}$$

$14x + 7 = 15015$
 $14x = 15008$
 $x = 1072$ (That's #21 and $14 = 7 \times 2$)
 $18x + 9 = 15015$
 $18x = 15006$
 $x = 833.6667$ – This one didn't work.
 $18 = 3 \times 3 \times 2$
 $22x + 11 = 15015$
 $22x = 15004$
 $x = 682$ (That's #22 and $22 = 11 \times 2$)
 $26x + 13 = 15015$
 $26x = 15002$
 $x = 577$ (That's #23 and $26 = 13 \times 2$)
 $30x + 15 = 15015$
 $30x = 15000$
 $x = 500$ (That's #24 and $30 = 5 \times 3 \times 2$)
 $34x + 17 = 15015$
 $34x = 14998$
 $x = 441.117$

Okay. There's a pattern here and that is that the even factors are composed of 2 and factors of 15015. We've already identified 3, 5, 7, 11, 13 and 15. So the rest of the possible factors are:

42 (21×2): #25
 66 (33×2): #26
 78 (39×2): #27
 70 (35×2): #28
 110 (55×2): #29
 130 (65×2): #30
 154 (77×2): #31

Any other values multiplied by 2 will be greater than 173.

31 **Ans.**

9. A positive integer is *squarish* if it contains the digits of the squares of its digits in order but not necessarily contiguous. What is the smallest squarish number that includes at least one digit greater than 1?

Let's look at the first squares.

1, 4, 9, 16, 25, 36, 49, 64, 81, 100
 1, 2, 3, 4, 5, 6, 7, 8, 9, 10

Let's start with 12. $1^2 = 1$ (that is why they said includes at least one digit greater than 1).

12 is next and $2^2 = 4$

124 is next and $4^2 = 16$

1246 is next and $6^2 = 36$

12436 is next and we can switch this to 12346 without violating the requirements. Now $3^2 = 9$

123469 is next and $9^2 = 81$

8123469 isn't next because $8^2 = 64$ and the 4 is before the 6. Let's move that.

8123649 – this works but can we make the value smaller by moving some of the numbers around?

2364981 – I just moved 81 to the end.

That's good but can I move anything again?

Yes, it won't hurt if I switch the 9 and 81.

2364819

13 can be reduced in a similar way to 381649 – that is definitely less than 2364981.

14 can be reduced to 348169.

15 can be reduced to 2364819

16 is can be reduced to 381649.

17 can be reduced to 8136479 – no matter what else we do this number is greater than 381649.

18 is next and leads to 381649

19 leads to 381649

And what you can see is that the choice becomes which two numbers leads to the smallest number of integers that we need to represent the squares.

381649 **Ans.**

10. A square of side length 1 inch is drawn with its center A on a circle O of radius 1 inch so that a side of the square is perpendicular to OA. What is the area of the shaded region?

Sprint Round

Problems 1–30

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

State _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ cents Eighty percent of a mango is edible. If mangos sell for \$2 a pound and Mary bought a mango that weighed $1\frac{1}{2}$ pounds, how many cents did she pay for the part of the mango that was not edible?

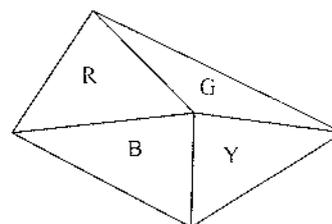

2. _____ ordered pairs How many ordered pairs of primes (a, b) satisfy $a + b = 22$?

3. _____ Among all three-digit positive integers ending in 9, what is the probability of randomly selecting one that is divisible by 9? Express your answer as a common fraction.

4. _____ What is the product of all of the values of x that satisfy $x^2 + 2012x = 2013$?

5. _____ The sum of seven distinct positive integers is 91. What is the greatest possible value of the second largest of these integers?

6. _____ ways A large quadrilateral is divided into four smaller non-congruent regions, and each region is painted with a different color. The possible colors are red, blue, green and yellow. One possible way to paint the quadrilateral is shown below. Including the way shown, how many total ways could the quadrilateral be painted?

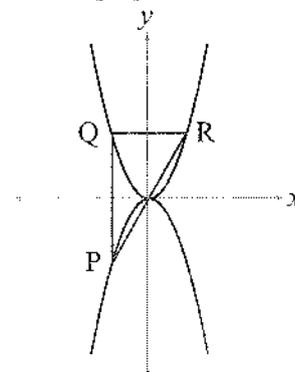

7. _____ students There were ten more girls than boys in a basket weaving class. Today six new boys enrolled, and the ratio of girls to boys is now five to four. How many students are now in the class?

8. _____ ft Three concentric circles have radii of lengths 2, 4 and 8 feet. What is the length of the shortest line segment that has at least one point in common with each of the three circles?

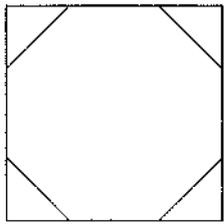

9. _____ If $w^a w^5 = w^{15}$ and $(w^4)^b = w^{12}$, what is the value of $a + b$?

10. _____ For $\triangle PQR$, shown here, points $Q\left(-\frac{2}{3}, q\right)$ and $R\left(\frac{2}{3}, r\right)$ lie on the graph of $y = ax^2$, and point $P\left(-\frac{2}{3}, p\right)$ lies on the graph of $y = -ax^2$, where $a > 0$. If the area of $\triangle PQR$ is 16 units², what is the value of a ?

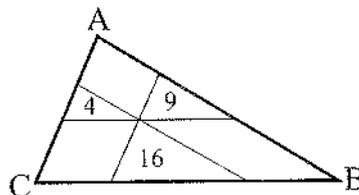

11. _____ What is the tens digit of the sum of the first 40 terms of this sequence?

9, 99, 999, 9999, 99999, . . .

12. _____  A square circumscribes a regular octagon, as shown. If a point is randomly selected inside the square region, what is the probability that it will not be inside the octagonal region? Express your answer in simplest radical form.

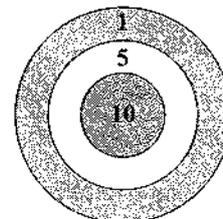

13. _____ subsets How many non-empty subsets of $\{1, 2, 3, 4, 5\}$ contain an element whose value is the number of elements in the subset?

14. _____ units² In $\triangle ABC$, line segments are drawn parallel to each of the sides dividing the triangle into six regions. The areas of three regions are shown in the figure. What is the total area of $\triangle ABC$?

15. _____ weeks A baseball league has four teams, and each team plays a game against one other team each week. Assuming there have been no ties, what is the minimum number of weeks after which it is possible to have one team that is undefeated but no team that has lost every game?

16. _____ To play a game of darts Michael throws three darts at the dart board shown. The number of points (1, 5 or 10) for each of the three regions is indicated. His score is the sum of the points for the three darts. If the radii of the three concentric circles are 1, 2 and 3 units, and each dart Michael throws hits this dart board at random, what is the probability that his score is evenly divisible by 3? Express your answer as a common fraction.

17. _____ teachers In a certain school district, the student-teacher ratio is 25:1. Currently, the school district has 3150 students. If the student enrollment increases by 20% and none of the current teachers leave, how many additional teachers must be hired to improve the student-teacher ratio to 18:1?

18. _____ In the coordinate plane, \overline{LM} passes through the origin. If $\overline{LM} \perp \overline{RS}$, and they intersect at $(5, 3)$, what is the x -coordinate of the point where \overline{RS} intersects the x -axis? Express your answer as a common fraction.

19. _____ The sequence 3, 4, 13, 15, 30, 33, 54, 58, 85, 90, ..., contains, in increasing order, all the positive integers that yield a triangular number when multiplied by 7. What is the 100th term of this sequence?

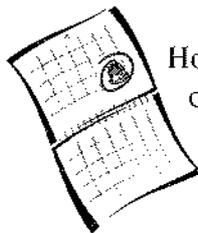

20. _____ ordered
triples Five people board a train containing three cars. The conductor records the ordered triple (a, b, c) indicating how many of the five passengers take a seat in the first, second and third car, respectively. How many such ordered triples are possible?

21. _____ units Two circles share a common chord. The chord cuts off a 90° arc of circle A and a 60° arc of circle B. The radius of circle A is $5\sqrt{3}$ units. What is the radius of circle B? Express your answer in simplest radical form.

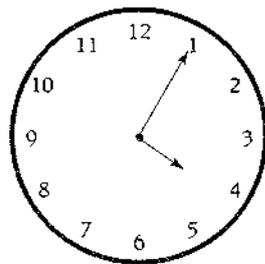

22. _____ If $f(x) = x + 3$ and $g(x) = [f(x)]^2$, what is the product of all possible values of $f(x - 1)$ for which $g(x) = 25$?

23. _____ people How many people must be in a room to guarantee that at least two of them have the same birthday or at least one of them was born in February?

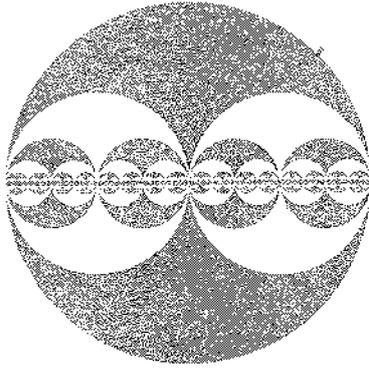

24. _____ If a and b are real numbers such that $a + b = 1$ and $a^2 + b^2 = 2$, what is the value of $a^3 + b^3$? Express your answer as a common fraction.

25. _____ times How many times in a 24-hour day will the hour and minute hands of a 12-hour analog clock form a 90-degree angle?

26. _____

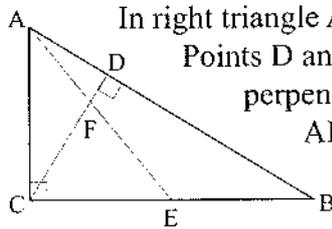

To create the figure shown, a circle of radius 1 was drawn at Stage 1. Two new circles of radius $\frac{1}{2}$ were drawn at Stage 2. Then 2^{n-1} new circles of radius $\frac{1}{2^{n-1}}$ were drawn at Stage n . Each circle is tangent to one other circle of the same size as well as to one other circle of the next larger size. This process is repeated infinitely. The interior of each circle drawn at an odd stage is shaded. The interior of each circle drawn at an even stage is unshaded. What fraction of the largest circle is shaded? Express your answer as a common fraction.

27. _____

What is the sum of the values of x that satisfy $9(x^3 - 3x^2 - 28x + 60) = 1$?

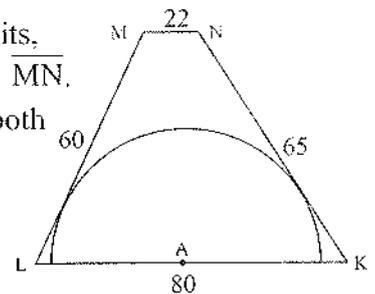

28. _____

In right triangle ABC , shown here, $AC = 5$ units and $BC = 12$ units. Points D and E lie on \overline{AB} and \overline{BC} , respectively, so that \overline{CD} is perpendicular to \overline{AB} and E is the midpoint of \overline{BC} . Segments \overline{AE} and \overline{CD} intersect at point F . What is the ratio of AF to FE ? Express your answer as a common fraction.

29. _____ units

Trapezoid $KLMN$ has sides $KL = 80$ units, $LM = 60$ units, $MN = 22$ units, and $KN = 65$ units, with \overline{KL} parallel to \overline{MN} . A semicircle with center A on \overline{KL} is drawn tangent to both sides \overline{KN} and \overline{ML} . What is the length of segment KA ? Express your answer as a mixed number.

30. _____ units

A triangle has sides of length 10, 17 and 21 units. What is the radius of its circumscribed circle? Express your answer as a common fraction.

1. 5

Bobby saved \$32 when he purchased a jacket at a clearance sale. If the clearance price was 40% less than the regular price, what was the regular price of the jacket?

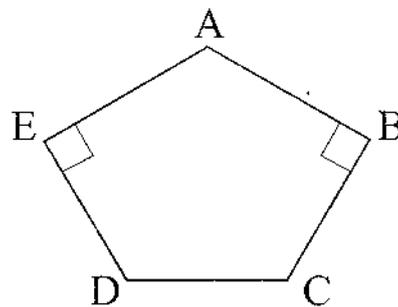

2. units²

The two cones in the diagram share a common apex and have parallel bases. Millie found the volumes of the smaller and larger cones to be 125π units³ and 512π units³, respectively. She found the lateral surface area of the smaller cone to be 125 units². What is the lateral surface area of the larger cone?

3. _____ A set contains four integers. The sums of the integers in each of its three-element subsets are 82, 88, 79 and 84. What is the median of the original set of four distinct integers?

4. _____ units² Pentagon ABCDE has $AE = AB = 1$ unit. Angles B and E each have measure 90° , and $m\angle A = 120^\circ$. The two remaining angles are congruent to each other, and the three remaining sides are congruent to each other. What is the area of pentagon ABCDE? Express your answer as a common fraction in simplest radical form.

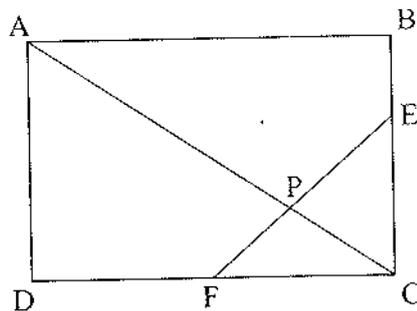

5. _____ We know the following five facts about the numbers a , b , c and d . What is the value of $a + b$?

- 1) $ab = 1$
- 2) $b + c = 0$
- 3) $b + c + d = 0$
- 4) $bc = -9$
- 5) $c + a < d$

Express your answer as a common fraction.

6. _____ In rectangle ABCD, shown here, points E and F lie on sides BC and CD, respectively. Point F is the midpoint of \overline{CD} and $BE = \frac{1}{3}BC$. Segments AC and FE intersect at point P. What is the ratio of AP to PC? Express your answer as a common fraction.

7. _____ What is the smallest possible value of the sum $|x - 2| + |x - 4| + |x - 5|$?

8. _____ units² What is the maximum possible area of a triangle with vertices $(a, 0)$, $(b, 0)$ and (c, d) , where $1 + a - 2a^2 = 1 + b - 2b^2 = 0$, $1 + c - 2c^2 = d$ and $d > 0$? Express your answer as a common fraction.

Team Round

Problems 1–10

State _____

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk during this section of the competition. This round assumes the use of calculators, and calculations may also be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers in the official team booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ What is the sum of all real numbers a that satisfy the equation $a + a = a \times a$?

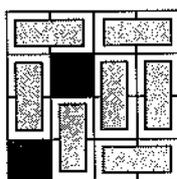

2. _____ The average of ten numbers is 41. The average of six of these numbers is 46. What is the average of the other four numbers? Express your answer as a decimal to the nearest tenth.

3. _____ permu-
tations Eight-letter permutations can be made by using four letters from the word MAINE and four letters from IDAHO. How many unique eight-letter permutations are there?

4. _____ The first term of a geometric sequence is 12, and the geometric mean of the first three terms is 18. What is the third term in the sequence?

5. _____ pairs

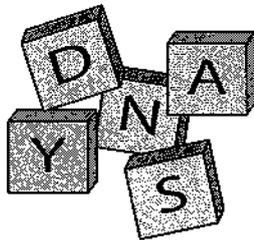

Two unit squares are removed from a 4×4 grid. Seven dominoes are available to cover each of the remaining 14 squares such that each domino covers two adjacent unit squares. One such example is shown. Including the pair shown in this example, how many pairs of unit squares can be removed so that the seven dominoes can cover the remaining 14 unit squares?

6. _____ The letters A through I denote distinct nonzero digits in the addition problem shown. What is the largest possible value of the three-digit number GHI?

$$\begin{array}{r} ABC \\ DE \\ + \quad F \\ \hline GHI \end{array}$$

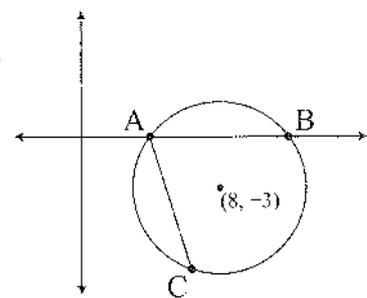

7. _____ gallons A tank containing 600 gallons of a water and sand mixture is 98% water. After some of the water evaporates, the remaining mixture is now found to be 97% water. How many gallons of mixture are in the tank now?

8. _____ games In a three-person Scrabble® tournament, Mary, Sherry and Terry each play three games against each of the other two opponents, with Sherry playing Mary first. A player faces the same opponent for three games before playing against the other opponent. On the score sheet, wins and losses are entered from left to right in the order they were played. A win is recorded as a 1, while a loss is recorded

as a 0. There were no ties. When the tournament is over, each player's score sheet contains a six-digit string of 1's and 0's that can be interpreted as a base 2 numeral. When these base 2 numbers were converted to decimal numbers, Sherry's number was 4 more than Mary's. How many more games did Mary win than Sherry?

9. _____ A circle with radius 5 units has its center at $(8, -3)$. Chord \overline{AB} has its endpoints on the x -axis with $A(4, 0)$. Point C is on the circle with $AC = AB$. What is the sum of the coordinates of point C ? Express your answer as a decimal to the nearest hundredth.

10. _____ If the sum of the first n positive integers equals the sum of the next k positive integers, where $n < 20$, what is the largest possible value of k ?

Written Competition Champion - Alec Sun, Massachusetts
Written Competition Runner-Up - Ashwin Sah, Oregon

Alec Sun Named 2013 National Champion, Massachusetts Team Awarded First Place at the 2013 Raytheon MATHCOUNTS National Competition

Alec Sun had already been highly successful at the 2013 Raytheon MATHCOUNTS National Competition before answering any Countdown Round questions. Not only had his team from Massachusetts been awarded First Place just moments before, but Alec also had learned that he was the first student to have participated in the Countdown Round three times, meaning he placed in the top 12 as a sixth-, seventh- and eighth-grade student.

Despite already having accomplished so much, Alec still had an important personal goal in mind: he wanted to answer a Countdown Round question correctly. It is hard to believe that this incredible Mathlete®—a student who was the only sixth grader to compete in the 2011 Countdown Round, who helped the Massachusetts team win First Place two years in a row, and who earlier that morning made a perfect score on arguably the toughest written National Competition ever—had never answered a question correctly in two years of Countdown Rounds.

Alec was determined to make his third and final National Competition different, and his hard work and determination paid off...

Having won his quarter-final and semi-final Countdown Round matchups, and with the score tied at three in the finals, the excitement in the room was palpable as Alec worked on a problem that his competitor had just attempted, but missed:

What is the greatest integer that must be a factor of the sum of any four consecutive positive odd integers?

In the remaining 30 seconds he had, Alec paused for a moment to check his work. He had already answered so many Countdown Round questions correctly this year, but he knew that getting this question right mattered most of all. Sitting in front of hundreds of people in a moment that was more than two years in the making, Alec buzzed in, confidently gave the correct answer (8), and became the 2013 National Champion.

2013 National Champion Alec Sun, pictured with Honorary Chairman William Swanson (left) and Executive Director Lou DiGioia.

Alec, an eighth-grade student from Lexington, Mass., competed against 223 of the nation's top middle school math students, who came together on Friday, May 10th for the 30th National Competition at the Marriott Wardman Park Hotel in Washington, D.C. Since claiming the title of National Champion, Alec has appeared on *Live! with Kelly and Michael* and *Good Morning America*.

Alec Sun competed in the Countdown Round in 6th (top left), 7th (bottom left) and 8th grade.

The Countdown Round consists of intense one-on-

one matchups, where the top 12 Mathletes answer a series of challenging questions, each in 45 seconds or less. Rankings for the Countdown Round were determined by the students' scores on the written tests in the morning. The four students with the highest scores on the written rounds, who received a bye in the first round of the Countdown Round, were Alec Sun (with a perfect score); Ashwin Sah, an eighth grader from Oregon; James Lin, an eighth grader from Massachusetts; and Andy Xu, a sixth grader from South Carolina.

After a riveting and hard-fought Countdown Round, the Second Place winner for the second year in a row was Ashwin Sah. The two semi-finalists were Andy Xu and seventh grader Franklyn Wang of Virginia.

In this year's team competition, First Place went to Massachusetts, with coach Josh Frost and team members Alec Sun; James Lin, from Winchester; Matthew Lipman, an eighth grader from Lexington; and Michael Ren, a seventh grader from Andover. The Washington team won Second Place and the Florida team won Third Place.

The First Place team from Massachusetts: coach Josh Frost and team members Alec Sun, Michael Ren, James Lin and Matthew Lipman, pictured with Raytheon Vice President of Community Relations Pam Erickson and MATHCOUNTS Chair of the Board Ron Wasserstein (right).

Being a National Competitor is an incredible accomplishment requiring passion, hard work and exceptional talent. MATHCOUNTS would like to congratulate all 224 of the Mathletes who competed in the National Competition. The results of the 2013 Raytheon MATHCOUNTS National Competition are available *here*.

National Competition Awards

National Champion: Alec Sun

- \$8,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

Countdown Round Second Place Winner:
Ashwin Sah

- \$6,000 Scholarship

Written Competition Champion: Alec Sun

- \$8,000 Scholarship

Written Competition Runner-Up:
Ashwin Sah

- \$6,000 Scholarship

Countdown Round Semi-Finalists:

Andy Xu and Franklyn Wang

- \$4,000 Scholarship each

First Place Team: Massachusetts—Alec Sun,
James Lin, Matthew Lipman and Michael Ren

- \$2,000 Scholarship each
- Trip to U.S. Space Camp

325 National Competition Participants Set Guinness World Record

This year's Mathletes are not only incredible mathematicians, they are also "Officially Amazing." On Friday, May 10th, the 244 students at the National Competition were joined by 61 MATHCOUNTS coaches and 20 volunteer advisors to make history. They set the Guinness World Record for the fastest time to construct the first 25 rows of Pascal's Triangle in human formation.

This difficult task—involving 325 people and numbers ranging from one to 2,704,156—was completed in just six minutes, 16 seconds and 5.7 tenths of a second!

Thank you to the volunteers who helped make this event a success, including Richard Rusczyk, David Patrick and Larry Evans from Art of Problem Solving; the Human Calculator® Scott Flansburg; and other MATHCOUNTS volunteers and staff members.

Congratulations to all of the Guinness World Record holders!

Recognizing Team Spirit at the 2013 Raytheon MATHCOUNTS National Competition

Above: Wisconsin team members Christopher Xu, Bryan Jin, Peter Yang and Anusha Sahai, and coach Sowmya Partha, pictured with Pam Erickson and Ron Wasserstein. Below: Colin Tang of Washington applauds Alec Sun, after Alec answers a just-for-fun Countdown Round question he was asked about the zoo.

Congratulations to the winners of the 2013 Spirit Award, the team from Wisconsin. This team not only showed excitement and enthusiasm throughout the National Competition, but also character and grace when a team member fell ill and was unable to complete his participation in the competition.

The Spirit Award is given to the team whose members personify the heart and energy of MATHCOUNTS. The recipient of this award is often difficult to determine, because passion, enthusiasm and sportsmanship are so prevalent in all of the teams. "MATHCOUNTS spirit" shows in the students at the Countdown Round who, after answering a question incorrectly, continue working just to see where they made a mistake. It shows in the students trading pins and making life-long friends. It shows in the support and encouragement students offer each other throughout the competition. MATHCOUNTS commends all of the students who made this year's National Competition memorable.

Soda Fountain Team from California Voted First Place at the 2013 Reel Math Challenge Finals

Movie-makers from across the country came together to present their videos at the 2013 Reel Math Challenge Finals on Saturday, May 11th in Washington, D.C. The Soda Fountain team from California won for their video, "Where's Waldorf?"

This year's insightful and creative videos show how math is used all the time in real-world situations. Whether hanging pictures using the Pythagorean Theorem or dividing up Halloween candy using algebraic expressions, Reel Mathletes have shown that math truly is everywhere.

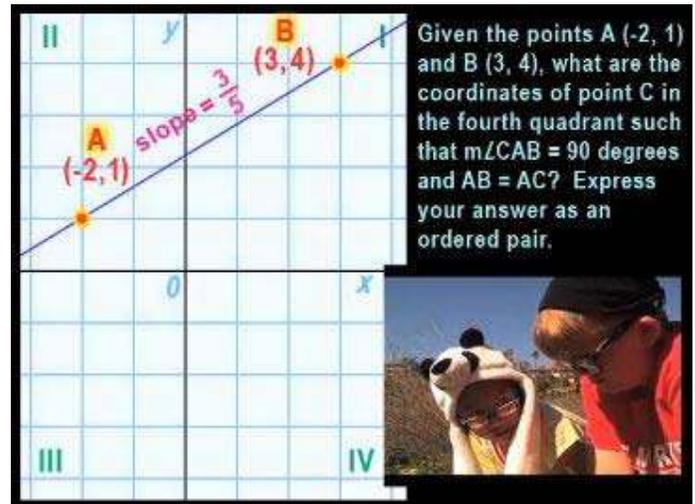

"Where's Waldorf?" bested over 250 videos submitted this year. The members of the four finalist teams each received a Droid DNA, generously donated by HTC, and an all-expenses-paid trip to the 2013 Raytheon MATHCOUNTS National Competition, where the 224 national competitors voted for the overall winner. Each member of the First Place Soda Fountain team won a \$1000 scholarship.

"Where's Waldorf?" features sixth-grade students Sarah Kung, Matthew Thomsen and Frederic Chirol Hill, and eighth-grade student Juliette Chirol Hill as a family hosting a foreign-exchange student who gets lost while trying to find the Hollywood sign. The video answers question 68 from this year's *MATHCOUNTS School Handbook*:

Given the points A(-2, 1) and B(3,4), what are the coordinates of point C in the fourth quadrant such that the measure of angle CAB is 90 degrees and $AB = AC$?

The students' creative real-world application of the math concept shows how slope could be used to find someone who is lost by mapping out coordinates. Their winning video is one of over 500 student-made movies in the Reel Math Challenge archive, a free resource for educators nationwide. Poor Waldorf may not ever find the Hollywood sign, but "Where's Waldorf?" will be found in classrooms across the country.

Congratulations to all of this year's outstanding student movie-makers! More information about the Reel Math Challenge is available [here](#).

Sarah Kung and Matthew Thomsen try to figure out how to find Waldorf by applying slope to a map of Los Angeles.

Team members Juliette Chirol Hill, Sarah Kung, Matthew Thomsen and Frederic Chirol Hill; and team advisor Christian Hill, pictured with Pam Erickson and Ron Wasserstein.

Reel Math Challenge 2013 Finalists

- “A Storm Is Coming” by SMSA Reel Math from New York
- “How Many Frogs” by Maple Lake Homeschool Team from Pennsylvania
- “Picture Perfect” by THE EAGLES from Nevada

MATHCOUNTS Club Program

This year, thousands of students from nearly 7,000 schools nationwide participated in the MATHCOUNTS Club Program, which provides educators with free resources to make math engaging and fun for students of all levels. Registration for the 2013-2014 program year will begin in September, and more information about the Club Program is available [here](#).

The most active and successful clubs can achieve Silver Level Status, and then can strive to achieve Gold Level Status—the most prestigious accolade in the Club Program. This year, over 550 schools achieved Silver Level Status, and over 250 schools achieved Gold Level Status. A complete list of these outstanding schools is available [here](#).

Swanson Middle School wins the Gold Level Grand Prize Drawing

Congratulations to Swanson Middle School from Arlington, Virginia. The club won a \$500 gift card and an all-expenses-paid trip for the club sponsor and four students to attend the 2013 Raytheon MATHCOUNTS National Competition.

MCP Grand Prize Winners: students Arjun Guidroz and Eric Weiner, coach Laura Partridge, and students William Xu and Owen Davies, with Pam Erickson (center) and Ron Wasserstein.

Gold Level \$500 Gift Card Winners

- Kazoo School; Kalamazoo, MI
- Jackson Preparatory School; Jackson, MS
- Yavneh Hebrew Academy; Los Angeles, CA
- T. Benton Gayle Middle School; Fredericksburg, VA
- Bishop Walsh School; Cumberland, MD

Silver Level \$250 Gift Card Winners

- Bridgewater Middle School; Wintergarden, FL
- East Middle School; Braintree, MA
- Lamar Middle School; Lamar, MO
- Harder Elementary School; Hayward, CA
- Weibel Elementary School; Fremont, CA
- Shady Side Academy Middle School; Pittsburg, PA
- Ballard Middle School; Huxley, IA
- Head Royce School; Oakland, CA
- Walkersville Middle School; Walkersville, MD
- Cardinal John Foley Catholic School; Havertown, PA

Do you have what it takes to achieve Gold Level? Here are some questions from the 2013 Ultimate Math Challenge...

1. How many ordered pairs (a, b) of positive integers satisfy the equation $18 \div a = b$?
2. The juice in a full pitcher will exactly fill 6 glasses. Kendra drank one full glass of juice. Phil drank 5 ounces of juice from another glass. If Phil drank one-third the amount of juice Kendra drank, how many ounces of juice does the pitcher contain when it is full of juice?
3. The three members of set A are consecutive integers with an average value of 9. The seven members of set B are consecutive integers with an average value of 9. What is the product of the largest value in set A and the largest value in set B?

$$A = \{ _, _, _ \}$$

$$B = \{ _, _, _, _, _, _, _ \}$$

Answers: 1: 6 ordered pairs, 2: 90 ounces, 3: 120

M² Onstage Staff Named MATHCOUNTS Honorary Alumni

Bob McWilliams, Keith Johnson and Steve Dziki of the company M² Onstage were named Honorary MATHCOUNTS Alumni on Saturday, May 12th at the 2013 Raytheon MATHCOUNTS National Competition. These three outstanding individuals have not only made the MATHCOUNTS National Competition an amazing spectacle for the Mathletes competing each year, but they also have done so with an never-ending positive attitude and a level of dedication unsurpassed by other vendors with whom the MATHCOUNTS Foundation has worked. We would like to thank them for the hard work and effort they put into making the National Competition an unforgettable event year after year.

Bob McWilliams and Steve Dziki receive their plaques naming them Honorary MATHCOUNTS Alumni. They are pictured with Deputy Director Kristen Chandler and Lou DiGioia.

Spotlight on State and Local Donors

We would like to extend our tremendous appreciation to the donors at the state and local level whose invaluable support helped make this year's MATHCOUNTS Competition Program possible.

2014

■ **School Competition** ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. candy bars

At a candy store Alexis purchased 3 candy bars for \$1.50. At this rate, how many whole candy bars can she buy with \$8.75?

2.

If $x \boxtimes y = (x + y)^2$ for positive integers x and y , then $4 \boxtimes 5 = (4 + 5)^2 = 9^2 = 81$. What is the value of $2 \boxtimes 3$?

3. °F

Consider the weather data for 10 days shown in the table below. John identified the mode of the daily high temperature and the mode of the daily low temperature, in degrees Fahrenheit, based on this data. What is the mean of those two numbers?

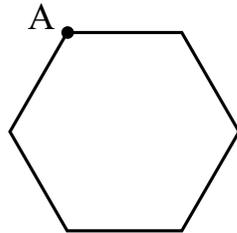

| | Mon. | Tues. | Wed. | Thurs. | Fri. | Sat. | Sun. | Mon. | Tues. | Wed. |
|------|------|-------|------|--------|------|------|------|------|-------|------|
| High | 72 | 74 | 70 | 69 | 72 | 74 | 78 | 79 | 72 | 70 |
| Low | 61 | 58 | 60 | 58 | 63 | 58 | 63 | 58 | 60 | 59 |

4.

Karina wrote the addition problem shown here on the board. However, one digit is incorrect. When written correctly, the number containing the incorrect digit is what four-digit integer?

$$\begin{array}{r} 2\ 6\ 3\ 5 \\ +\ 1\ 8\ 6\ 2 \\ \hline 4\ 5\ 3\ 7 \end{array}$$

5. triangles

Point A is a vertex of a regular hexagon. When all possible diagonals from point A are drawn in this hexagon, how many triangles are formed?

6.

The function $y = 3x + 6$ is graphed on a coordinate plane. The y -coordinate of a point on the line is 27. What is the x -coordinate of that point?

7. _____ yards

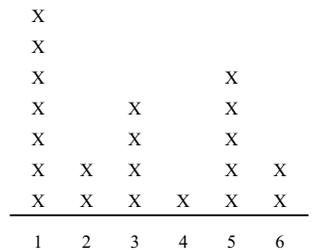

Two men stand back-to-back and walk in opposite directions for 40 yards each. Each of them then turns left and walks another 30 yards each. In yards, how far are the two men from one another?

8. _____

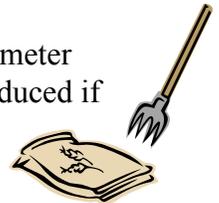

Jacinta rolled a standard six-sided die repeatedly until she got every number from 1 to 6. She stopped rolling the die when she'd gotten each number at least once. The line plot shows how many times each number occurred. What number occurred on her last roll?

Number of Times 1 through 6 Rolled

9. _____ pounds

If 1 bag of seed covers exactly 90 square meters, and each square meter produces 60 pounds of oats, how many pounds of oats will be produced if 3 bags are planted?

10. _____

What is the sum of the two integers between which $\frac{\sqrt{17}}{2}$ lies?

11. _____ fractions

How many common fractions strictly between 0 and 1 have a denominator of at most 6 when written in lowest terms?

12. _____

What is the sum of the exponents when $\frac{(x^4y^2)(x^3y)^3}{(x^3y^2)^2(x^2y)}$ is written in simplest form with all exponents non-negative?

13. _____ What is the absolute difference between the additive inverse and multiplicative inverse of $\frac{2}{3}$? Express your answer as a common fraction.
14. _____ Three integers greater than 190 but less than 200 have a sum of 577. What is the average of the three numbers? Express your answer as a mixed number.
15. _____ A jar is filled with red, orange and yellow jelly beans. The probability of randomly selecting a red jelly bean from this jar is 0.2, and the probability of randomly selecting an orange jelly bean from this jar is 0.5. What is the probability of randomly selecting a yellow jelly bean from this jar? Express your answer as a decimal to the nearest tenth.
16. \$ _____ One Saturday, Sam and Joe worked together to mow yards. Sam started at 8:00 a.m. and Joe started at 11:00 a.m. When they finished at 4:00 p.m., they had earned a total of \$156. They want to share the money they earned fairly based on the number of hours worked. How much should Joe receive?
17. (_____ , _____) At what point do the lines $y = 2x - 5$ and $y = -\frac{1}{2}x + 5$ intersect? Express your answer as an ordered pair.
18. _____ The positive integer n is 100 less than one perfect square and 28 less than another perfect square. If $n < 50$, what is the value of n ?

19. _____

In one middle school, 300 students play sports and 200 students are on the Honor Roll. If 120 of the students on the Honor Roll also play sports, what is the probability that a randomly chosen student who plays a sport is also on the Honor Roll? Express your answer as a common fraction.

20. _____ dimes

Tailynn has 12 common US coins that add to 83¢. She has exactly five coins of one type. How many dimes does she have?

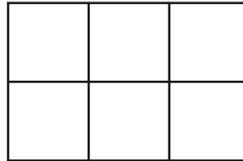

21. _____ drops

A veterinary assistant needs to prepare a mixture of a vitamin solution for parakeets. The ratio is 1 drop of vitamin oil to 25 drops of water. If the assistant needs to prepare 260 drops of the combined solution, how many drops of the vitamin oil will she need?

22. _____ ways

How many ways can the integers 1 through 6 be arranged in the 2-by-3 grid shown such that each row and each column have their numbers in increasing order?

23. _____ games

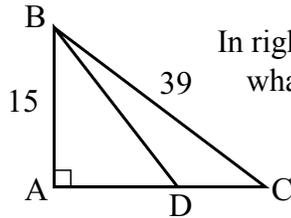

A baseball team has won 15 games and lost 9. If these 24 games represent $\frac{1}{6}$ of the games played during the entire season, how many more games must the team win in order to win $\frac{3}{4}$ of their games for the season?

24. _____

An arithmetic progression is formed by five distinct prime numbers. What is the least possible sum of those five numbers?

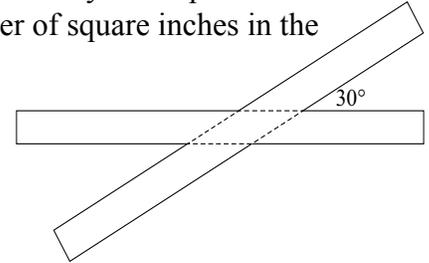

25. _____ units

In right triangle ABC, $BD = CD + 9$. If $AB = 15$ and $BC = 39$, what is AD ?

26. _____ in²

Two long strips of paper are each 2 inches wide, and they overlap so that the angle between the strips is 30° . What is the number of square inches in the area of the parallelogram formed by the overlap?

27. _____ people

Every year, 20% of a city's population moves to the suburbs and 10% of the suburban population moves to the city. Remarkably, this migration does not change their respective populations. If the city and suburbs have a total population of 600,000 people, how many people live in the city?

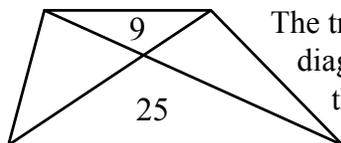

28. _____ coins

Amy has \$5 in quarters, dimes and nickels, where the total value in quarters is more than the total value of the dimes, and the total value of the dimes is more than the total value of the nickels. What is the maximum number of coins Amy could have?

29. _____

The four vertices of a square are $(-5, 4)$, $(1, 4)$, $(1, -2)$ and $(-5, -2)$. What is the slope of the line that passes through the origin and divides the square into two congruent trapezoids? Express your answer as a common fraction.

30. _____ units²

The trapezoid shown is divided into four triangles by its diagonals. The areas of two triangles are indicated. What is the area of the whole trapezoid?

Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____

On Monday, Sam ran one mile. The distance he runs each day thereafter, is 15% greater than the distance he ran the previous day. The day that the distance Sam runs first exceeds two miles is what day of the week?

2. \$ _____

The table shows the number of coins produced at each of the two U.S. Mint facilities in a particular year. The entry 352.80 M indicates that 352,800,000 nickels (worth \$17,640,000) were produced at the Denver facility that year. In dollars, what is the total value of all coins produced that year at the facility in Philadelphia?

| | Pennies | Nickels | Dimes | Quarters |
|---------------------|----------------|----------------|--------------|-----------------|
| Denver | 2849.60 M | 352.80 M | 637.50 M | 1287.60 M |

1. _____ The integers 1 to 8, inclusive, are arranged into four pairs of distinct numbers, using each integer exactly once. The product of each pair is calculated, and then the sum of the four products is found. What is the maximum possible value of the sum?

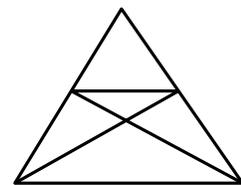

2. _____ What is the largest positive integer such that each digit is at least the sum of all the digits to its left?

3. _____ cm A rectangular box is 9 cm wide, 11 cm tall and 20 cm long. In centimeters, what is the diameter of the smallest circular opening through which the box will fit? Express your answer as a decimal to the nearest tenth.

4. _____ In the table shown, a and b each represent an integer from 1 to 9, inclusive. The sum of each row and each column is given. What is the value of ab ?

| | | | | | |
|--------------|-----|-----|-----|-----|--------------|
| | | | | | Total |
| | a | 8 | b | 5 | 23 |
| | 2 | a | 2 | b | 14 |
| | b | b | a | a | 20 |
| | b | 8 | 5 | a | 23 |
| Total | 19 | 26 | 17 | 18 | |

5. _____ triangles How many triangles of any size are there in this figure?

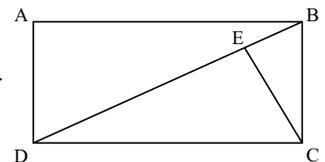

6. _____ feet A small rubber ball always bounces to half the height from which it fell. If one bounce is considered to be the downward drop and the upward rebound, how far will the ball travel (up and down combined) in 10 bounces if it is dropped from a height of 10 feet? Express your answer to the nearest whole number.

7. _____ feet Police can use the formula $s = \sqrt{24d}$ in accident investigations to determine the speed of a vehicle when the brakes are applied on asphalt in dry conditions. The s represents the speed of the vehicle, in miles per hour, when the brakes are applied, and d represents the stopping distance of the vehicle, in feet. Using this formula, how many feet would a car traveling 65 mi/h need in order to come to a stop on asphalt in dry conditions? Express your answer to the nearest whole number.

8. _____ ft² In a particular rectangular pool, it is possible to swim a mile by swimming the length 40 times or along the perimeter (the pool's edge) 11 times. There are 5280 feet in a mile. In square feet, what is the area of the region bounded by the edge of the pool?

9. _____ mi/h Jinting's speed in a seven-person drag race was 153 mi/h. Jinting's speed was 24 mi/h faster than Xavier's. Kasimu's speed was 14 mi/h slower than Misha's. Pierre's speed was 10 mi/h faster than Yoko's and was 38 mi/h faster than Xavier's. Becca's speed was 17 mi/h slower than Kasimu's. Yoko's speed was 15 mi/h faster than Becca's. In miles per hour, what was the speed of the person who finished fourth?

10. _____ units In rectangle ABCD, shown here, \overline{CE} is perpendicular to \overline{BD} . If $BC = 15$ and $DC = 36$, what is CE ? Express your answer as a common fraction.

GENERAL INSTRUCTIONS

This section contains instructions, rules and procedures for administering the MATHCOUNTS School Competition. It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better mathematics skills in all participants. Therefore, the coach is encouraged to postpone the selection of those students who will be competing at the Chapter Competition until just prior to the event in February. *Selection of the students need not be based on the results of a school competition.* For this reason, schools may deviate from these rules in administering the School Competition. However, experience with the official rules may aid the students who compete at the chapter, state and national levels.

Individual scores are kept for each participating student, and a team score is calculated for each team. Before beginning the competition, divide participants into teams of four students and designate a captain for each team.

At the end of each round of the competition, collect all competition booklets, problems and scratch paper.

1. Use of notes or other reference materials (including dictionaries) is not permitted.
2. **The Target and Team Rounds assume the use of a calculator.** Calculator use is permitted in these rounds only. Any calculator that does not contain a QWERTY (i.e., typewriter-like) keypad is permitted. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. *Smart phones, laptops, iPads®, iPods®, personal digital assistants (PDAs), and any other “smart” devices are not considered to be calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.*
3. Talking and signals are permitted only during the Team Round.
4. Before the competition, coaches should review the rules for acceptable forms of answers with students. They can be found in the “Forms of Answers” section of this booklet and in the *MATHCOUNTS School Handbook* (page 51).

SPRINT ROUND INSTRUCTIONS

1. Distribute scratch paper.
2. Distribute Sprint Round booklet, and instruct each student to print his/her name in the allotted space.
3. Read aloud instructions appearing on the front cover of the booklet while students read instructions silently.
4. Instruct students to begin. Start timing.
5. After 37 minutes, give a three-minute warning. After 40 minutes, say, “**Stop, pencils down**” and instruct students to close competition booklets.

TARGET ROUND INSTRUCTIONS

1. Distribute scratch paper.
2. Distribute the first/next pair of Target Round problems, and instruct each student to print his/her name in the allotted space.
3. Read aloud the instructions appearing on the cover of the first pair of problems.

4. Instruct students to begin. Start timing.
5. Give a ten-second warning at 5 minutes 50 seconds, and, after 6 minutes say **“Stop, pencils down.”** Collect all papers.
6. Repeat steps 2, 4 and 5 for each of the next three pairs of problems.

TEAM ROUND INSTRUCTIONS

1. Place each team (of four students) in a room with at least five feet of unoccupied space between teams. Distribute scratch paper.
2. Distribute Team Round booklet to each person, and instruct team captain to print team name and team members’ names on his/her booklet. This becomes the team’s official answer booklet.
3. Read aloud the instructions printed on the cover of the booklet while students read the instructions silently.
4. Instruct students to begin. Start timing.
5. After 17 minutes, give a three-minute warning. After 20 minutes, say **“Stop, pencils down”** and instruct students to close competition booklets.

COUNTDOWN ROUND INSTRUCTIONS

The Countdown Round is a mandatory component at the National Competition, and it is used to determine the final rank of the top competitors. At the chapter and state levels, the use of the Countdown Round officially is at the discretion of the state coordinator. When used officially, the Countdown Round will adhere to the rules presented below. The instructions may be modified as necessary at the school level. ***This round is available in PowerPoint format for the School Competition. See the cover of this School Competition Booklet for instructions on obtaining a copy.***

1. Based on scores in the Sprint and Target Rounds, rank all students and select the top 25%, up to ten students, to compete in the Countdown Round.
2. Seat the two lowest-ranked students so they are in clear view of the moderator. Each competitor should be given scratch paper and sharpened pencils before the round begins. Invite the competitors to introduce themselves and test their buzzers.
3. Read the following statement to all students who will be competing in the round:

I will read a problem to you as it is being projected. You may use the scratch paper and pencil in front of you to calculate your answer to the problem. You are not allowed to use calculators during this round.

You will have a maximum of 45 seconds to solve the problem after it appears on the screen. You will be given a ten-second warning before time expires. As soon as you have solved the problem, press your buzzer. [Schools may have alternate methods of determining order of finish and should adjust directions to students accordingly.] I will call on the first person who signals. Do not announce your answer until I call on you. Each time you wish to answer, you must signal, though you may not answer more than once for any question. If you do not signal before you answer, your answer will be disqualified. If you answer after signaling but before I call on you, your answer will be accepted, but I ask that you please wait until you hear your name so that there is no confusion.

Once I call on you, you will have three seconds to begin your answer. Your opponent may continue working while you are responding.

If you answer correctly, you will score one point in the round. If you answer incorrectly, your opponent will have the remainder of the 45 seconds to press his/her buzzer for an opportunity to answer the problem and score a point in the round.

Whoever answers *the most of the three problems correctly*—*not necessarily two out of the three*—will progress to the next round to compete for the next place. If you are tied after three questions, we will use the sudden victory rule, which I will describe if it occurs.

[Note that the above procedure does not necessarily require a student to answer two out of the three problems correctly. For instance, a student answering only one problem of three will progress to the next round if his/her opponent has not correctly answered any questions in the round.]

It is very important that rules be followed exactly. If you answer without signaling your buzzer, your answer will be disqualified.

4. Conduct the round as described above. After the winner of each round is identified, dismiss his/her opponent, and ask the next written competition place-holder to be seated to participate in the next round. Invite the new competitor to introduce himself or herself and test his/her buzzer.
5. If a sudden victory situation occurs, read the following statement to the students:

Since you are tied at the end of three problems, I must declare a sudden victory situation. I will now continue to read problems to both of you. Rules for answering problems remain the same as before. The first one of you to answer a problem correctly will progress to the next round.

6. Repeat procedure until the champion is identified. *However, just before the 4th-ranked student competes in his/her first round, announce that for the final four rounds, the first student to answer three problems correctly will progress to the next round.*

*Rules for the Countdown Round change for the National Competition.

SCORING

1. Acceptable form for answers is as follows:
 - a. All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers, and $\text{GCF}(a,b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions, and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N \frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a,b) = 1$.
 - b. Ratios should be expressed as common fractions, unless otherwise specified.

- c. Radicals must be simplified. A simplified radical must satisfy the following conditions: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form.
 - d. Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form of (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule occur when a is zero, in which case it may be omitted, and when b and c are both zero, in which case they may both be omitted.
 - e. Units of measurement are not required in answers, but must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. Similarly, if a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.
 - f. Do not make approximations for numbers (e.g. π , $\frac{2}{7}$, $\sqrt{2}$) in the data given or in solutions unless the problem says to do so.
 - g. Do not do any intermediate rounding (other than the “rounding” the calculator performs) when computing solutions to problems. All rounding should be done at the end of the calculation process.
 - h. Answers expressed in scientific notation should be in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$ and n is an integer.
 - i. An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form. Thus, 25.0 will not be accepted for 25.
 - j. The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.
2. Specific instructions stated in a given problem should take precedence over any general rule or procedure.
 3. Scores are kept for individuals and teams. The **individual score** is the sum of the number of Sprint Round questions answered correctly plus twice the number of Target Round questions answered correctly. *The maximum possible individual score is 46.* The **team score** is calculated by dividing the sum of the team members’ individual scores by four, and then adding twice the number of Team Round questions answered correctly. *The maximum possible team score is 66.*

Because the School Competition is not the only mechanism available to determine which students should advance to the Chapter Competition, ties on the School Competition needn’t be broken. At the Chapter, State and National Competitions, however, ties among individuals or teams will be broken by comparing the scores of specific rounds.

Sprint Round Answers

- | | | |
|------------------|----------------------|---------------------------|
| 1. 17 candy bars | 11. 11 fractions | 21. 10 drops |

■ **School Competition** ■
Sprint Round
Problems 1–30

Name _____

**DO NOT BEGIN UNTIL YOU ARE INSTRUCTED
TO DO SO.**

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. candy bars

At a candy store Alexis purchased 3 candy bars for \$1.50. At this rate, how many whole candy bars can she buy with \$8.75?

2.

If $x \boxtimes y = (x + y)^2$ for positive integers x and y , then $4 \boxtimes 5 = (4 + 5)^2 = 9^2 = 81$. What is the value of $2 \boxtimes 3$?

3. °F

Consider the weather data for 10 days shown in the table below. John identified the mode of the daily high temperature and the mode of the daily low temperature, in degrees Fahrenheit, based on this data. What is the mean of those two numbers?

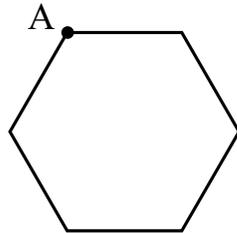

| | Mon. | Tues. | Wed. | Thurs. | Fri. | Sat. | Sun. | Mon. | Tues. | Wed. |
|------|------|-------|------|--------|------|------|------|------|-------|------|
| High | 72 | 74 | 70 | 69 | 72 | 74 | 78 | 79 | 72 | 70 |
| Low | 61 | 58 | 60 | 58 | 63 | 58 | 63 | 58 | 60 | 59 |

4.

Karina wrote the addition problem shown here on the board. However, one digit is incorrect. When written correctly, the number containing the incorrect digit is what four-digit integer?

$$\begin{array}{r} 2635 \\ + 1862 \\ \hline 4537 \end{array}$$

5. triangles

Point A is a vertex of a regular hexagon. When all possible diagonals from point A are drawn in this hexagon, how many triangles are formed?

6.

The function $y = 3x + 6$ is graphed on a coordinate plane. The y -coordinate of a point on the line is 27. What is the x -coordinate of that point?

7. _____ yards

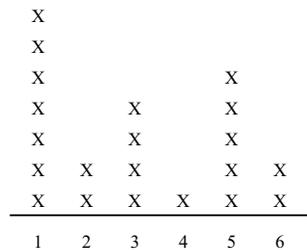

Two men stand back-to-back and walk in opposite directions for 40 yards each. Each of them then turns left and walks another 30 yards each. In yards, how far are the two men from one another?

8. _____

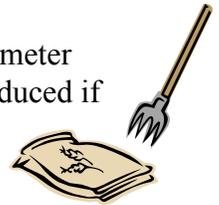

Jacinta rolled a standard six-sided die repeatedly until she got every number from 1 to 6. She stopped rolling the die when she'd gotten each number at least once. The line plot shows how many times each number occurred. What number occurred on her last roll?

Number of Times 1 through 6 Rolled

9. _____ pounds

If 1 bag of seed covers exactly 90 square meters, and each square meter produces 60 pounds of oats, how many pounds of oats will be produced if 3 bags are planted?

10. _____

What is the sum of the two integers between which $\frac{\sqrt{17}}{2}$ lies?

11. _____ fractions

How many common fractions strictly between 0 and 1 have a denominator of at most 6 when written in lowest terms?

12. _____

What is the sum of the exponents when $\frac{(x^4y^2)(x^3y)^3}{(x^3y^2)^2(x^2y)}$ is written in simplest form with all exponents non-negative?

13. _____ What is the absolute difference between the additive inverse and multiplicative inverse of $\frac{2}{3}$? Express your answer as a common fraction.
14. _____ Three integers greater than 190 but less than 200 have a sum of 577. What is the average of the three numbers? Express your answer as a mixed number.
15. _____ A jar is filled with red, orange and yellow jelly beans. The probability of randomly selecting a red jelly bean from this jar is 0.2, and the probability of randomly selecting an orange jelly bean from this jar is 0.5. What is the probability of randomly selecting a yellow jelly bean from this jar? Express your answer as a decimal to the nearest tenth.
16. \$ _____ One Saturday, Sam and Joe worked together to mow yards. Sam started at 8:00 a.m. and Joe started at 11:00 a.m. When they finished at 4:00 p.m., they had earned a total of \$156. They want to share the money they earned fairly based on the number of hours worked. How much should Joe receive?
17. (_____ , _____) At what point do the lines $y = 2x - 5$ and $y = -\frac{1}{2}x + 5$ intersect? Express your answer as an ordered pair.
18. _____ The positive integer n is 100 less than one perfect square and 28 less than another perfect square. If $n < 50$, what is the value of n ?

19. _____

In one middle school, 300 students play sports and 200 students are on the Honor Roll. If 120 of the students on the Honor Roll also play sports, what is the probability that a randomly chosen student who plays a sport is also on the Honor Roll? Express your answer as a common fraction.

20. _____ dimes

Tailynn has 12 common US coins that add to 83¢. She has exactly five coins of one type. How many dimes does she have?

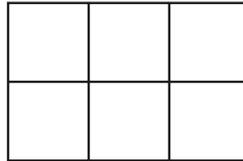

21. _____ drops

A veterinary assistant needs to prepare a mixture of a vitamin solution for parakeets. The ratio is 1 drop of vitamin oil to 25 drops of water. If the assistant needs to prepare 260 drops of the combined solution, how many drops of the vitamin oil will she need?

22. _____ ways

How many ways can the integers 1 through 6 be arranged in the 2-by-3 grid shown such that each row and each column have their numbers in increasing order?

23. _____ games

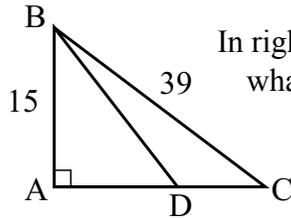

A baseball team has won 15 games and lost 9. If these 24 games represent $\frac{1}{6}$ of the games played during the entire season, how many more games must the team win in order to win $\frac{3}{4}$ of their games for the season?

24. _____

An arithmetic progression is formed by five distinct prime numbers. What is the least possible sum of those five numbers?

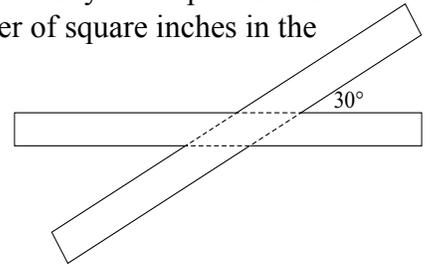

25. _____ units

In right triangle ABC, $BD = CD + 9$. If $AB = 15$ and $BC = 39$, what is AD ?

26. _____ in²

Two long strips of paper are each 2 inches wide, and they overlap so that the angle between the strips is 30° . What is the number of square inches in the area of the parallelogram formed by the overlap?

27. _____ people

Every year, 20% of a city's population moves to the suburbs and 10% of the suburban population moves to the city. Remarkably, this migration does not change their respective populations. If the city and suburbs have a total population of 600,000 people, how many people live in the city?

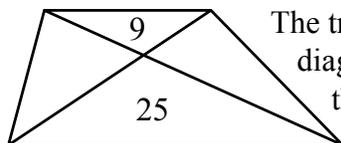

28. _____ coins

Amy has \$5 in quarters, dimes and nickels, where the total value in quarters is more than the total value of the dimes, and the total value of the dimes is more than the total value of the nickels. What is the maximum number of coins Amy could have?

29. _____

The four vertices of a square are $(-5, 4)$, $(1, 4)$, $(1, -2)$ and $(-5, -2)$. What is the slope of the line that passes through the origin and divides the square into two congruent trapezoids? Express your answer as a common fraction.

30. _____ units²

The trapezoid shown is divided into four triangles by its diagonals. The areas of two triangles are indicated. What is the area of the whole trapezoid?

Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____

On Monday, Sam ran one mile. The distance he runs each day thereafter, is 15% greater than the distance he ran the previous day. The day that the distance Sam runs first exceeds two miles is what day of the week?

2. \$ _____

The table shows the number of coins produced at each of the two U.S. Mint facilities in a particular year. The entry 352.80 M indicates that 352,800,000 nickels (worth \$17,640,000) were produced at the Denver facility that year. In dollars, what is the total value of all coins produced that year at the facility in Philadelphia?

| | Pennies | Nickels | Dimes | Quarters |
|---------------------|----------------|----------------|--------------|-----------------|
| Denver | 2849.60 M | 352.80 M | 637.50 M | 1287.60 M |
| Philadelphia | 2569.60 M | 287.76 M | 413.00 M | 1251.20 M |

| | b | 8 | 5 | a | 23 |
| Total | 19 | 26 | 17 | 18 | |

5. _____ triangles How many triangles of any size are there in this figure?

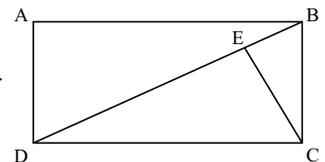

6. _____ feet A small rubber ball always bounces to half the height from which it fell. If one bounce is considered to be the downward drop and the upward rebound, how far will the ball travel (up and down combined) in 10 bounces if it is dropped from a height of 10 feet? Express your answer to the nearest whole number.

7. _____ feet Police can use the formula $s = \sqrt{24d}$ in accident investigations to determine the speed of a vehicle when the brakes are applied on asphalt in dry conditions. The s represents the speed of the vehicle, in miles per hour, when the brakes are applied, and d represents the stopping distance of the vehicle, in feet. Using this formula, how many feet would a car traveling 65 mi/h need in order to come to a stop on asphalt in dry conditions? Express your answer to the nearest whole number.

8. _____ ft² In a particular rectangular pool, it is possible to swim a mile by swimming the length 40 times or along the perimeter (the pool's edge) 11 times. There are 5280 feet in a mile. In square feet, what is the area of the region bounded by the edge of the pool?

9. _____ mi/h Jinting's speed in a seven-person drag race was 153 mi/h. Jinting's speed was 24 mi/h faster than Xavier's. Kasimu's speed was 14 mi/h slower than Misha's. Pierre's speed was 10 mi/h faster than Yoko's and was 38 mi/h faster than Xavier's. Becca's speed was 17 mi/h slower than Kasimu's. Yoko's speed was 15 mi/h faster than Becca's. In miles per hour, what was the speed of the person who finished fourth?

10. _____ units In rectangle ABCD, shown here, \overline{CE} is perpendicular to \overline{BD} . If $BC = 15$ and $DC = 36$, what is CE ? Express your answer as a common fraction.

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What is the value of \clubsuit if $\frac{\clubsuit + 2}{3} = 5$?
2. \$ _____ Arturo bought a shirt on sale for 30% off its original price of \$10. He then sold it for a price that was 50% more than the price he paid for it. How much did Arturo sell the shirt for?
3. _____ quarts Sally is mixing a cleaning solution. She wants the ratio of bleach to water to be 1:8. How many quarts of bleach should she add to 24 quarts of water?
4. _____ triangles A square is divided by its four lines of symmetry. Triangles of different sizes are formed. How many total triangles are formed?
5. _____ inches There are already 4.5 inches of snow on the ground. Snow is falling at an average rate of 1.5 inches per hour and is predicted to continue for nine more hours. If the prediction is correct, how many inches of snow will be on the ground when the snow stops after 9 hours?
6. _____ If x and y are positive integers such that $xy = 100$, what is the positive difference between the maximum and minimum possible values of $x + y$?

7. _____ bugs If a bat catches a total of 560 bugs in 7 nights, and each night the bat catches the same number of bugs, how many bugs did the bat catch on the fifth night?

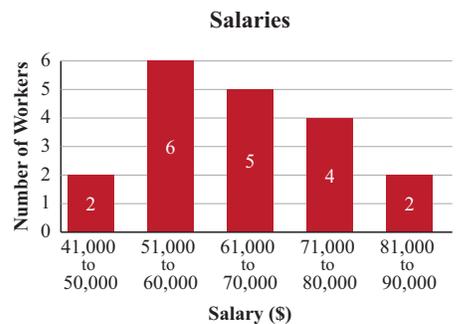

8. _____ cm Kaylee cut a 20-cm by 20-cm piece of paper along a diagonal to form two congruent triangles. What is the length of the hypotenuse of one of the triangles? Express your answer in simplest radical form.

9. _____ If $a \otimes b = \frac{ab}{a+b}$ and $a \otimes 4 = 3$, what is the value of a ?

10. _____ What is the probability Kai will select a red or blue marble when he selects one marble from a jar containing three green, two red and five blue marbles? Express your answer as a common fraction.

11. _____ lines  There are six points in a plane, and no three of these points are collinear. How many distinct lines are determined by all possible pairs of these six points?

12. \$ _____ The bar graph shows the salaries of workers at the Oro De Montana office, and all the salaries are multiples of \$1000. What is the absolute value of the difference between the greatest possible mean salary for the employees and the least possible mean salary?

13. _____ What is the sum of the first 2000 positive integers?
14. _____ years On the ceiling of a cavern, a stalactite grows downward 0.004 *inches* per year. Ten *feet* directly below on the cavern's floor, a stalagmite grows upward 0.006 *inches* per year. How many years will it take them to meet?
15. _____ The product of three distinct positive integers is 144. If the sum of the three integers is 26, what is the sum of their squares?
16. _____ ordered triples How many ordered triples (x, y, z) of positive integers have the property that $x + y + z = 6$?
17. _____ If the slope of a line is k , and the line passes through the points $(0, k + 3)$ and $(-3, 0)$, what is the value of k ? Express your answer as a common fraction.
18. _____ permutations How many permutations of the digits 1, 2, 3, 4 have 1 before 3 and 2 before 4? One such permutation to include is 2134.
19. _____ What is the value of $(\sqrt[3]{-8})^4$?

25. _____ For what positive integer n does $3n^3 + 3n^2 + 4n = n^n$?
26. _____ combinations How many different combinations of three numbers can be selected from the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ so that the numbers could represent the side lengths of a triangle?
27. _____ If $\frac{1}{x} + \frac{3}{y} = \frac{3}{4}$ and $\frac{3}{x} - \frac{2}{y} = \frac{5}{12}$, what is the value of $x + y$?
28. _____ What is the smallest prime number that divides some number of the form $424242\dots42 + 1$ or of the form $424242\dots42 - 1$?
29. _____ units Point E lies within rectangle ABCD. If $AE = 7$, $BE = 5$ and $CE = 8$, what is DE? Express your answer in simplest radical form.
30. _____ What is the value of $\sqrt{1 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \dots}}}}$, where all subsequent numbers in the expression are 2s? Express your answer in simplest radical form.

■ Chapter Competition ■
Target Round
Problems 1 & 2

Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

Team Round
Problems 1–10

School _____

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ units² This figure consists of eight squares labeled A through H. The area of square F is 16 units². The area of square B is 25 units². The area of square H is 25 units². In square units, what is the area of square D?

2. _____
- | | | |
|----|---|----|
| 38 | ? | ? |
| ? | ? | 40 |
| 46 | ? | 50 |
- Nine consecutive positive even integers are entered into the 3×3 grid shown so that the sums of the three numbers in each row, each column and each diagonal are the same. What is the average value of the five numbers that are missing? Express your answer as a decimal to the nearest tenth.

3. _____ routes Quatro Airlines flies between four major cities. To provide direct flights from each city to the other three cities requires a total of six different direct routes, as shown. How many routes are needed to connect 15 cities, with exactly one route directly connecting each pair?

4. _____ shirts Xiang needs to print T-shirts for a class project. For what number of shirts will the cost under Plan A and Plan B be the same?

| | Plan A | Plan B |
|---------------------------|---------------|---------------|
| Set-up charge | \$250 | \$150 |
| Printing charge per shirt | \$4.25 | \$5.25 |

5. _____ years Jackie invested \$1000 into an account that earns 3% interest, compounded annually. If she has \$1125.51 now, for how many years did she have her money in her account? Express your answer as a whole number.

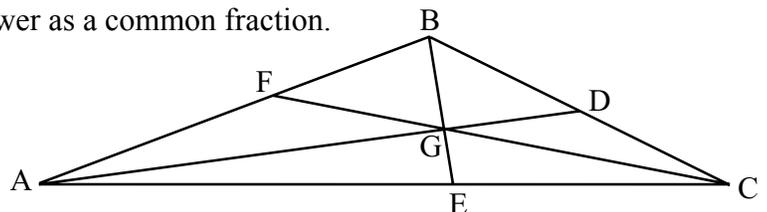

6. primes Abigail, Bartholomew and Cromwell play a game in which they take turns adding 1, 2, 3 or 4 to a sum in order to create an increasing sequence of primes. For example, Abigail must start with either 2 or 3. If she chooses 2, then Bartholomew can add 1 to make 3, or he can add 3 to make 5. If Bartholomew makes 3, then Cromwell can add 2 to make 5, or he can add 4 to make 7. Abigail, Bartholomew and Cromwell take turns, in that order, until no more primes can be made, and the game ends. The player who makes the last prime wins. If Bartholomew wins, how many primes were made?

7. integers How many positive integers less than 1000 do not have 7 as any digit?

8. points In a particular word game, there are two types of letters: vowels and consonants. Vowels are worth 1 point each and consonants are worth 2 points each. (The letter Y is always considered a consonant.) When more than one letter of the same type appears consecutively, each letter is worth twice as much as the one before. For example, CUP is worth $2 + 1 + 2 = 5$ points and SLY is worth $2 + 4 + 8 = 14$ points. What is the absolute difference between the values of QUEUEING and SYZYG Y?

9. integers Using each of the digits 1 to 6, inclusive, exactly once, how many six-digit integers can be formed that are divisible by 6?

10. _____ Points D, E and F lie along the perimeter of $\triangle ABC$ such that \overline{AD} , \overline{BE} and \overline{CF} intersect at point G. If $AF = 3$, $BF = BD = CD = 2$ and $AE = 5$, then what is $\frac{BG}{EG}$? Express your answer as a common fraction.

1. _____ (minutes) How many minutes after 12:34 p.m. will it first be 1:30 p.m.?
2. _____ (cm²) A sector of a circle with a radius of 6 cm has a central angle of 90°. What is the area of the sector, in square centimeters? Express your answer in terms of π .
3. _____ If $5x - 4 = 26$, what is the value of x ?
4. _____ (pounds) The average weight of a rock in a pile containing eight rocks is 15 pounds. Another rock is added, and the average weight of a rock in the pile increases to 16 pounds. What is the weight, in pounds, of the added rock?
5. _____ (degrees) In one day, through how many degrees does the hour hand of a clock rotate from 2:00 p.m. to 7:00 p.m.?
6. _____ What is the 2014th digit to the right of the decimal point in the decimal representation of $\frac{13}{990}$?
7. _____ (dollars) The number of juice boxes sold at the PTA Movie Night was three times the number of bags of popcorn sold. A bag of popcorn costs $\frac{1}{2}$ as much as a juice box. If the PTA collected \$120 for selling 120 juice boxes, how much did the PTA collect for the bags of popcorn sold?
8. _____ (units) The diagram shows a circle of radius 6 units and a line segment of length 8 units tangent to the circle at one of its endpoints. What is the distance from the other endpoint of the segment to the closest point on the circle, in units? 
9. _____ (percent)  The rectangle shown is divided into 10 congruent sections, three of which are white. What percent of the rectangle is gray?
10. _____ If $a + b = 3$ and $c + w = 4$, what is the value of $ac + bw + aw + bc$?
11. _____ (books) Evan was born on January 1, 2004. If Evan reads one book every three days starting on his 8th birthday, what is the greatest possible number of books he could read before his 12th birthday?

12. _____ What is the probability that a randomly selected factor of 36 is divisible by 3? Express your answer as a common fraction.
13. _____ (zeros) How many zeros are after the last nonzero digit of $125!$?
14. _____ (sides) What is the number of sides in a regular polygon when the measure of each interior angle is 162° ?
15. _____ (cubes) There are 15 red, 11 blue and 13 green cubes in a bag. All cubes are identical, except for color. How many cubes must be randomly selected to ensure that at least one pair of each color has been removed from the bag?
16. _____ What is $0 \cdot 1 + \frac{0}{1} + 0^1 + 1^0$?
17. _____ (dollars) Chris has twice as much money as Ivan. Tae has \$4.00 less than Ivan. If Tae has \$8.00, what is the total amount Chris, Tae and Ivan have all together?
18. _____ (cm²) Square $P'Q'R'S'$, shown here, is the image of square $PQRS$ when it is rotated clockwise 90° about the midpoint T of segment PS . If the area of square $PQRS$ is 64 cm^2 , how many square centimeters are in the gray region?
- 
19. _____ What is the least positive integer greater than 20 that has exactly three positive factors?
20. _____ What is the mean of the integers in the arithmetic sequence $33, 43, 53, \dots, 213, 223$?
21. _____ (inches) The length of one piece of rope is 4 inches more than twice the length of a shorter piece. If the length of the longer piece is 26 inches, what is the length, in inches, of the shorter piece?
22. _____ What common fraction is equivalent to $1\frac{1}{2} + \frac{6}{5} - 0.25$?
23. _____ What is the greatest integer x such that $\sqrt{x^2} \neq x$?

24. _____ (votes) In the primary election, Ms. Eli Fant received twice as many votes as her opponent. If she received 3248 votes, how many votes did her opponent receive?
25. _____ If $a \star b = 3a - 4b$, then $1 \star 4 = 3(1) - 4(4) = -13$. What is the value of $5 \star (2 \star 3)$?
26. _____ (pounds) There were 1304 people who participated in an egg-and-spoon race. If each person carried a two-ounce egg, what was the total weight, in pounds, of the eggs carried?
27. _____ (campers) At a certain camp, the counselor-to-camper ratio is 2 to 9. If the camp has 18 counselors, how many campers does it have?
28. _____ (integers) The probability of selecting an even integer at random from a list of 30 integers is $\frac{7}{10}$. How many odd integers are in the list?
29. _____ The distance between two points is $5\sqrt{2}$ units. The coordinates are $(-1, 1)$ and $(p, 6)$, where p is a positive number. What is the value of p ?
30. _____ What is the value of the greatest of the following expressions:
 $7 \div \frac{1}{3}$, $6 \div \frac{1}{4}$, $5 \div \frac{1}{5}$, $4 \div \frac{1}{6}$, $3 \div \frac{1}{7}$?
31. _____ What is the least positive integer n for which $165 \cdot 513 + 10n$ is a multiple of 9?
32. _____ If $x^{3y} = 27$, what is the value of x^y ?
33. _____ What is the least positive integer n such that the value of $\frac{2014!}{n!}$ does not have a units digit of zero?
34. _____ Given $\frac{1}{4} > \frac{x}{9} > \frac{1}{5}$, what is the only possible integer value of x ?
35. _____ What is the value of $4 \times (50 + 7)$?
36. _____ What is the value of $\left(\frac{2}{3}\right)^4 \cdot \left(\frac{3}{8}\right)^2$? Express your answer as a common fraction.

37. _____ (miles) Jessica hikes east for 9 miles, then turns and hikes south for 12 miles. What is the distance, in miles, of the shortest route back to her starting location?
38. _____ What is the largest six-digit number with an odd number of positive factors?
39. _____ If $6x + px = 14x$ and $x \neq 0$, what is the value of p ?
40. _____ (pieces) Jose has 120 pieces of candy. If he divides the candy evenly between himself and 14 friends, how many pieces of candy does each person get?
41. _____ (years old) Ten years from now Simon will be twice as old as he was 10 years ago. How old is Simon now?
42. _____ (sets) How many sets of distinct odd positive integers have a sum of 16?
43. _____ (units) In this pattern, n squares are added at stage n , as shown. If the pattern continues, what will be the perimeter, in units, of the figure at stage 19?
- The diagram illustrates a sequence of four stages of a geometric pattern. Stage 1 consists of a single square. Stage 2 consists of a 2x2 square. Stage 3 consists of a 3x3 square with a 1x1 square attached to the top-right corner. Stage 4 consists of a 4x4 square with a 1x1 square attached to the top-right corner of the 3x3 part.
44. _____ (pounds) If three woodchucks could chuck 600 pounds of wood in 5 days, how many pounds of wood could a woodchuck chuck in one day?
45. _____ In a stack of 40 cards, each number 1 to 10 is used four times with one number on each card. What is the probability of choosing a prime number from this stack of 40 cards? Express your answer as a common fraction.
46. _____ The six-digit number $357,abc$ has six distinct digits and is divisible by each of 3, 5 and 7. What is the smallest possible value of $a + b + c$?
47. _____ (multiples) Using each of the four digits 2, 4, 6 and 8 exactly once, how many four-digit multiples of 4 can be formed?
48. _____ (integers) How many three-digit positive integers can be written using only odd digits?

49. _____ (customers) In a random sample of 400 customers at a local fast food restaurant, it was determined that 152 customers ordered French fries. Based on this sample, if the restaurant typically serves 4500 customers a day, how many customers would be expected to order French fries?

50. _____ What is the value of $\sqrt{3! \cdot 4!}$?

51. _____ (,) Triangle ABC has vertices A(-1, 1), B(5, 1) and C(6, 4). Point D is on segment AB such that the area of $\triangle ACD$ equals the area of $\triangle BCD$. What are the coordinates of point D? Express your answer as an ordered pair.

52. _____ If a and b are positive integers such that $a! + b! = (a + b)!$, what is the value of $a + b$?

53. _____ (degrees) What is the degree measure of the smaller angle between the minute and hour hands of an analog clock at 8:20?

54. _____ (cheer-
leaders) Among the 65 cheerleaders at an Austin middle school, 25 were Cowboys fans, 42 were Texans fans, and 6 were not fans of either team. How many cheerleaders were fans of both teams?

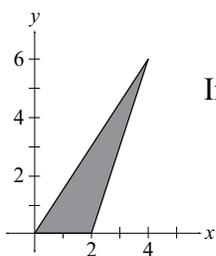

55. _____ What is the greatest possible value of $(x^y)^z$, when x, y and z are distinct positive integers less than five?

56. _____ (values) If $n \geq 3$, for how many values of n is the measure of an interior angle of a regular n -gon less than the measure of an exterior angle?

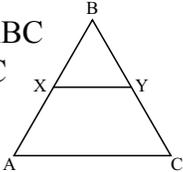

57. _____ (integers) How many integers greater than 99 and less than 1000 have 0 as at least one of their digits?

58. _____ (questions) Connie scored 84% on a 25-question math test. How many questions did she get correct?

59. _____ (units²)

In square units, what is the area of the gray triangle?

60. _____ The sum S_n of the first n terms of a certain sequence satisfies $S_n = n^2 + 2^n - 1$. What is the sixth term of the sequence?
61. _____ If $ab = 12$ and $ab^2 = 48$, what is the value of a ?
62. _____ In a sequence, the first term is 2 and the product of any two consecutive terms is -1 . What is the product of the first seven terms of the sequence?
63. _____ (units³) A square pyramid has a base area of 27 units² and a height of 36 units. In cubic units, what is the volume of this pyramid?
64. _____ (units) Segment XY is parallel to side AC and divides equilateral triangle ABC such that the ratio of the areas of equilateral triangles $XB Y$ and ABC is 1:4. If $AC = 6$ units, what is the length of segment XY , in units?
- 
65. _____ (integers) How many positive integers are less than and relatively prime to 24?
66. _____ A bag contains 10 tiles numbered 1 through 10. If two numbers are randomly drawn from the bag without replacement, what is the probability that their sum is even? Express your answer as a common fraction.
67. _____ Given the points $A(3, 2)$ and $B(-5, -3)$, what is the product of the coordinates of the midpoint of \overline{AB} ? Express your answer as a common fraction.
68. _____ The square root of x is equal to the square of y , for $x \geq 0$. If $y = 3$, what is the value of x ?
69. _____ What is the largest possible sum of two positive integers whose product is 100?
70. _____ If $27^a = 9$, and $9^b = 27$, what is the value of ab ?
71. _____ What is the sum of the three prime factors of 2014?
72. _____ (minutes) How many minutes are in a 24-hour day?

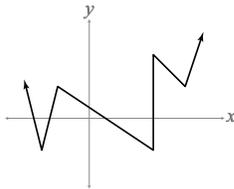

73. _____ What is $111_5 - 111_4$ as a base-ten number?

74. _____ If $f(x) = \sqrt{\sqrt{x} - 1}$ for all real numbers x where $x \geq 1$, what is the value of $f(100)$?

75. _____ (integers) How many two-digit integers contain at least one 9?

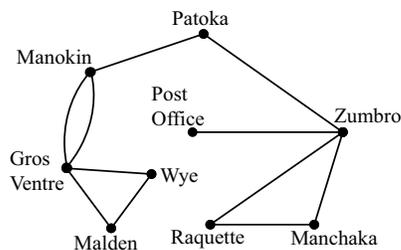

76. _____ (dollars) A controller and a jump drive cost \$106 together. If the controller costs \$100 more than the jump drive, how much does the jump drive cost?

77. _____ (intercepts)

If the graph shown is reflected about the x -axis, what is the total number of x - and y -intercepts in the reflected image?

78. _____ (locations) Marty the Mailman needs to deliver at least one package on each of the 11 roads shown on this map. He must travel down each road at least once, starting and finishing at the post office. Not counting the post office, how many of the other eight locations must Marty visit more than once?

79. _____ (cookies) A bag contains some cookies. The cookies can be divided evenly among four, five or seven people. What is the least number of cookies that can be in the bag?

80. _____ What is the value of $(10 - 5)^2 + 12 \div 4$?

MATHCOUNTS®

2014 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Team Round problem with less than 10 sheets of scratch paper?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2014 MATHCOUNTS® Chapter Competition. Though these solutions provide creative and concise ways of solving the problems from the competition, there are certainly numerous other solutions that also lead to the correct answer, and may even be more creative or more concise! We encourage you to find numerous solutions and representations for these MATHCOUNTS problems.

*Special thanks to volunteer author **Mady Bauer** for sharing these solutions with us and the rest of the MATHCOUNTS community!*

2014 Chapter Competition

Sprint Round

1. $(\text{gear} + 2)/3 = 5$

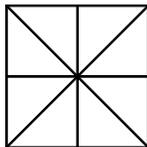

$\text{gear} + 2 = 15$

$\text{gear} = 13$ **Ans.**

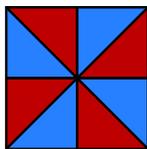

2. A shirt sells originally for \$10. 30% off is $10 \times 0.7 = 7$
 Arturo pays \$7 for the shirt. 50% more than \$7 is $7 + (1/2 \times 7) = 7 + 3.50 = 10.50$ **Ans.**

3. Sally needs a cleaning solution of 1 part bleach to 8 parts water. That means she needs 1 quart of bleach for every 8 quarts of water. Therefore, she needs $24/8 = 3$ quarts of bleach. **3 Ans.**

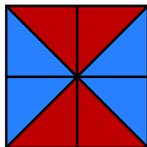

4. A square is divided by its four lines of symmetry. The four lines of symmetry are the two diagonals and the horizontal and vertical bisectors of the square.

There are 8 triangles created by the bisectors.

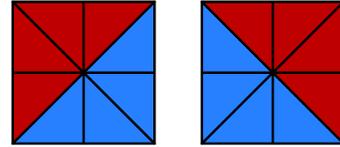

Let's put together two adjacent triangles that form a bigger triangle. There are 4 of those.

There's no way to put three adjacent triangles together but we can do four adjacent

triangles. There are 4 of those.

The total number of triangles is $8 + 4 + 4 =$

16 Ans.

5. There are 4.5 inches of snow on the ground. Snow is falling at an average rate of 1.5 inches per hour for 9 more hours. At this rate, an additional $9 \times 1.5 = 13.5$ inches of snow will fall.
 This makes a total of $4.5 + 13.5 = 18$ inches that will have fallen. **18 Ans.**

6. Given $xy = 100$, find the positive difference between the maximum and minimum possible values of $x + y$, if x and y are positive. Integer pairs with a product of 100 are:

1×100

2×50

4×25

5×20

10×10

So, $x + y$ has minimum and maximum values $10 + 10 = 20$ and $1 + 100 = 101$, respectively, and $101 - 20 = 81$ **Ans.**

7. A bat catches 560 bugs in 7 nights. The bat catches the same number of bugs each night.
 Each night, the bat caught $560/7 = 80$ bugs. Therefore, the bat caught 80 bugs on the fifth night. **80 Ans.**

8. This problem basically asks us to find the length of the diagonal of a square with side length 20.
 You may recognize that the diagonal of a square also is the hypotenuse of a 45-45-90 right triangle. Recall that a 45-45-90 right

triangle with side length s , has hypotenuse of length $s\sqrt{2}$. Thus, the length of the diagonal is $20\sqrt{2}$ **Ans.**

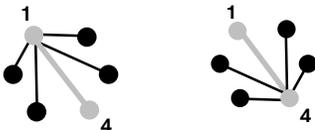

If you aren't familiar with this property of 45-45-90 right triangles, you can use the Pythagorean Theorem. Let x represent the length of the diagonal.

$$\begin{aligned} 20^2 + 20^2 &= x^2 \\ 400 + 400 &= x^2 \\ x^2 &= 800 \\ x &= \sqrt{800} = \sqrt{2} \times \sqrt{4} \times \sqrt{100} \\ x &= \sqrt{2} \times 2 \times 10 = 20\sqrt{2} \text{ **Ans.**} \end{aligned}$$

9. $a \odot b = ab/(a + b)$
 $4a/(a + 4) = 3$
 $4a = 3(a + 4)$
 $4a = 3a + 12$
 $a = 12$ **Ans.**

10. A jar has 3 green, 2 red and 5 blue marbles.
 The jar has a total of
 $3 + 2 + 5 = 10$ marbles.
 $P(\text{red}) = 2/10$
 $P(\text{blue}) = 5/10$
 $P(\text{red or blue}) = 2/10 + 5/10$
 $= 7/10$ **Ans.**

11. Six points are in a plane and no three are collinear. Find the number of distinct lines that are determined by all possible pairs of points.
 There are 6 points and each point connects to 5 other points making a total of $6 \times 5 = 30$ lines. But we end up counting the same line twice, as this example illustrates:

The line from point 1 to point 4 is counted once among the lines between point 1 and the 5 other points, then again with the lines from point 4 to the other 5 points. This will be true for each line. So, $30/2 = 15$ **Ans.**

If you are familiar with the concept of combinations, you can solve this problem by finding the number of combinations of 2 objects chosen from a collection of 6 objects. That's ${}_6C_2 = 6!/(4! \times 2!) = 30/2 = 15$ **Ans.**

12. According to the bar graph
 2 workers earn \$41,000 to \$50,000.
 6 workers earn \$51,000 to \$60,000.
 5 workers earn \$61,000 to \$70,000.
 4 workers earn \$71,000 to \$80,000.
 2 workers earn \$81,000 to \$90,000.
 To find the greatest mean salary we need to take the highest value in each range, multiply it by the number of workers in that range, add them all up and divide by the number of workers. Then we need to follow the same steps to find the lowest mean salary. Let's see if we can avoid actually adding and multiplying those large values since we do have the aid of a calculator. Let's write the sum of the lowest salaries as
 $2a + 6b + 5c + 4d + 2e = S$. Since the difference between the lowest and highest salary in each range is \$9000, the sum of the highest salaries is $2(a + 9000) + 6(b + 9000) + 5(c + 9000) + 4(d + 9000) + 2(e + 9000) = 2a + 6b + 5c + 4d + 2e + 9000(2 + 6 + 5 + 4 + 2) = S + 9000(19) = S + 171,000$. The difference in the means would be $((S + 171,000) - S)/19 = 171,000/19 = 9000$ **Ans.**

13. The sum of the first n integers is $(n + 1) \times (n/2)$. So, the sum of the first 2000 positive integers is $(2000 + 1) \times (2000/2) = 2001 + 1000 = 2,001,000$ **Ans.**

14. A stalactite grows downward at 0.004 inches per year. A stalagmite, directly below grows upward at 0.006 inches per year. The height of the ceiling is 10 feet (or 120 inches). Each passing year, the stalactite and stalagmite grow $0.006 + 0.004 = 0.01$ inches closer. At

this rate, the number of years until they meet is $120/0.01 = 12,000$ **Ans.**

15. The product of 3 positive integers is 144.

The sum of the three integers is 26. What is the sum of their squares?

Let's look at the factor pairs of 144.

$$1 \times 144$$

$$2 \times 72 = 1 \times 2 \times 72$$

$$3 \times 48 = 1 \times 3 \times 48$$

$$4 \times 36 = 1 \times 4 \times 36$$

$$6 \times 24 = 1 \times 6 \times 24$$

$$8 \times 18 = 1 \times 8 \times 18$$

$$9 \times 16 = 1 \times 9 \times 16$$

$$12 \times 12 = 1 \times 12 \times 12$$

Of these triples, the one that works for us is

$1 \times 9 \times 16$ since $1 + 9 + 16 = 26$. The sum of the squares is $1^2 + 9^2 + 16^2 =$

$$1 + 81 + 256 = 338$$
 Ans.

16. How many ordered triples (x, y, z) of positive integers have a sum of 6?

Three triples have a sum of 6:

2, 2 and 2 yield 1 ordered triple

1, 1 and 4 yield $3!/2 = \underline{3}$ ordered triples

1, 2 and 3 yield $3! = \underline{6}$ ordered triples

The total number of ordered triples is

$$1 + 3 + 6 = 10$$
 Ans.

17. The slope of a line is k . The line passes through $(0, k + 3)$ and $(-3, 0)$. Find the value of k .

Recall the formula for the slope of a line

$$\Delta y / \Delta x = (y_2 - y_1) / (x_2 - x_1).$$
 Using the two

given ordered pairs, we have $x_1 = -3, y_1 = 0, x_2 = 0$ and $y_2 = k + 3$. Using the formula, the line has slope

$$k = [(k + 3) - 0] / [0 - (-3)] = (k + 3) / 3$$
 Ans.

18. How many permutations of the digits 1, 2, 3, 4 have 1 before 3 and 2 before 4?

Let's start with 1 as the thousands digit.

1324

1234 } 3 permutations

1243

When 2 is the thousands digit.

2134

2143 } 3 permutations

2413 }

When 3 is the thousands digit.

3 – uh, oh. Can't happen because 1 must always come before 3.

The same is true for 4. The number of permutations is $3 + 3 = 6$ **Ans.**

19. What is the value of $(\sqrt[3]{-8})^4$?

The cube root of -8 is -2 .

$$\text{And } (-2)^4 = 16$$
 Ans.

20. The line $y = -(1/3)x + 4$ intersects a perpendicular line at $(6, 2)$.

Find the y -intercept of the perpendicular line.

The slope of the line, m , is $-(1/3)$

The slope of the perpendicular line is $-1/m =$

$$-1 / -(1/3) = 3.$$
 Therefore, the equation for

the perpendicular line is $y = 3x + b$. Since

$(6, 2)$ is on this line, we can substitute for x, y and m to get

$$2 = 3 \times 6 + b$$

$$2 = 18 + b$$

$$b = -16$$

The equation of the perpendicular line is

$$y = 3x - 16.$$
 And when $x = 0$, we have

$$y = 3(0) - 16$$

$$y = -16$$

The y -intercept has coordinates $(0, -16)$ **Ans.**

21. Nine regions of a spinner are numbered 1 through 9. The probability of the spinner landing on a given region is proportional to the label on the region.

$$1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 45.$$

Therefore, the probability of the spinner landing on the region labeled 1 is $1/45$.

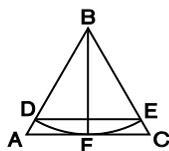

The probability of landing on the region

labeled 2 is $\frac{2}{45}$, and so on. Thus, the probabilities of landing on each of the spaces labeled 3, 5, 7 and 9 are $\frac{3}{45}$, $\frac{5}{45}$, $\frac{7}{45}$ and $\frac{9}{45}$, respectively. It follows that, in a given spin, the probability that the spinner will land on a space labeled 1, 3, 5, 7 or 9 is $\frac{1}{45} + \frac{3}{45} + \frac{5}{45} + \frac{7}{45} + \frac{9}{45} = \frac{25}{45} = \frac{5}{9}$ **Ans.**

22. The length of the diagonal of rectangle ABCD is half the rectangle's perimeter less four-fifths the length of the shorter side. Find the ratio of the length of the shortest side to the length of the longest side of the rectangle. Let L and W represent the length and width of the rectangle, respectively. Four-fifths of the length of the shortest side of the rectangle is $(\frac{4}{5})W$.

The rectangle has diagonal of length $\sqrt{L^2 + W^2} = L + W - (\frac{4}{5})W$
 $\sqrt{L^2 + W^2} = L + (\frac{1}{5})W$
 $L^2 + W^2 = L^2 + (\frac{2}{5})LW + (\frac{1}{25})W^2$
 $0 = (\frac{2}{5})LW - (\frac{24}{25})W^2$
 $(\frac{2}{5})L = (\frac{24}{25})W$
 $10L = 24W$
 $5L = 12W$
 $W/L = 5/12$ **Ans.**

23. An equilateral triangle has sides of length 2. A circular arc is centered at B. Find the length of a segment drawn parallel to side AC with endpoints D and E. Triangle ABC is an equilateral triangle, so angle B measures 60° . Let's find the radius of the circle containing arc DE. To do so, we drop a perpendicular from B to point F on side AC.

We are told that $AB = 2$. Because $\triangle ABF$ is a 30-60-90 right triangle, we know that $AF = \frac{1}{2}(2) = 1$ and the circle containing arc

DE has radius, $BF = \sqrt{3}$. Segments BD and BE also are radii of the circle containing arc DE. Note that $\triangle DBE \sim \triangle ABC$, which means that $\triangle DBE$ is an equilateral triangle. It follows, then, that $BD = DE = \sqrt{3}$ **Ans.**

24. On a number line, how many units apart are the two points that are twice as far from 0 as they are from 9? Let a be one of the points, and $0 < a < 9$. The distances from 0 to a and from a to 9 are a and $9 - a$, respectively. Since a is to be twice as far from 0 as it is from 9, we can write the equation $2 \times (9 - a) = a$. Solving for a , we see the first point is $18 - 2a = a \rightarrow 3a = 18 \rightarrow a = 6$. Now, assume the second point, b , is located on the number line such that $b > 9$. The distances from 0 to b and from 9 to b are b and $b - 9$, respectively. We have the equation $2 \times (b - 9) = b$. Solving for b , we see the other point is $2b - 18 = b \rightarrow b = 18$. It follows that the distance between a and b is $18 - 6 = 12$ **Ans.**

25. Given $3n^3 + 3n^2 + 4n = n^n$, find n . We can simplify this equation a bit by dividing both sides by n : $\frac{3n^3 + 3n^2 + 4n}{n} = \frac{n^n}{n} \rightarrow 3n^2 + 3n + 4 = n^{n-1}$ That simplifies the equation, but it doesn't tell us the value of n . Let's evaluate the simplified equation for several values of n . The results are displayed in the table below.

| n | $3n^2 + 3n + 4$ | n^{n-1} | Is n a solution? |
|----------|--------------------------------------|------------------------------|---|
| 1 | $3 + 3 + 4 = 10$ | $1^0 = 1$ | $10 \neq 1 \rightarrow$ NO |
| 2 | $12 + 6 + 4 = 22$ | $2^1 = 2$ | $22 \neq 2 \rightarrow$ NO |
| 3 | $27 + 9 + 4 = 40$ | $3^2 = 9$ | $40 \neq 9 \rightarrow$ NO |
| 4 | $48 + 12 + 4 = 64$ | $4^3 = 64$ | $64 = 64 \rightarrow$ YES |

$n = 4$ **Ans.**

26. How many different combinations of 3 numbers can be selected from the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ so that the numbers could

represent the side lengths of a triangle?
 The sum of the lengths of two sides of a triangle must be greater than the other side.

Start with a smallest side of 2:

(2, 3, 4) (2, 6, 7)

(2, 4, 5) (2, 7, 8)

(2, 5, 6) -- 5 values

Start with a smallest side of 3:

(3, 4, 5) (3, 5, 6) (3, 6, 7) (3, 7, 8)

(3, 4, 6) (3, 5, 7) (3, 6, 8) -- 7 values

Start with a smallest side of 4:

(4, 5, 6) (4, 6, 7) (4, 7, 8)

(4, 5, 7) (4, 6, 8)

(4, 5, 8) -- 6 values

Start with a smallest side of 5:

(5, 6, 7) (5, 7, 8)

(5, 6, 8) -- 3 values

Start with a smallest side of 6:

(6, 7, 8) -- 1 value

$5 + 7 + 6 + 3 + 1 = 22$ **Ans.**

27. If $1/x + 3/y = 3/4$ and $3/x - 2/y = 5/12$, what is $x + y$?

To solve this system of equations, we start by multiplying the first equation by 2 and the second equation by 3 to get $2/x + 6/y = 6/4$ and $9/x - 6/y = 15/12$.

Next, we add the two equations and get $2/x + 9/x + 6/y - 6/y = 6/4 + 15/12 \rightarrow 11/x = 33/12 \rightarrow 33x = 132 \rightarrow x = 4$.

Substituting for x in the first equation and solving for y yields $1/4 + 3/y = 3/4 \rightarrow 3/y = 1/2 \rightarrow y = 6$. So, $x + y = 4 + 6 = 10$ **Ans.**

28. What is the smallest prime number that divides some number of the form $424242\dots42 + 1$ or $424242\dots42 - 1$?

Let's start checking from the smallest prime number.

2: Any number of this form will have a ones digit that is odd, namely 3 or 1, and therefore will not be divisible by 2.

3: For a number to be divisible by 3, the sum of its digits must be divisible by 3. The sum of

the numbers in $424242\dots42$ is divisible by 3, so adding or subtracting 1 results in a number that is not divisible by 3.

5: For a number to be divisible by 5, it must end in 0 or 5. As previously stated, a number of this form will have a ones digit of 3 or 1, and is therefore not divisible by 5.

7: As with 3, the number $424242\dots42$ is divisible by 7. Therefore, adding or subtracting 1 will result in a number that is not divisible by 7.

11: We can't immediately rule out 11 as we did the other primes, so let's divide and see if it is a factor of some number of the given form. Dividing, we find that

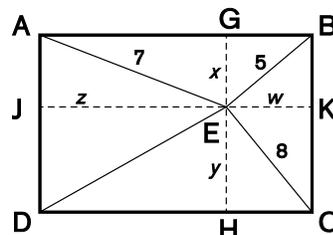

$424242424243/11 = 38567493113$ and

$4242424241/11 = 385674931$. The

smallest prime that divides a number of this form is 11 **Ans.**

29. Point E lies within rectangle ABCD.

If $AE = 7$, $BE = 5$ and $CE = 8$, what is DE ?

Draw horizontal segment JK through point E and parallel to sides AB and DC . Then draw vertical segment GH through point E and parallel to sides AD and BC . As shown, we'll let $EG = x$, $EH = y$, $EK = w$ and $EJ = z$. It follows that $JK = z + w$ and $GH = x + y$.

Segments GH and JK are perpendicular to the sides of the rectangle and several right triangles are formed. Applying the Pythagorean Theorem, we have :

$$x^2 + z^2 = 7^2 \rightarrow x^2 + z^2 = 49$$

$$w^2 + x^2 = 5^2 \rightarrow w^2 + x^2 = 25$$

$$w^2 + y^2 = 8^2 \rightarrow w^2 + y^2 = 64$$

$$y^2 + z^2 = (DE)^2 \rightarrow DE = \sqrt{(y^2 + z^2)}$$

We can manipulate the first three equations to get a new equation relating y and z .

Subtracting the second equation from the first yields the following:

$$(x^2 + z^2) - (w^2 + x^2) = 49 - 25$$

$$z^2 - w^2 = 24$$

To this we can add the third equation to get:

$$(z^2 - w^2) + (w^2 + y^2) = 24 + 64$$

$$y^2 + z^2 = 88$$

$$\text{So, } DE = \sqrt{88} = 2\sqrt{22} \text{ Ans.}$$

30. What is the value of

$$\sqrt{1 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \dots}}}}$$

where all subsequent numbers in the expression are 2s?

Start by finding the value of the square of the expression. The square is

$$1 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \dots}}}}$$

$$\text{Let } x = \sqrt{2 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \dots}}}}$$

$$\sqrt{2 + x} = x$$

$$2 + x = x^2$$

$$x^2 - x - 2 = 0$$

$$(x + 1)(x - 2) = 0$$

$$x = -1 \text{ or } x = 2$$

Since x must be positive, $x = 2$.

$$1 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \dots}}}} = 1 + 2 = 3$$

Recall that the original expression is the square root of this expression. So, the value of the original expression is $\sqrt{3}$ Ans.

Target Round

- Box A has 142 marbles.
Box B has 152 marbles.
Box C has 136 marbles.
Moving marbles only from B to C, what's the least number of marbles that need to be transferred so that C contains more marbles

than each of the other two boxes?

If we transfer 6 marbles from B to C, then B will have 146 marbles and A and C will each have 142 marbles.

If we transfer 2 more marbles from B to C then C will have 144 marbles as will B.

If we transfer one more marble from B to C we will have:

Box A with 142 marbles

Box B with 143 marbles.

Box C with 145 marbles.

The total number of marbles transferred

$$6 + 2 + 1 = 9 \text{ Ans.}$$

- What is the largest prime that divides both $20! + 14!$ and $20! - 14!$?

The expression $20! + 14!$ can be rewritten as $20 \times 19 \times 18 \times 17 \times 16 \times 15 \times 14! + 14!$
 $= 14!((20 \times 19 \times 18 \times 17 \times 16 \times 15) + 1)$.

Similarly, $20! - 14!$ can be rewritten as $20 \times 19 \times 18 \times 17 \times 16 \times 15 \times 14! - 14!$
 $= 14!((20 \times 19 \times 18 \times 17 \times 16 \times 15) - 1)$.

The greatest common factor for $20! + 14!$ and $20! - 14!$ is $14!$, and 13 is the largest prime factor of $14!$. So the greatest common prime factor of these two numbers is 13 Ans.

- In how many ways can the letters in the word NINE be arranged?

If all four letters were different the answer would be $4!$ or 24. But since two of the letters are the same, we have to account for duplicates. So the total number of arrangements is $24/2 = 12$ Ans.

- A vendor offers discounts for orders of 11 or more shirts as follows:

11-25 – 10% off

26-50 – 15% off

51-100 – 20% off

101-250 – 30% off

251 or more – 35% off

For how many different quantities of shirts would the cost exceed the cost of buying the

least number of shirts at the next discount level?

Let x = the cost of a shirt. We will consider each discount level separately to count the number of quantities for which the cost exceeds the cost of buying the least number of shirts at the next discount level.

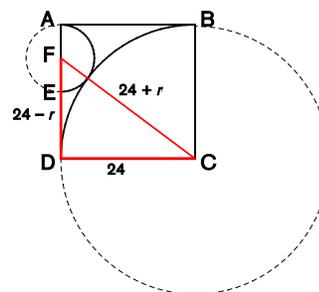

| | | |
|----------------------|---------------------------------------|--|
| LEVEL 1-10 | 11 for $11(0.9x) = 9.9x$ | |
| No discount | 10 for $10x$ | 1 quantity (10 shirts) |
| | 9 for $9x$ | |
| LEVEL 11-25 | 26 for $26(0.85x) = 22.1x$ | |
| 10% OFF | 25 for $25(0.9x) = \mathbf{22.5x}$ | 1 quantity (25 shirts) |
| | 24 for $24(0.9x) = 21.6x$ | |
| LEVEL 26-50 | 51 for $51(0.8x) = 40.8x$ | |
| 20% OFF | 50 for $50(0.85x) = \mathbf{42.5x}$ | 2 quantities (49-50 shirts) |
| | 49 for $49(0.85x) = \mathbf{41.65x}$ | |
| | 48 for $48(0.85x) = 40.8x$ | |
| LEVEL 51-100 | 101 for $101(0.7x) = 70.7x$ | |
| 20% OFF | 100 for $100(0.8x) = \mathbf{80x}$ | 12 quantities (89-100 shirts) |
| | 90 for $90(0.8x) = \mathbf{72x}$ | |
| | 89 for $89(0.8x) = \mathbf{71.2x}$ | |
| | 88 for $88(0.8x) = 70.4x$ | |
| LEVEL 101-250 | 251 for $251(0.65x) = 163.15x$ | |
| 30% OFF | 250 for $250(0.7x) = \mathbf{175x}$ | 17 quantities (234-250 shirts) |
| | 240 for $240(0.7x) = \mathbf{168x}$ | |
| | 235 for $235(0.7x) = \mathbf{164.5x}$ | |
| | 234 for $234(0.7x) = \mathbf{163.8x}$ | |
| | 233 for $233(0.7x) = 163.1x$ | |

In all the number of quantities for which this is true is $1 + 1 + 2 + 12 + 17 = 33$ **Ans.**

5. Each term in the sequence 13, 9, 18, ... is the sum of three times the tens digit and two times the units digit of the previous term. Find the greatest value of a term in the sequence. Let's look at the next several terms to see if this is a repeating sequence. After 18 we get, 19, 21, 8, 16, 15, 13 and it does repeat. The highest value in this sequence is 21 **Ans.**

6. In square ABCD, sector BCD is drawn with center C and $BC = 24$. A semicircle with diameter AE is drawn tangent to the sector BCD. Points A, E and D are collinear. Find AE.

Since $BC = 24$, the radius of the sector is 24. When two circles are tangent to each other a line can be drawn from the center of one circle to the center of the other one. (In the figure, the entire circles are displayed for clarity.)

Right triangle CDF has leg CD (a side of the square). It has hypotenuse CF, which is the line drawn from the circle with center C. And it has leg DF, which is the portion of side AD with one endpoint at the center of the circle, F, with diameter AE. Let r represent the radius of the circle with center at point F. Again, we know that $AD = 24$. It follows that $FD = AD - AF = 24 - r$, and $CF = 24 + r$.

Using the Pythagorean Theorem, we have

$$(24 - r)^2 + 24^2 = (24 + r)^2$$

$$24^2 - 48r + r^2 + 24^2 = 24^2 + 48r + r^2$$

$$-48r + 576 = 48r$$

$$96r = 576$$

$$r = 6$$

Therefore, $AE = 2r = 2 \times 6 = 12$ **Ans.**

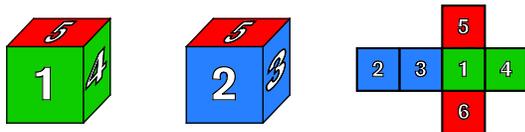

7. How many distinct unit cubes are there with two faces painted red (R), two painted green (G) and two painted blue (B)? We'll consider a cube with pairs of opposite faces numbered as follows: $1 \leftrightarrow 2$ (front/back), $3 \leftrightarrow 4$ (right/left) and $5 \leftrightarrow 6$ (top/bottom).

CUBE 1: All opposite faces of the same color.
 $1G \leftrightarrow 2G \mid 3B \leftrightarrow 4B \mid 5R \leftrightarrow 6R$

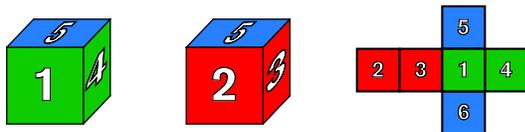

Note: Each color has is arbitrarily assigned to a pair of opposite faces and when rotated the result is still CUBE 1.

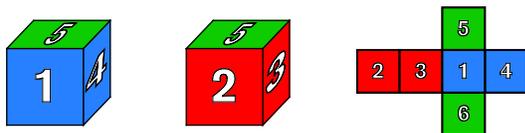

CUBE 2: One pair of opposite faces both red.
 Other opposite faces one blue, one green.
 $1G \leftrightarrow 2B \mid 3B \leftrightarrow 4G \mid 5R \leftrightarrow 6R$

CUBE 3: One pair of opposite faces both blue.
 Other opposite faces one red, one green.
 $1G \leftrightarrow 2R \mid 3R \leftrightarrow 4G \mid 5B \leftrightarrow 6B$

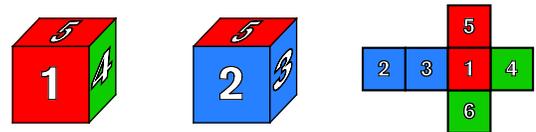

CUBE 4: One pair of opposite faces both green.
 Other opposite faces one red, one blue.
 $1B \leftrightarrow 2R \mid 3R \leftrightarrow 4B \mid 5G \leftrightarrow 6G$

CUBE 5: No opposite faces of the same color.
 Left face green and right face blue.
 $1R \leftrightarrow 2B \mid 3G \leftrightarrow 4B \mid 5R \leftrightarrow 6G$

CUBE 6: No opposite faces of the same color.
 Left face blue and right face green.
 $1R \leftrightarrow 2B \mid 3B \leftrightarrow 4G \mid 5R \leftrightarrow 6G$

CUBE 5 and CUBE 6 are different because no rotation of CUBE 5 results in any rotation of CUBE 6. In fact, if you turn them upside down (6 on top and 5 on the bottom), the lateral faces (1-4) of CUBE 5 are now in the original order of the lateral faces of CUBE 6, and vice versa. As we have shown, the number of different cubes is 6 **Ans.**

8. What is the greatest possible area of a triangle with vertices on or above the x -axis and on or below the parabola

$$y = -(x - 1/2)^2 + 3$$

$$y = -(x^2 - x + 1/4) + 3$$

$$y = -x^2 + x - 1/4 + 3$$

$$y = -x^2 + x + 11/4$$

For a parabola given by the equation

$y = ax^2 + bx + c$, the axis of symmetry is

$x = -b/2a$. In this case, $a = -1$ and $b = 1$. So,

the parabola is symmetric across the line $x =$

$1/2$, and its vertex occurs at the point $(1/2, 3)$.

Since this parabola opens down the vertex is

also the highest point. Now let's determine

where this parabola crosses the x -axis. We

will use the quadratic formula to solve

$0 = -x^2 + x + 11/4$. Since $a = -1$, $b = 1$ and

$c = 11/4$, we have

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-1 \pm \sqrt{1^2 - 4(-1)(\frac{11}{4})}}{2(-1)}$$

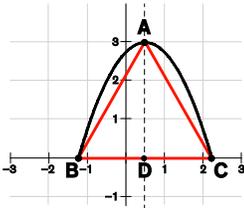

$$= \frac{-1 \pm \sqrt{1 - (-11)}}{-2} = \frac{-1 \pm \sqrt{12}}{-2} = \frac{-1 \pm 2\sqrt{3}}{-2} = \frac{1}{2} \pm \sqrt{3}$$

The parabola crosses the x -axis at $(1/2 - \sqrt{3},$

$0)$ and $(1/2 + \sqrt{3}, 0)$. The triangle shown has

vertices on the parabola and the x -axis at

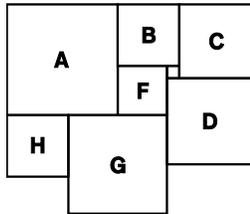

$A(1/2, 3)$, $B(1/2 - \sqrt{3}, 0)$ and $C(1/2 + \sqrt{3}, 0)$.

Point $D(\frac{1}{2}, 0)$ is the midpoint of segment BC . The length of base BC is $\frac{1}{2} + \sqrt{3} - (\frac{1}{2} - \sqrt{3}) = 2\sqrt{3}$, and the height, which is the length of segment AD , is 3. The area of the triangle is $\frac{1}{2} \times 3 \times 2\sqrt{3} = 3\sqrt{3}$ **Ans.**

Team Round

1. The area of square F is 16. The area of square B is 25. The area of square H is 25. Find the area of square D.

Let a, b, c, d, e, f, g and h represent the side lengths of squares A through H, respectively. Square F has area 16, and square B and H have area 25. So, it follows that $f = 4, b = 5$ and $h = 5$. From the figure we see that $b = f + e$. So $5 = 4 + e$ and $e = 1$. We also can see that $b + c = f + d$. So $5 + c = 4 + d$ and $c = d - 1$. Since $a + b + c = a + f + d$, $a = b + f$. So $a = 5 + 4$ and $a = 9$. Next, since $h + g = a + f$, it follows that $5 + g = 9 + 4$ and $g = 8$. According to the figure, $e + b = c$. That means $1 + 5 = c$ and $c = 6$. Finally, we have $d = c + 1$, so $d = 7$. The area of square D is $7 \times 7 = 49$ **Ans.**

2. Nine consecutive positive even integers are entered into a 3×3 grid. The sums of the three numbers in each row, column and diagonal are the same. Find the average value of the five missing numbers.

| | | |
|-----|-----|-----|
| 38 | u | v |
| w | x | 40 |
| 46 | y | 50 |

We'll let u, v, w, x and y represent the missing numbers, then calculate their average value, which is $(u + v + w + x + y)/5$. The sums of the numbers in each row, each column and each diagonal must be equal, so we have the following equivalent sums:

$$38 + u + v = w + x + 40 = 46 + y + 50 = 38 + w + 46 = u + x + y = v + 40 + 50 = 38 + x + 50 = 46 + x + v.$$

That means $38 + x + 50 = 46 + x + v$

$$88 + x = 46 + x + v$$

$$88 = 46 + v$$

$$v = \underline{42}.$$

And $38 + u + v = v + 40 + 50$

$$38 + u = 90$$

$$u = \underline{52}.$$

In addition, $38 + w + 46 = v + 40 + 50$

$$84 + w = 42 + 40 + 50$$

$$84 + w = 132$$

$$w = \underline{48}.$$

Finally, $38 + w + 46 = u + x + y$

$$84 + 48 = 52 + x + y$$

$$132 = 52 + x + y$$

$$\underline{80} = x + y.$$

It follows that, $(u + v + w + x + y)/5 =$

$$(52 + 42 + 48 + 80)/5 = 222/5 = 44.4$$
 Ans.

3. To provide direct flights between four cities takes 6 routes. We must find the number of routes needed to connect 15 cities. Each city can be connected to the other 14 cities by 14 unique routes. However, we will end up counting each route twice. That means the number of routes needed is actually $(15 \times 14)/2 = 105$ **Ans.**
4. Plan A costs \$250 to set up and \$4.25 per shirt. Plan B costs \$150 to set up and \$5.25 per shirt. Find the number of shirts to print

that cost the same with either plan.
 Let x represent the number of shirts for which the cost is the same using either plan. Now, we solve $250 + 4.25x = 150 + 5.25x$ and get $x = 100$ **Ans.**

5. \$1000 is in an account that earns 3% interest, compounded annually. The account now is worth \$1125.51. How many years has the money been in the account? The table shows the year-end balance of an account with an initial balance of \$1000 that earns 3% interest, compounded annually.

| Year | Ending Balance |
|------|------------------------------------|
| 1 | $1.03 \times 1000 = 1030$ |
| 2 | $1.03 \times 1030 = 1060.90$ |
| 3 | $1.03 \times 1060.90 = 1092.727$ |
| 4 | $1.03 \times 1092.73 = 1125.50881$ |

That means, 4 years after the account balance was \$1000, the account earned enough interest to have a balance of \$1125.51.

4 Ans.

6. Abigail, Bartholomew and Cromwell play a game in which they take turns adding 1, 2, 3, or 4 to a sum in order to create an increasing sequence of primes.
 We'll let A, B and C stand for Abigail, Cromwell and Bartholomew, respectively.
 Let's suppose the game proceeds as follows:
 A chooses 2
 B adds 1 to make 3
 C adds 2 to make 5
 A chooses 2 to make 7
 B chooses 4 to make 11
 C chooses 2 to make 13
 A chooses 4 to make 17
 B chooses 2 to make 19
 C chooses 4 to make 23
 A chooses...
 Well, A can't choose, since there are no primes between 24 and 27. That means

Cromwell chose the last prime. But we want Bartholomew to end up with the last prime. So let's suppose, instead, that the game proceeds this way:

- A chooses 2
 B adds 3 to make 5
 C adds 2 to make 7
 A chooses 4 to make 11
 B chooses 2 to make 13
 C chooses 4 to make 17
 A chooses 2 to make 19
 B chooses 4 to make 23

This time, Bartholomew has chosen the last prime, and the total number of primes made was **8 Ans.**

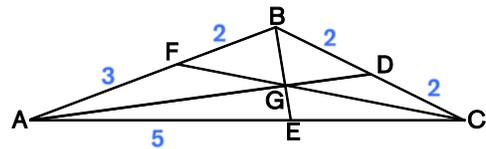

7. How many positive integers less than 1000 do not have 7 as any digit?
 Let's start with positive 3-digit integers. The possible values for the digit the hundreds place are 1 through 6, 8 or 9. That's 8 choices. The possible values for the digit the tens and ones places are of 0 through 6, 8 or 9. That's 9 choices for the tens place value and 9 choices for the ones place value. Thus, there are $8 \times 9 \times 9 = 648$ positive 3-digit integers. For positive 2-digit integers, the possible values for the digit in the tens place are 1 through 6, 8 or 9. That's 8 values. And again, there are 9 choices for the ones place value. So there are $8 \times 9 = 72$ positive 2-digit integers. Finally, the positive 1-digit integers are 1, 2, 3, 4, 5, 6, 8 and 9. That's **8** positive 1-digit integers. That brings the total number of integers to $648 + 72 + 8 = 728$ **Ans.**
8. In the game, vowels are worth 1 point and consonants are worth 2 points. When more than one letter of the same type appears consecutively, each letter is worth twice as much as the one before. Find the absolute difference between the values of QUEUEING and SYZYGY. Following are the point values for each letter in QUEUEING.

Q is a consonant worth 2.
 U is a vowel worth 1.
 E is an adjacent vowel worth 2.
 U is an adjacent vowel worth 4.
 E is an adjacent vowel worth 8.
 I is an adjacent vowel worth 16.
 N is a consonant worth 2.
 G is a consonant worth 4.
 QUEUEING is worth a total of $2 + 1 + 2 + 4 + 8 + 16 + 2 + 4 = 39$ points.
 Following are the point values for each letter in SYZYGY.

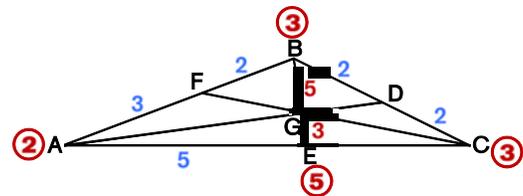

S is a consonant worth 2.
 Y is an adjacent consonant worth 4.
 Z is an adjacent consonant worth 8.
 Y is an adjacent consonant worth 16.
 G is an adjacent consonant worth 32.
 Y is an adjacent consonant worth 64.
 SYZYGY is worth a total of $2 + 4 + 8 + 16 + 32 + 64 = 126$ points. That gives us an absolute difference of $126 - 39 = 87$ **Ans.**

9. Using each of the digits 1 to 6 exactly once, how many six-digit integers can be formed that are divisible by 6?
 An integer is divisible by 6 if it is divisible by both 2 and 3. So, for an integer to be divisible by 6, it must be even (divisible by 2), and the sum of its digits must be divisible by 3. Well, $1 + 2 + 3 + 4 + 5 + 6 = 21$, which is divisible by 3. But only half of the integers composed of these six digits are even. There are a total of $6! = 720$ different ways to arrange the digits 1, 2, 3, 4, 5 and 6 to form a six-digit integer. Therefore, the number of these integers that are divisible by 6 is $720/2 = 360$ **Ans.**

10. Points D, E and F lie along the perimeter of $\triangle ABC$ such that AD, BE and CF intersect at point G. $AF = 3$, $BF = BD = CD = 2$ and $AE = 5$. Find BG/EG .

This problem can be solve using mass-point geometry to solve this problem. Let D serve as the fulcrum balancing segments BC. Likewise, E and F each serve as the fulcrum balancing segments AC, and AB, respectively. So the product of the mass at B and the length of segment BF must be equal to the product of the mass at A and the length of segment AF. Since $AF = 3$ and $BF = 2$, we assign a mass of 3 to B, which leads to assigning a mass of 2 to A. Now since the mass at C must be such that the product of the mass and the length of segment CD must equal the product of the mass at B and the length of segment BD. Since $BD = CD = 2$, we assign a mass of 3 to C. Therefore, the mass at E (the sum of the masses at A and C) is 5.

Finally, if G serves as a fulcrum balancing segment BE, the product of the mass at B and the length of segment BG must equal the product of the mass at E and the length of segment EG. While we don't know the exact lengths of segments BG and EG, we do know that in order for segment BE to remain balanced on G, the segments must be in the ratio $BG/EG = 5/3$ **Ans.**

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ The mass of a mouse is 25 grams, and the mass of a small dog is 5000 grams.
The mass of the dog is how many times the mass of the mouse?

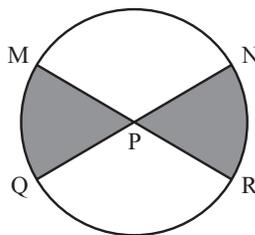

2. _____ What is the product of all the solutions to $|x - 3| = 4$?

3. _____ A square target has side length 16 inches. In the center of the target is a smaller square, as shown, with side length 4 inches. If a dart randomly hits within the larger square, what is the probability that it will land in the smaller square?
Express your answer as a common fraction.

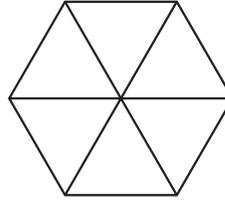

4. _____ Circle P has diameter 2 cm and $m\angle MPN = 120^\circ$. If the shaded region has area $k\pi$ cm², what is the value of k ? Express your answer as a common fraction.

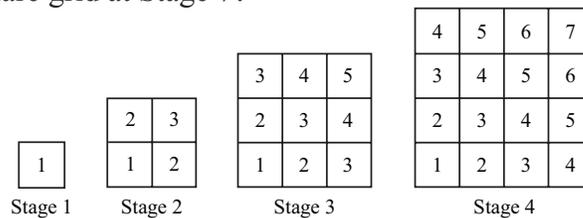

5. _____ If $f(x) = \frac{f(x+1)}{2}$ and $f(2) = 4$, then what is the value of $f(10) - f(7)$?

6. _____ If n represents the number of seconds in a day, what is the largest prime factor of n ?

7. _____ polygons How many convex polygons with an even number of sides are in the figure shown?

8. _____ Consider the pattern of square grids shown. The sum of the numbers in the square grid at Stage 3 is 27. If the pattern continues, what will be the sum of the numbers in the square grid at Stage 7?

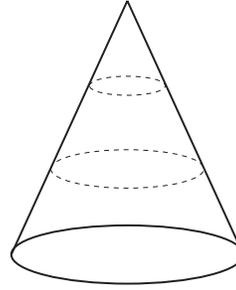

9. _____ terms Consider the sequence 1, 3, 4, 7, 11, 18, 29, ... in which each term is the sum of the two previous terms after the first two terms. How many of the first 100 terms of this sequence are multiples of 5?

10. _____ Three different gifts were bought to be distributed to three children. Each gift box was labeled with the recipient's name. Unfortunately, the gifts were later wrapped, covering the labels. If each child is given one of the three gifts at random to open, what is the probability that no child opens a gift labeled with his or her name? Express your answer as a common fraction.

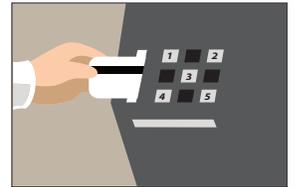

11. _____ in^2 The side lengths of three similar regular pentagons are in the ratio 2:5:7. The area of the smallest pentagon is 40 in^2 . What is the area of the largest pentagon?
12. _____ units^2 What is the area of the quadrilateral with vertices $(0, 0)$, $(1, 2)$, $(3, 4)$ and $(6, 5)$? Express your answer as a mixed number.
13. _____ The non-negative integers a, b, c, d and e form an arithmetic sequence. If their sum is 440, what is the largest possible value for e ?
14. _____ The six-digit integer "789,XYZ" consists of six *distinct* digits and is divisible by 7, 8 and 9. What is the three-digit integer "XYZ"?
15. _____ The nonzero roots of the equation $x^2 + 6x + k = 0$ are in the ratio 2:1. What is the value of k ?

16. _____ A cone is sliced by planes parallel to its base into three pieces of equal height. What fraction of the original volume is in the middle piece? Express your answer as a common fraction.

17. _____ A fair, six-sided die has two red, two blue and two yellow faces. The die is rolled three times. What is the probability of getting each color once? Express your answer as a common fraction.

18. _____ codes The First National Bank of Zyzylvaria requires each customer to choose a code comprising four distinct digits from 1 to 5, inclusive, where the positive difference between any two consecutive digits must be at least 2. How many such codes are possible?

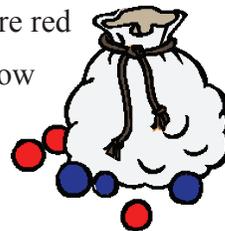

19. _____ students To the nearest whole percent, the composition of a particular class is 43% male students and 57% female students. What is the minimum number of students that could be in the class?

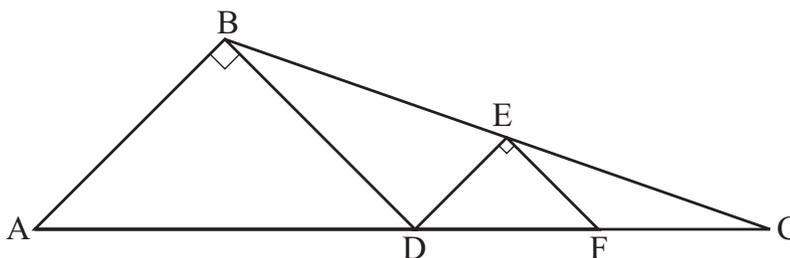

20. _____ base 5 In base 5, what is the value of $27_{10} \times 314_5$?

21. _____ If $x^2 + \frac{1}{x^2} = 3$ and $x > 0$, what is the value of $x + \frac{1}{x}$? Express your answer in simplest radical form.

22. _____ marbles A bag contains red marbles and blue marbles. If two marbles are chosen at random without replacement, the probability that both marbles are red is $\frac{1}{5}$, and the probability that both marbles are blue is also $\frac{1}{5}$. How many marbles are in the bag?

23. _____ units Triangles ABD and DEF are isosceles right triangles. Points A, D, F and C are collinear, and points B, E and C are collinear. If $AB = BD = 4$ and $ED = EF = 2$, what is the length of segment AC? Express your answer in simplest radical form.

24. _____ digits How many digits are in the integer representation of 2^{30} ?

25. _____ cm^2 The diagonals of a parallelogram have lengths 82 cm and 30 cm. One altitude is 18 cm long. What is the smallest possible area of the parallelogram?

26. _____ ways Seven different prizes are to be distributed among three contest winners such that each winner receives at least one prize and each of the prizes goes to one of the three winners. In how many different ways can the prizes be distributed among the three winners?

27. _____ The fourth degree polynomial equation $x^4 - 7x^3 + 4x^2 + 7x - 4 = 0$ has four real roots, a , b , c and d . What is the value of the sum $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d}$? Express your answer as a common fraction.

28. _____ What is the remainder when 11^{12} is divided by 13?

29. _____ integers Let $f(n) = \begin{cases} n^2 + 1 & \text{if } n \text{ is odd} \\ \frac{n}{2} & \text{if } n \text{ is even} \end{cases}$. For how many integers n from 1 to 100, inclusive, does $f(f(\dots f(n))) = 1$ for some number of applications of f ?

30. _____ units In pentagon ABCDE, $\angle E$ and $\angle C$ are right angles and $m\angle D = 120^\circ$. If $AB = 12$, $AE = BC = 18$ and $ED = DC$, what is ED ? Express your answer in simplest radical form.

Forms of Answers

The following list explains acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N \frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: Express 8 divided by 12 as a common fraction. *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: Express 12 divided by 8 as a common fraction. *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}, 1\frac{1}{2}$
Problem: Express the sum of the lengths of the radius and the circumference of a circle with a diameter of $\frac{1}{4}$ as a common fraction in terms of π . *Answer:* $\frac{1+2\pi}{8}$
Problem: Express 20 divided by 12 as a mixed number. *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}, \frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}, \frac{3}{\pi}, \frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}, \frac{1}{3}, 3.5, 2:1$

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: Evaluate $\sqrt{15} \times \sqrt{5}$. *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits.

The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they may both be omitted. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not do any intermediate rounding (other than the “rounding” a calculator performs) when calculating solutions. All rounding should be done at the end of the calculation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: Write 6895 in scientific notation. *Answer:* 6.895×10^3

Problem: Write 40,000 in scientific notation. *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole number answers should be expressed in their whole number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

MATHCOUNTS®

2014
■ State Competition ■
Target Round
Problems 1 & 2

Name _____

School _____

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. \$ _____

Including tax, Mr. Magoo paid \$94.94 for a birthday present for Mrs. Magoo. Sales tax in his state is 5.5%. What was the price of the present before sales tax?

2. _____ pounds

The sides of the following scale balance. Each distinct shape has a unique integer weight from 1 to 10 pounds. The total weight of the seven shapes in the diagram is 32 pounds. What is the weight of the rectangle, if the weight of the rhombus minus two pounds equals the weight of the rectangle plus the weight of the circle? Assume all arms and strings have no weight.

5. _____

A grid contains all of the integers 1 through 100 in ten rows of ten numbers each. The numbers are arranged in increasing order from left to right so that 1 through 10 are in the top row, 11 through 20 are in the second row, and so on, with 91 through 100 in the bottom row. A token placed on the board can be moved in any of eight different directions, as shown here.

If the token is initially placed on 27 and the following series of moves is made, on what number will the token end?

6. _____

When Mandi shoots free throws, she consistently makes the shot with a probability of p , where $p < \frac{1}{2}$. When she shoots six free throws, the probability that she makes exactly half of them is $\frac{4^4}{5^5}$. What is the value of p ? Express your answer as a common fraction.

7. _____

An ant is standing at the origin of a coordinate grid. The ant will take four steps, each 1 unit in length. Each step taken is either forward, backward, right or left, chosen at random. What is the probability that the ant's fourth step places the ant back at the origin? Express your answer as a common fraction.

8. _____ m²

A solid right, circular cone has a base radius of 5 meters and a slant height of 10 meters. A top cone will be removed so that the volume of the remaining frustum will be $\frac{1}{3}$ that of the original cone. In square meters, what is the total surface area, including both bases, of the frustum? Express your answer to the nearest whole number.

1. _____ What is the least possible denominator of a common fraction that lies strictly between $\frac{1}{3}$ and $\frac{1}{2}$?
2. _____ (even integers) In a list of 30 integers, 18 of the integers are multiples of 5. If 10 of the multiples of 5 are odd integers, what is the maximum number of even integers in the list?
3. _____ (units²) What is the largest possible area, in square units, of a triangle with perimeter 6 units? Express your answer in simplest radical form.
4. _____ (workers) A library system with 6 branches employs 60 workers. If no branch has fewer than 7 workers and no more than 11 workers, what is the minimum number of total workers in any two of the branches?
5. _____ (classes) At a school, grade point averages are calculated by making an A worth 4 points, a B worth 3, etc., and all courses are equally weighted. After 20 courses, Zach has a grade point average of exactly 3.9. If he can get As in all of his future classes, how many more classes must Zach take to raise his average to exactly 3.95?
6. _____ (feet) A rectangle of area 9 ft² is made by placing square A next to half of square B, as shown. In feet, what is the side length of square A? Express your answer in simplest radical form.

7. _____ If $b = \frac{3}{a}$, where $a \neq 0$ and $b \neq 1$, then $\frac{a-3}{b-1} = ka$. What is the value of k ?
8. _____ (integers) How many positive integers divide 6^{2014} but not 6^{2013} ?
9. _____ What is the sum of all integer values of x that satisfy $|x + 4| < 4$ and $-x < 3$?
10. _____ What integer is closest to $\sqrt{9800}$?
11. _____ The mean, median and mode of a collection of five positive integers are all 5. What is the largest possible number in the set?

12. _____ For what nonzero integer a is the point (a, a) on the graph of $f(x) = x^2 + 6x$?
13. _____ (units²) Centered at each vertex of a regular decagon of side length 2 units, a circle of radius 1 unit is drawn. In square units, what is the total area of the parts of the circles that are inside the decagon? Express your answer in terms of π .
14. _____ If $x + \frac{1}{x} = 6$, what is the value of $x^3 + \frac{1}{x^3}$?
15. _____ (values) A wallet contains exactly two each of \$5, \$10 and \$20 bills. Two bills are randomly selected from the wallet. How many different dollar values are possible?
16. _____ (units) Triangle ABC has B at the origin and \overline{AC} is parallel to the x -axis. $AC = 5$ units, $BC = 7$ units and the y -axis bisects \overline{AC} . What is the length of \overline{AB} , in units?
17. _____ (digits) How many digits are in the value of the product $8^5 \cdot 5^8$?
18. _____ (packages) Pencils can be purchased in packages of 12 or 25. If Masi purchased 8 packages to get 135 pencils, how many packages of 12 did he buy?
19. _____ (combinations) Caleb's Cupcakes sells red velvet, vanilla cream and chocolate chip cupcakes. How many different combinations are possible for a dozen cupcakes at Caleb's?
20. _____ For $y = kx^3$, $y = 36$ when $x = 2$. What is the value of y when $x = 4$?
21. _____ (units²) If ABCDEF is a regular hexagon of area 36 units², what is the area of $\triangle ACE$, in square units?
22. _____ (minutes) In a one-mile race, Blue Streak finished 30 seconds after The Flash. If Blue Streak had been given a $\frac{1}{8}$ -mile head start, Blue Streak would have finished 30 seconds before The Flash. How many minutes did it take for Blue Streak to run one mile?
23. _____ What is the absolute difference between the two real numbers x for which $(x + 1)(x - 1)(x - 2) = (x + 2)(x + 3)(x - 3)$? Express your answer in simplest radical form.

24. _____ (permutations) How many of the permutations that can be made using one or more letters in SOUTH CAROLINA also can be made using the letters in MAINE?

25. _____ (meters) An equilateral triangle is divided into a trapezoid and a smaller equilateral triangle as shown. The larger triangle has a side length of 24 m. If the area of the trapezoid is $\frac{3}{4}$ of the area of the larger triangle, in meters, how long is a side of the smaller triangle?

26. _____ (in²) Eight segments measuring 3, 5, 6, 9, 11, 13, 15 and 16 inches are used to construct a rectangle. In square inches, what is the largest possible area of the rectangle?

27. _____ The result of multiplying a number by m is the same as adding it to m . In terms of m , what is the number? Express your answer as a common fraction.

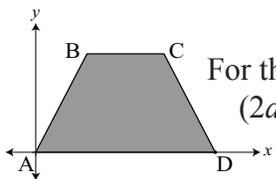

28. _____ What is the greatest positive 4-digit integer n for which the sum of its proper divisors is $n - 1$?

29. _____ If $3x + y + z = 15$ and $x - 2y - z = 30$, what is the value of $5x - 3y - z$?

30. _____ The fourth and fourteenth terms of an arithmetic progression are -14 and -4 , respectively. What is the 2014th term?

31. _____ When $(a + 2b + 3c)^6$ is expanded, what is the coefficient of a^3b^2c ?

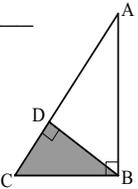

32. _____ A number equals its double decreased by 1. What is the number?

33. _____  For the isosceles trapezoid shown, three of the vertices are $(0, 0)$, $(2a, 2b)$ and $(2a + c, 2b)$. The coordinates of point D are $(ra + sb + tc, 0)$. What is the value of $r + s + t$?

34. _____ The quadratic equation $x^2 + ax + b = 0$ has roots -3 and -7 . What is the value of $a + b$?

35. _____ What is the value of $(11^2 - 10^2)^2$?
36. _____ The sum of the first 14 terms of an arithmetic sequence is 2014. If the sum of the first 28 terms of the same sequence is 2014, what is the sum of the first 42 terms of the sequence?
37. _____ (people) If two of the people in Demi's family are selected at random, there is a 50% chance that both people will have brown eyes. What is the minimum number of people in Demi's family?
38. _____ In a class of 99 students, 1 student represents 1% of the class (rounded to the nearest whole percent) and 99 students represent 100% of the class. What positive integer between 1 and 100 cannot be represented as a percentage of the class?
39. _____ Michael is two years older than three times Jennifer's age. If Jennifer is x years old, then, in years, Michael's age can be expressed as $mx + b$. What is the value of $m + b$?
40. _____ (ways) Alex has 3 books, and Eli has 4 books. If the 7 books are all different, in how many ways can they place their books on a shelf so that all of Alex's books are next to one another?
41. _____ The product $(x^{-2}y^3z^{-\frac{2}{3}})(xyz^{\frac{5}{3}})$ is equivalent to what common fraction that has only positive exponents?
42. _____ (dollars) A store sells fancy letters. There are no prices on the individual letters, but ADI buys the letters in her name for \$15, DIANE buys the letters in her name for \$21 and NADIA buys the letters in her name for \$23. In dollars, how much will ANNE pay for the letters in her name?

43. _____ What is the value of $9\left(\frac{1}{3} + 2 - \frac{2}{3}\right)$?

44. _____
- 
- Triangles ABC and BDC, shown here, are 30-60-90 right triangles, and $AC = 12$ cm. The area of $\triangle BDC$ can be written in simplest radical form as $\frac{a\sqrt{c}}{b}$ cm^2 , where a , b and c are positive integers. What is the value of $a + b + c$?

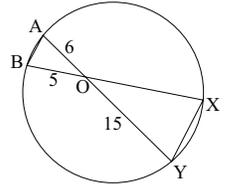

45. _____ (students) The mean score on a physics test for all students in the class was exactly 77. When Albert's score of 100 was removed, the mean decreased to exactly 76. How many students are in the class?
46. _____ What is the sum of all integers x such that $|2x + 5| \leq 4$?
47. _____ The two congruent sides of an isosceles triangle are each 3 inches longer than the base. The perimeter is 30 inches. What is the product of the numerical values of the lengths of the three sides of the triangle?
48. _____ Betty was counting the diagonals of a regular polygon with n sides. She stopped counting after 48 diagonals. What is the least possible value of n ?
49. _____ A weighted die has six sides, labeled 1 through 6, where the probability of rolling an n is directly proportional to n . What is the probability of rolling a 3? Express your answer as a common fraction.
50. _____ If x and y are nonzero real numbers such that $x^2 - 4xy + 4y^2 = 0$, what is the value of $\frac{y}{x}$? Express your answer as a common fraction.
51. _____ Jack and Jill both rolled two standard dice. What is the probability that Jill got the same two numbers as Jack, though not necessarily in the same order? Express your answer as a common fraction.
52. _____ (degrees) A regular pentagon has two interior diagonals originating at a vertex. What is the degree measure of the acute angle between the two diagonals?
53. _____ (ways) In how many ways can five integers from 1 to 7, inclusive, be placed in the boxes shown so that the row entries increase from left to right and the column entries increase from top to bottom?
- | | | | |
|--|--|--|--|
| | | | |
| | | | |
54. _____ Simeon calculated the sum of the first n positive integers, but he accidentally added one of those integers twice. If Simeon calculated the sum to be 100, what integer did he add twice?
55. _____ (reports) A 24-hour news station gives a weather report every 10 minutes. How many weather reports are given at the station each day?

56. _____ What is the value of $\sqrt{1^3 + 2^3 + 3^3 + 4^3 + 5^3 + 6^3 + 7^3 + 8^3 + 9^3 + 10^3}$?

57. _____ (miles) A car travels 33 feet in $\frac{1}{4}$ second. How many miles will it travel in 10 minutes?

58. _____ If $f(x) = 3x - 10$ and $g(x) = 2x^2 - 10$, what is the value of $g(f(2))$?

59. _____ (units) In the figure, chords AY and BX intersect at O, AO = 6 units, BO = 5 units and YO = 15 units. What is XO, in units?

60. _____ (ways) One way to represent 60 as the sum of consecutive positive integers is $19 + 20 + 21$. Including this example, how many ways are there to represent 60 as the sum of two or more consecutive positive integers?

61. _____ (problems) Donald solved 5 more MATHCOUNTS problems than Janet. Janet solved 3 more than Ann. Ann solved twice as many as Randy. If Randy solved 7 problems, how many problems did Donald solve?

62. _____ The graphs of $y = -|x|$ and $y = |x| + a$ enclose an area of 72 units^2 , on a coordinate plane. What is the value of a ?

63. _____ A sack contains 7 red marbles and 3 black marbles. Two marbles are randomly selected, with replacement. What is the probability of choosing a red marble and then a black marble? Express your answer as a common fraction.

64. _____ If $2^x = 8,388,608$, what is the value of x ?

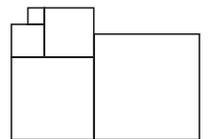

65. _____ (cents) Marika paid \$28.80 for a pound of gourmet coffee beans. One ounce of coffee beans makes 64 fluid ounces of brewed coffee. What is her cost, in cents, for 16 fluid ounces of brewed coffee?

66. _____ What is the units digit of the product $2^{2014} \cdot 3^{2014}$?

67. _____ When x is multiplied by 28, the result is a perfect square. If x is a positive integer, what is the smallest possible value of x ?

68. _____ (integers) How many positive integers are not less than the sum of their positive divisors?

69. _____ (ordered pairs) If x and y are integers and $y < 10$, for how many different ordered pairs (x, y) is $x^2 = y$?
70. _____ (percent) If the population of a city doubles in two years, what is its average yearly percentage growth? Express your answer to the nearest whole number.
71. _____ A line passes through the points $(3, 5)$ and $(-1, 3)$. What is the value of k such that the point $(k, 11)$ also is on the line?
72. _____ (miles) In miles, what is the perimeter of a $\frac{2}{3}$ -mile by $1\frac{3}{5}$ -mile rectangular piece of land? Express your answer as a mixed number.
73. _____ A set of consecutive even integers starts with -2 and ends with x . If the sum of the integers in the set is 108, what is the value of x ?
74. _____ (digits) A positive integer n is multiplied by 7. The resulting product contains just one digit repeated several times, and that digit is not 7. What is the least number of digits in n ?
75. _____ What is the sum of the prime factors of 102,102?
76. _____ (units) In isosceles trapezoid ABCD, with diagonals intersecting at E, $AB = 6$ units, $AE = BE = 4$ units and $CE = DE = 10$ units. What is CD, in units?
77. _____ (arrangements) Yasuko wants to arrange seven different family pictures in a row on her desk. If Yasuko wants the only picture of her parents to be in the middle, how many different arrangements of the pictures are possible?
78. _____ (ways) The squares in the figure are each to be painted either yellow or green. How many different ways can the five squares be painted?
79. _____ (votes) In the primary election, candidates Adams, Buchanan and Cleveland received votes in the ratio of 13:15:19, respectively. If there were 9447 votes cast, how many votes did Adams receive?
80. _____ A particular rectangle has length 7 units and perimeter 21 units. What is the ratio of its width to its length? Express your answer as a common fraction.

MATHCOUNTS®

2014 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Team Round problem with less than 10 sheets of scratch paper?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2014 MATHCOUNTS® State Competition. Though these solutions provide creative and concise ways of solving the problems from the competition, there are certainly numerous other solutions that also lead to the correct answer, and may even be more creative or more concise! We encourage you to find numerous solutions and representations for these MATHCOUNTS problems.

Special thanks to volunteer author Mady Bauer for sharing these solutions with us and the rest of the MATHCOUNTS community!

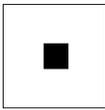

2014 State Competition

Sprint Round

1. A mouse weighs 25 grams and a dog weighs 5000 grams. The weight of the dog is $\frac{5000}{25} = 200$ times the weight of the mouse. 200 **Ans.**

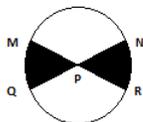

2. $|x - 3| = 4$
 First the positive value:
 $x - 3 = 4$
 $x = 7$
 Now the negative value:
 $-(x - 3) = 4$
 $-x + 3 = 4$
 $x = -1$
 The two solutions are 7 and -1.
 The product of the solutions is:
 $7 \times -1 = -7$ **Ans.**

3. A square target has a side length of 16. The smaller square has a side length of 4. Find the probability that the dart lands in the smaller square.

The area of the smaller square is:
 $4 \times 4 = 16$
 The area of the larger square is:
 $16 \times 16 = 256$
 The probability that the dart lands in the smaller square is:
 $\frac{16}{256} = \frac{1}{16}$ **Ans.**

4. The diameter of Circle P is 2. The measure of $\angle MPN$ is 120° . The area of the shaded region is $k\pi$. Find k.

Given that the measure of $\angle MPN$ is 120° , then that is also the measure of $\angle QPR$.
 $120 + 120 = 240$
 $360 - 240 = 120$
 The measure of $\angle MPQ$ and $\angle NPR$ are

both the same, i.e. 60° .

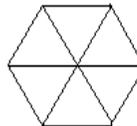

Each section denoted by those angles has an area of $1/6$ the area of the circle for a total of $1/3$ the area of the circle. Given that the diameter of the circle is 2, then the radius is 1.

The area of the circle is $\pi r^2 = \pi$. $1/3$ the area of the circle is $(1/3)\pi$. Therefore, $k = 1/3$ **Ans.**

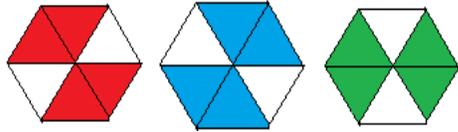

5. $f(x) = \frac{f(x+1)}{2}$
 $f(2) = 4$
 Find the value of $f(10) - f(7)$
 From the first equation:
 $f(x + 1) = 2f(x)$
 $f(3) = 2f(2) = 8$
 $f(4) = 2f(3) = 16$
 $f(5) = 2f(4) = 32$
 Anyone see what the value of $f(x)$ really is?
 $f(x) = 2^x$
 Therefore, $f(7) = 2^7 = 128$ and $f(10) = 2^{10} = 1024$
 $f(10) - f(7) = 1024 - 128 = 896$ **Ans.**

6. If n is the number of seconds in a day, find the largest prime factor of n.
 The number of seconds in the day is:
 $24 \times 60 \times 60 =$
 $(2 \times 2 \times 2 \times 3) \times (2 \times 2 \times 3 \times 5) \times$
 $(2 \times 2 \times 3 \times 5)$
 Clearly, 5 is the largest prime.
 5 **Ans.**

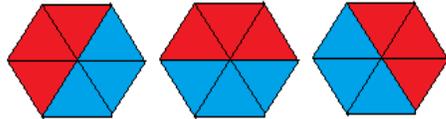

7. How many convex polygons with an even number of sides are in the figure shown?

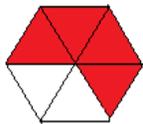

A convex polygon has all angles less than 180° . A polygon must have at least 3 sides but we are only dealing with 4 sides so let's start with polygons of size 4. The first 4-sided shape we can look at is a rhombus. There are 6 of those.

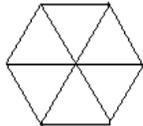

Next we have the trapezoid. There are 6 of those:

Now 6 sided polygons. We have some "irregular" shaped polygons, like this one..

But...remember that we are looking for convex polygons. It's obvious that we have an angle that is larger than 180° . This doesn't qualify. So what is left, is the original hexagon..

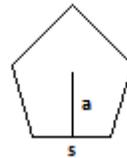

$$6 + 6 + 1 = 13 \text{ Ans.}$$

8. Stage 1 has the number 1. Obviously the sum is 1.
 Stage 2 has the numbers 2, 3 and 1, 2. The sum is 8.
 Stage 3 has the numbers, 3, 4, 5 and 2, 3, 4 and 1, 2, 3. The sum is $12 + 9 + 6 = 27$.
 Stage 4 has the numbers 4, 5, 6, 7 and 3, 4, 5, 6 and 2, 3, 4, 5 and 1, 2, 3, 4 for a sum of $22 + 18 + 14 + 10 = 64$.
 See the pattern? The sum of the numbers in a stage? If the stage is n , then the sum of the numbers is n^3 .
 The sum of the numbers for stage 7 is $7^3 = 343$. Ans.
9. The sequence 1, 3, 4, 7, 11, 18, 29 is constructed by adding the two previous terms (after the first two terms). How many of the first 100 terms of this

sequence are multiples of 5?
 So far, none. Let's go a little further but we only need to put down the one's column.
 7, 6, 3, 9, 2, 1, 3, 4, 7, 1, 8 – wait a minute. We're into repeating the ones column. We never got the value 0 or 5. Therefore, there will be 0 terms in this sequence that are multiples of 5.
 0 Ans.

10. 3 different gifts were bought for 3 children. The gifts were wrapped after their names were put on them. Find the probability that no child opens a gift labeled with his or her name. Name the gifts 1, 2, and 3. Name the kids A, B and C.
 A was meant to have 1, B was meant to have 2 and C was meant to have 3.
 If A gets present 2, then B can get 3 and C can get 1.
 If A gets present 3, then B can get 1 and C can get 2. That's 2 choices. And those same choices apply if we start with B or C. I.e.,
 A→2, B→3, C→1 and
 A→3, B→1, C→2.
 There are $3! = 6$ combinations.
 $2/6 = 1/3$ Ans.

11. The sides of 3 similar regular pentagons are in the ratio of 2:5:7. The area of the smallest pentagon is 40. Find the area of the largest pentagon.

The formula for the area of a regular pentagon is $\frac{5}{2}sa$ where s is the side of the pentagon and a is the apothem (a line drawn from the center of the pentagon to the midpoint of a side).
 Let $2x =$ the side of the smallest pentagon. Then the apothem for the pentagon is:

$$40 = \frac{5}{2}sa = \frac{5}{2} \times 2xa = 5xa$$

$$8 = xa$$

$$a = \frac{8}{x}$$

Since the ratio of the smallest to the middle pentagon is 2:5, the side of the middle pentagon is $5x$ and the apothem of the middle pentagon is:

$$\frac{8}{x} \times \frac{5}{2} = \frac{40}{2x} = \frac{20}{x}$$

Finally, the ratio of the middle to the largest pentagon is 5:7.

Therefore, the side of the largest is $7x$.

The apothem of the largest pentagon is:

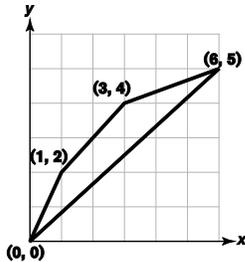

$$\frac{20}{x} \times \frac{7}{5} = \frac{28}{x}$$

The area of the largest pentagon is:

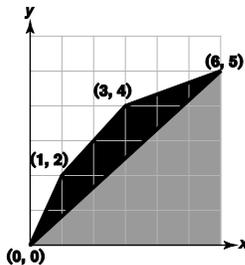

$$\frac{5}{2} \times 7x \times \frac{28}{x} = \frac{5}{2} \times 7 \times 28 = 5 \times 7 \times 14 =$$

490 **Ans.**

12. Find the area of the quadrilateral with vertices $(0,0)$, $(1,2)$, $(3,4)$ and $(6,5)$. Let's look at a graph of the quadrilateral.

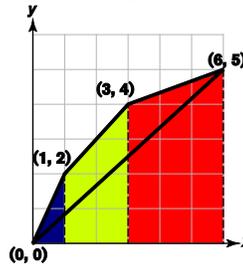

It's going to be tough to try and find the area of the quadrilateral directly, so let's consider the pentagon with vertices $(0,0)$, $(1,2)$, $(3,4)$, $(6,5)$ and $(6,0)$. As shown, the area of the quadrilateral is the area of the pentagon minus the area of the right triangle with vertices $(0,0)$, $(6,5)$ and $(6,0)$.

To determine the area of the pentagon, let's partition it into two trapezoids and a

right triangle, as shown.

Therefore, the area of the quadrilateral is $[(1/2) \times 1 \times 2] + [((2 + 4)/2) \times 2] + [((4 + 5)/2) \times 2] - [(1/2) \times 6 \times 5] = 1 + 6 + 27/2 - 15 = (14 + 27 - 30)/2 = 11/2 = 5 \frac{1}{2}$ **Ans.**

13. The integers a , b , c , d and e form an arithmetic sequence. Their sum is 440. Find the largest possible value of e . A sequence is an arithmetic sequence if the terms differ by the same value. Let x = that difference. Then
- $$b = a + x$$
- $$c = a + 2x$$
- $$d = a + 3x$$
- $$e = a + 4x$$
- $$a + b + c + d + e =$$
- $$a + a + x + a + 2x + a + 3x + a + 4x =$$
- $$5a + 10x = 440$$
- $$a + 2x = 88$$
- To find the largest value of e , a must be as small as possible. The numbers in the series are non-negative. Suppose $a = 0$.
- $$0 + 2x = 88$$
- $$2x = 88$$
- $$x = 44$$
- $$e = a + 4x = 0 + (4 \times 44) = 176$$
- Ans.**

14. "789XYZ" is a 6-digit integer consisting of six distinct digits. It is divisible by 7, 8 and 9. Find the three-digit integer "XYZ". A number that is divisible by 9 must have the sum of the digits add up to a value that is divisible by 9.
- $$7 + 8 + 9 = 24$$
- $X + Y + Z$ must be divisible by 3 but not divisible by 9, otherwise the entire number will not be divisible by 9. We have combinations of
- {1, 2, 3} (sums to 6)
- {1, 2, 9}, {1, 3, 8}, {1, 4, 7}, {1, 5, 6},

{2, 3, 7}, {2, 4, 6}, {3, 4, 5} (sums to 12)
 {3, 4, 8}, {3, 5, 7}, {4, 5, 6} (sums to 15)
 {5, 7, 9}, {6, 7, 8} (sums to 21)
 {7, 8, 9} (sums to 24)

But we can't use any groups that have a 7, 8 or 9 in them because all numbers are distinct. That takes us down to:

{1, 2, 3}
 {1, 5, 6}
 {2, 4, 6}
 {3, 4, 5}
 {4, 5, 6}

A number is divisible by 8 if its last three digits are divisible by 8. Obviously, the last digit must also be an even number.

So we can look at each of these combinations choose an even number to be the ones digit and see if the three digit number is divisible by 8.

{1, 2, 3} gives us 132 and 312. **312** is divisible by 8.

{1, 5, 6} gives us 156 and 516. Neither are divisible by 8.

{2, 4, 6} gives us 246, 264, 426, 462, 624 and 642. **264** and **624** are divisible by 8.

{3, 4, 5} gives us 354 and 534. Neither are divisible by 8.

{4, 5, 6} gives us 456, 546, 564 and 654. **564** is divisible by 8.

So we are left at looking at each of
 789,312

789,264

789,624

789,564

Only 789,264 is divisible by 7 as well.

264 **Ans.**

15. The roots of the equation

$$x^2 + 6x + k = 0$$

are in the ratio of 2:1. Find k.

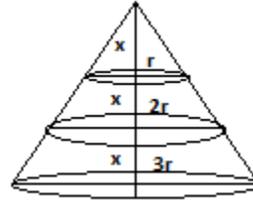

If we looked at $x^2 + 6x + 9 = 0$, the two roots are $x = 3$. No ratio of 2:1 there.

But if we looked at

$$(x + 2)(x + 4) = x^2 + 6x + 8 = 0$$

the roots are -2 and -4 which do satisfy the requirement that the roots are in the ratio of 2:1. Therefore, $k = 8$. **Ans.**

16. A cone is sliced by planes parallel to its base into 3 pieces of equal height. Find what fraction of the original volume is in the middle piece.

Let h = the height of the entire cone.

Let x = the length of the height between the top of the cone and the first plane, between the first and second planes and between the second and third planes.

Then $h = 3x$

If r = the radius of the smallest cone, then $2r$ and $3r$ are the radii of the other two cones since the sides of the cone and the planes all form similar triangles.

The volume of a cone is $\frac{1}{3}\pi r^2 h$.

The volume of the entire cone is

$$\frac{1}{3}\pi \times (3r)^2 \times 3x = 9\pi r^2 x$$

The volume of the smallest cone is

$$\frac{1}{3}\pi \times (r)^2 \times x = \frac{1}{3}\pi r^2 x$$

The volume of the middle cone is

$$\frac{1}{3}\pi \times (2r)^2 \times 2x = \frac{8}{3}\pi r^2 x$$

The volume of the middle piece is the volume of the middle cone minus the volume of the smallest cone.

$$\frac{8}{3}\pi r^2 x - \frac{1}{3}\pi r^2 x = \frac{7}{3}\pi r^2 x$$

The fraction of the original volume is

$$\frac{\frac{7}{3}\pi r^2 x}{9\pi r^2 x} = \frac{7}{9} = \frac{7}{27}$$

$\frac{7}{27}$ **Ans.**

17. A six-sided die has two red, two blue and two yellow faces. The die is rolled 3 times. Find the probability of getting each color once.

The probability of getting a particular color when the die is rolled is

$$\frac{2}{6} = \frac{1}{3}$$

The probability of getting a certain color the first time (say red), a different color (say blue) the second time and a different color again (say yellow) the third time is:

$$\frac{1}{3} \times \frac{1}{3} \times \frac{1}{3} = \frac{1}{27}$$

There are $3! = 6$ different combinations of red, blue and yellow. Therefore, the probability of getting each color once is:

$$\frac{6}{27} = \frac{2}{9} \quad \text{Ans.}$$

18. A code has to include 4 distinct digits in the range of 1 through 5. The positive difference between any two consecutive digits must be at least 2. Find how many codes can be used.

Start with 1.

1 3 5 2

1 4 2 5

1 5 2 4 – That's 3 possibilities.

Now start with 2.

2 4 1 3

2 4 1 5

2 5 1 3

2 5 1 4

2 5 3 1 – That's 5 possibilities.

Now start with 3:

3 1 4 2

3 1 5 2

3 5 1 4

3 5 2 4 – That's 4 possibilities.

Now start with 4:

4 1 3 5

4 1 5 2

4 1 5 3

4 2 5 1

4 2 5 3 – That's 5 possibilities.

And finally, start with 5

5 1 4 2

5 2 4 1

5 3 1 4 – That's 3 possibilities.

That's a total of $3 + 5 + 4 + 5 + 3 =$

20 combinations.

20 **Ans.**

19. The composition, to the nearest whole percent of a class is 43% male and 57% female. What is the minimum number of students that could be in the class?

Nearest whole percent is the operative term here.

Clearly, if we have 2 students, one male and one female, it's 50% for either.

3 students would be $\frac{1}{3}$ or $\frac{2}{3}$. That won't work.

4 students obviously won't work either nor would 5 students or 6 students.

What about 7 students?

$$\frac{3}{7} \approx 0.4285 \dots \approx 43\%$$

7 **Ans.**

20. Express $27_{10} \times 314_5$ in base 5.

I don't mind adding in a base different from 10 but multiplication is nasty. Let's convert 314_5 into base 10, perform the multiplication and then turn it back into a value in base 5.

$$314_5 = (3 \times 5^2) + (1 \times 5^1) + (4 \times 5^0) = 75 + 5 + 4 = 84$$

$$84 \times 27 = 2268$$

$$2268 = 1875 + 375 + 15 + 3 =$$

$$(625 \times 3) + (125 \times 3) + (5 \times 3) + (1 \times 3) =$$

$$(3 \times 5^4) + (3 \times 5^3) + (3 \times 5^1) +$$

$$(3 \times 5^0) = 33033_5 \quad \text{Ans.}$$

21. $x^2 + \frac{1}{x^2} = 3, x > 0$

Find the value of $x + \frac{1}{x}$

$$\left(x + \frac{1}{x}\right)^2 = x^2 + 2 + \frac{1}{x^2}$$

$$\left(x + \frac{1}{x}\right)^2 = 3 + 2 = 5$$

$$x + \frac{1}{x} = \sqrt{5} \quad \text{Ans.}$$

22. A bag contains red marbles and blue marbles. The probability that two marbles chosen are red is $\frac{1}{5}$. The probability that two marbles chosen are blue is $\frac{1}{5}$.

Determine the number of marbles in the bag.

Let x = the number of red marbles.

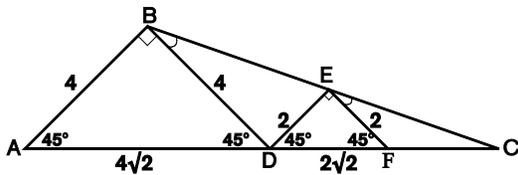

x is also the number of blue marbles.

$$\frac{x}{2x} \times \frac{x-1}{2x-1} = \frac{1}{5}$$

$$\frac{x^2 - x}{4x^2 - 2x} = \frac{1}{5}$$

$5x^2 - 5x = 4x^2 - 2x$
 $x^2 - 3x = 0$
 $x(x - 3) = 0$
 x cannot be 0 since we have to have "some" marbles here.
 $x = 3$
 $2x$ is the number of marbles or
6 Ans.

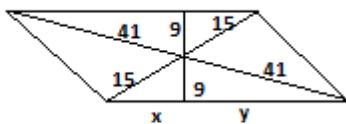

23. Triangles ABD and DEF are isosceles right triangles. A, D, F and C are collinear and B, E and C are collinear. AB = BD = 4. ED = EF = 2. Find the length of AC.

Since $\angle DBE$ is congruent to $\angle FEC$, triangles ABC and DEC are similar (AA). Therefore, $AB/DE = AC/DC \rightarrow 4/2 = (4\sqrt{2} + 2\sqrt{2}AD + FC)/(2\sqrt{2} + FC) \rightarrow 8\sqrt{2} + 4 \times FC = 8\sqrt{2} + 4\sqrt{2} + 2 \times FC \rightarrow 2 \times FC = 4\sqrt{2} \rightarrow FC = 2\sqrt{2}$ units. Thus, $AC = 4\sqrt{2} + 2\sqrt{2} + 2\sqrt{2} = 8\sqrt{2}$. **Ans.**

24. How many digits are in the integer representation of 2^{30} ?
 Looking at the powers of 2, we have
 2 4 8 16 32 64 128 256 512 1024 2048
 4096 8192 16384 32768
 The number of digits in each can be written as:
 1 1 1 2 2 2 3 3 3 etc.
 Therefore, the number of digits needed to represent 2^{30} is 10. **Ans.**

25. The diagonals of a parallelogram are 82 and 30. One altitude is 18. Find the smallest possible area of the parallelogram.

The area of a parallelogram is bh where b is the base of the parallelogram and h is

the altitude. To find the area, we need to find the base, b . Break that into two pieces, x and y , which are formed by dropping the altitude. The intersection of the diagonals also bisects the altitude.

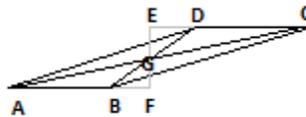

$$\begin{aligned}
 b &= x + y \\
 y^2 + 9^2 &= 41^2 \\
 y + 81 &= 1681 \\
 y^2 &= 1681 - 81 = 1600 \\
 y &= 40 \\
 x^2 + 9^2 &= 15^2 \\
 x^2 + 81 &= 225 \\
 x^2 &= 225 - 81 = 144 \\
 x &= 12 \\
 b = x + y &= 12 + 40 = 52
 \end{aligned}$$

The area of the parallelogram is:

$$bh = 52 \times 18 = 936$$

But does this give us the smallest possible area? Probably not since this is the obvious solution.

In the diagram above, the altitude was completely contained within the parallelogram. Is there a way in which the altitude is not contained within the parallelogram?

This happens when the two of the parallel lines of the parallelogram are entirely divorced from each other – i.e., move DC down and move AB up and no point of AB will touch a point of DC.

$$\begin{aligned}
 h &= EF \text{ and } EG = GF = 9 \\
 DB &= 30 \text{ and } DG = GB = 15 \\
 AC &= 82 \text{ and } AG = GC = 41
 \end{aligned}$$

$$\begin{aligned}
 \text{Let } x &= AF. \text{ Then} \\
 x^2 + 9^2 &= 41^2 \\
 x^2 + 81 &= 1681 \\
 x^2 &= 1681 - 1600 \\
 x &= 40
 \end{aligned}$$

$$\begin{aligned}
 \text{Let } y &= BF. \text{ Then} \\
 y^2 + 9^2 &= 15^2 \\
 y^2 + 81 &= 225 \\
 y^2 &= 225 - 81 = 144 \\
 y &= 12
 \end{aligned}$$

$$\begin{aligned}
 AF &= AB + BF \\
 x &= AB + y
 \end{aligned}$$

Now, instead of adding x and y , we get to subtract y from x .

$$40 = AB + 12$$

$$AB = 40 - 12 = 28$$

AB is the base so the area is

$$28 \times 18 = 504$$

504 is definitely smaller than 936.

504 **Ans.**

26. 7 prizes are to be distributed between 3 people with a guarantee that each person gets at least one prize. Find the number of ways the prizes can be distributed. Prizes can be given to the three people in the following combinations:

1, 1, 5

1, 2, 4

1, 3, 3

2, 2, 3

For 1, 1, 5 there are $\frac{7!}{5!2!} = \frac{7 \times 6}{2} = 21$ ways for the 5 gifts to be given to one particular person. To make this more understandable, assume person #3 has the 5 gifts. Then person #1 gets gift A and person #2 gets gift B (A and B are not part of the 5) or person #1 gets gift B and person #2 gets gift A. So, for one set of 5 gifts going to person #3, there are two combinations for persons #1 and #2. Therefore, for 21 combinations of the 5 gifts there are $21 \times 2 = 42$. This is just for Person #3 receiving the 5 gifts. There are 42 more for Person #1 and Person #2 receiving the 5 gifts, respectively.

$42 \times 3 = 126$
For 1, 2, 4 there are $\frac{7!}{4!3!} = \frac{7 \times 6 \times 5}{3 \times 2 \times 1} = 35$ ways to choose the 4. Again, assume that Person #3 receives the 4 gifts. Assume that Person #1 receives the single gift and Person #2 receives the two gifts.

There are $\frac{3!}{2!1!} = 3$ ways to allocate the 3 gifts between Person #1 and Person #2. If we now let Person #1 receive two gifts and Person #2 receive the single gift, that's another 3 combinations for a total of 6 combinations while Person #3 receive the 4 gifts. $35 \times 6 = 210$ combinations

when Person #3 receives the 4 gifts. Adding in combinations when Person #1 receives the 4 gifts and Person #2 receives the 4 gifts we get a total of $210 \times 3 = 630$ combinations.

For 1, 3, 3, let's have Person #3 receive the single gift. There are

$$\frac{6!}{3!3!} = \frac{6 \times 5 \times 4}{3!} = 20 \text{ ways to allocate the}$$

first group of 3 prizes, say, to Person #1.

But allocation of 3 prizes to Person #1 also allocates the other 3 prizes to Person #2. This allocation covers all combinations for both Person #1 and Person #2 (e.g., Person #3 gets present 1, Person #1 gets presents 2-4 and Person #2 gets 5-7 or Person #1 gets presents 5-7 and Person #2 gets 2-4 etc.) Therefore, we have 20 combinations per single present for Person #3 for a total of 7×20 combinations when Person #3 gets the single present. This ends up being a total of $140 \times 3 = 420$ combinations when Person #1 and person #2 get the single present.

Finally, for 2, 2, 3, there are 35 ways to allocate the group of 3 and $\frac{4!}{2!2!} = \frac{4 \times 3}{2} = 6$ ways to allocate the sets of 2 presents to the other two people.

$35 \times 6 = 210$ ways and $210 \times 3 = 630$ total combinations.

The final total of combinations is $126 + 630 + 420 + 630 = 1806$ ways **Ans.**

27. The fourth degree polynomial equation of $x^4 - 7x^3 + 4x^2 + 7x - 4 = 0$ has 4 roots, a, b, c and d. Find the value of the sum

$$\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d}$$

$x^4 - 7x^3 + 4x^2 + 7x - 4$ is of the form:

$$a_4x^4 + a_3x^3 + a_2x^2 + a_1x^1 + a_0 \text{ where}$$

$$a_4 = 1, a_3 = -7, a_2 = 4, a_1 = 7 \text{ and}$$

$$a_0 = -4$$

The quickest way to solve this is to

understand what the product of

$$(x - a) \times (x - b) \times (x - c) \times (x - d)$$

looks like.

$$(x - a) \times (x - b) \times (x - c) \times (x - d) = x^4 - x^3(a + b + c + d) +$$

$$x^2(ab + ac + ad + bc + bd + cd) - x(abc + abd + acd + bcd) + abcd$$

$$a_4 = 1$$

$$a_3 = -7 = a + b + c + d$$

Note that this is the sum of the roots.

$$a_2 = 4 = ab + ac + ad + bc + bd + cd$$

Note that this is the sum of the product of two of the roots.

$$a_1 = 7 = abc + abd + acd + bcd$$

Note that this is the sum of the product of three of the roots.

$$\text{Finally, } a_0 = -4 = abcd$$

This is the product of all 4 roots.

Now let's look at

$$\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d}$$

$$\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d} = \frac{b + a}{ab} + \frac{d + c}{cd} = \frac{bcd + acd + abd + abc}{abcd} =$$

$$\frac{abc + abd + acd + bcd}{abcd} = \frac{a_1}{a_0} = \frac{7}{-4} \text{ **Ans.**}$$

28. Find the remainder when 11^{12} is divided by 13. One way to solve this problem without a calculator is by using modular arithmetic.

Since $11 \pmod{13} = -2 \pmod{13}$, we know that $11^{12} \pmod{13} = (-2)^{12} \pmod{13}$. But $(-2)^{12} = 2^{12}$, so we just need to find the remainder when 2^{12} is divided by 13.

$2^{12} = 4096$, and $13 \times 315 = 4095$. So, the remainder is **1 Ans.**

29. $f(n) = n^2 + 1$ if n is odd

$$f(n) = \frac{n}{2} \text{ if } n \text{ is even}$$

For how many integers from 1 to 100

does $f(f(\dots f(n))) = 1$ for some number of applications of f ?

Let's start with 1.

$$f(1) = 1^2 + 1 = 1 + 1 = 2$$

$$f(f(1)) = f(2) = \frac{2}{2} = 1$$

At this point, we're going to repeat 2, 1, 2, 1, etc.

Now start with 2.

$$f(2) = \frac{2}{2} = 1$$

$$f(f(2)) = f(1) = 2$$

And again, we'll just repeat 1, 2.

Now start with 3.

$$f(3) = 3^2 + 1 = 9 + 1 = 10$$

$$f(f(3)) = f(10) = \frac{10}{2} = 5$$

$$f(f(f(3))) = f(5) = 5^2 + 1 = 26$$

$$f(f(f(f(3)))) = f(26) = \frac{26}{2} = 13$$

Continued application of the function f will only result in larger and larger values.

Therefore, 3 is not a part of this (and none of the rest of the odd values).

Now start with 4.

$$f(4) = \frac{4}{2} = 2$$

$$f(f(4)) = f(2) = \frac{2}{2} = 1$$

So 4 works. We already know that 5 will not so let's look at 6.

$$f(6) = \frac{6}{2} = 3$$

$$f(f(6)) = f(3) = 10$$

We now have enough information. For

$n=1, 2, 4$, we can have the situation where multiple applications of f will result in the value 1. Odd values starting with 3 will never result in the value of the function being 1 because the value just gets bigger and bigger. That leaves multiples of 4.

$$f(8) = \frac{8}{2} = 4$$

We already know that $f(4)$ works so 8 is also good.

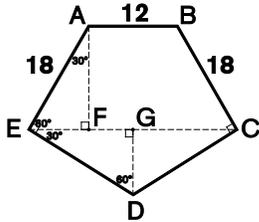

$$f(12) = \frac{12}{2} = 6$$

And now we can see that any multiple of 3 (and, of course, 4) cannot be used.

Basically, what we are down to are powers of 2. 1, 2, 4, 8, 16, 32, 64

7 Ans.

30. In pentagon ABCDE, $\angle E$ and $\angle C$ are right angles and $m\angle D = 120$, $AB=12$, $AE=BC=18$ and $FD=DC$. Find ED.
Let's start by constructing segment EC. Then we'll draw a perpendicular segment from A that intersects EC at a point we'll call F. Lastly, we'll draw another perpendicular from D that intersects EC at a point we'll call G.

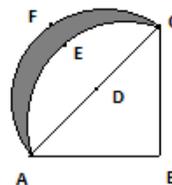

The figure shows that when these additional segments drawn, 30-60-90 right triangles AFE and DGE are created. For triangle AFE, since $AE = 18$, using the properties of 30-60-90 right triangles, we conclude that $EF = 9$. Notice that $FG = AB/2 = 12/2 = 6$, which means $EG = 9 + 6 = 15$. For 30-60-90 triangles the ratio of the hypotenuse to the longer leg is $2/\sqrt{3}$. Therefore, for triangle DGE, the hypotenuse, side ED, and the longer leg, side EG, must be in the ratio $2/\sqrt{3}$. We have $ED/EG = 2/\sqrt{3} \rightarrow ED/15 = 2/\sqrt{3} \rightarrow ED = 15 \times 2/\sqrt{3} = 30/\sqrt{3}$. Rationalizing the denominator, we get $30/\sqrt{3} \times \sqrt{3}/\sqrt{3} = 30\sqrt{3}/3 = 10\sqrt{3}$. **Ans.**

Target Round

1. A birthday present costs \$94.94. Sales tax is 5.5%. Find the cost of the present before the tax was applied.
Let x = the cost of the present before tax is applied.
Then \$94.94 is 1.055 times the cost of the present or $1.055x$.
 $94.94 = 1.055x$
 $x = \frac{94.94}{1.055}$
 $x = \$88.99$ **Ans.**

2. The sides of the scales balance. Each shape has a weight from 1 to 10 pounds. All 7 shapes total 32 pounds. Find the weight of the rectangle given that the weight of the rhombus minus two pounds equals the weight of the rectangle plus the weight of the circle.
Let c = the weight of the circle.
Let t = the weight of the triangle.
Let r = the weight of the rectangle.
Let h = the weight of the rhombus.
 $3c + h + r + 2t = 32$
 $h = r + c + 2$
Since the scale balances:
 $r + c$ balances $2t$
 $r + c = 2t$
 $2c + h$ balances $r + c + 2t$
 $2c + h = r + c + 2t =$
 $r + c + r + c = 2r + 2c$
 $2c + h = 2r + 2c$
 $h = 2r = r + c + 2$
 $r = c + 2$
 $c = r - 2$
Going back to the equation representing the sum of all the weights:
 $3c + 2r + r + r + c = 32$
 $4c + 4r = 32$
 $c + r = 8$
 $r - 2 + r = 8$
 $2r - 2 = 8$
 $2r = 10$
 $r = 5$ **Ans.**

3. Arc AFC is drawn on isosceles right triangle ABC. The arc is drawn with center D which is the midpoint of AC. The length of AB is 90 feet. Find the area of the shaded region.

Given that AB is 90, so is BC since the triangle is an isosceles right triangle. Therefore, the length of AC is $\sqrt{90^2 + 90^2} = 90\sqrt{2}$. D is the midpoint of AC.

$AD = DC = 45\sqrt{2}$ which is the radius of the circle at point D.

Now let's find some areas.

The area of the quarter-circle with center B and arc AEC is:

$$\frac{\pi r^2}{4} = \frac{\pi \times 90^2}{4} = \frac{8100\pi}{4} = 2025\pi$$

The area of triangle ABC is

$$\frac{1}{2} \times 90 \times 90 = 45 \times 90 = 4050$$

Finally, the area of the half circle with center D and arc AFC is

$$\frac{1}{2} \pi r^2 = \frac{1}{2} \pi (45\sqrt{2})^2 = \frac{4050\pi}{2} = 2025\pi$$

The area of the shaded region is:

$$2025\pi - (2025\pi - 4050) = 4050 \text{ **Ans.**}$$

4. The sum of seven positive integers is 42.

The mean, median and mode are consecutive integers. Find the largest possible integer in the list.

That the sum of the seven integers is 42 tells us that $\frac{42}{7} = 6$ is the mean.

Start by assuming that the mean is the smallest value. Then we can have the median at 7 and the mode at 8 or the mode at 7 and the median at 8.

If the mode is 8 and the median is 7, then 1, 2, 3, 7, 8, 8, x would be the situation with the largest x for that scenario.

$$1 + 2 + 3 + 7 + 8 + 8 = 29$$

$$29 + x = 42$$

$$x = 13$$

In the next scenario with the mode at 7 we would have:

$$1 + 7 + 7 + 8 + 9 + 10 + x$$

$$1 + 7 + 7 + 8 + 9 + 10 = 42$$

We're at an impasse – this can't work.

So far, the largest value is 13.

Now, assume that the mean (6) is in the middle. Then the mode could be 5 and the median 7 or the median could be 7 and the mode 5.

Starting with a mode of 5, we would have:

$$1, 5, 5, 7, 8, 9, x$$

$$1 + 5 + 5 + 7 + 8 + 9 = 35 + x$$

$x = 7$ and that breaks the requirements.

If the median is 5, then we have

$$1, 2, 3, 5, 7, 7, x$$

$$1 + 2 + 3 + 5 + 7 + 7 = 25$$

$$25 + x = 42$$

$$x = 17$$

So far, this is the best value.

Finally the last scenario is that the mean is the largest value. Then we have a mode of 4 and median of 5 or a mode of 5 and median of 4.

Starting with the mode of 4,

$$1, 4, 4, 5, 6, 7, x$$

$$1 + 4 + 4 + 5 + 6 + 7 = 27$$

$$27 + x = 42$$

$$x = 15$$

That's smaller than 17.

Finally we have:

$$1, 2, 3, 4, 5, 5, x$$

$$1 + 2 + 3 + 4 + 5 + 5 = 20$$

$$20 + x = 42$$

$$42 - 20 = 22$$

And that's the best choice!

22 Ans.

5. A grid contains all of the integers 1 through 100 in ten rows of ten numbers.

1 through 10 are on the top row, 11 through 20 are in the second row, etc.

A token placed on the board can be moved to the right, up, left, down, up and right, up and left, down and left or down and right. The token is placed on 27.

The first move made is down 1 and to the right 1.

Down 1 moves the token to 37 and to the right 1 moves it to 38.

The second move is up 1. That moves the token up to 28.

The third move is left 1. That moves the token to 27.

The fourth move is right 1. That moves the token to 28.

The fifth move is up one and to the left 1.

Up 1 moves the token to 18. Left one moves the token to 17.

The sixth move is down 1 and left 1.

Down 1 moves the token to 27. Left 1 moves the token to 26.

The seventh move is down 1 and left 1.

Down 1 moves the token to 36. Left 1

moves the token to 35.
 The eighth move is right 1.
 Right 1 moves the token to 36.
 The ninth move is up 1 and left 1.
 Up 1 moves the token to 26. Left 1 moves the token to 25.
 The tenth move is down 1 and left 1.
 Down 1 is 35. Left 1 is 34.
 The eleventh move is down 1.
 This moves the token to 44.
 The twelfth move is up 1 and right 1.
 Up 1 moves the token to 34.
 Right 1 moves the token to 35.
 The thirteenth move is down 1 left 1.
 Down 1 moves the token to 45.
 Left 1 moves the token to 44.
 The fourteenth move is down 1 right 1.
 Down 1 moves the token to 54.
 Right 1 moves the token to 55.
 The fifteenth move is up 1.
 Up 1 moves the token to 45.
45 Ans.

6. Mandy shoots free throws with the probability of $p < 1/2$. The probability of her shooting six free throws and making exactly half of them is $4^4/5^5$. Find the value of p .

The probability of making a free throw is p .
 The probability of missing the free throw is $1 - p$.

There are $\frac{6!}{3!3!} = \frac{6 \times 5 \times 4}{3 \times 2 \times 1} = 20$ combinations where she makes exactly half of the six free throws. The probability of making 3 free throws out of six is:

$$p^3 \times (1 - p)^3 \times 20$$

Now that just looks ugly. Let's go at this a different way – in particular, backwards.

We know that $\frac{4^4}{5^5}$ is the probability of making 3 out of 6 free throws. That's actually all 20 scenarios. So the probability of making 3 out of 6 free throws using a specific scenario (like getting the first 3 free throws and missing the last 3) is

$$\frac{4^4}{5^5} = \frac{4^4}{5^5 \times 4 \times 5} = \frac{4^3}{5^6}$$

$$4^3 = \frac{1}{5} \times \frac{1}{5} \times \frac{1}{5} \times \frac{4}{5} \times \frac{4}{5} \times \frac{4}{5}$$

So either p is $1/5$ or p is $4/5$. But we are told that $p < 1/2$, so p must be $1/5$ **Ans.**

7. An ant takes four steps each 1 unit in length from the origin. Each step is either forward or backward, right or left. Find the probability that the ant's fourth step places the ant back at the origin. Let's list the ways the ant can get back to the origin.

First by returning to the origin after 2 steps.

- right, left, right, left
- left, right, left, right
- forward, backward, forward, backward
- backward, forward, backward, forward
- right, left, up, down
- right, left, down, up
- right, left, left, right
- left, right, up, down
- left, right, down, up
- left, right, right, left

and similarly for forward and backward. That's 16 movements.

The ant can also go around a one unit square.

- right, backward, left, forward
 - right, forward, left, backward
 - forward, right, backward, left
 - forward, left, backward, right
- and similarly for left and backward.

That's a total of 8 ways. Add that to the 16 we listed before and that's 24 ways.

The ant can go halfway around the square and then come back.

- right, backward, forward, left
 - right, forward, backward, left
- etc. for another 8 ways for a total of 32 ways.

The ant can go 2 steps in one direction and then come back the same way, e.g.,

- left, left, right, right etc. for a total of 36 more.

$$32 + 4 = 36$$

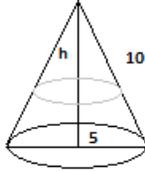

In moving each step, the ant has a $\frac{1}{4}$ probability that he moves in a certain direction. This means that choosing 4

specific movements is

$$\frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} = \frac{1}{256}$$

$$\frac{36}{256} = \frac{9}{64} \quad \text{Ans.}$$

8. The cone has a base radius of 5 and a slant height of 10. The top cone will be removed so that the volume of the remaining frustum is $\frac{1}{3}$ of the original cone. Find the total surface area of the frustum.

First find the volume of the full cone. This means that we need to know the height of the cone.

$$r = 5$$

$$h^2 + r^2 = h^2 + 5^2 = 10^2$$

$$h^2 + 25 = 100$$

$$h^2 = 75$$

$$h = \sqrt{75} = 5\sqrt{3}$$

Let h_1 = the height of the top cone.

Let h_2 = the height of the frustum.

$$h = h_1 + h_2$$

Let s = the slant height of the whole cone.

Let s_1 = the slant height of the top cone.

Let s_2 = the slant height of the frustum.

$$s = s_1 + s_2$$

Let r_1 = the radius of the top cone.

The volume of the entire cone is

$$\frac{1}{3}\pi r^2 h = \frac{1}{3}\pi(5)^2 \times 5\sqrt{3} = \frac{125}{3}\sqrt{3}\pi$$

If the volume of the frustum is $\frac{1}{3}$ the volume of the entire cone, the volume of the smaller cone (the top part that is removed) is $\frac{2}{3}$ of the entire volume of the cone. The triangle formed by the sides h , r and s is similar to the triangle formed by side h_1 , r_1 and s_1 . The volume of the top cone is

$$\frac{1}{3}\pi(r_1)^2 h_1 = \frac{2}{3}\left(\frac{1}{3}\pi r^2 h\right) = \frac{2}{9}\pi r^2 h$$

$$\pi(r_1)^2 h_1 = \frac{2}{3}\pi r^2 h$$

$$(r_1)^2 h_1 = \frac{2}{3}r^2 h$$

Since the triangles are similar the smaller triangle is proportionally smaller than the larger triangle.

Let x = the proportion.

$$h_1 = xh$$

$$r_1 = xr$$

$$(r_1)^2 h_1 = (xr)^2 xh = x^3 r^2 h = \frac{2}{3}r^2 h$$

$$x^3 = \frac{2}{3}$$

$$x = \sqrt[3]{\frac{2}{3}} \approx 0.87358$$

$$s_2 = s - s_1 = s - xs = (1 - x)s$$

$$s_2 = (1 - 0.87358)s = (0.12642) \times 10$$

$$s_2 = 1.2642$$

$$h_2 = h - h_1 = h - hx = (1 - x)s$$

$$h_2 = (0.12642) \times 5\sqrt{3} \approx 1.094829$$

$$r_1 = xr = 0.87358 \times 5 \approx 4.3679$$

The surface area of a frustum is

$$\pi[s_2(r + r_1) + r^2 + r_1^2] =$$

$$\pi[1.2642(5 + 4.3679) + 5^2 + (4.3679)^2]$$

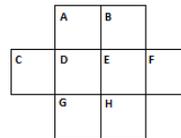

$$= \pi[1.2642(9.3679) + 25 + 19.07855] =$$

$$\pi[11.84289 + 44.07855] =$$

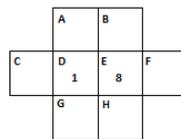

$$55.92145\pi \approx 175.6822 \approx 176$$

Team Round

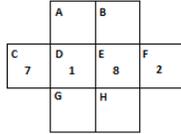

1. The numerals 1 to 8 are arranged so that no two consecutive integers touch at a side or on a corner. Find the product of the numbers in boxes C and F.

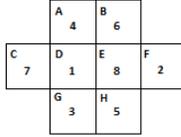

Boxes D and E have the most adjacent boxes. Therefore, they should have the numbers that have the least adjacent values. That would be 1 and 8.

Boxes C and F should be as far away from the values in Boxes D and E as possible. That would be 7 and 2.

And that would leave 4 and 6 for Boxes A and B and 3 and 5 for Boxes G and H.

We could also switch the values in A and B with those in G and H. In any event the values in boxes C and F are $7 \times 2 = 14$
Ans.

2. The chart was generated using the equation

$$y = ax^2 + bx + c$$

Find the value of a.

| x | y |
|-----|-----|
| -5 | 8 |
| -3 | 5 |
| -1 | 4 |
| 1 | 5 |
| 3 | 8 |

Let's start by using the first set of values of x and y in the equation.

$$8 = a(-5)^2 + (b \times -5) + c$$

$$8 = 25a - 5b + c \text{ (Eq. 1)}$$

Now do the same with the second set of values.

$$5 = a(-3)^2 + (b \times -3) + c$$

$$5 = 9a - 3b + c \text{ (Eq. 2)}$$

Now do the same with the third set of values.

$$4 = a(-1)^2 + (b \times -1) + c$$

$$4 = a - b + c \text{ (Eq. 3)}$$

Subtract the second equation from the first:

$$3 = 16a - 2b \text{ (Eq. 4)}$$

Subtract the third equation from the second.

$$1 = 8a - 2b \text{ (Eq. 5)}$$

Subtract the fifth equation from the fourth equation.

$$2 = 8a$$

$$a = \frac{2}{8} = \frac{1}{4} \text{ **Ans.**}$$

3. $f(x) = x + 2$

$$g(x) = x^2$$

For what value of x does

$$f(g(x)) = g(f(x))?$$

$$f(g(x)) = f(x^2) = x^2 + 2$$

$$g(f(x)) = g(x + 2) = (x + 2)^2$$

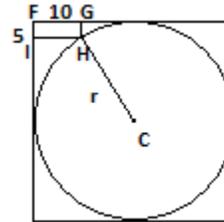

$$x^2 + 2 = (x + 2)^2 = x^2 + 4x + 4$$

$$2 = 4x + 4$$

$$4x = -2$$

$$x = -\frac{2}{4} = -\frac{1}{2} \text{ **Ans.**}$$

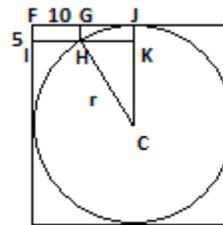

4. The side lengths of the small rectangle are 5 and 10. The lower right vertex of the rectangle is on the circle. Find the radius of the circle.

Let's start by naming the center of the circle, C. The rectangle is FGHI and H is the point where the rectangle touches the circle. Then $CH = r$, the radius.

$$FI = GH = 5$$

$$FG = IH = 10.$$

Draw another radius of point C to the midpoint of the top of the square, at point J. Extend rectangle FGHI to make the larger rectangle FJKI. GJKH is also a rectangle.

$$JK = GH = FI = 5$$

$$HK = IK - IH$$

$$IK \text{ is also the radius so}$$

$$HK = r - 10$$

$$KC = JC - JK = r - 5$$

$$r^2 = (r - 10)^2 + (r - 5)^2$$

$$r^2 = r^2 - 20r + 100 + r^2 - 10r + 25$$

$$r^2 = 2r^2 - 30r + 125$$

$$r^2 - 30r + 125 = 0$$

$(r - 25)(r - 5) = 0$
 $r = 25$ or $r = 5$
 r can't be 5 since $FI = 5$ and $FI < JC$.
25 Ans.

5. How many positive 3-digit integers are palindromes and multiples of 11? Let's look at the multiples of 11 between 100 and 200.
 110, 121, 132, 143, 154, 165, 176, 187, 198
 Only 121. Any other 3-digit integers that are multiples of 11 (and palindromes) will be such that if abc is the 3-digit integer, $a = c$, and $a + c = b$
 That would be 242, 363, 484.
 Once we get to 500 that won't work. Now the requirement is that $a = c$ and $b = a + c - 11$
 $5 + 5 = 10$ so we can't subtract 11 from it. But continuing on:
 616, 737, 858, 979
 $1 + 3 + 4 = 8$ **Ans.**

6. When traffic is heavy you can average 30 mi/hour to arrive on time. If it is light, you can average 55 mi/hour and arrive 1 hour and 15 minutes early. Find the distance to the football stadium.
 Let's say that it takes x hours at 30 miles an hour to get to the stadium. That's a total of $30x$ miles. At 55 mi/hour it takes 1 hour and 15 minutes less than x hours or $x - 1\frac{1}{4}$

$$30x = 55\left(x - \frac{5}{4}\right)$$

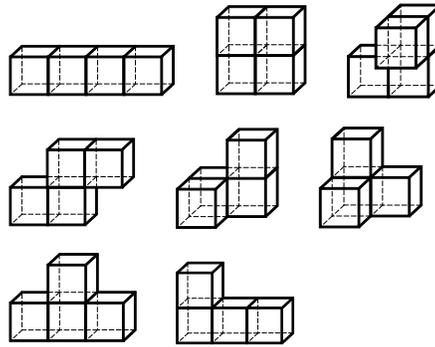

$$30x = 55x - \frac{5 \times 55}{4}$$

$$25x = 55x - \frac{5 \times 55}{4}$$

$$25x = \frac{5 \times 55}{4}$$

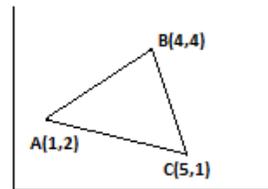

$$x = \frac{5 \times 55}{25 \times 4} = \frac{11}{4} = 2\frac{3}{4} \text{ hr}$$
 Therefore the distance is:
 $30 \times 2.75 = 82.5$ **Ans.**

7. Four 1 cm cubes are joined face to face in all ways to form geometric solids. How many solids are possible?

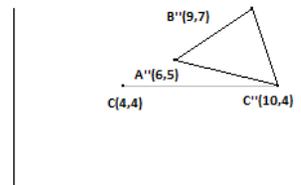

As shown, 8 geometric solids can be formed. **8 Ans.**

8. Triangle ABC has vertices $A(1,2)$, $B(4,4)$ and $C(5,1)$. It is translated horizontally to the right 5 units, then vertically up 3 units. Finally the triangle is rotated 90° around $(4, 4)$. Find the coordinates of image C.

Translate 5 units to the right. This means adding 5 to the x -coordinate. We have three new points:
 $A'(6,2)$, $B'(9,4)$, $C'(10,1)$
 Now translate 3 units up. This means adding 3 to the y -coordinate. We have three new points:
 $A''(6,5)$, $B''(9,7)$, $C''(10,4)$
 We are asked to rotate the triangle $A''B''C''$ 90° clockwise around $(4,4)$ and find the coordinates of the new point C. We need only rotate point C.

To do the rotation, note that C'' is directly to the right of C. If you imagine that C is the center of a clock then C'' can

be considered as 3:00. We need to find the coordinates of 6:00 (since we're moving the pointer clockwise). Point C' is 6 units to the right of point C. To make the new point "seem" like 6:00 it must be on a line 6 units directly below point C. That point is (4, -2). **Ans.**

9. a and b are positive integers.

$$\frac{1}{2} + \frac{1}{a} = \frac{1}{3} + \frac{1}{b}$$

Find the sum of all possible values of a .

$$\frac{1}{b} - \frac{1}{a} = \frac{1}{2} - \frac{1}{3} = \frac{3}{6} - \frac{2}{6} = \frac{1}{6}$$

Clearly, $b = 2$ and $a = 3$ is one solution.

Let's look at b .

$$1 - \frac{1}{a} = \frac{1}{6} \rightarrow \frac{6}{6} - \frac{1}{6} = \frac{5}{6}$$

Thus, $a = 6/5$ which is not an integer.

Now let's look at $b = 3$.

$$\frac{1}{3} - \frac{1}{a} = \frac{1}{6} \rightarrow \frac{1}{3} - \frac{1}{6} = \frac{1}{6}$$

So a can also be 6. So far, the sum is $3 + 6 = 9$

Now let's look at $b = 4$.

$$\frac{1}{4} - \frac{1}{a} = \frac{1}{6} \rightarrow \frac{6}{24} - \frac{1}{24} = \frac{5}{24} \rightarrow \frac{1}{4} - \frac{1}{12} = \frac{1}{6}$$

So a can be 12. The sum is now

$$9 + 12 = 21.$$

Now let's look at $b = 5$.

$$\frac{1}{5} - \frac{1}{a} = \frac{1}{6} \rightarrow \frac{6}{30} - \frac{1}{30} = \frac{5}{30} \rightarrow \frac{1}{5} - \frac{1}{30} = \frac{1}{6}$$

So a can be 30. The sum is now

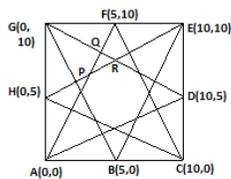

$$21 + 30 = 51.$$

Now let's look at $b = 6$.

Oops, that's $\frac{1}{6}$,

We are done. 51. **Ans.**

10. In square ABCD, each vertex is connected to the midpoints of its two opposite sides. Find $\frac{QR}{PQ}$.

Let s = the side of the square. Then if we were to graph the square, it would have the coordinates as displayed in the

diagram – if you used $s = 10$.

First, let's find the equation for the line APQF.

$$y = mx + b \text{ using point A}$$

$$0 = (m \times 0) + b$$

$$b = 0$$

Using point F:

$$10 = 5m$$

$$m = \frac{10}{5} = 2$$

Therefore, the equation for line APQF is

$$y = 2x$$

Now the equation for line DRQG:

Using point D:

$$5 = 10m + b$$

Using point G:

$$10 = 0m + b$$

$$b = 10$$

$$5 = 10m + 10$$

$$10m = -5$$

$$m = -\frac{5}{10} = -\frac{1}{2}$$

The equation for DRQG:

$$y = -\frac{1}{2}x + 10$$

Finally, the equation for the line HPRE:

Using point H:

$$5 = (m \times 0) + b$$

$$b = 5$$

Using point E:

$$10 = (m \times 10) + 5$$

$$5 = 10m$$

$$m = \frac{5}{10} = \frac{1}{2}$$

The equation for line HPRE is

$$y = \frac{1}{2}x + 5$$

We can find the coordinates of P if we find the intersection of lines HPRE and APQF.

$$y = \frac{1}{2}x + 5$$

$$y = 2x$$

$$2x = \frac{1}{2}x + 5$$

$$2x - \frac{1}{2}x = 5$$

$$\frac{3}{2}x = 5$$

$$x = \frac{10}{3}$$

$$y = 2x = 2 \times \frac{10}{3} = \frac{20}{3}$$

So, point P is $(\frac{10}{3}, \frac{20}{3})$

Now for point Q. That is at the intersection of lines APQF and DRQG.

$$y = -\frac{1}{2}x + 10$$

$$y = 2x$$

$$2x = -\frac{1}{2}x + 10$$

$$2x + \frac{1}{2}x = 10$$

$$\frac{5}{2}x = 10$$

$$x = \frac{20}{5} = 4$$

$$y = 2x = 2 \times 4 = 8$$

The coordinates of point Q are (4,8)

Finally, point R is at the intersection of lines HPRE and DRQG.

$$y = -\frac{1}{2}x + 10$$

$$y = \frac{1}{2}x + 5$$

$$-\frac{1}{2}x + 10 = \frac{1}{2}x + 5$$

$$x = 5$$

$$y = \left(\frac{1}{2} \times 5\right) + 5 = \frac{15}{2}$$

The coordinates of point R are $(5, \frac{15}{2})$.

Now that we have the coordinates, we can get the lengths of PQ and QR.

$$PQ = \sqrt{\left(4 - \frac{10}{3}\right)^2 + \left(8 - \frac{20}{3}\right)^2} =$$

$$\sqrt{\left(\frac{12 - 10}{3}\right)^2 + \left(\frac{24 - 20}{3}\right)^2} =$$

$$\sqrt{\left(\frac{2}{3}\right)^2 + \left(\frac{4}{3}\right)^2} =$$

$$\sqrt{\frac{4}{9} + \frac{16}{9}} = \sqrt{\frac{20}{9}} = \frac{1}{3}\sqrt{20} = \frac{2}{3}\sqrt{5}$$

$$QR = \sqrt{(5 - 4)^2 + \left(\frac{15}{2} - 8\right)^2} =$$

$$\sqrt{(1)^2 + \left(\frac{15 - 16}{2}\right)^2} =$$

$$\sqrt{1 + \left(-\frac{1}{2}\right)^2} + \sqrt{1 + \frac{1}{4}} = \sqrt{\frac{5}{4}} = \frac{1}{2}\sqrt{5}$$

Finally:

$$\frac{QR}{PQ} = \frac{\frac{1}{2}\sqrt{5}}{\frac{2}{3}\sqrt{5}} = \frac{1}{2} \times \frac{3}{2} = \frac{3}{4} \text{ **Ans.**}$$

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

State _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What is the mean of the 10,000 integers from 1 to 10,000, inclusive? Express your answer as a decimal to the nearest tenth.
2. _____ % What percent of the integers from 3 to 12, inclusive, are neither primes nor multiples of 4?
3. _____ years On the next full moon, Bob will celebrate being alive for 100 full moons. On average, the cycle of the moon has lasted 29.53 days since he was born. In years, how old will Bob be on his 100-moons birthday? Express your answer to the nearest whole number.
4. \$ _____ Samantha bought 6 total pounds of red and green candies to share with her friends. The red candies cost \$1.00 per pound and the green candies cost \$1.25 per pound. She bought twice as many pounds of red candies as green candies. How much did Samantha pay for the 6 pounds of candies?
- 
5. _____ The sum of nine consecutive integers is 216. What is the smallest of the nine integers?
6. (_____ , _____) A kite is a quadrilateral in which two pairs of adjacent sides are congruent. Points A(-2, 1), B(1, 5), C(4, 1) and D(x, y) are vertices of a convex kite with an area of 18 units². If x and y are integers, what are the coordinates of point D? Express your answer as an ordered pair.

7. _____ What is the smallest value of x such that $3(x - 21) > 8$ and x is a multiple of 7?

8. _____ cm Two squares, with integer side lengths a and b , are arranged so that one entire side of the smaller square overlaps a part of a side of the larger square, and the two squares share a vertex, as shown. The perimeter of the entire figure is 86 cm, and the sum of the areas of the two squares is 386 cm^2 . In centimeters, what is the value of $a + b$?

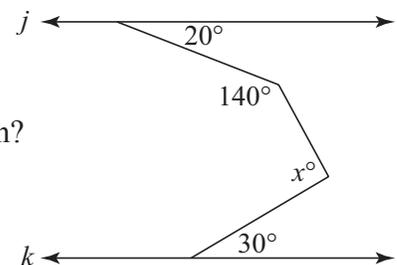

9. _____ The mean of 10, 4, 1, x and 1 is equal to the median. What is the smallest possible value of x ?

10. _____ cm Lothario wants to cut out five circles, each 2 cm in diameter, from a rectangular piece of cardboard that is 6 cm long. What must be the minimum width of the rectangular cardboard? Express your answer in simplest radical form.

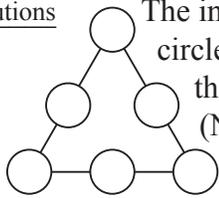

11. _____ If $j \parallel k$, what is the value of x , in the figure shown?

12. _____ What is the value of $\frac{2013^3 - 2 \cdot 2013^2 \cdot 2014 + 3 \cdot 2013 \cdot 2014^2 - 2014^3 + 1}{2013 \cdot 2014}$?

13. _____ solutions

The integers 1 through 6 are to be used, each exactly once to fill the six circles in the figure so that the sums of three integers along each side of the triangle are the same. How many different solutions are possible? (Note that two solutions are considered the same if one can be rotated or reflected to obtain the other.)

14. _____ pairs

How many pairs of consecutive, positive three-digit multiples of 9 contain the same three digits?

15. _____

| | | | |
|---|---|---|---|
| 7 | 5 | 3 | 1 |
| 5 | 5 | 3 | 1 |
| 3 | 3 | 3 | 1 |
| 1 | 1 | 1 | 1 |

A square dartboard is divided into 16 congruent regions, with a point value assigned to each region as shown. Assuming each dart thrown hits the dartboard in a region, what is the probability that the sum of the points earned from three randomly thrown darts will be greater than 15? Express your answer as a common fraction.

16. _____ m²

A right triangle has a hypotenuse of 10 m and a perimeter of 22 m. In square meters, what is the area of the triangle?

17. _____

For the following system of equations, what is the value of c ?

$$a + b + c + d = 88$$

$$a + b + c + e = 84$$

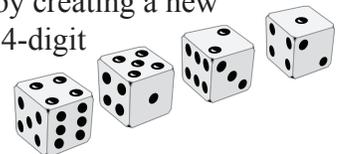

$$a + b + d + e = 82$$

$$a + c + d + e = 78$$

$$b + c + d + e = 72$$

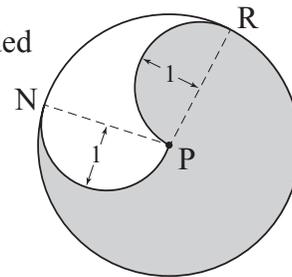

18. _____

Alexi rolled four standard dice and lined them up to create a 4-digit number. He removed two dice from the line and rolled them again. Alexi then returned each re-rolled die to its original position in the line, thereby creating a new 4-digit number. What is the probability that the new 4-digit number is greater than the original 4-digit number? Express your answer as a common fraction.

19. _____

In circle P with radius 2 units, $m\angle NPR = 100^\circ$. If the shaded region has area $k\pi$ units², what is the value of k ? Express your answer as a common fraction.

20. _____

For integers a, b, c and d , $(x^2 + ax + b)(x^2 + cx + d) = x^4 + x^3 - 2x^2 + 17x - 5$. What is the value of $a + b + c + d$?

21. _____

Two random integers, a and b , are independently chosen, with replacement, from 1 to 1000, inclusive. What is the probability that both $2^a + 2^b$ and $3^a + 3^b$ are multiples of 5? Express your answer as a common fraction.

22. _____

What is the smallest integer greater than 38 that cannot be the length of the hypotenuse of a right triangle with integer side lengths?

23. _____

base 10

In base b , 441_b is equal to n^2 in base 10, and 351_b is equal to $(n - 2)^2$ in base 10. What is the value of b , expressed in base 10?

24. _____

Larry tells Mary and Jerry that he is thinking of two consecutive integers from 1 to 10. He tells Mary one of the numbers, and he tells Jerry the other number. Then the following conversation occurs between Mary and Jerry:

Mary: I don't know your number.

Jerry: I don't know your number, either.

Mary: Ah, now I know your number.

Assuming both Mary and Jerry used correct logic, what is the sum of the possible numbers Mary could have?

25. _____ If the 4014th term of a geometric sequence of non-negative numbers is 135, and the 14th term is 375, what is the 2014th term?
26. \$ _____ A certain car drives 40 mi per gallon of gas at a rate of 60 mi/h. The same car drives 35 mi per gallon of gas at a rate of 75 mi/h. Thus, traveling at the higher speed saves time, but uses more gas. Gasoline costs \$3.50 per gallon. What is the expense for each hour of time saved when traveling at the higher speed?
27. _____ An unfair coin has the property that when flipped four times, the probability of it landing twice heads up and twice tails up (in any order) is the same as the probability of it landing three times heads up and once tails up (in any order). What is the probability of this coin landing heads up in one flip? Express your answer as a common fraction.
28. _____ If $f(x) = \frac{ax+b}{cx+d}$, $abcd \neq 0$ and $f(f(x)) = x$ for all x in the domain of f , what is the value of $a + d$?
29. _____ pages Sam and Delilah are reading different books. Today, Sam and Delilah read one chapter in their respective books, and they each read more than one page. Interestingly, they read the same number of pages, but the sum of the page numbers for the chapter Sam read was 880, and the sum of the page numbers for the chapter Delilah read was 1008. How many pages did Sam read today?
30. _____ The area of the largest equilateral triangle that can be inscribed in a square of side length 1 unit can be expressed in the form $a\sqrt{b} - c$ units², where a , b and c are integers. What is the value of $a + b + c$?

1. _____ If $f(x) = ax^2 + bx + c$, $f(1) = 0$, $f(2) = 1$ and $f(3) = 8$, what is the value of c ?

2. \$ _____ Ezra spent \$60 on gas each week for a period of three weeks. The first week gas was \$3 per gallon, the second week it was \$4 per gallon, and the third week it was \$5 per gallon. What was the average amount Ezra paid per gallon of gas over this three-week period? Express your answer as a decimal to the nearest hundredth.

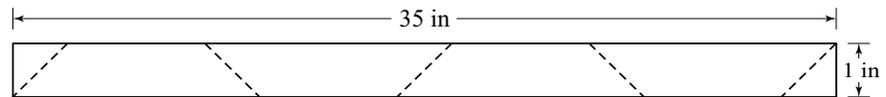

3. _____ A two-digit, positive integer, b , is formed by reversing the digits of another two-digit, positive integer, a . If both $a + b$ and $a - b$ are perfect squares, what is the value of a ?

4. _____ travelers At a New York airport 135 international travelers were polled to see what language or languages each spoke. Of those polled, 87 spoke English; 86 spoke Spanish; 39 spoke French; 31 spoke English and Spanish, but not French; and 19 spoke English and French, but not Spanish. Only one person polled spoke Spanish and French but not English. If everyone spoke at least one of these three languages, how many travelers spoke all three languages?

5. _____ in² A 1-inch by 35-inch piece of wood was divided into six pieces by making five 45° cuts, as shown. The four trapezoidal pieces were kept, and the two triangular pieces were discarded. All four trapezoidal pieces were then used to form a rectangular picture frame. A picture measuring $17\frac{1}{2}$ inches by 20 inches was reduced proportionally so it could fit in the interior of the frame. If the cuts were made so that the re-sized picture fit exactly within the frame, what was the area of the interior of the frame?

6. _____ What is the sum of all real values of x that are solutions to the equation $\left(\frac{2}{3}x^2 - x - \frac{2}{3}\right)^{(x^2 - 9x + 20)} = 1$? Express your answer as a common fraction.

7. _____ If 1% of the planets in the universe contain water, and astronomers develop a test that is 95% accurate for determining whether or not a planet contains water, then what is the probability that a planet identified by the test as containing water really does contain water? Express your answer as a common fraction.

8. _____ in A circle passes through two diagonally opposite vertices of a 3-inch by 4-inch rectangle. What is the least possible distance between the center of the circle and a vertex of the rectangle? Express your answer as a common fraction.

1. _____ boxes

The figure shows some identical boxes in a room stacked flush against a wall and each other. How many boxes, including those not visible, are in this arrangement?

2. \$ _____

At a health food store, income from trail mix is \$4.95 per pound. The expense, in dollars, of preparing n pounds of the trail mix is represented by $-0.005n^2 + 5n + 620$. If the store prepares and sells 600 pounds of trail mix, after expenses, what is the total profit?

3. _____

The prime factorization of 1995, which is $3 \times 5 \times 7 \times 19$, uses each odd digit exactly once and 1995 is the smallest positive integer with this property. What is the next smallest?

4. _____

A sequence is defined by $a_1 = 0$, $a_2 = 4$ and $a_n = 4(a_{n-1} - a_{n-2})$ for $n > 2$. What is the greatest value of n such that $n < 100$ and a_n is a power of 2?

5. _____

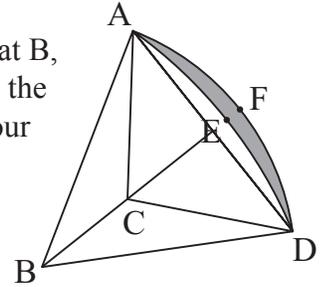

If three standard six-sided dice are rolled, what is the probability that the sum of the numbers on the top faces is 17 or 18? Express your answer as a common fraction.

6. _____ units²

What is the area of the region defined by $|x| + |y| \leq 4$?

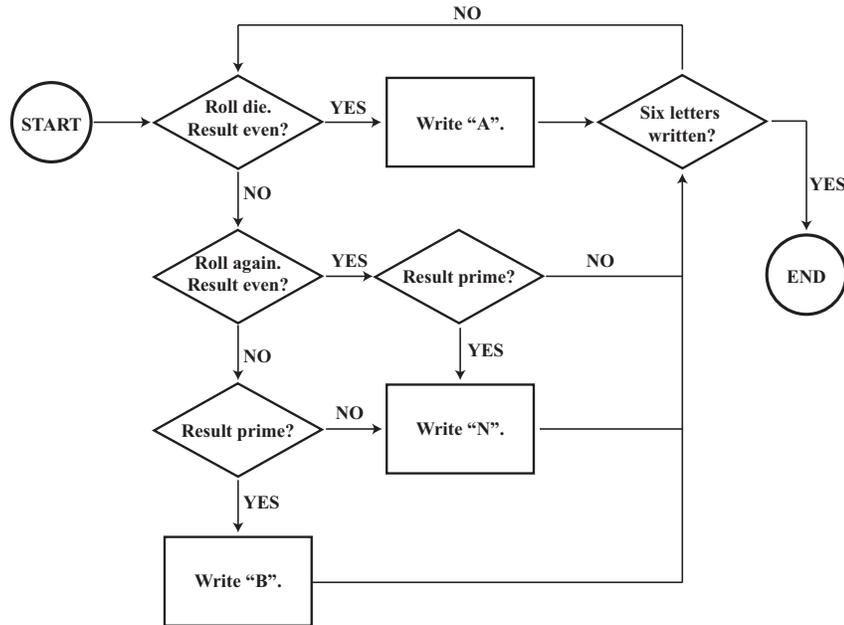

7. _____ in²

In the figure, \widehat{AFD} has its center at C, \widehat{AED} has its center at B, $AD = DB = 20$ inches and $m\angle ACD = 2(m\angle ABD)$. What is the area of the shaded region between the two arcs? Express your answer to the nearest whole number.

8. _____

Using a standard six-sided die and the directions shown, a string of six letters is written in order. What is the probability that once 'END' is reached, the six letters that have been written are B, A, N, A, N and A, in that order? Express your answer as a common fraction.

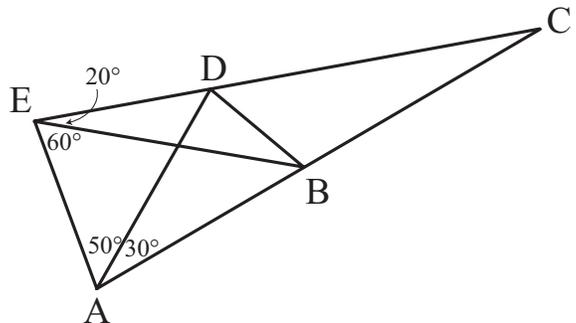

9. _____ ways

How many ways are there to color the walls of a pentagonal room using five different colors, so that no two non-adjacent walls have the same color?

10. _____ degrees

In the triangle shown, what is the degree measure of $\angle ADB$?

Vol 34 | Issue 2

Swapnil Garg Crowned National Champion at 2014 Raytheon MATHCOUNTS National Competition

With a score of 3-2 in the final matchup of the Countdown Round, Swapnil Garg knew he needed to answer just one more question correctly to win. He also knew how quickly his competitor, who came into the Countdown Round

Raytheon Chairman William H. Swanson (left), Chairman of the MATHCOUNTS Board Robert S. Miller, III (center), and Executive Director of MATHCOUNTS Lou DiGioia congratulate 2014 National Champion Swapnil Garg.

MATHCOUNTS National Competition, winning the \$20,000 Donald G. Weinert Scholarship and making history as the first Californian ever to be crowned a National Champion.

Garg's performance in the Countdown Round was incredibly impressive. Coming in as the #10 seed, he had to best three of the top young mathematicians in the country before earning the right to compete in the final matchup. Not only was Garg able to solve problems at lightning speed, he did so without once putting a pencil to paper!

Like many national competitors, Garg is very well-rounded, with interests varying from playing the trumpet and tennis to reading *Harry Potter*. An avid speller, the eighth grader from Cupertino Middle School in Sunnyvale also had aspirations to get to the national level of the Scripps Spelling Bee, a fact he shared when he introduced himself during the Countdown Round. Garg made it to the regional Spelling Bee, but his success at the national level in MATHCOUNTS undoubtedly will be one of the most memorable moments of his academic life.

as the #1 seed, could catch up to him. As the question was read, the audience was silent with excitement.

The smallest integer of a set of consecutive integers is -32. If the sum of these integers is 67, how many integers are in the set? (Answer: 67 integers)

Before the question was finished being read, Garg buzzed in—causing his competitor, who was furiously working, to groan in frustration. “Sixty—...” he began, before hesitating. Just a beat before time was called, he finished his answer “—seven!” It took him less than 12 seconds to answer the question.

With a hard-fought set of matchups and a nail-bitingly tense finish, Garg took the top prize at the 2014 Raytheon

Garg reacts when he learns he answered a question correctly during the final matchup against Kevin Liu of Indiana during the Countdown Round.

Garg competed against 223 of the nation's top middle school Mathletes®, who came together on Friday, May 9th to participate in the

2014 Raytheon MATHCOUNTS National Competition at the Walt Disney World Swan and Dolphin Resort in Orlando, Fla. Competitors came from all 50 states and U.S. territories, as well as from schools worldwide affiliated with the U.S. Department of Defense and State Department.

Mathletes competing at the National Competition complete a series of written rounds in the morning, working both individually and as part of their state team. The top 12 scoring students earn the right to compete in the Countdown Round, an intense oral contest consisting of fast-paced one-on-one matchups in which students answer a series of difficult questions. Students have only 45 seconds to answer each question, though many competitors can answer Countdown Round questions after only a few seconds.

Rankings for the Countdown Round were determined by the students' scores on the written rounds. The four students with the highest scores on the written tests, who received a bye in the first round of the Countdown Round, were Kevin Liu, a seventh grader from Indiana; Nicholas Sun, an eighth grader from Illinois; Hongyi Chen, an eighth grader from Colorado; and Colin Tang, a seventh grader from Washington.

The Countdown Round Second Place Winner was Kevin Liu, who was also the Written Competition Champion. The two semifinalists were Daniel Zhu, a seventh-grade student from Michigan and Alan Peng, an eighth-grade student from Missouri.

Since winning the title of 2014 National Champion, Garg has appeared on *Live! with Kelly and Michael*, where he competed against hosts Kelly Ripa and Michael Strahan in an on-air mock Countdown Round.

Qualifying for the National Competition is an outstanding achievement that requires a tremendous amount of hard work, practice and dedication. MATHCOUNTS congratulates all 224 of the Mathletes who competed in the 2014 Raytheon MATHCOUNTS National Competition. The [results](#) of the competition are available on the MATHCOUNTS website.

Garg and his family pose with Kelly Ripa and Michael Strahan during the taping of his segment on Live! with Kelly and Michael.

California Team Awarded First Place

California won First Place in this year's team competition, with team members Swapnil Garg; Jeffery Li, a seventh grader from Pleasanton; Rajiv Movva, an eighth grader from San Jose; and Harry Wang, an eighth grader from Los Gatos; as well as coach David Vaughn and assistant coach Vandana Kadam. Each student was awarded a \$2,000 college scholarship, as well as a trip to U.S. Space Camp.

In addition to trophies and scholarships, members of the First Place Team were awarded a once-in-a-lifetime honor: they served as Grand Marshals in "Disney's Festival of Fantasy Parade" at the Magic Kingdom. To solidify their status as Disney VIPs, Mickey Mouse himself helped present the team with their First Place medals at the Countdown Round and officially invited them to lead the parade. In addition to exclusive access at the park, the team had the privilege of riding in the Grand Marshal carriage in the parade while park visitors applauded and congratulated them on their accomplishments.

The Maryland team won Second Place and the Virginia team won Third Place. Team rankings were determined by the teams' scores on the written Team Round, and also factored in students' individual scores on the written Sprint and Target Rounds.

Top: The 1st Place California Team served as Grand Marshals at the Magic Kingdom's "Disney Festival of Fantasy Parade" on Saturday, May 10.
Bottom: Coach David Vaughn, team members Harry Wang, Rajiv Movva, Swapnil Garg, Jeffery Li and Assistant Coach Vandana Kadam receive medals at the Countdown Round.

2014 NATIONAL COMPETITION WINNERS

NATIONAL CHAMPION:

Swapnil Garg, CA

- \$20,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

COUNTDOWN ROUND

2ND PLACE WINNER:

Kevin Liu, IN

- \$7,500 Scholarship

COUNTDOWN ROUND

SEMIFINALISTS:

Daniel Zhu, MD

Alan Peng, MO

- \$3,000 Scholarship each

WRITTEN COMPETITION

CHAMPION: Kevin Liu, IN

- \$2,500 Scholarship

1ST PLACE TEAM: California
Swapnil Garg, Jeffery Li, Rajiv
Movva and Harry Wong

- \$2,000 Scholarship each
- Trip to U.S. Space Camp

WRITTEN COMPETITION

RUNNER-UP: Nicholas Sun, IL

COUNTDOWN ROUND

QUARTERFINALISTS:

Nicholas Sun, IL

Hongyi Chen, CO

Colin Tang, WA

Vinjai Vale, TX

COUNTDOWN ROUND

PARTICIPANTS:

Freddie Zhao, MI

Jun-Hee Lee, IA

Graham O'Donnell, FL

Akshaj Kadaveru, VA

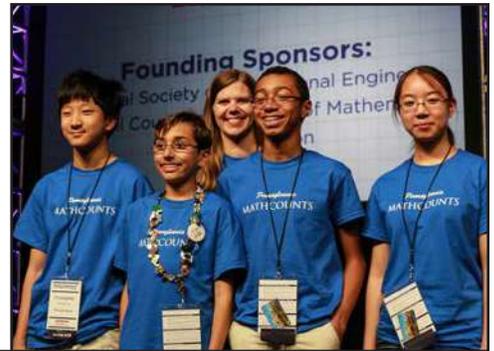

2ND PLACE TEAM: Maryland

3RD PLACE TEAM: Virginia

Celebrating Spirit at the National Competition

The Virgin Islands team won this year's Spirit Award for demonstrating exceptional camaraderie, enthusiasm and good sportsmanship at the 2014 Raytheon MATHCOUNTS National Competition. Among the team's best moments was their math jingle to the tune of Pharrell's "Happy," which they performed at the beginning of the Written Competition.

Students from all teams showed passion and excitement throughout the weekend. The National Competition is only as great as the people who participate, and the energy that teams brought to this event made it so much more than simply a math test—it was a celebration of exceptional students, dedicated coaches and of what incredible things they can accomplish together.

Top: Christopher Lee, Kiran Rebholz, Coach Rebekah Sjoberg, Joey Feffer and Wanlin Li of Pennsylvania at the Countdown Round. Bottom Left: Hannah Zhang of Colorado and Alice Wang of Arkansas get ready to run in for the Countdown Round. Bottom Center: Rohith Paidikondala, Peter Zhu, Sruthi Parthasarathi and Max Guo of Ohio perform their state cheer before the Written Competition. Bottom Right: Robert Hunter, Mansi Totwani, Divyesh Gurnani, Manav Thadani and Coach Michele Humphries of the Virgin Islands celebrate winning the Spirit Award.

Mathletes Featured on ABC World News with Diane Sawyer

Not many people can say they have been featured on the national news, but Mathletes Michelle Shen, an eighth grader from Indiana; Harshitha Gogineni, an eighth grader from Guam; and David Ma, an eighth grader from Massachusetts can say just that. On Thursday, May 8th the 2014 Raytheon MATHCOUNTS National Competition

was featured on ABC World News with Diane Sawyer in a story about the incredible achievements of MATHCOUNTS national competitors like Shen, Gogineni and Ma.

ABC Reporter Gio Benitez and his production team got a behind-the-scenes look at the hard work and preparation that goes into competing at the national competition. After interviewing students and coaches and observing practice sessions, Benitez put his own math skills to the test, as he squared off against the Mathletes in a mock Countdown Round.

Eight million viewers tuned in to "Are You Smarter Than an Eighth Grader?" on Thursday. The [video](#) is available online.

ABC World News Reporter Gio Benitez and Mathletes Harshitha Gogineni, David Ma and Michelle Shen get ready for a mock Countdown Round.

“We’re Rich” by Team Get ‘M from Georgia Voted Best Video at 2014 Math Video Challenge Finals

Team Get ‘M from Georgia won at the 2014 Math Video Challenge Finals for their creative, funny video “[We’re Rich](#).” Get ‘M teammates **G**arrett Minor, **E**rick Patterson, **T**errell Prince, and **M**atthew Meadows, all eighth-grade students from The Ron Clark Academy in Atlanta, Ga., each won a \$1,000 college scholarship. Their Team Advisor was Dr. Camille Jones, a math teacher at The Ron Clark Academy.

The four videos presented at this year’s Math Video Challenge Finals were among the best videos ever made in the program’s three-year span. From creative costumes to outstanding acting to excellent video editing, the finalists in this year’s contest truly brought math to life. See all student-made videos in the [Math Video Challenge archive](#).

A total of 312 videos were submitted for this year’s contest. Students from the finalist teams came together on Saturday, May 10th at the Walt Disney World Swan and Dolphin Resort in Orlando, Fla. to present their videos to the 224 Mathletes participating in the National Competition, who then voted to determine the winning video.

“We’re Rich” tells the story of three lucky teachers who win the lottery. When the amount they receive is less than they were expecting, the teachers calculate the percentage they paid in taxes to understand their lottery payout... and then they have to decide how to spend their winnings. The video solves question #143 from the 2013-2014 MATHCOUNTS School Handbook:

Three Maryland educators will split equally \$234 million from the Mega Million Lottery. Each will collect about \$53 million after taxes. What percentage of tax will be paid by each of the winners if the taxes also are split equally among the winners? Express your answer to the nearest whole number. (Answer: 32%)

“We’re Rich” had the entire audience laughing as the three teachers dreamed of parading around the mall looking for expensive clothes and jewelry. But in the end, the teachers decide to use their lottery winnings to start a new school.

From Left: Garrett Minor, Matthew Meadows, Terrell Prince and Erick Patterson of Team Get ‘M pose with the pins and candy they traded with national competitors during the event. In “We’re Rich” three teachers learn they have won \$234 million in the lottery.

2014 MATH VIDEO CHALLENGE FINALISTS

“ICE CREAM CHALLENGE” BY PEOPLE OF PYTHAGORAS, NEVADA

DaKara Cooper, Shane Risolio, Aimee Sampayan, Joseph Tran and Team Advisor Hikmet Erdogan

“PRESIDENT POLYNOMIAL HAS BEEN POISONED!” BY POLYMA+HEMA+1C5, NEW YORK

Connie Chen, Elena Diaz, Kristen Palmer, Sylvia Staal Riordan and Team Advisor Linda Russo

“THE BI-LIGHT ZONE” BY BILANDERS, NEW JERSEY

Sora Bridges, Dave Diez, Safiyyah Mosaad, Saleema Walter and Team Advisor Amro Mosaad

Adrienne Carmack Wins 2014 MATHCOUNTS Alumni Scholarship

The [MATHCOUNTS Alumni Scholarship](#) was created this year to recognize an alumnus/a whose experience in MATHCOUNTS—regardless of which program they participated in or how far they made it in their program—had a meaningful impact on his/her academic and professional life.

MATHCOUNTS received applications from more than 200 outstanding alumni across the country. The recipient of this year's \$3,000 scholarship award was Adrienne Carmack from Veazie, Maine. Carmack competed as a member of the Maine Team at the 2009 Raytheon MATHCOUNTS National Competition when she was in middle school. She went on to serve as a MATHCOUNTS coach for four years, and was Salutatorian of her high school, a National Merit Scholar and National AP Scholar. Carmack later joined AmeriCorps to work with Girl Scouts of Maine, where she created financial literacy planning programming and led troops.

Carmack's experience as a coach and troop leader helped her realize her passion for teaching and mentoring. She will attend Colby College this fall to study psychology and education, with the hopes of becoming a clinical psychologist and high school teacher.

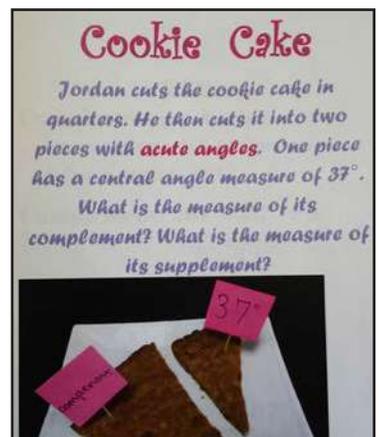

Left: MATHCOUNTS Alumni Scholarship winner Adrienne Carmack talks to the 2014 National Competitors. Right: As an 8th grader Carmack competed with the Maine Team at the 2009 Raytheon MATHCOUNTS National Competition.

Program Highlights in The National Math Club

Thousands of clubs participated in The National Math Club this year, making it one of the most successful years in the program's seven-year history. Every year, Club Leaders across the country receive free materials to start and maintain their school or organization's math club. Then they set off to make math fun for students of all ability and interest levels.

Clubs that are actively involved in the program can earn additional prizes and awards by applying for Silver and Gold Level. This year, over 400 clubs achieved [Silver Level](#).

This year marked a change in the Gold Level reward. Rather than taking a test, Gold Level clubs completed a mathematical scavenger hunt. Club members were challenged to find real-life examples of 12 different math terms, create a math problem involving each term, and then write out each problem's solution. Over 200 clubs achieved [Gold Level](#) this year.

The club from Union Middle School in Dysart, Iowa won this year's Gold Level Grand Prize Drawing. The club won a \$500 gift card and an all-expenses-paid trip for four students and the Club Leader to attend the 2014 Raytheon MATHCOUNTS National Competition. Congratulations to the Union Middle School Club! See the complete list of Silver and Gold Level [drawing winners](#) online.

Top: Club members from St. Catharine's School in Columbus, OH created a detailed, creative storybook for their Gold Level Project. Bottom: Pam Erickson, Vice President of Corporate Affairs at Raytheon (left) and Robert S. Miller (right) present the Gold Level banner to the Grand Prize winning club from Union Middle School.

Spotlight on State and Local Donors

We would like to express our gratitude to the donors at the state and local level whose support impacted thousands of students attending Chapter and State Competitions this year. Their generosity helped make the 2013-14 MATHCOUNTS Competitions Series possible.

CRITICAL 2013-2014 DATES

2013

Sept. 3 -
Dec. 13

Send in your school's Competition Series Registration Form to participate in the Competition Series and to receive the 2013-2014 School Competition Kit, with a hard copy of the *2013-2014 MATHCOUNTS School Handbook*. Kits begin shipping shortly after receipt of your form, and mailings continue every two weeks through December 31, 2013.

Mail, e-mail or fax the MATHCOUNTS Competition Series Registration Form with payment to:

MATHCOUNTS Registration, P.O. Box 441, Annapolis Junction, MD 20701
E-mail: reg@mathcounts.org
Fax: 240-396-5602

Questions? Call 301-498-6141 or confirm your registration via www.mathcounts.org/competitionschools.

Nov. 1

The 2014 School Competition will be available. With a username and password, a registered coach can download the competition from www.mathcounts.org/CompetitionCoaches.

Nov. 15

Deadline to register for the Competition Series at reduced registration rates (\$90 for a team and \$25 for each individual). After Nov. 15, registration rates will be \$100 for a team and \$30 for each individual.

Dec. 13
(postmark)

Competition Series Registration Deadline

*In some circumstances, late registrations might be accepted at the discretion of MATHCOUNTS and the local coordinator. **Late fees may also apply. Register on time to ensure your students' participation.***

2014

Early Jan.

If you have not been contacted with details about your upcoming competition, call your local or state coordinator! ***If you have not received your School Competition Kit by the end of January, contact MATHCOUNTS at 703-299-9006.***

Feb. 1-28

Chapter Competitions

March 1-31

State Competitions

May 9

2014 Raytheon MATHCOUNTS National Competition in Orlando, FL.

INTRODUCTION TO THE NEW LOOK OF MATHCOUNTS®

Although the names, logos and identifying colors of the programs have changed, the mission of MATHCOUNTS remains the same: to provide fun and challenging math programs for U.S. middle school students in order to increase their academic and professional opportunities. Currently in its 31st year, MATHCOUNTS meets its mission by providing three separate, but complementary, programs for middle school students: the **MATHCOUNTS Competition Series**, **The National Math Club** and the **Math Video Challenge**. This *School Handbook* supports each of these programs in different ways.

The **MATHCOUNTS Competition Series**, formerly known as the Competition Program, is designed to excite and challenge middle school students. With four levels of competition - school, chapter (local), state and national - the Competition Series provides students with the incentive to prepare throughout the school year to represent their schools at these MATHCOUNTS-hosted* events. MATHCOUNTS provides the preparation and competition materials, and with the leadership of the National Society of Professional Engineers, more than 500 Chapter Competitions, 56 State Competitions and the National Competition are hosted each year. These competitions provide students with the opportunity to go head-to-head against their peers from other schools, cities and states; to earn great prizes individually and as members of their school team; and to progress to the 2014 Raytheon MATHCOUNTS National Competition in Orlando, Florida. There is a registration fee for students to participate in the Competition Series, and participation past the School Competition level is limited to the top 10 students per school.

Working through the School Handbook and previous competitions is the best way to prepare for competitions. A more detailed explanation of the Competition Series is on pages 42 through 53.

The National Math Club, formerly known as the MATHCOUNTS Club Program or MCP, is designed to increase enthusiasm for math by encouraging the formation within schools of math clubs that conduct fun meetings with a variety of math activities. The resources provided through The National Math Club are also a great supplement for classroom teaching. The activities provided for The National Math Club foster a positive social atmosphere, with a focus on students working together as a club to earn recognition and rewards in The National Math Club. All rewards require a minimum number of club members (based on school/organization/group size) to participate. Therefore, there is an emphasis on building a strong club and encouraging more than just the top math students within a school to join. There is no cost to sign up for The National Math Club, but a National Math Club Registration Form must be submitted to receive the free Club in a Box, containing a variety of useful club materials. (Note: A school that registers for the Competition Series is NOT automatically signed up for The National Math Club. A separate registration form is required.)

The School Handbook is supplemental to The National Math Club. Resources in the Club Activity Book will be better suited for more collaborative and activities-based club meetings. More information about The National Math Club can be found at www.mathcounts.org/club.

*While MATHCOUNTS provides an electronic version of the actual School Competition Booklet with the questions, answers and procedures necessary to run the School Competition, the administration of the School Competition is up to the MATHCOUNTS coach in the school. The School Competition is not required; selection of team and individual competitors for the Chapter Competition is entirely at the discretion of the school coach and need not be based solely on School Competition scores.

The **Math Video Challenge** is an innovative program involving teams of students using cutting-edge technology to create videos about math problems and their associated concepts. This competition excites students about math while allowing them to hone their creativity and communication skills. Students form teams consisting of four students and create a video based on one of the Warm-Up or Workout problems included in this handbook. In addition, students are able to form teams with peers from around the country. As long as a student is a 6th, 7th or 8th grader, he or she can participate. Each video must teach the solution to the selected math problem, as well as demonstrate the real-world application of the math concept used in the problem. All videos are posted to videochallenge.mathcounts.org, where the general public votes on the best videos. The top 100 videos undergo two rounds of evaluation by the MATHCOUNTS judges panel. The panel will announce the top 20 videos and then identify the top four finalist videos. Each of the four finalist teams receives an all-expenses-paid trip to the 2014 Raytheon MATHCOUNTS National Competition, where the teams will present their videos to the 224 students competing in that event. The national competitors then will vote for one of the four videos to be the winner of the Math Video Challenge. Each member of the winning team will receive a \$1000 college scholarship.

The School Handbook provides the problems from which students must choose for the Math Video Challenge. More information about the Math Video Challenge can be found at videochallenge.mathcounts.org.

ALSO NEW THIS YEAR

THE MATHCOUNTS SOLVE-A-THON

MATHCOUNTS SOLVE-A-THON

This year, MATHCOUNTS is pleased to announce the launch of the MATHCOUNTS Solve-A-Thon, a new fundraising event that empowers students and teachers to use math to raise money for the math programs at their school. Starting September 3, 2013, teachers and students can sign up for Solve-A-Thon, create a personalized Fundraising Page online and begin collecting donations and pledges from friends and family members.

After securing donations, students go to their Solve-A-Thon Profile Page and complete an online Solve-A-Thon Problem Pack, consisting of 20 multiple-choice problems. A Problem Pack is designed to take a student 30-45 minutes to complete. Supporters can make a flat donation or pledge a dollar amount per problem attempted in the online Problem Pack. Schools must complete their Solve-A-Thon fundraising event by January 31, 2014.

All of the money raised through Solve-A-Thon, 100% of it, goes directly toward math education in the student's school and local community, and students can win prizes for reaching particular levels of donations. For more information and to sign up, visit solveathon.mathcounts.org.

RELATIONSHIP BETWEEN COMPETITION AND CLUB PARTICIPATION

The MATHCOUNTS Competition Series was formerly known as the Competition Program. However, no eligibility rules or testing rules have changed. The only two programmatic changes for the Competition Series are how it is related to The National Math Club (formerly the MATHCOUNTS Club Program).

(1) Competition Series schools are no longer automatically registered as club schools. In order for competition schools to receive all of the great resources in the Club in a Box, the coach must complete The National Math Club Registration Form (on page 87 or online at www.mathcounts.org/clubreg). Participation in The National Math Club and all of the accompanying materials still are completely free but do require a separate registration.

(2) To attain Silver Level Status in The National Math Club, clubs are no longer required to complete five monthly challenges. Rather, the Club Leader simply must attest to the fact that the math club met five times with the appropriate number of students at each meeting (usually 12 students; dependent on the size of the school). Because of this more lenient requirement, competition teams/clubs can more easily attain Silver Level Status without taking practice time to complete monthly club challenges. It is considerably easier now for competition teams to earn the great awards and prizes associated with Silver Level Status in The National Math Club. The Silver Level Application is included in the Club in a Box, which is sent to schools after registering for The National Math Club.

ELIGIBILITY FOR THE NATIONAL MATH CLUB

Starting with this program year, eligibility for The National Math Club (formerly the MATHCOUNTS Club Program) has changed. Non-school-based organizations and any groups of at least four students not affiliated with a larger organization are now allowed to register as a club. (Note that registration in the Competition Series remains for schools only.) In order to register for The National Math Club, participating students must be in the 6th, 7th or 8th grade, the club must consist of at least four students and the club must have regular in-person meetings. In addition, schools and organizations may register multiple clubs.

Schools that register for the Competition Series will no longer be automatically enrolled in The National Math Club. Every school/organization/group that wishes to register a club in The National Math Club must submit a National Math Club Registration Form, available at the back of this handbook or at www.mathcounts.org/club.

PROGRESSION IN THE NATIONAL MATH CLUB

Progression to Silver Level Status in The National Math Club will be based solely on the number of meetings a club has and the number of members attending each meeting. Though requirements are based on the size of the school/organization/group, the general requirement is having at least 12 members participating in at least five club meetings. Note that completing monthly challenges is no longer necessary. Progression to Gold Level Status in The National Math Club is based on completion of the Gold Level Project by the math club. Complete information about the Gold Level Project can be found in the *Club Activity Book*, which is sent once a club registers for The National Math Club. Note that completing an Ultimate Math Challenge is no longer the requirement for Gold Level Status.

HELPFUL RESOURCES

INTERACTIVE MATHCOUNTS PLATFORM

This year, MATHCOUNTS is pleased to offer the *2011-2012*, *2012-2013* and *2013-2014 MATHCOUNTS School Handbooks* and the 2012 and 2013 School, Chapter and State Competitions online (www.mathcounts.org/handbook). This content is being offered in an interactive format through NextThought, a software technology company devoted to improving the quality and accessibility of online education.

The NextThought platform provides users with online, interactive access to problems from Warm-Ups, Workouts, Stretches and competitions. It also allows students and coaches to take advantage of the following features:

- Students can highlight problems, add notes, comments and questions, and show their work through digital whiteboards. All interactions are contextually stored and indexed within the *School Handbook*.
- Content is accessible from any computer with a modern web browser, through the cloud-based platform.
- Interactive problems can be used to assess student or team performance.
- With the ability to receive immediate feedback, including solutions, students develop critical-thinking and problem-solving skills.

- An adaptive interface with a customized math keyboard makes working with problems easy.
- Advanced search and filter features provide efficient ways to find and access MATHCOUNTS content and user-generated annotations.
- Students can build their personal learning networks through collaborative features.
- Opportunities for synchronous and asynchronous communication allow teams and coaches flexible and convenient access to each other, building a strong sense of community.
- Students can keep annotations private or share them with coaches, their team or the global MATHCOUNTS community.
- Digital whiteboards enable students to share their work with coaches, allowing the coaches to determine where students need help.
- Live individual or group chat sessions can act as private tutoring sessions between coaches and students or can be de facto team practice if everyone is online simultaneously.
- The secure platform keeps student information safe.

THE MATHCOUNTS OPLET **(One Problem Library and Extraction Tool)**

. . . a database of thousands of MATHCOUNTS problems AND step-by-step solutions, giving you the ability to generate worksheets, flash cards and Problems of the Day

Through www.mathcounts.org, MATHCOUNTS is offering the MATHCOUNTS OPLET - a database of 13,000 problems and over 5,000 step-by-step solutions, with the ability to create personalized worksheets, flash cards and Problems of the Day. After purchasing a 12-month subscription to this online resource, the user will have access to *MATHCOUNTS School Handbook* problems and MATHCOUNTS competition problems from the past 13 years and the ability to extract the problems and solutions in personalized formats. (Each format is presented in a pdf file to be printed.) The personalization is in the following areas:

- Format of the output: Worksheet, Flash Cards or Problems of the Day
- Number of questions to include
- Solutions (whether to include or not for selected problems)
- Math concept: Arithmetic, Algebra, Geometry, Counting and Probability, Number Theory, Other or a Random Sampling
- MATHCOUNTS usage: Problems without calculator usage (Sprint Round/Warm-Up), Problems with calculator usage (Target Round/Workout/Stretch), Team problems with calculator usage (Team Round), Quick problems without calculator usage (Countdown Round) or a Random Sampling
- Difficulty level: Easy, Easy/Medium, Medium, Medium/Difficult, Difficult or a Random Sampling
- Year range from which problems were originally used in MATHCOUNTS materials: Problems are grouped in five- year blocks in the system.

How does a person gain access to this incredible resource as soon as possible?

A 12-month subscription to the MATHCOUNTS OPLET can be purchased at www.mathcounts.org/oplelet. The cost of a subscription is \$275; however, schools registering students in the MATHCOUNTS Competition Series will receive a \$5 discount per registered student. If you purchase OPLET before October 12, 2013, you can save a total of \$75* off your subscription. Please refer to the coupon above for specific details.

*The \$75 savings is calculated using the special \$25 offer plus an additional \$5 discount per student registered for the MATHCOUNTS Competition Series, up to 10 students.

**SAVE
\$25 OFF**

YOUR SUBSCRIPTION FEE IF YOU PURCHASE
OPLET BEFORE
October 12, 2013.

Use code **OPLET1314** to receive your discount
when registering online as a NEW subscriber.

Use code **RENEW1314** to receive your discount
when renewing a current subscription.

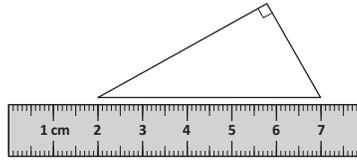

MATHCOUNTS®

www.mathcounts.org/OPLET

Warm-Up 1

1. _____ cm What is the length, to the nearest centimeter, of the hypotenuse of the right triangle shown?

2. _____ cm If the ratio of the length of a rectangle to its width is $\frac{9}{4}$ and its length is 18 cm, what is the width of the rectangle?

3. _____ bins Mike bought $2\frac{3}{4}$ pounds of rice. He wants to distribute it among bins that each hold $\frac{1}{3}$ pound of rice. How many bins can he completely fill?

4. _____ : _____ p.m. It took Jessie 15 minutes to drive to the movie theater from home. He waited 10 minutes for the movie to start, and the movie lasted 1 hour 43 minutes. After the movie ended, Jessie immediately went home. It took Jessie 25 minutes to drive home from the theater. If he left for the movie at 4:05 p.m., at what time did he get home?

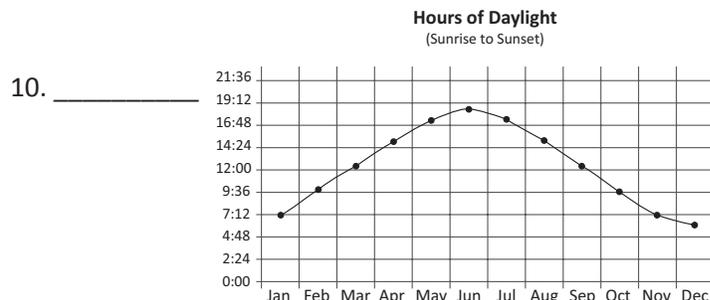

5. \$ _____ A carnival pass costs \$15 and is good for 10 rides. This is a savings of \$2.50 compared to paying the individual price for 10 rides. What is the individual price of a ride without the pass?

6. _____ If $x + y = 7$ and $x - y = 1$, what is the value of the product $x \cdot y$?

7. _____ Mrs. Stephens has a bag of candy. The ratio of peppermints to chocolates is 5:3, and the ratio of peppermints to gummies is 3:4. What is the ratio of chocolates to gummies? Express your answer as a common fraction.

8. _____ degrees The angles of a triangle form an arithmetic progression, and the smallest angle is 42 degrees. What is the degree measure of the largest angle of the triangle?

9. _____ Each of the books on Farah's shelves is classified as sci-fi, mystery or historical fiction. The probability that a book randomly selected from her shelves is sci-fi equals 0.55. The probability that a randomly selected book is mystery equals 0.4. What is the probability that a book selected at random from Farah's shelves is historical fiction? Express your answer as a decimal to the nearest hundredth.

According to the graph shown, which of the other eleven months has a number of daylight hours most nearly equal to the number of daylight hours in April?

Warm-Up 2

11. _____ Consider the following sets: $A = \{2, 5, 6, 8, 10, 11\}$, $B = \{2, 10, 18\}$ and $C = \{10, 11, 14\}$. What is the greatest number in either of sets B or C that is also in set A?

12. _____ °F The temperature is now 0 °F. For the past 12 hours, the temperature has been decreasing at a constant rate of 3 °F per hour. What was the temperature 8 hours ago?

13. _____ What is the value of x if $\frac{1}{x} + \frac{1}{2x} = \frac{1}{2}$?

14. _____ In June, Casey counted the months until he would turn 16, the minimum age at which he could obtain his driver's license. If the number of months Casey counted until his birthday was 45, in what month would Casey turn 16?

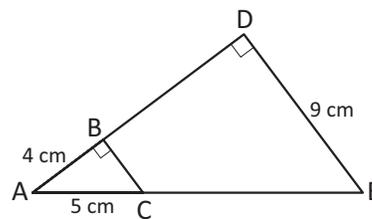

15. _____ buckets It takes 1 gallon of floor wax to cover 600 ft². If floor wax is sold only in 1-gallon buckets, how many buckets of floor wax must be purchased to wax the floors of three rooms, each measuring 20 feet by 15 feet?

16. _____ Consider the pattern below:
 $22^2 = 121 \times (1 + 2 + 1)$
 $333^2 = 12,321 \times (1 + 2 + 3 + 2 + 1)$
 $4444^2 = 1,234,321 \times (1 + 2 + 3 + 4 + 3 + 2 + 1)$
For what positive value of n will $n^2 = 12,345,654,321 \times (1 + 2 + 3 + 4 + 5 + 6 + 5 + 4 + 3 + 2 + 1)$?

17. _____ times If United States imports increased 20% and exports decreased 10% during a certain year, the ratio of imports to exports at the end of the year was how many times the ratio at the beginning of the year? Express your answer as a common fraction.

18. _____ James needs \$150 to buy a cell phone. In January, he saved \$5. He saved twice as much in February as he saved in January, for a total savings of \$15. If James continues to save twice as much each month as he saved the previous month, in what month will his total savings be enough to purchase the cell phone?

19. _____ cm What is the perimeter of $\triangle ADE$ shown here?

20. _____ females The following table shows the results of a survey of a random sample of people at a local fair. If there are 1100 people at the fair, how many females would you expect to prefer the Flume?

| Favorite Ride | Male | Female |
|----------------|------|--------|
| Ferris Wheel | 15 | 20 |
| Roller Coaster | 24 | 14 |
| Carousel | 6 | 10 |
| Flume | 5 | 6 |

Workout 1

21. _____ hours It takes Natasha nine hours to mow six lawns. On average, how many hours does it take her to mow each lawn? Express your answer as a decimal to the nearest tenth.

22. _____ What is the value of $(\pi^4 + \pi^5)^{\frac{1}{6}}$ when expressed as a decimal to the nearest hundredth?

23. _____ cm What is the length of a diagonal that cuts through the center of a cube with edge length 4 cm? Express your answer in simplest radical form.

24. \$ _____ Carol finds her favorite brand of jeans on sale for 20% off at the mall. If the jeans are regularly \$90 and the tax is 7.5%, how much will she pay for one pair of jeans?

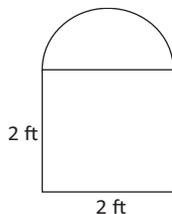

25. _____ What is the value of $1 + 1$ when written in base 2?

26. _____ euros In May 2002, the exchange rate for converting U.S. dollars to euros was 1 dollar = 1.08 euros. At this rate, 250 U.S. dollars could be exchanged for how many euros?

27. _____ units Two sides of a right triangle have lengths 5 units and 12 units. If the length of its hypotenuse is not 13 units, what is the length of the third side? Express your answer in simplest radical form.

28. _____ ft²

A Norman window has the shape of a rectangle on three sides, with a semicircular top. This particular Norman window includes a 2-foot by 2-foot square. What is the area of the whole window? Express your answer as a decimal to the nearest hundredth.

29. _____ A fair coin is flipped, and a standard die is rolled. What is the probability that the coin lands heads up and the die shows a prime number? Express your answer as a common fraction.

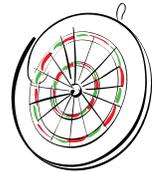

30. _____ in³ Bailey is estimating the volume of a container. The container is a cube that measures 2 feet 7 inches on each edge. Bailey estimates the volume by using 3 feet for each edge. In cubic inches, what is the positive difference between Bailey's estimate and the actual volume?

Warm-Up 3

31. _____ If the ratio of a to b is $\frac{7}{3}$, what is the ratio of $2a$ to b ? Express your answer as a common fraction.

32. _____ Remy throws three darts and Rita throws one dart at a dartboard. Each dart lands at a different distance from the center. Assuming Remy and Rita are equally skilled at darts, what is the probability that the dart closest to the center is one that Remy threw? Express your answer as a common fraction.

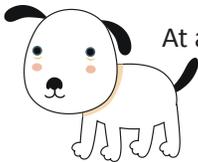

33. _____ Grace had an average test score of exactly 89 in her algebra class after the first three tests. After the fourth test, her average was exactly 91. What was Grace's score on the fourth test?

34. _____ cm^3 What is the volume, in cubic centimeters, of a cube that has a surface area of 96 cm^2 ?

35. _____ If 45% of the students at South Park High School were born at South Park Hospital, what is the ratio of the number of students who were not born at South Park Hospital to the number of students who were born at South Park Hospital? Express your answer as a common fraction.

36. _____ If $\frac{c}{d} = 4$, what is the value of $\frac{d}{c} + \frac{1}{2}$? Express your answer as a common fraction.

37. _____ dogs

At a pet store, there are 23 animals. Among the animals in the store, 15 are white, 5 are white dogs and 7 animals are neither dogs nor white. How many dogs are at the pet store?

38. _____ Yoon is expecting an important phone call today at a randomly selected time from 2:00 p.m. to 3:30 p.m. What is the probability that he will receive the call before 2:15 p.m.? Express your answer as a common fraction.

39. _____ quarts Donatella's recipe for punch calls for the following ingredients:

- $\frac{1}{2}$ gallon of apple juice
- 3 cups of lemon-lime soda
- 64 fluid ounces of pineapple juice
- 2 quarts of cold water
- 1 cup of lemon juice

One gallon = 4 quarts = 8 pints = 16 cups = 128 fluid ounces. How many quarts of punch will this recipe produce?

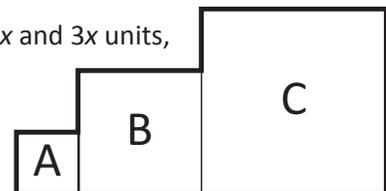

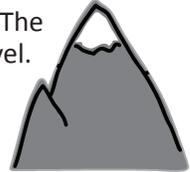

40. _____ cookies Jude ate 100 cookies in five days. On each day, he ate 6 more than on the previous day. How many cookies did he eat on the fifth day?

Warm-Up 4

41. _____ If the point $(-3, 5)$ is reflected across the x -axis, what is the sum of the coordinates of the image?
42. _____ Let $@x@$ be defined for all positive integer values of x as the product of all of the factors of $2x$. For example, $@7@ = 14 \times 7 \times 2 \times 1 = 196$. What is the value of $@3@$?
43. _____ feet The peak of Mount Everest is approximately 29,000 feet above sea level. The bottom of the Mariana Trench is approximately 36,201 feet below sea level. What is the vertical distance, to the nearest thousand, from the base of the Mariana Trench to the peak of Mount Everest?
44. _____ What is the mean of $7\frac{1}{2}$, $-3\frac{1}{4}$, 4 , $-5\frac{1}{4}$ and 2 ?
45. _____ If $45 + \sqrt{c} = 49$, what is the value of $c^2 - 21$?
46. _____ weeks Spending at a rate of 100 dollars every minute, how many weeks will it take Janelle to spend one million dollars? Express your answer to the nearest whole number.
47. _____ What is the value of $(-20) + (-17) + (-14) + \dots + 13 + 16 + 19 + 22$?
48. _____ cm The area of a right triangle is 36 cm^2 . If the length of one leg of this triangle is 8 cm, what is the length of the other leg, in centimeters?
49. _____  There is a $\frac{2}{3}$ chance of rain for each of three days. If the weather on each day is independent of the weather on the other two days, what is the probability that it will rain on none of the three days? Express your answer as a common fraction.
50. _____ units Squares A, B and C, shown here, have sides of length x , $2x$ and $3x$ units, respectively. What is the perimeter of the entire figure? Express your answer in terms of x .

Workout 2

51. _____ The line passing through points $(1, c)$ and $(-5, 3)$ is parallel to the line passing through the points $(4, 3)$ and $(7, -2)$. What is the value of c ?

52. _____ minutes

The book of *Guinness World Records* states that Fuatai Solo set a world record in 1980 by climbing a coconut tree 29 feet 6 inches tall in 4.88 seconds. At that rate, how many minutes would it take Fuatai to climb the 1454 feet to the top of the Empire State Building? Express your answer to the nearest whole number.

53. _____ cents

At a store, a four-pack of 16-oz cans of soup costs \$3.20 and a three-pack of 24-oz cans costs \$3.60. How many cents are in the absolute difference between the price per ounce of a four-pack and the price per ounce of a three-pack?

54. _____ What is the closest integer to the real number x such that $2^x=1000$?

55. _____ feet

A wheel that makes 10 revolutions per minute takes 18 seconds to travel 15 feet. In feet, what is the diameter of the wheel? Express your answer as a decimal to the nearest tenth.

56. _____ years

The average age of a group of 12 people is 26 years. If 8 new people are added to the group, the average age of the group increases to 32 years. In years, what is the average age of the 8 new people?

57. _____

Connie and her little brother like to play a number game. When Connie says a number, her brother then says the number that is 3 less than half of Connie's number. If Connie says a number, and her brother gives the correct response, 9, what number did Connie say?

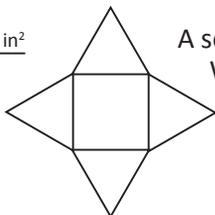

58. _____ pounds

Arnold, Benji and Celal found an old scale. When Arnold and Benji stepped on the scale, it showed a weight of 158 pounds. When Benji and Celal stepped on the scale, it showed a weight of 176 pounds. When all three of them stepped on the scale, it accurately showed a weight of 250 pounds but then promptly broke under the strain. However, they already had enough information to determine each of their weights. How much does Benji weigh?

59. _____ odd numbers

Of all three-digit natural numbers less than 523, how many of the odd numbers contain no 5?

60. _____ in²

A square of side length 4 inches has four equilateral triangles attached as shown. What is the total area of this figure? Express your answer in simplest radical form.

Warm-Up 5

61. _____ What number must be added to the set {5, 10, 15, 20, 25} to increase the mean by 5?

62. _____ For each pair (x, y) in the table shown, $y = \frac{c}{x}$ where c is a constant. What is the value of c ?

| | | | | |
|-----|----------------|----|----|----|
| x | $-\frac{1}{2}$ | -1 | -2 | -4 |
| y | -16 | -8 | -4 | -2 |

63. _____ : _____ p.m. Sinclair is going to visit her family in New York. She lives 90 miles away in New Jersey. Assuming that there are no traffic delays and she can travel at an average speed of 45 mi/h for the entire trip, at what time should she leave if she needs to meet her family at 4:00 p.m.?

64. _____ knots A ship is 108 feet long and travels on open water at a speed of 30 knots. A model of the ship that is 12 feet long is used to test its hydrodynamic properties. To replicate the wave pattern that appears behind a ship, the speed of the model, r , should be equal to $r = s\sqrt{\frac{m}{a}}$, where s is the speed of the actual ship, a is the length of the actual ship and m is the length of the model. What speed, in knots, should be used for the model to simulate travel in open water?

65. _____ What fraction of 45 is 60% of 50? Express your answer as a common fraction.

66. _____ The integer x is the sum of three different positive integers, each less than 10. The integer y is the sum of three different positive integers, each less than 20. What is the greatest possible value of $\frac{y}{x}$?

67. _____ In the four by four grid shown, move from the 1 in the lower left corner to the 7 in the upper right corner. On each move, go up, down, right or left, but do not touch any cell more than once. Add the numbers as you go. What is the maximum possible value that can be obtained, including the 1 and the 7?

| | | | |
|---|---|---|---|
| 4 | 5 | 6 | 7 |
| 3 | 4 | 5 | 6 |
| 2 | 3 | 4 | 5 |
| 1 | 2 | 3 | 4 |

68. _____ complete pages

If a printer prints at a uniform rate of 3 complete pages every 40 seconds, how many complete pages will it print in 3 minutes?

69. _____ sides The measure of an interior angle of a regular polygon is eight times the measure of one of its exterior angles. How many sides does the polygon have?

70. _____ The number 101 is a three-digit palindrome because it remains the same when its digits are reversed. What is the ratio of the number of four-digit palindromes to the number of five-digit palindromes? Express your answer as a common fraction.

Warm-Up 6

71. _____ values For how many nonzero values of x does $x^{2x} = 1$?

72. _____ (,) The function $y = 3x + 6$ is graphed in the coordinate plane. At what point on the graph is the y -value double the x -value? Express your answer as an ordered pair.

73. _____ degrees The typical person spends 8 hours a day sleeping. In a circle graph that shows how 24 hours in a day are spent, how many degrees are in the central angle for sleeping?

74. _____ The average of a , b and c is 15. The average of a and b is 18. What is the value of c ?

75. _____ Jeremiah has written four letters, one to each of four different people, and he has an addressed envelope for each person. If Jeremiah randomly places each letter in a different one of the four envelopes, what is the probability that two letters are in the correct envelopes and the other two are not? Express your answer as a common fraction.

76. _____ If the points $(-2, 5)$, $(0, y)$ and $(5, -16)$ are collinear, what is the value of y ?

77. _____ If $(2x - 5)(2x + 5) = 5$, what is the value of $4x^2$?

78. \$ _____ Arturo invests \$5000 in a mutual fund that gains 20% of its value in the first month, and then loses 20% of its value the following month. In dollars, how much is Arturo's investment worth at the end of the second month?

79. _____ What is the sum of the 31st through 36th digits to the right of the decimal point in the decimal expansion of $\frac{4}{7}$?

80. _____ What numeral in base 8 is equivalent to 332_5 (denoting 332 base 5)?

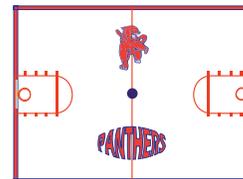

Workout 3

81. _____ mi/h A pilot flew a small airplane round-trip between his home airport and a city 720 miles away. The pilot logged 5 hours of flight time and noted that there was no wind during the flight to the city, but he did encounter a headwind on his return flight. If the pilot was able to maintain a speed of 295 mi/h during the flight to the city, what was his average speed during the return flight, in miles per hour? Express your answer as a decimal to the nearest hundredth.

82. _____ For nonzero numbers a , b and c , b is $\frac{1}{3}$ of a , and c is twice b . What is the value of $\frac{a^2}{c^2}$? Express your answer as a decimal to the nearest hundredth.

83. _____ ft² A rectangular basketball court had an area of 1200 ft². The court was enlarged so that its length was increased by 40% and its width by 50%. How many square feet larger than the original court is the new court?

84. _____ There are 300 members of the eighth-grade class at Woodlawn Beach Middle School, of whom 28 have Mr. Jackson for Algebra 1. Two members of the eighth-grade class will be selected at random to represent the school at an upcoming event. What is the probability that neither of the students selected will be from Mr. Jackson's Algebra 1 class? Express your answer as a decimal to the nearest hundredth.

85. \$ _____ Matthew earns a regular pay rate of \$8.80 per hour, before deductions, at his full-time job. If he works more than 40 hours in a week, he earns overtime at $1\frac{1}{2}$ times his normal pay rate for any time worked beyond 40 hours. All of his deductions combined are 35% of his gross pay. How much does Matthew earn after deductions if he works 48 hours in one week?

86. _____ books  According to one estimate, a new book is published every 13 minutes in the United States. Based on this estimate, how many books will be published in the year 2014? Express your answer to the nearest whole number.

87. _____ feet Stephen took a ride on a circular merry-go-round. The horse Stephen rode was at a distance of 15 feet from the center of the merry-go-round. If the ride made exactly $2\frac{3}{4}$ revolutions, how many feet did Stephen travel? Express your answer as a common fraction in terms of π .

88. _____ degrees The absolute difference between the measure of an acute angle and the measure of its supplement is 136 degrees. What is the degree measure of the acute angle?

89. _____ For what fraction of the day is the hour hand or minute hand (or both the hour and minute hands) of an analog clock in the upper half of the clock? Express your answer as a common fraction.

90. _____ m What is the height of a right square pyramid whose base measures 48 m on each side and whose slant height is 72 m? Express your answer as a decimal to the nearest hundredth.

Warm-Up 7

91. _____ If positive integers p , q and $p + q$ are all prime, what is the least possible value of pq ?

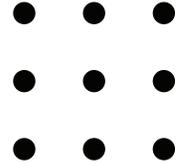

92. _____ Two concentric circles have radii of x and $3x$. The absolute difference of their areas is what fraction of the area of the larger circle? Express your answer as a common fraction.

93. _____ To unlock her mobile device, Raynelle must enter the four different digits of her security code in the correct order. Raynelle remembers the four different digits in her security code. However, since she can't recall their order, she enters the four digits in a random order. What is the probability that the security code Raynelle enters will unlock her device? Express your answer as a common fraction.

94. _____ Penny has $4x$ apples and $7y$ oranges. If she has the same number of apples and oranges, what is the ratio of x to y ? Express your answer as a common fraction.

95. _____ sides A polygon is made in this grid of 9 dots, by connecting pairs of dots with line segments. At each vertex there is a dot joining exactly two segments. What is the greatest possible number of sides of a polygon formed in this way?

96. _____ If $f(x) = x^2 + 3x - 4$ and $g(x) = \frac{3}{4}x + 6$, what is $g(-8) - f(-2)$?

97. _____ hours As Gregory enters his room for the night, he glances at the clock. It says 9:12 p.m. He listens to music and checks his social media page for half an hour. He then spends 15 minutes getting ready for bed. If he falls asleep 8 minutes after he climbs into bed and wakes up at 8:00 a.m. the next day, for how many hours was he asleep? Express your answer as a mixed number.

98. _____ If $\frac{x}{y} = \frac{3}{4}$ and $\frac{x}{z} = \frac{1}{8}$, what is the value of $\frac{y}{z}$? Express your answer as a common fraction.

99. \$ _____ Bright Middle School has budgeted \$10,000 to purchase computers and printers. Using the full amount budgeted, the school can buy 10 computers and 10 printers or 12 computers and 2 printers. What is the cost of 1 computer, in dollars?

100. \$ _____ Last year, David earned money by performing odd jobs for his neighbors, and he had no other source of income. The combined amount David earned during January, February and March was $\frac{1}{12}$ of his total income. During April, May and June, combined, he earned $\frac{1}{6}$ of his total income. David earned $\frac{1}{2}$ of his total income during July, August and September. If the combined amount he earned during October, November and December was \$2,000, what was his total income last year?

Warm-Up 8

101. segments Sebi has a string that is 1.75 m long. What is the greatest number of segments, each 10 cm in length, that he can cut from this string?

102. children

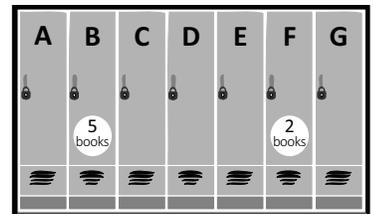

A group of children stopped to buy ice cream from a stand that sold 9 different flavors of ice cream. When every child in the group had purchased one double-scoop cone with two different flavors, every possible two-flavor combination had been served exactly once. If none of the children purchased the same two flavors, how many children were there in the group?

103. The result of multiplying a number by 5 is the same as adding it to 5. What is the number? Express your answer as a common fraction.

104. feet For a certain rectangle, its perimeter, in feet, and area, in square feet, are numerically equal. If the length of the rectangle is 8 feet, what is its width? Express your answer as a mixed number.

105. books Lockers A through G are arranged side by side as shown, with lockers B and F containing exactly 5 books and exactly 2 books, respectively. In one of the other five lockers, there are exactly 8 books, in another exactly 7 books, in another locker exactly 5 books, in one other only 2 books, and one locker contains no books. The number of books in each of the lockers A through G is such that the total number of books contained in any two adjacent lockers is different from the number of books in each of the other five lockers. For example, the total number of books contained in lockers A and B is different from the number of books in each of the lockers labeled C, D, E, F and G. What is the combined number of books in lockers A and G?

106. units The center of a circle in a rectangular coordinate system has the coordinates $(-8, -3)$. What is the radius of the circle if the circle touches the y -axis at only one point?

107. dollars Barbara's allowance is x cents per day. How many dollars in allowance will Barbara receive during the month of June? Express your answer as a common fraction in terms of x .

108. units² What is the absolute difference between the largest and smallest possible areas of two rectangles that each have a perimeter of 46 units and integer side lengths?

109. men In a group of 212 men and women, there were 32 more men than women. How many men were in the group?

110. socks A drawer contains five brown socks, five black socks and five gray socks. Randomly selecting socks from this drawer, what is the minimum number of socks that must be selected to guarantee at least two matching pairs of socks? A matching pair is two socks of the same color.

Workout 4

| Year | % Change |
|------|----------|
| 2001 | +10 |
| 2002 | -5 |
| 2003 | -10 |
| 2004 | +4 |
| 2005 | +4 |
| 2006 | +4 |
| 2007 | +4 |
| 2008 | +4 |

111. _____ inches The Pine Lodge Ski Resort had exactly 200 inches of snowfall in 2000. The table shows the percent change in total snowfall for each year compared with the previous year. After 2003, what was the total snowfall, in inches, the year that the total snowfall first exceeded 200 inches? Express your answer as a decimal to the nearest hundredth.

112. _____ games

Country Bowl charges \$2.60 for bowling shoe rental and \$4.00 for each game of bowling, with no charge for using their bowling balls. Super Bowl charges \$2.50 per game, but its charge for shoe and ball rental is \$7.10. For what number of games is the price the same at the two bowling alleys?

113. _____ dates

A particular date is called a difference date if subtracting the month number from the day gives you the two-digit year. For example, June 29, 2023 and January 1, 2100 are difference dates since $29 - 6 = 23$ and $1 - 1 = 00$. Including these two dates, how many dates during the 21st century (January 1, 2001 to December 31, 2100) can be classified as difference dates?

114. _____

If the median of the ordered set $\{0, \frac{2}{5}x, x, 11.5x, 5, 9\}$ is 2, what is the mean? Express your answer as a decimal to the nearest hundredth.

115. \$ _____

Carmen bought new software for her computer for \$133.38, including 8% tax. What was the cost for the software before the tax was added?

116. _____ boxes

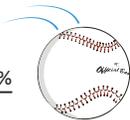

Square tiles measuring 6 inches by 6 inches are sold in boxes of 10 tiles. What is the minimum number of boxes of tiles needed to exactly cover a rectangular floor that has dimensions 12 feet by 13 feet if only whole boxes can be purchased?

117. _____ pounds

A giant panda bear must eat about 38% of its own weight in bamboo shoots or 15% of its own weight in bamboo leaves and stems each day. A male panda at the local zoo requires 49.35 pounds of bamboo leaves and stems daily. How much does the male panda weigh?

118. _____ %

Suppose the yarn wrapped around the rubber core inside a major league baseball is 450 feet long. In 1991, Cecil Fielder made a home run by hitting a baseball an amazing 502 feet. By what percent does the length of Fielder's home run exceed the length of yarn used to create a major league baseball? Express your answer to the nearest hundredth.

119. _____ newtons

The formula $P = F/A$ indicates the relationship between pressure (P), force (F) and area (A). In newtons, what is the maximum force that could be applied to a square area with side length 4 meters so that the pressure does not exceed 25 newtons per square meter?

120. _____ in²

A cylindrical can has a label that completely covers the lateral surface of the can with no overlap. If the can is 6 inches tall and 4 inches in diameter, what is the area of the label? Express your answer as a decimal to the nearest tenth.

Warm-Up 9

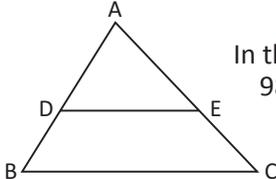

121. _____ feet A flea can jump 350 times the length of its own body. If a human were able to jump 350 times his or her height, how many feet would an average American, whose height is 5 feet 6 inches, be able to jump?

122. _____ people Of the 3 million people who auditioned for a television talent competition in the past 10 years, only 1% of 1% were selected to be contestants. How many people were selected to be contestants in this talent competition in the past 10 years?

123. _____ cans A rectangular room has a length, width and height of 15 feet, 12 feet and 8 feet, respectively. The room has one 30-inch by 60-inch window on each of the four walls. One wall also contains two 3-foot by 7-foot doors. If a can of paint is enough to cover an area of 100 ft², what is the minimum number of whole cans of paint needed to paint the walls and ceiling in this room?

124. _____ dollars Together Brianna and Shanita have \$24.00. If Brianna has \$3.00 more than twice the amount of money Shanita has, how many more dollars than Shanita does Brianna have?

125. _____ m

In the figure, segment DE is parallel to segment BC. The area of $\triangle ABC$ is 98 m². The area of $\triangle ADE$ is 50 m². The perimeter of $\triangle ADE$ is 55 m. What is the perimeter, in meters, of $\triangle ABC$?

126. _____ fractions Two standard six-sided dice are rolled. One of the dice represents the numerator and the other represents the denominator of a fraction. The fraction is simplified, if possible. How many distinct fractions less than one can be generated by this method?

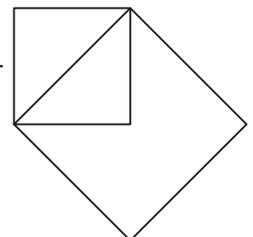

127. _____ dimes Rayshon has 51 coins consisting of dimes and nickels that total \$3.55. How many dimes does he have?

128. (_____ , _____) A circle passes through the origin and (8, 0). It has a radius of 5, and its center is in the first quadrant. What are the coordinates of its center? Express your answer as an ordered pair.

129. _____ If $f(x) = -(x - 1)^2 + 2$, what is the greatest possible value of $f(x) + 3$?

130. _____ units² In the figure shown, a side of the larger square is a diagonal of the smaller square. If the area of the smaller square is 1 square unit, what is the area of the larger square?

Warm-Up 10

131. _____

A 2-cup mixture consists of $\frac{2}{3}$ cup of flour and the rest is nuts. If 1 cup of flour is added to make a 3-cup mixture, what fraction of the 3-cup mixture is flour? Express your answer as a common fraction.

132. _____ years

Marshall's age is 53, and Cody's age is 17. How many years ago was Marshall four times as old as Cody was?

133. _____ houses

The houses on Main Street have three-digit house numbers that begin with either 7 or 9. If the remaining digits must contain one even and one odd digit and cannot contain a 0, what is the greatest number of houses that could be on Main Street?

134. _____ mi/h

What is the average speed of a cyclist who bikes up a hill at 6 mi/h but then bikes back along the same path down the hill at 12 mi/h?

135. _____ hours

Shimdra is on vacation and wants to drive from Melbourne, Florida to Miami Beach, Florida.

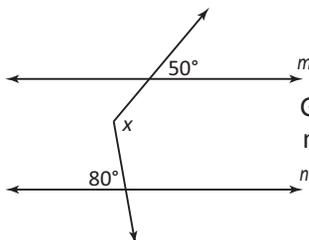

The scale on the map is 1 inch = 16 miles. The map distance from Melbourne to Miami Beach is $11\frac{1}{4}$ inches. If Shimdra's average speed is 60 mi/h, how many hours will it take Shimdra to make the trip?

136. _____

What is the value of $\frac{(1.4 \times 10^{-7})(2.4 \times 10^8)}{1.2 \times 10^9}$ when written in simplest form? Express your answer in scientific notation to two significant digits.

137. _____ degrees

Given parallel lines m and n and the degree measures of the two marked angles, what is the degree measure of the angle marked x ?

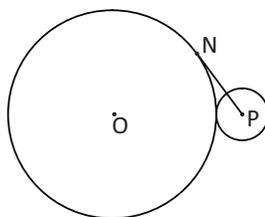

138. _____ students

Three-year-old Sally attends a preschool class every weekday. One day, five new students were added to her class, after which there were $\frac{3}{2}$ as many students in Sally's preschool class as before. How many students were in the class before the addition of five new students?

139. _____ slugs

Two cobbles and 3 burreys cost 19 slugs. If you subtract the cost of 5 cobbles from the cost of 37 slugs, you get the cost of 4 burreys. What is the total cost, in slugs, of 1 cobble and 1 burrey?

140. _____ cm

Circles O and P, of radius 16 cm and 4 cm, respectively, are tangent, as shown. Segment NP is tangent to circle O at point N. What is the length of segment NP?

Workout 5

141. _____ units One cube has a volume that is 728 units^3 larger than that of a second cube. If the smaller cube has edge length 10 units, what is the number of units in the edge length of the larger cube?
142. _____ cm^2 A rectangle is inscribed in a circle of radius 5 cm. The base of the rectangle is 8 cm. What is the area of the rectangle?
143. _____ % Three Maryland educators will split equally \$234 million from the Mega Million Lottery. Each will collect about \$53 million after taxes. What percentage of tax will be paid by each of the winners if the taxes also are split equally among the winners? Express your answer to the nearest whole number.

Warm-Up 11

151. _____ The mean of seven numbers is 9. What is the new mean if each of the numbers is doubled?

152. _____ What is the 2013th digit after the decimal point when $\frac{1}{7}$ is expressed as a decimal?

153. _____ A number z is chosen at random from the set of positive integers less than 20. What is the probability that $\frac{19}{z} \geq z$? Express your answer as a common fraction.

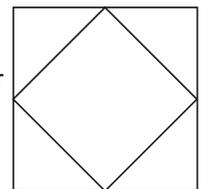

154. _____ If $\frac{3}{4} = \frac{a}{36} = \frac{36}{b}$, what is the value of $a + b$?

155. _____ degrees Some Mathletes® bought a circular pizza for \$10.80. Pat's share was \$2.25. Each student contributed to its cost based on the area of the fractional part he or she received. In degrees, what was the measure of the central angle of Pat's part?

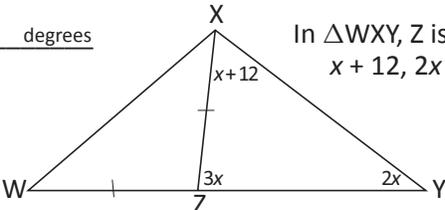

156. _____ minutes  A pedestrian averages 3 mi/h on the streets of Manhattan, and a subway train averages 30 mi/h. If each city block is $\frac{1}{20}$ of a mile, how many more minutes than the subway train does it take for a pedestrian to travel 60 blocks in Manhattan?

157. _____ Two different integers are randomly selected from the set of positive integers less than 10. What is the probability that their product is a perfect square? Express your answer as a common fraction.

158. _____ inches The figure shown here is to be made from a single piece of yarn. What is the shortest length of yarn that can be used to make the figure if each side of the outer square is 12 inches long and the vertices of the inner square each bisect a side of the outer square? Express your answer in simplest radical form.

159. _____ mi/h After driving along at a certain speed for 5 hours, Rich realizes that he could have covered the same distance in 3 hours if he had driven 20 mi/h faster. What is his current speed?

160. _____ degrees  In $\triangle WXY$, Z is on side WY and $WZ = XZ$. If the angles of $\triangle XYZ$ have measures $x + 12$, $2x$ and $3x$, as shown, what is the degree measure of $\angle W$?

Warm-Up 12

161. _____ km² If 1000 cubic meters of pine mulch can fertilize 0.02 square kilometers of soil, how many square kilometers of soil can be fertilized by 10^8 cubic meters of pine mulch?

162. _____ If $9^c = 27^{c-1}$, what is the value of c ?

163. _____ Each term after the first term of the sequence 2, 4, 8, ... is 2 times the preceding term. Each term after the first of sequence 10, 20, 30, ... is 10 more than the preceding term. What is the least value of n such that the n th term of the first sequence is greater than the n th term of the second sequence?

164. _____ combinations For the orchestra contest, Mrs. Treble is going to select 4 pieces of music from the recommended list of 20 pieces. How many combinations of 4 pieces of music are possible?

165. _____ integers How many of the first 500 positive integers are multiples of all three integers 3, 4 and 5?

166. _____ inches

The distance from the center of a clock to the tip of the minute hand is 4 inches. Between 2:45 p.m. and 7:15 p.m., what is the total distance traveled by the tip of the minute hand? Express your answer in terms of π .

167. _____ Nine people are forming three teams of three people each for a game of XFlag. Each team has one player who is the captain. The nine participants are Alana, Benny, Chico, Danzig, Elias, Frederico, Gina, Hsin-Hsin and Illiana. They are very particular about which players can be on a team together. Frederico must be with Hsin-Hsin or Illiana. Elias, Frederico and Gina must be on different teams. Hsin-Hsin and Illiana must be on different teams. Chico and Danzig must be on the same team; neither is a captain. Danzig cannot be on a team with Gina as captain. Frederico cannot be on a team with Alana as captain. Hsin-Hsin cannot be on a team with Elias as captain. Alana and Benny are captains. Who is the third captain?

168. _____ ft² In Figure 1, four congruent circles are inscribed in a square, and in Figure 2, sixteen congruent circles are inscribed in a square. Both squares measure 4 feet by 4 feet. What is the absolute difference between the shaded area in Figure 1 and the shaded area in Figure 2?

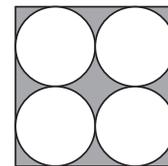

Figure 1

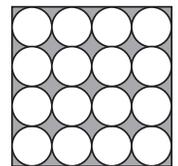

Figure 2

169. _____ If $x^2 + \frac{1}{x^2} = 3$, what is the value of $x^4 + \frac{1}{x^4}$?

170. _____ units² What is the area of the $\triangle JKL$ in the coordinate plane with vertices $J(-3, 2)$, $K(-1, -2)$ and $L(5, 6)$?

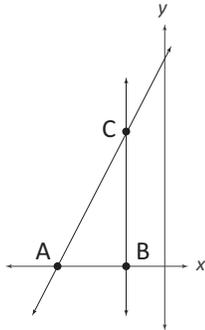

Workout 6

171. _____ Juwan purchased several coats from a manufacturer. He wants to sell the coats at his store for 60% more than he paid. By what number should he multiply the manufacturer's price to determine his price? Express your answer as a decimal to the nearest tenth.

172. _____ % What is the percent of increase in the volume of a cube when its edge length is increased by 50%? Express your answer to the nearest tenth.

173. _____ inches What is the perimeter of a 60-degree slice of a pizza with a 7-inch radius? Express your answer as a decimal to the nearest tenth.

174. _____

In the xy -coordinate plane, $AB = 5$, $AC = 13$, and lines BC and AB are perpendicular, as shown. The coordinates of point B are $(-4, 0)$, and point A is on the x -axis. If the y -intercept of line CA has coordinates $(0, k)$, what is the value of k ? Express your answer as a decimal to the nearest tenth.

175. _____ The quadratic equation $x^2 - 7x + 5 = 0$ has two real roots, m and n . What is the value of $\frac{1}{m} + \frac{1}{n}$? Express your answer as a common fraction.

176. _____ To win a certain lottery, one must match three different numbers chosen from the integers 1 through 25, in any order. Liam buys 500 tickets, each with a unique combination of numbers. What is his probability of winning? Express your answer as a decimal to the nearest hundredth.

177. \$ _____ Jayden buys two belts and four scarves for \$59.70. Katrina buys three belts and five scarves for \$80.60. Assuming that all belts cost the same and all scarves cost the same, what is the cost of one belt?

178. _____ inches A piece of wood is to be sawed into 15 smaller pieces, each 2 inches in length. If each cut eliminates $\frac{1}{8}$ inch of wood as sawdust, how many inches long must the original piece of wood be? Express your answer as a decimal to the nearest hundredth.

179. _____ penguins There are 190 penguins standing near the beach, and then one penguin dives into the sea, followed by two penguins, then three penguins, and so on, with one more penguin in each group. How many penguins will be in the last group?

180. _____ cm^2 A circle of radius 1 cm is inscribed in a square, as shown in Figure 1. In Figure 2, a circle of radius 1 cm circumscribes a square. What is the absolute difference between the shaded area in Figure 1 and the shaded area in Figure 2? Express your answer as a decimal to the nearest hundredth.

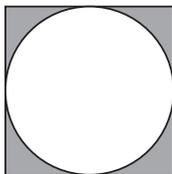

Figure 1

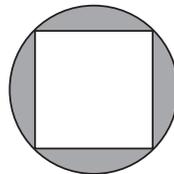

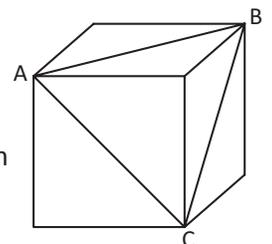

Figure 2

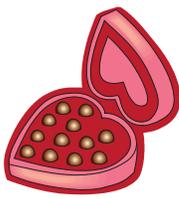

Warm-Up 13

181. ordered pairs A bag contains eight red tags numbered from 1 to 8 and two blue tags numbered 9 and 10. If Sid selects two tags from the bag at random, with replacement, how many different ordered pairs of tags can he select with at least one red tag?
182. While working with a drawing program, Rochelle changed the dimensions of a rectangle so that the new rectangle was $\frac{1}{2}$ as tall and $\frac{1}{4}$ as wide as the original rectangle. What is the ratio of the area of the new rectangle to the area of the original rectangle? Express your answer as a common fraction.
183. The graph of a linear equation contains the points $(1, a)$, $(2, b)$ and $(4, 18)$. What is the value of $\frac{3}{2}b - a$?
184. marbles Sue, Kim and Donna each entered into a drawing to guess the number of marbles in a jar. Sue estimated 300, Kim estimated 325 and Donna estimated 360. One estimate was off by 49 marbles, another estimate was off by 24 marbles and the remaining estimate was off by 11 marbles. How many marbles are in the jar?
185. A cylinder has height 9 inches and diameter 8 inches. The volume of the largest sphere that can fit in the cylinder is $\frac{\pi x}{3}$ in³. What is the value of x ?
186. \$ Briana's retail store had a \$1000 surplus last quarter, so she awarded employee bonuses. She divided the entire surplus among her sales team, which includes a sales manager, five full-time sales associates and four junior associates. Each junior associate received the same amount of money. Each full-time sales associate received twice as much as each junior associate. The sales manager received three times as much as each full-time sales associate. What was the amount of the sales manager's bonus?
187. Given that $x^2 + 2xy + y^2 = 81$, $x > 0$ and $y > 0$, what is the mean of x and y ? Express your answer as a decimal to the nearest tenth.
188. What is the value of $1 - 5 \cdot 2 + 10 \cdot 2^2 - 10 \cdot 2^3 + 5 \cdot 2^4 - 2^5$?
189. bricks Vincent is building a structure out of LEGO® bricks. The top level (first level) is a rectangle of 1 brick by 2 bricks. The level directly below the top level (second level) is a rectangle of 2 bricks by 3 bricks. The third level is a 3-by-4 rectangle. If the pattern continues, how many bricks are needed to build a structure 12 levels high?
190. in² Vertices A, B and C of a cube are connected as shown. If the volume of the cube is 27 in³, what is the area of $\triangle ABC$? Express your answer as a common fraction in simplest radical form.

Warm-Up 14

191. _____ What is the units digit of $1! + 2! + 3! + \dots + 2014!$?
192. _____ units² In a square of side length 12 units, what is the area of the region of points that are closer to the center of the square than to any vertex?
193. _____ The product of the integers from 1 through 10 is equal to $2^a \cdot 3^b \cdot 5^2 \cdot 7$, where a and b are positive integers. What is the value of $a + b$?
194. _____ km/h Ava and Lizzy were both competing in long-distance bike races. Ava's race was 150 km long, and Lizzy's race was 180 km long. They completed their races in the same time. If Lizzy's average rate was 2 km/h faster than Ava's, what was Ava's average rate?
- 
195. _____ The product of the first three terms of an arithmetic sequence of integers is a prime number. What is the sum of the three numbers?
196. _____ feet A triangle has a base of 3 feet and a height of 6 feet. If its area is increased to 35 ft² by increasing the base and height by the same number of feet, what is the sum of the new base and height?
197. _____ lists How many lists of integers that contain only powers of 2 have a sum of 9, if the order within each list is not important and numbers can be repeated?
198. _____ Anthony took five tests in physics last semester, each with a maximum score of 100. Anthony's five integer test scores have a mean of 85, a median of 87 and a unique mode of 92. What is the lowest possible score Anthony could have for one of his five tests?
199. _____ marbles Sara told Jo, "If you give me three of your marbles, I will have twice as many as you." Jo responded, "If you give me just two of your marbles, I will have twice as many as you." How many marbles does Sara have?
200. _____ Angel opens a box containing a dozen chocolate-covered candies. Each candy has a vanilla, raspberry or lemon cr me filling. Angel likes the vanilla candies, but she can't tell which candies have vanilla filling because the candies in the box look identical. If four of the candies have vanilla filling, and Angel randomly selects two candies from the box, what is the probability that both candies have vanilla filling? Express your answer as a common fraction.
- 

Workout 7

201. \$ _____

Twenty of Ms. Oliver's math students each agreed to contribute the same amount of money toward the purchase of her retirement gift. The students would have had exactly enough for the gift they selected, but four students forgot to bring in their contributions. If each of the other students gives an additional \$1.50, they will still have exactly enough to purchase the gift that was selected. What is the total amount of money the students need to purchase the gift they selected for Ms. Oliver?

202. _____ When $\frac{(a^2b^{-3}c)^2(a^{-1}b^3c^3)^{-3}}{(a^{-1}b^3c^{-2})^2(a^4bc^{-3})^4}$ is rewritten as $a^xb^yc^z$, what is the value of $x + y + z$?

203. _____ miles The engineers at an auto manufacturer pay students \$0.08 per mile plus \$25 per day to road test their new vehicles. Archer earned \$48 on one day by road testing a new car. How far did he drive? Express your answer as a decimal to the nearest tenth.

204. _____ times In 1982, Albert Rayner skipped a rope 128 times in 10 seconds. If he could have continued at that rate, how many times would he have skipped the rope in 1 hour?

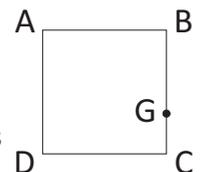

205. _____ If Andrew and Beth each randomly think of an integer from 1 to 10 inclusive, what is the probability that their numbers are relatively prime? Note: Every integer is relatively prime to 1. Express your answer as a common fraction.

206. _____ hours The number of *E. coli* bacteria in a rich medium is increasing at a rate of 50% every 3 hours. How many hours does it take for 960 bacteria to increase to 4860 bacteria?

207. _____ spheres A pile of clay can be molded to form a solid cube with edges that measure 10 cm. What is the maximum number of solid spheres of radius 2 cm that can be made from the same amount of clay?

208. _____ There are exactly $n!$ seconds in 6 weeks. What is the value of n ?

209. _____ m² A goat is fastened by a rope to an exterior wall of a square building ABCD at point G, shown here. The distance from the goat's collar to the end of the rope fastened to the wall is 3 m. If G is 1 m from C and 2 m from B, how many square meters of the large yard surrounding ABCD can the goat cover? Express your answer to the nearest integer.

210. _____ For the integer 263, neither pair of consecutive digits (the pair 2 and 6 and the pair 6 and 3) is relatively prime. But the nonconsecutive digits 2 and 3 are relatively prime. What is the greatest positive integer n that satisfies the following three conditions?

- (1) None of the digits is zero.
- (2) No pair of consecutive digits is relatively prime.
- (3) All non-consecutive digits are relatively prime.

Warm-Up 15

211. _____ hours A cylindrical tank starts with an unspecified amount of water in it, and water is added to it at a constant rate. After 8 hours the depth of the water in the tank is 34 feet. After 12 hours, the water depth is 35 feet. After how many hours in all will the water depth in the tank be 37 feet?

212. \$ _____

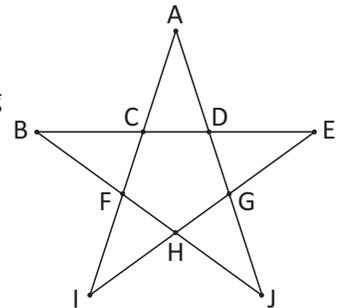

The closing price of a stock on Tuesday was double its closing price on Monday. Its closing price on Wednesday was 3 times its closing price on Tuesday. Its closing price on Thursday was 10 times its closing price on Wednesday. Its closing price on Thursday was \$72,000. What was its closing price on Monday?

213. _____ ft²

In the Mexican jungle, an archaeologist finds a right square pyramid with a base edge length of 60 yards. The pyramid has lateral edge length 50 yards. In square feet, what is the total surface area of the lateral faces of the pyramid?

214. _____ arrangements

The game board for Star Line-Up is shown. Players take turns placing markers on the lettered points. The first player to get three markers on the same line is the winner. For instance, a player would win for covering A, D and G or for covering A, D and J. How many winning arrangements of three markers are there?

215. _____ If $\frac{64^8}{32^{-3}} = 2^k$, what is the value of k ?

216. _____ A wooden cube is painted on each of its faces and then cut into n^3 unit cubes. If 216 of those smaller cubes are painted on exactly one face, what is the value of n ?

217. _____ Line m is tangent to a circle at the point $(3, 7)$. If $(1, 4)$ is the center of the circle, what is the slope of line m ? Express your answer as a common fraction.

218. _____ If $f(x) = \begin{cases} \sqrt{x} & \text{if } x \geq 16 \\ x+1 & \text{if } 10 < x < 16 \\ \frac{x}{2} - 10 & \text{if } 0 \leq x \leq 10 \\ x^2 & \text{if } x < 0 \end{cases}$, what is the value of $f(f(f(f(f(f(f(f(f(f(f(f(13))))))))))))))$?

219. _____ days

The *ides* occur on the 15th day of March, May, July and October, but the *ides* occur on the 13th day of every other month. What is the maximum number of days strictly between two *ides*?

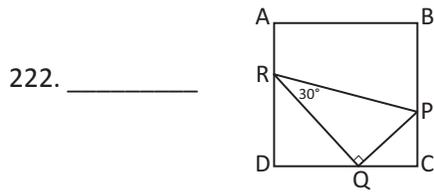

220. _____ units

There exist two non-congruent right triangles for which the length of the shorter leg in each triangle is 9 units and all sides have integer lengths. What is the sum of the lengths of the longer legs of these two triangles?

Warm-Up 16

221. _____ In the decimal representation of $\frac{1}{17} = 0.058m235294117647$, what is the value of the digit m ?

Quadrilateral ABCD is a square. What is the ratio of the area of $\triangle PQC$ to the area of $\triangle RQD$? Express your answer as a common fraction.

223. _____ teams In a basketball league of n teams in which each team plays every other team twice, the total number of games played is $n^2 - n$. How many teams are in the league if 56 games were played?

224. _____ The odds against the Patriots playing in the championship game are 4:1. The odds against the Texans playing in the championship game are 7:1. What is the probability that those two teams will play each other in the championship game? Express your answer as a common fraction.

225. _____ ordered pairs How many ordered pairs of integers (x, y) satisfy $xy = 144$?

226. _____ yards A boat can hold three people, one of whom needs to row to cross a river that is 20 yards wide. What is the minimum distance the boat must travel to transport 9 people from the left bank of the river to the right bank?

227. _____ Point $C(4, 2)$ is on circle O , with center $(4, -2)$. Segment CD is a diameter of circle O . If circle O intersects the x -axis at A and B , what is the ratio of the length of \widehat{ACB} to the length of \widehat{ADB} ? Express your answer as a common fraction.

228. _____ On October 12, 2006, Michael Cresta scored 830 points in a game of Scrabble. At one point in the game, the letter R was on the board, and he had the letters I, O, Q, U and X on his rack. In the bag of tiles, there were 3 Ts, 1 Y and 52 other tiles. He needed to draw a T and a Y in two draws, without replacement, to have the letters to make the word QUIXOTRY. What is the probability of getting a T and a Y when 2 tiles are randomly selected, without replacement, from the bag of tiles described? Express your answer as a common fraction.

229. _____ gallons A 5-gallon and a 20-gallon jug can be used to measure exactly 5 gallons or 20 gallons of water, respectively. They can also be used to measure 15 gallons by filling the 20-gallon jug with water, dumping 5 gallons into the 5-gallon jug and having 15 gallons of water left in the 20-gallon jug. Using similar processes, what is the sum of all positive integer numbers of gallons that can be obtained using only the 5-gallon and the 20-gallon jugs?

230. _____ cars As a used-car salesperson, Noah has a monthly sales quota, which is the minimum number of cars he must sell each month. Noah had not sold any cars in June, as of the 24th of the month. However, on June 25th, Noah sold half of the number of cars in his monthly quota, plus one more car. On June 26th, he sold half of the remaining number of cars he needed to sell, plus one more car. The same pattern continued until June 30th, when Noah sold half of the remaining cars he needed to sell, plus one more car and reached his monthly sales quota. Noah has a monthly sales quota to sell how many cars?

Workout 8

231. _____ Given that $12, v, w, x, y, z$ is an arithmetic sequence whose median is 20.75, what is the sum of these six numbers? Express your answer as a decimal to the nearest tenth.

232. _____ ways In a beauty contest, 51 contestants must be narrowed down to a first-, second- and third-place finalist. In how many ways can the three finalists be chosen?

233. _____ minutes  A runner completes the first mile of a 26-mile race in 5 minutes. After that, each mile takes 1% longer than the previous mile. How many minutes does it take the runner to complete 26 miles? Express your answer to the nearest whole number.

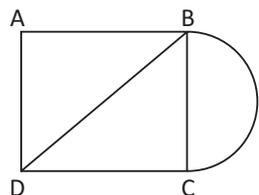

234. _____ combinations In the land of Binaria, the currency consists of coins worth 1¢, 2¢, 4¢, 8¢, 16¢, 32¢ and 64¢. Bina has two of each coin. How many combinations of her coins have a combined value of 50¢?

235. _____ in² John has an 8-inch by 10-inch photo that he wants to shrink so that its perimeter is exactly 27 inches. After the photo has been reduced in size, what will be the area of the new photo?

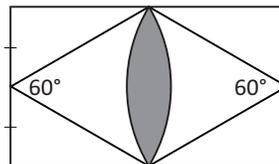

236. _____ cm Each rectangle in a collection has a length 1 cm more than three times its width. What is the maximum possible width of one of these rectangles if its perimeter is less than or equal to 150 cm? Express your answer as a decimal to the nearest tenth.

237. _____ % If $x > 0$, then 2% of 5% of $3x$ equals what percent of x ? Express your answer to the nearest tenth.

238. _____ ways  Figure ABCD can be drawn, without retracing, in one continuous pen stroke. If the stroke must begin at A, B, C or D, in how many different ways can this be done?

239. _____ units² A rectangle measures $2 \times 2\sqrt{3}$ units. Two arcs are drawn with their centers at the midpoints of the shorter sides, as shown. What is the area of the shaded region? Express your answer as a decimal to the nearest hundredth.

240. _____ % If four people each randomly pick an integer from 1 to 10, inclusive, what is the probability that at least two of the people pick the same integer? Express your answer to the nearest tenth.

Warm-Up 17

241. _____ students At one school, the ratio of students who have one or more younger siblings to those who have no younger siblings is 6 to 5. If 180 students do not have a younger sibling, how many students at this school have one or more younger siblings?

242. _____ inches A regular octagon has side length $2\sqrt{2}$ inches. What is the median length of all its diagonals? Express your answer in simplest radical form.

243. _____ Kevin and Evan have a set of 10 freshly inked stamps, one for each digit 0 through 9. When freshly inked, each stamp makes exactly 20 impressions. Kevin and Evan will stamp consecutive integers beginning with 1 and continuing until not enough ink remains to stamp the next consecutive number. What is the last number Kevin and Evan will be able to stamp?

244. _____ Each box in the expression below is to be filled in with one of the symbols $+$, $-$, \times or \div , with each symbol used exactly once. If no parentheses are inserted, what is the least possible absolute value of the resulting number? Express your answer as a decimal to the nearest tenth.

$$1 \square 2 \square 3 \square 4 \square 5$$

245. _____ units What is the greatest possible distance between some point on a square of side length 2 units and some point on its inscribed circle? Express your answer in simplest radical form.

246. _____ If $f(x) = x(x - 1)(x + 1)$, what is the product of the nonzero real numbers x such that $f(x) = x$?

247. _____ inches The integer sides of a triangle are in the ratio 3:4:6. If the perimeter of the triangle is 26 inches, what is the length of the longest side?

248. _____ seconds There is a moving sidewalk in the local shopping mall. When Marlow stands still on the moving sidewalk, it takes her 180 seconds to get from one end of the sidewalk to the other end. Walking beside the moving sidewalk at a constant rate, it takes Marlow 90 seconds to travel the same distance. If Marlow were to get on the sidewalk and walk at her same rate, in the same direction as the moving sidewalk, how many seconds would it take her to get from one end of the sidewalk to the other end?

249. _____ ten-dollar bills Sam went to the bank to withdraw \$440.00. He received 30 bills altogether. There were some five-, some ten- and some twenty-dollar bills. Sam received four times as many twenty-dollar bills as five-dollar bills. How many ten-dollar bills did Sam receive?

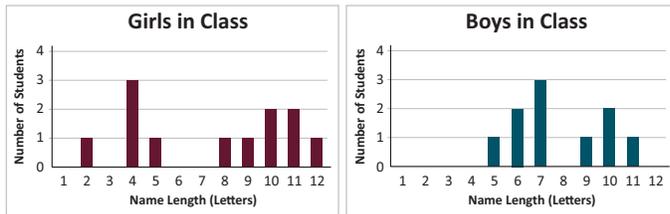

250. _____ Using the number keypad shown, it is possible to convert any three-digit number to various three-letter strings by choosing one letter for each number. For example, 223 can be used to make *BAD*, *ACE*, *CCF*, and 24 others, some of which are real words and some of which are not. Using only the buttons 2 through 9, what is the smallest three-digit number such that none of its possible three-letter strings are real words? (Exclude proper nouns and abbreviations.)

Warm-Up 18

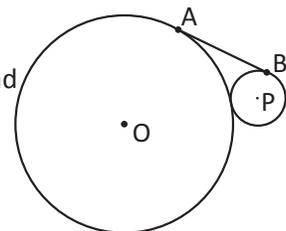

251. _____ The bar charts below show the number of letters in the first names of the girls and boys in Mrs. Rodriguez's class. If one girl and one boy are chosen at random, what is the probability that the chosen students have the same number of letters in their first names? Express your answer as a common fraction.

252. _____ positive integers How many positive integers are in the domain of $f(x) = \frac{\sqrt{12-x}}{4-x^2}$?
253. _____ Two standard six-sided dice are to be rolled. If the sum is an even number greater than 7, then what is the probability that both dice are even? Express your answer as a common fraction.
254. _____ units³ A cylinder's radius is equal to its height. If its surface area is 100π units², what is its volume? Express your answer in terms of π .
255. _____ A number n is randomly chosen from the set $\{1, 2, 3, \dots, 24, 25\}$. What is the probability that the equation $x^2 + nx + 24 = 0$ has two integer solutions? Express your answer as a common fraction.
256. _____ : a.m. Silas has a clock that gains 15 minutes each hour; for instance, if it shows the correct time at 2:00 p.m., one hour later it will show a time of 3:15 p.m. when it should show 3:00 p.m. Last night, Silas set the clock to the correct time at 10:00 p.m. While he was sleeping, the clock stopped working, and it showed a time of 4:00 a.m. That was 4 hours before he woke up. At what time did Silas wake up?

257. _____ cm Circle O and circle P are tangent to each other. Circle O has radius 8 cm and is tangent to segment AB at A, as shown. Circle P has radius 2 cm and is tangent to segment AB at B. What is the length of segment AB?

258. _____ The six integers 1, 3, 5, 7, 9 and 11 form an arithmetic sequence. If three of the integers are selected randomly without replacement, what is the probability that they form an arithmetic sequence in the order they are selected? Express your answer as a common fraction.
259. _____ The first three terms of an arithmetic sequence are p , 6 and $2p - 3$. What is the tenth term of this sequence?
260. _____ If $RATS \times 4 = STAR$, and each letter represents a different digit from 0 to 9, inclusive, what is the value of $S + T + A + R$?

Workout 9

261. _____

| | | |
|------------|----|---|
| Subtract → | | |
| 17 | 10 | 7 |
| 8 | 5 | 3 |
| 9 | 5 | 4 |

Figure 1

In Figure 1, numbers were subtracted vertically and horizontally until a value was found for the shaded box. For instance, $17 - 10 = 7$ and $8 - 5 = 3$ were the results from the first two rows, with $7 - 3 = 4$ in the third column. If the partially completed grid in Figure 2 follows the same rules, what is the value of $m + n$?

| | | |
|------------|-----|-----|
| Subtract → | | |
| 263 | m | |
| n | 34 | |
| | | 104 |

Figure 2

262. _____

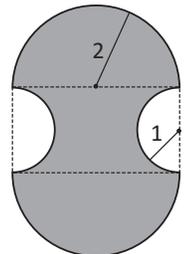

If $(a + b)^c = 1024$ for positive integers $a < b < c$, what is the value of b ?

263. _____ seconds

The time, t seconds, that it takes for a rock to fall a distance, d meters, is approximately $t = 0.45\sqrt{d}$. How many seconds does it take a rock to fall 200 m? Express your answer as a decimal to the nearest tenth.

264. _____ units²

Congruent semicircles are placed on the top and bottom of a rectangle (dotted segments), and congruent semicircles are removed from the left and right sides of the rectangle, as shown. How many square units are in the area of the shaded figure? Express your answer as a decimal to the nearest hundredth.

265. _____ in²

An ice cream cone is 5 inches tall with a radius of 1.5 inches. The outer surface area of the cone is covered with chocolate. How many square inches of cone are covered with chocolate? Express your answer as a decimal to the nearest tenth.

266. _____

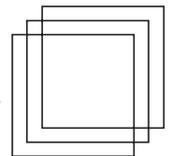

In Bag A are 9 red balls and 1 green ball. A player gets one draw from Bag A and wins if the green ball is selected. In Bag B are 99 red balls and 1 green ball. A player gets 20 draws from Bag B and wins if the green ball is selected, but if the selected ball is red, it must be returned to the bag before the next draw. What is the absolute difference between the probability of winning with Bag A and the probability of winning with Bag B? Express your answer as a decimal to the nearest thousandth.

267. _____ elements

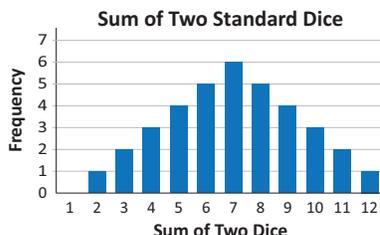

How many elements are in the set $\{x^2 - 2x + 1 \mid x = -5, -4, \dots, 4, 5\}$?

268. _____ regions

When three squares are arranged as shown, seven unique regions are formed. What is the maximum number of regions that can be formed by three congruent, overlapping squares?

269. _____

Two standard six-sided dice, each with faces numbered with the positive integers 1 through 6, have the probability distribution shown for the sum of the top-facing values on the dice. Two non-standard but fair six-sided dice can be numbered differently with nonnegative integers on each face and still yield the same probability distribution. Though a number may be on both dice, a number may not appear more than once on either die. If a is the sum of the six numbers on one of these non-standard dice, and b is the sum of the six numbers on the other die, what is the value of the product $a \times b$?

270. _____

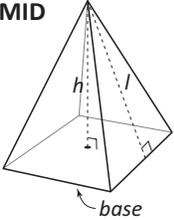

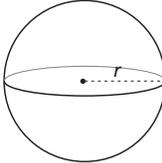

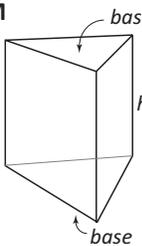

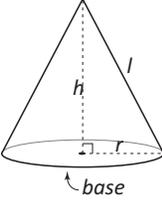

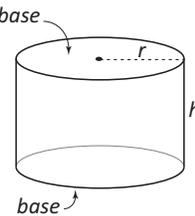

The digits 2, 0, 1 and 4 are used to create every possible positive four-digit integer, with each digit used exactly once in each integer. What is the arithmetic mean of all these integers?

Surface Area & Volume Stretch

This activity involves determining the surface area (SA) and volume (V) of various geometric solids. For the purposes of these exercises, all solids are assumed to be right (the height is perpendicular to the base at its center). Below is an example of each solid along with the formulas for determining its surface area and volume.

| | | | | |
|-----------------|----------------------|--------------|--------------------|--------------|
| B = base area | P = base perimeter | h = height | l = slant height | r = radius |
|-----------------|----------------------|--------------|--------------------|--------------|

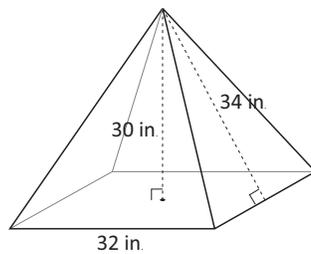

| | | |
|---|--|--|
| <p>PYRAMID</p>  <p>SA = $B + \frac{1}{2}Pl$ V = $\frac{1}{3}Bh$</p> | <p>SPHERE</p>  <p>SA = $4\pi r^2$ V = $\frac{4}{3}\pi r^3$</p> | <p>PRISM</p>  <p>SA = $2B + Ph$ V = Bh</p> |
| <p>CONE: Pyramid with circular base</p>  <p>SA = $\pi r^2 + \pi rl$ V = $\frac{1}{3}\pi r^2 h$</p> | <p>CYLINDER: Prism with circular bases</p>  <p>SA = $2\pi r^2 + 2\pi rh$ V = $\pi r^2 h$</p> | |

For 271 and 272, find the surface area and volume of the geometric solid.

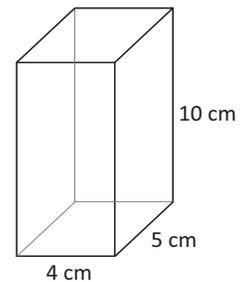

271. SA = _____ in²

V = _____ in³

271. square pyramid

272. rectangular prism

272. SA = _____ cm²

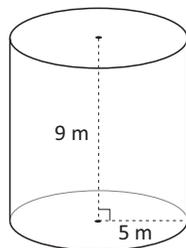

V = _____ cm³

For 273-275, find the surface area and volume of the geometric solid. Express your answer in terms of π .

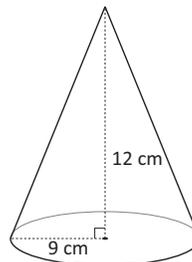

273. SA = _____ m²

V = _____ m³

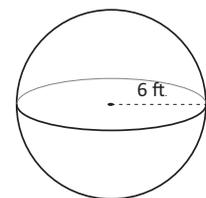

273. cylinder

274. cone

275. sphere

274. SA = _____ cm²

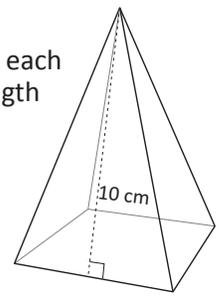

V = _____ cm³

275. SA = _____ ft²

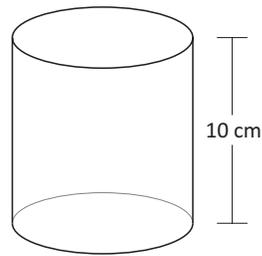

V = _____ ft³

276. _____ cm

A right square pyramid has lateral faces with slant heights that are each 10 cm. If the surface area of this pyramid is 96 cm^2 , what is the length of one of the edges of the base?

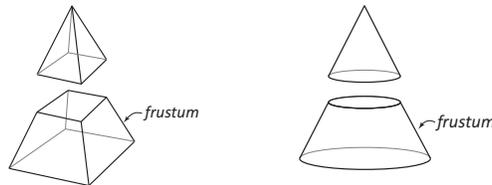

277. _____ cm^2

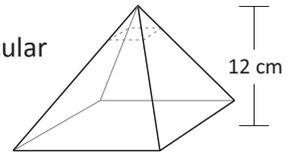

What is the surface area, in square centimeters, of a cylinder with volume $250\pi \text{ cm}^3$ and height 10 cm? Express your answer in terms of π .

The frustum of a cone or a pyramid is that part of the solid left when the top portion is cut off by a plane parallel to its base.

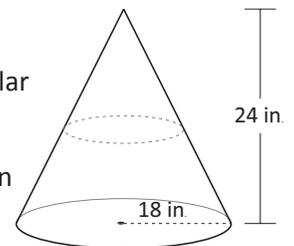

278. A pyramid with height 12 cm has a square base with area 64 cm^2 . A plane perpendicular to the height intersects the pyramid 3 cm from its apex.

a. _____ cm^3 What is the volume of the resulting frustum?

b. _____ cm^2 What is the surface area of the frustum? Express your answer in simplest radical form.

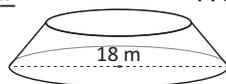

279. A cone with a height of 24 inches has a base with radius 18 inches. A plane perpendicular to the height intersects the cone halfway between its apex and base.

a. _____ in^3 What is the volume of the resulting frustum? Express your answer in terms of π .

b. _____ in^2 What is the surface area of the frustum? Express your answer in terms of π .

280. _____ m^3

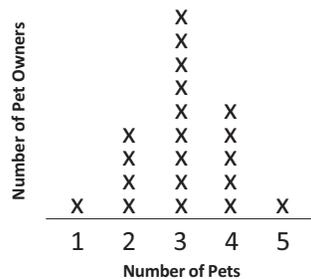

A cone of height 9 m was cut parallel to its base at 3 m above its base. If the base of the original cone had diameter 18 m, what is the volume of the resulting frustum? Express your answer in terms of π .

Data & Statistics Stretch

281. _____ pets As part of a survey, 20 pet owners indicated the total number of pets they currently own, and the results are displayed in the line plot shown. What is the mean of the median and the mode of the data?

Total Number of Pets per Owner

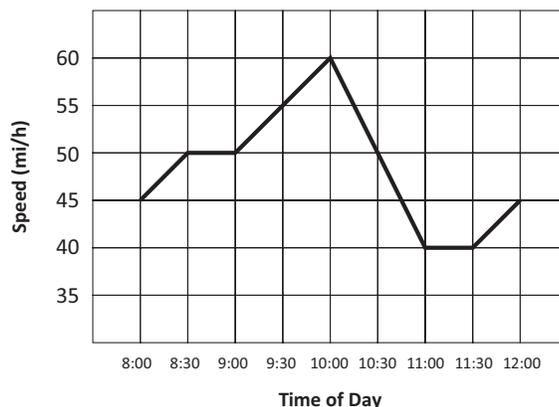

282. _____ mi/h The maximum speed of the fastest roller coaster at 20 different amusement parks is shown in this stem-and-leaf plot, where 10|7 represents 107 mi/h. What is the absolute difference between the mean and the median of the data? Express your answer as a decimal to the nearest tenth.

Maximum Speed of 20 Roller Coasters (mi/h)

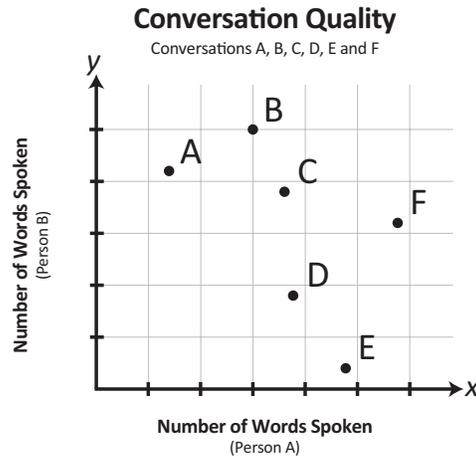

| Stem | Leaf |
|------|-----------|
| 9 | 0 2 3 5 6 |
| 10 | 0 0 7 |
| 11 | 6 9 |
| 12 | 0 8 |
| 13 | 0 5 6 9 |
| 14 | 1 3 8 |
| 15 | 0 |

283. _____ mi/h The line graph shows one driver's speed, in miles per hour, from 8:00 a.m. to 12:00 noon. Based on the graph, what was the driver's average speed from 10:30 to 11:30? Express your answer as a decimal to the nearest tenth.

Driver's Speed
8:00 a.m. to 12:00 noon

284. point The quality of a conversation between two people can be described by the ratio of the number of words spoken by each person. The closer the ratio is to 1, the higher the quality. Each point in the graph shown represents a two-person conversation, with the number of words spoken by one person on the x -axis and the number of words spoken by the other person on the y -axis. If both axes use the same scale, which point in the graph represents the conversation with the highest quality?

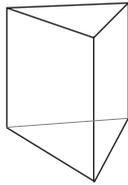

285. _____ If the mean of five values is 27, what is the sum of the five values?
286. _____ When each of five numbers is doubled, the mean of the five new numbers is 60. What was the mean of the five original numbers?
287. _____ A list of 20 numbers has a mean of 37. When two numbers are removed from the list, the new mean is 38. What is the mean of the two numbers that were removed?
288. _____ The mean, median and unique mode of six positive integers are 8, 7 and 3, respectively. What is the maximum possible value for the range of the six numbers?
289. _____ The mean of three consecutive terms in an arithmetic sequence is 10, and the mean of their squares is 394. What is the largest of the three original terms?
290. _____ Six different positive integers add to 66. If one of them is the mean and another is the range, what is the largest possible number in the set?

Geometric Proportions Stretch

291. _____ smaller prisms

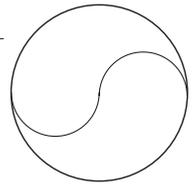

Each edge of the smaller triangular prism shown is $\frac{1}{2}$ the corresponding edge length of the larger triangular prism. How many of the smaller prisms combined have a total volume equal to the volume of the larger prism?

292. _____

A plane, parallel to the bases, slices the smaller prism $\frac{3}{4}$ of the way from one base to the other, dividing it into two smaller prisms. Of the three prisms, what fraction of the volume of the largest prism is the volume of the smallest prism? Express your answer as a common fraction.

293. _____

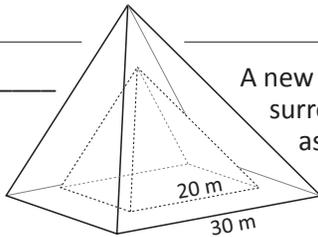

For the two similar circles shown, the area of the large circle is nine times the area of the small circle. What is the ratio of the radius of the small circle to the radius of the large circle? Express your answer as a common fraction.

294. _____ cm

If the S-curve in the large circle has length 3.12 cm, what is the length of the S-curve in the small circle? Express your answer as a decimal to the nearest hundredth.

295. _____

A new solid pyramid with a square base of side length 30 m will be constructed surrounding an existing solid pyramid with a square base of side length 20 m, as shown. If the existing and new pyramids are similar, what is the ratio of the total volume of the new pyramid to the volume of the old pyramid? Express your answer as a common fraction.

296. _____ years

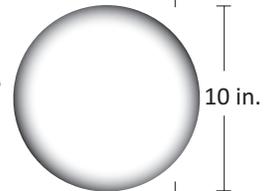

It took 16 years to completely build the original pyramid. Adding to the original pyramid, at the same volume-per-year rate, in how many years will construction of the new, larger pyramid be completed?

297. _____ in³

A glassblower starts with a solid glass sphere that is 2 inches in diameter. What is the volume of the glass sphere? Express your answer as a decimal to the nearest hundredth.

298. _____

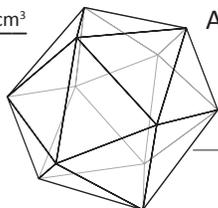

The glassblower will heat the glass sphere and blow air into it to create a hollow sphere 10 inches in diameter of uniform thickness. What is the ratio between the surface area of the original sphere and that of the new, hollow sphere? Express your answer as a common fraction.

299. _____

In the finished hollow sphere, what is the ratio of the volume of glass to the volume of enclosed air? Express your answer as a common fraction.

300. _____ cm³

An icosahedron sculpture is being installed at a state fair. On the architect's model of the sculpture, each of the 20 equilateral triangular faces has area 2.85 cm². The actual sculpture has a total surface area of 4617 cm². If the volume of the model is 34 cm³, what is the volume of the actual sculpture?

BUILDING A COMPETITION PROGRAM

RECRUITING MATHLETES[®]

Ideally, the materials in this handbook will be incorporated into the regular classroom curriculum so that all students learn problem-solving techniques and develop critical thinking skills. When the meetings of a school's MATHCOUNTS team or club are limited to extracurricular sessions, all interested students should be invited to participate regardless of their academic standing. Because the greatest benefits of the MATHCOUNTS programs are realized at the school level, the more Mathletes involved, the better. Students should view their experience with MATHCOUNTS as fun, as well as challenging, so let them know from the very first meeting that the goal is to have a good time while learning.

Here are some suggestions from successful competition coaches and club leaders on how to stimulate interest at the beginning of the school year:

- Build a display case showing MATHCOUNTS shirts and posters. Include trophies and photos from previous years' club sessions or competitions.
- Post intriguing math questions (involving specific school activities and situations) in hallways, the library and the cafeteria. Refer students to the first meeting for answers.
- Make a presentation at the first pep rally or student assembly.
- Approach students through other extracurricular clubs (e.g., honor society, science club, chess club).
- Inform parents of the benefits of MATHCOUNTS participation via the school newsletter or PTA.
- Create a MATHCOUNTS display for Back-to-School Night.
- Have former Mathletes speak to students about the rewards of the program.
- Incorporate the Problem of the Week from the MATHCOUNTS website (www.mathcounts.org/potw) into the weekly class schedule.

MAINTAINING A STRONG PROGRAM

Keep the school program strong by soliciting local support and focusing attention on the rewards of MATHCOUNTS. Publicize success stories. Let the rest of the student body see how much fun Mathletes have. Remember, the more this year's students get from the experience, the easier recruiting will be next year. Here are some suggestions:

- Publicize MATHCOUNTS meetings and events in the school newspaper and local media.
- Inform parents of meetings and events through the PTA, open houses and the school newsletter.
- Schedule a special pep rally for the Mathletes.
- Recognize the achievements of club members at a school awards program.
- Have a students-versus-teachers Countdown Round, and invite the student body to watch.
- Solicit donations from local businesses to be used as prizes in practice competitions.
- Plan retreats or field trips for the Mathletes to area college campuses or hold an annual reunion.
- Take photos at club meetings, coaching sessions or competitions and keep a scrapbook.
- Distribute MATHCOUNTS shirts to participating students.
- Start a MATHCOUNTS summer-school program.
- Encourage teachers of students in lower grades to participate in mathematics enrichment programs.

A MORE DETAILED LOOK

The MATHCOUNTS Foundation administers its math enrichment, coaching and competition program with a grassroots network of more than 17,000 volunteers who organize MATHCOUNTS competitions nationwide. Each year more than 500 local competitions and 56 “state” competitions are conducted, primarily by chapter and state societies of the National Society of Professional Engineers. All 50 states, the District of Columbia, Puerto Rico, Guam, Virgin Islands, U.S. Department of Defense schools and U.S. State Department schools worldwide participate in MATHCOUNTS. Here’s everything you need to know to get involved.

PREPARATION MATERIALS

The annual *MATHCOUNTS School Handbook* provides the basis for coaches and volunteers to coach student Mathletes on problem-solving and mathematical skills. Coaches are encouraged to make maximum use of MATHCOUNTS materials by incorporating them into their classrooms or by using them with extracurricular math clubs. Coaches also are encouraged to share this material with other teachers at their schools, as well as with parents.

The *2013–2014 MATHCOUNTS School Handbook* contains 300 problems. As always, these FREE, challenging and creative problems have been written to meet the National Council of Teachers of Mathematics’ Standards for grades 6-8. The link for the *School Handbook* is being sent electronically to every U.S. school with 7th- and/or 8th-grade students and to any other school that registered for the MATHCOUNTS Competition Series last year. This handbook also is available to schools with 6th-grade students. A hard copy of the *MATHCOUNTS School Handbook* is available upon request to all schools, free of charge. Coaches who register for the MATHCOUNTS Competition Series will receive the handbook in their School Competition Kit.

In addition to the great math problems, be sure to take advantage of the following resources that are included in the *2013-2014 MATHCOUNTS School Handbook*:

Vocabulary and Formulas are listed on pages 52-53.

A **Problem Index** is provided on pages 82-83 to assist you in incorporating the *MATHCOUNTS School Handbook* problems into your curriculum. This index organizes the problems by topic, difficulty rating and mapping to the Common Core State Standard for each problem.

Difficulty Ratings on a scale of 1-7, with 7 being the most difficult, are explained on page 54.

Common Core State Standards are explained on page 81.

A variety of additional information and resources can be found on the MATHCOUNTS website, at www.mathcounts.org, including problems and answers from the previous year’s Chapter and State Competitions, the MATHCOUNTS Coaching Kit, The National Math Club resources and links to state programs. When you register for either the Competition Series or The National Math Club (and you have created a User Profile on the website), you will receive access to even more free resources that are not visible or available to the general public. Be sure to create a User Profile as soon as possible, and then visit the Coaches section of the site.

The MATHCOUNTS OPLET, which contains *MATHCOUNTS School Handbook* problems and competition problems from the last 13 years, is a wonderful resource. Once a 12-month subscription is purchased, the user can create customized worksheets, flash cards and Problems of the Day by using this database of problems. For more information, see page 8 or go to www.mathcounts.org/oplet and check out some screen shots of the MATHCOUNTS OPLET. A 12-month subscription can be purchased online.

Additional coaching materials and novelty items may be ordered through Sports Awards. An order form, with information on the full range of products, is available in the MATHCOUNTS Store section at www.mathcounts.org/store or by calling Sports Awards toll-free at 800-621-5803. A limited selection of MATHCOUNTS materials also is available at www.artofproblemsolving.com.

COACHING STUDENTS

The coaching season begins at the start of the school year. The sooner you begin your coaching sessions, the more likely students still will have room in their schedules for your meetings and the more preparation they can receive before the competitions.

The original problems found in the *MATHCOUNTS School Handbook* are divided into three sections: Warm-Ups, Workouts and Stretches. Each Warm-Up and Workout contains problems that generally survey the grades 6-8 mathematics curricula. Workouts assume the use of a calculator; Warm-Ups do not. The Stretches are collections of problems centered around a specific topic.

The problems are designed to provide Mathletes with a large variety of challenges and prepare them for the MATHCOUNTS competitions. (These materials also may be used as the basis for an exciting extracurricular mathematics club or may simply supplement the normal middle school mathematics curriculum.) Answers to all problems in the handbook include codes indicating level of difficulty and Common Core State Standard. The difficulty ratings are explained on page 54, and the Common Core State Standards are explained on page 81.

WARM-UPS AND WORKOUTS

The Warm-Ups and Workouts are on pages 9-35 and are designed to increase in difficulty as students go through the handbook.

For use in the classroom, Warm-Ups and Workouts serve as excellent additional practice for the mathematics that students already are learning. In preparation for competition, the Warm-Ups can be used to prepare students for problems they will encounter in the Sprint Round. It is assumed that students will not be using calculators for Warm-Up problems. The Workouts can be used to prepare students for the Target and Team Rounds of competition. It is assumed that students will be using calculators for Workout problems. All of the problems provide students with practice in a variety of problem-solving situations and may be used to diagnose skill levels, to practice and apply skills or to evaluate growth in skills.

STRETCHES

Pages 36-40 present the Surface Area and Volume, Data and Statistics, and Geometric Proportions Stretches. The problems cover a variety of difficulty levels. These Stretches may be incorporated in your students' practice at any time.

ANSWERS

Answers to all problems can be found on pages 54-58.

SOLUTIONS

Compete solutions for the problems start on page 59. These are only possible solutions. You or your students may come up with more elegant solutions.

SCHEDULE

The Stretches can be used at any time. The following chart is the recommended schedule for using the Warm-Ups and Workouts if you are participating in the Competition Series.

| | | |
|----------------|--|--------------|
| September 2013 | Warm-Ups 1-2 | Workout 1 |
| October | Warm-Ups 3-6 | Workouts 2-3 |
| November | Warm-Ups 7-10 | Workouts 4-5 |
| December | Warm-Ups 11-14 | Workouts 6-7 |
| January 2014 | Warm-Ups 15-16 | Workout 8 |
| | MATHCOUNTS School Competition | |
| | Warm-Ups 17-18 | Workout 9 |
| February | Selection of competitors for Chapter Competition | |
| | MATHCOUNTS Chapter Competition | |

To encourage participation by the greatest number of students, postpone selection of your school's official competitors until just before the local competition.

On average, MATHCOUNTS coaches meet with Mathletes for an hour one or two times a week at the beginning of the year and with increasing frequency as the competitions approach. Sessions may be held before school, during lunch, after school, on weekends or at other times, coordinating with your school's schedule and avoiding conflicts with other activities.

Here are some suggestions for getting the most out of the Warm-Ups and Workouts at coaching sessions:

- Encourage discussion of the problems so that students learn from one another.
- Encourage a variety of methods for solving problems.
- Have students write problems for each other.
- Use the MATHCOUNTS Problem of the Week. Currently, this set of problems is posted every Monday on the MATHCOUNTS website at www.mathcounts.org/potw.
- Practice working in groups to develop teamwork (and to prepare for the Team Round).
- Practice oral presentations to reinforce understanding.
- Take advantage of additional MATHCOUNTS coaching materials, such as previous years' competitions, to provide an extra challenge or to prepare for competition.
- Provide refreshments and vary the location of your meetings to create a relaxing, enjoyable atmosphere.
- Invite the school principal to a session to offer words of support.
- Recruit volunteers. Volunteer assistance can be used to enrich the program and expand it to more students. Fellow teachers can serve as assistant coaches. Individuals such as MATHCOUNTS alumni and high school students, parents, community professionals and retirees also can help.

OFFICIAL RULES AND PROCEDURES

The following rules and procedures govern all MATHCOUNTS competitions. The MATHCOUNTS Foundation reserves the right to alter these rules and procedures at any time. **Coaches are responsible for being familiar with the rules and procedures outlined in this handbook.** Coaches should bring any difficulty in procedures or in student conduct to the immediate attention of the appropriate chapter, state or national official. Students violating any rules may be subject to immediate disqualification.

REGISTRATION

For your school to participate in the MATHCOUNTS Competition Series, a school representative is required to complete and return the Competition Series Registration Form (available at www.mathcounts.org/competitionreg) along with a check, money order, purchase order or credit card authorization. **Your registration must be postmarked no later than December 13, 2013** and mailed to MATHCOUNTS Registration, P.O. Box 441, Annapolis Junction, MD 20701. Registration forms also may be scanned and submitted via e-mail at reg@mathcounts.org or faxed to 240-396-5602. *For early bird registrations postmarked by November 15, 2013, the discounted cost to register a team is \$90, and the discounted cost to register each individual is \$25.* For registrations postmarked after November 15, 2013 but by December 13, 2013, the cost to register a team is \$100, and the cost to register each individual is \$30. Schools entitled to receive Title I funds may register for half the cost of the applicable registration fee. An additional fee of \$20 will be assessed to process late registrations. (This fee is for each late registration form and not for each student being registered.)

Please note that submission of your Competition Series Registration Form will not register your school for The National Math Club. In order to register for The National Math Club and receive your Club in a Box, please complete and return a National Math Club Registration Form, available at the back of this handbook or on our website at www.mathcounts.org/clubreg.

By completing the Competition Series Registration Form, the coach attests to the school administration's permission to register students for MATHCOUNTS.

Academic centers or enrichment programs that do not function as students' official school of record are not eligible to register.

Registration in the Competition Series entitles a school to send students to the local competition and receive the School Competition Kit (which includes the *2013-2014 School Handbook*, recognition ribbons, student participation certificates and a catalog of additional coaching materials) and an e-mailed copy of the School Competition (with instructions, problems and answers). Mailings of the School Competition Kits will occur on a rolling basis through December 31, 2013.

Your Registration Form must be postmarked by December 13, 2013. *In some circumstances, late registrations might be accepted, at the discretion of MATHCOUNTS and the local coordinator.* However, late fees will apply.

The sooner you register, the sooner you will receive your School Competition Kit to help prepare your team. Once processed, confirmation of your registration will be available at www.mathcounts.org/competitionschools. Other questions about the status of your registration should be directed to MATHCOUNTS Registration, P.O. Box 441, Annapolis Junction, MD 20701. Telephone: 301-498-6141. Your state or local coordinator will be notified of your registration, and you then will be informed of the date and location of your local competition. **If you have not been contacted by mid-January with competition details, it is your responsibility to contact your local coordinator** to confirm that your registration has been properly routed and that your school's participation is expected. Coordinator contact information is available at www.mathcounts.org/competition.

ELIGIBLE PARTICIPANTS

Students enrolled in the 6th, 7th or 8th grade are eligible to participate in MATHCOUNTS competitions. Students taking middle school mathematics classes who are not full-time 6th, 7th or 8th graders are not eligible. Participation in MATHCOUNTS competitions is limited to three years for each student, though there is no limit to the number of years a student may participate in the school-based coaching phase.

School Registration: A school may register one team of four and up to six individuals for a total of 10 participants. You must designate team members versus individuals prior to the start of the Chapter (local) Competition (i.e., a student registered as an "individual" may not help his or her school team advance to the next level of competition).

Team Registration: Only one team (of up to four students) per school is eligible to compete. Members of a school team will participate in the Sprint, Target and Team Rounds. Members of a school team also will be eligible to qualify for the Countdown Round (where conducted). Team members will be eligible for team awards, individual awards and progression to the state and national levels based on their individual and/or team performance. It is recommended that your strongest four Mathletes form your school team. Teams of fewer than four will be allowed to compete; however, the team score will be computed by dividing the sum of the team members' scores by 4 (see "Scoring" on page 49 for details). Consequently, teams of fewer than four students will be at a disadvantage.

Individual Registration: Up to six students may be registered in addition to or in lieu of a school team. Students registered as individuals will participate in the Sprint and Target Rounds but not the Team Round. Individuals will be eligible to qualify for the Countdown Round (where conducted). Individuals also will be eligible for individual awards and progression to the state and national levels.

School Definitions: *Academic centers or enrichment programs that do not function as students' official school of record are not eligible to register.* If it is unclear whether an educational institution is considered a school, please contact your local Department of Education for specific criteria governing your state.

School Enrollment Status: *A student may compete only for his or her official school of record.* A student's school of record is the student's base or main school. A student taking limited course work at a second school or educational center may not register or compete for that second school or center, even if the student is not competing for his or her school of record. MATHCOUNTS registration is not determined by where a student takes his or her math course. If there is any doubt about a student's school of record, the local or state coordinator must be contacted for a decision before registering.

Small Schools: MATHCOUNTS does not distinguish between the sizes of schools for Competition Series registration and competition purposes. Every "brick-and-mortar" school will have the same registration allowance of up to one team of four students and/or up to six individuals. A school's participants may not combine with any other school's participants to form a team when registering or competing.

Homeschools: Homeschools in compliance with the homeschool laws of the state in which they are located are eligible to participate in MATHCOUNTS competitions in accordance with all other rules. Homeschool coaches must complete a Homeschool Participation Attestation Form, verifying that students from the homeschool or homeschool group are in the 6th, 7th or 8th grade and that each homeschool complies with applicable state laws. Completed attestations must be submitted to the national office before registrations will be processed. A Homeschool Participation Attestation Form can be downloaded from www.mathcounts.org/competition. Please fax attestations to 703-299-5009.

Virtual Schools: Any virtual school interested in registering students must contact the MATHCOUNTS national office at 703-299-9006 before December 13, 2013 for registration details. Any student registering as a virtual school student must compete in the MATHCOUNTS Chapter Competition assigned according to the student's home address. Additionally, virtual school coaches must complete a Homeschool Participation Attestation Form verifying that the students from the virtual school are in the 6th, 7th or 8th grade and that the virtual school complies with applicable state laws. Completed attestations must be submitted to the national office before registrations will be processed. A Homeschool Participation Attestation Form can be downloaded from www.mathcounts.org/competition. Please fax attestations to 703-299-5009.

Substitutions by Coaches: Coaches may not substitute team members for the State Competition unless a student voluntarily releases his or her position on the school team. Additional requirements and documentation for substitutions (such as requiring parental release or requiring the substitution request to be submitted in writing) are at the discretion of the state coordinator. Coaches may not make substitutions for students progressing to the State Competition as individuals. At all levels of competition, student substitutions are not permitted after on-site competition registration has been completed. A student being added to a team need not be a student who was registered for the Chapter Competition as an individual.

Religious Observances: A student who is unable to attend a competition due to religious observances may take the written portion of the competition up to one week in advance of the scheduled competition. In addition, all competitors from that student's school must take the exam at the same time. ***Advance testing will be done at the discretion of the local and state coordinators. If advance testing is deemed possible, it will be conducted under proctored conditions.*** If the student who is unable to attend the competition due to a religious observance is not part of the school team, then the team has the option of taking the Team Round during this advance testing or on the regularly scheduled day of the competition with the other teams. The coordinator must be made aware of the team's decision before the advance testing takes place. Students who qualify for an official Countdown Round but are unable to attend will automatically forfeit one place standing.

Special Needs: Reasonable accommodations may be made to allow students with special needs to participate. ***A request for accommodation of special needs must be directed to local or state coordinators in writing at least three weeks in advance of the local or state competition.*** This written request should thoroughly explain a student's special need as well as what the desired accommodation would entail. Many accommodations that are employed in a classroom or teaching environment cannot be implemented in the competition setting. Accommodations that are not permissible include, but are not limited to, granting a student extra time during any of the competition rounds or allowing a student to use a calculator for the Sprint or Countdown Rounds. In conjunction with the MATHCOUNTS Foundation, coordinators will review the needs of the student and determine if any accommodations will be made. In making final determinations, the feasibility of accommodating these needs at the National Competition will be taken into consideration.

LEVELS OF COMPETITION

MATHCOUNTS competitions are organized at four levels: school, chapter (local), state and national. Competition questions are written for the 6th- through 8th-grade audience. The competitions can be quite challenging, particularly for students who have not been coached using MATHCOUNTS materials. All competition materials are prepared by the national office.

The real success of MATHCOUNTS is influenced by the coaching sessions at the school level. This component of the program involves the most students (more than 500,000 annually), comprises the longest period of time and demands the greatest involvement.

SCHOOL COMPETITION: In January, after several months of coaching, schools registered for the Competition Series should administer the School Competition to all interested students. The School Competition is intended to be an aid to the coach in determining competitors for the Chapter (local) Competition. *Selection of team and individual competitors is entirely at the discretion of coaches and need not be based solely on School Competition scores.* School Competition material is sent to the coach of a school, and it may be used by the teachers and students only in association with that school's programs and activities. The current year's School Competition questions must remain confidential and may not be used in outside activities, such as tutoring sessions or enrichment programs with students from other schools. *For additional announcements or edits, please check the Coaches section on the MATHCOUNTS website before administering the School Competition.*

It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better math skills in all students, not just in those students who will be competing. Therefore, it is suggested that the coach postpone selection of competitors until just prior to the local competitions.

CHAPTER COMPETITIONS: Held from February 1 through February 28, 2014, the Chapter Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be included. The chapter and state coordinators determine the date and administration of the Chapter (local) Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The winning team will advance to the State Competition. Additionally, the two highest-ranking competitors not on the winning team (who may be registered as individuals or as members of a team) will advance to the State Competition. This is a minimum of six advancing Mathletes (assuming the winning team has four members). Additional teams and/or Mathletes also may progress at the discretion of the state coordinator. The policy for progression must be consistent for all chapters within a state.

STATE COMPETITIONS: Held from March 1 through March 31, 2014, the State Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be included. The state coordinator determines the date and administration of the State Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The four highest-ranked Mathletes and the coach of the winning team from each State Competition will receive an all-expenses-paid trip to the National Competition.

RAYTHEON MATHCOUNTS NATIONAL COMPETITION: Held Friday, May 9, 2014 in Orlando, Florida, the National Competition consists of the Sprint, Target, Team and Countdown Rounds. Expenses of the state team and coach to travel to the National Competition will be paid by MATHCOUNTS. The national program does not make provisions for the attendance of additional students or coaches. All national competitors will receive a plaque and other items in recognition of their achievements. Winning teams and individuals also will receive medals, trophies and college scholarships.

COMPETITION COMPONENTS

MATHCOUNTS competitions are designed to be completed in approximately three hours:

The **SPRINT ROUND** (40 minutes) consists of 30 problems. This round tests accuracy, with the time period allowing only the most capable students to complete all of the problems. **Calculators are not permitted.**

The **TARGET ROUND** (approximately 30 minutes) consists of 8 problems presented to competitors in four pairs (6 minutes per pair). This round features multistep problems that engage Mathletes in mathematical reasoning and problem-solving processes. **Problems assume the use of calculators.**

The **TEAM ROUND** (20 minutes) consists of 10 problems that team members work together to solve. Team member interaction is permitted and encouraged. **Problems assume the use of calculators.**

Note: Coordinators may opt to allow those competing as individuals to create a “squad” to take the Team Round for the experience, but the round *should not be scored and is not considered official.*

The **COUNTDOWN ROUND** is a fast-paced oral competition for top-scoring individuals (based on scores in the Sprint and Target Rounds). In this round, pairs of Mathletes compete against each other and the clock to solve problems. **Calculators are not permitted.**

At Chapter and State Competitions, a Countdown Round may be conducted officially or unofficially (for fun) or it may be omitted. However, the use of an official Countdown Round must be consistent for all chapters within a state. In other words, *all* chapters within a state must use the round officially in order for *any* chapter within a state to use it officially. All students, whether registered as part of a school team or as individual competitors, are eligible to qualify for the Countdown Round.

An **official Countdown Round** is defined as one that determines an individual’s final overall rank in the competition. If the Countdown Round is used officially, the official procedures as established by the MATHCOUNTS Foundation must be followed.

If a **Countdown Round is conducted unofficially**, the official procedures do not have to be followed. Chapters and states choosing not to conduct the round officially must determine individual winners on the sole basis of students’ scores in the Sprint and Target Rounds of the competition.

In an **official Countdown Round**, the top 25% of students, up to a maximum of 10, are selected to compete. These students are chosen based on their individual scores. The two lowest-ranked students are paired, a question is projected and students are given 45 seconds to solve the problem. A student may buzz in at any time, and if he or she answers correctly, a point is scored; if a student answers incorrectly, the other student has the remainder of the 45 seconds to answer. Three questions are read to the pair of students, one question at a time, and the student who scores the higher number of points (not necessarily 2 out of 3) captures the

place, progresses to the next round and challenges the next-higher-ranked student. (If students are tied after three questions (at 1-1 or 0-0), questions continue to be read until one is successfully answered.) This procedure continues until the fourth-ranked Mathlete and his or her opponent compete. For the final four rounds, the first student to correctly answer three questions advances. The Countdown Round proceeds until a first-place individual is identified. (More detailed rules regarding the Countdown Round procedure are identified in the Instructions section of the School Competition Booklet.) *Note: Rules for the Countdown Round change for the National Competition.*

ADDITIONAL RULES

All answers must be legible.

Pencils and paper will be provided for Mathletes by competition organizers. However, students may bring their own pencils, pens and erasers if they wish. They may not use their own scratch paper or graph paper.

Use of notes or other reference materials (including dictionaries and translation dictionaries) is not permitted.

Specific instructions stated in a given problem take precedence over any general rule or procedure.

Communication with coaches is prohibited during rounds but is permitted during breaks. All communication between guests and Mathletes is prohibited during competition rounds. Communication between teammates is permitted only during the Team Round.

Calculators are not permitted in the Sprint and Countdown Rounds, but they are permitted in the Target, Team and Tiebreaker (if needed) Rounds. When calculators are permitted, students may use any calculator (including programmable and graphing calculators) that does not contain a QWERTY (typewriter-like) keypad. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. Smart phones, laptops, iPads®, iPods®, personal digital assistants (PDAs), and any other “smart” devices are not considered to be calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.

Coaches are responsible for ensuring that their students use acceptable calculators, and students are responsible for providing their own calculators. Coordinators are not responsible for providing Mathletes with calculators or batteries before or during MATHCOUNTS competitions. Coaches are strongly advised to bring backup calculators and spare batteries to the competition for their team members in case of a malfunctioning calculator or weak or dead batteries. Neither the MATHCOUNTS Foundation nor coordinators shall be responsible for the consequences of a calculator’s malfunctioning.

Pagers, cell phones, iPods® and other MP3 players should not be brought into the competition room. Failure to comply could result in dismissal from the competition.

Should there be a rule violation or suspicion of irregularities, the MATHCOUNTS coordinator or competition official has the obligation and authority to exercise his or her judgment regarding the situation and take appropriate action, which might include disqualification of the suspected student(s) from the competition.

SCORING

Competition scores do not conform to traditional grading scales. **Coaches and students should view an individual written competition score of 23 (out of a possible 46) as highly commendable.**

The individual score is the sum of the number of Sprint Round questions answered correctly and twice the number of Target Round questions answered correctly. There are 30 questions in the Sprint Round and 8 questions in the Target Round, so the maximum possible individual score is $30 + 2(8) = 46$.

The team score is calculated by dividing the sum of the team members’ individual scores by 4 (even if the team has fewer than four members) and adding twice the number of Team Round questions answered correctly. The

highest possible individual score is 46. Four students may compete on a team, and there are 10 questions in the Team Round. Therefore, the maximum possible team score is $((46 + 46 + 46 + 46) \div 4) + 2(10) = 66$.

If used officially, the Countdown Round yields final individual standings.

Ties will be broken as necessary to determine team and individual prizes and to determine which individuals qualify for the Countdown Round. For ties between individuals, the student with the higher Sprint Round score will receive the higher rank. If a tie remains after this comparison, specific groups of questions from the Sprint and Target Rounds are compared. For ties between teams, the team with the higher Team Round score, and then the higher sum of the team members' Sprint Round scores, receives the higher rank. If a tie remains after these comparisons, specific questions from the Team Round will be compared. Note: These are very general guidelines. Competition officials receive more detailed procedures.

In general, questions in the Sprint, Target and Team Rounds increase in difficulty so that the most difficult questions occur near the end of each round. In a comparison of questions to break ties, generally those who correctly answer the more difficult questions receive the higher rank.

RESULTS DISTRIBUTION

Coaches should expect to receive the scores of their students and a list of the top 25% of students and top 40% of teams from their coordinators. In addition, single copies of the blank competition materials and answer keys may be distributed to coaches after all competitions at that level nationwide have been completed. ***Before distributing blank competition materials and answer keys, coordinators must wait for verification from the national office that all such competitions have been completed.*** Both the problems and answers from Chapter and State Competitions will be posted on the MATHCOUNTS website following the completion of all competitions at that level nationwide (Chapter - early March; State - early April). The previous year's problems and answers will be taken off the website at that time.

Student competition papers and answers will not be viewed by or distributed to coaches, parents, students or other individuals. Students' competition papers become the confidential property of the MATHCOUNTS Foundation.

FORMS OF ANSWERS

The following rules explain acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not have a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: Express 8 divided by 12 as a common fraction. *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$

Problem: Express 12 divided by 8 as a common fraction. *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}$, $1\frac{1}{2}$

Problem: Express the sum of the lengths of the radius and the circumference of a circle with a diameter of $\frac{1}{4}$ as a common fraction in terms of π . *Answer:* $\frac{1+2\pi}{8}$

Problem: Express 20 divided by 12 as a mixed number. *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}$, $\frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}$, $\frac{3}{\pi}$, $\frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}$, $\frac{1}{3}$, 3.5, 2:1

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: Evaluate $\sqrt{15} \times \sqrt{5}$. *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they may both be omitted. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lb 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not do any intermediate rounding (other than the “rounding” a calculator performs) when calculating solutions. All rounding should be done at the end of the calculation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: Write 6895 in scientific notation. *Answer:* 6.895×10^3

Problem: Write 40,000 in scientific notation. *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

VOCABULARY AND FORMULAS

The following list is representative of terminology used in the problems but should not be viewed as all-inclusive. It is recommended that coaches review this list with their Mathletes.

| | | |
|-----------------------------|---|---|
| absolute difference | decimal | infinite series |
| absolute value | degree measure | inscribe |
| acute angle | denominator | integer |
| additive inverse (opposite) | diagonal of a polygon | interior angle of a polygon |
| adjacent angles | diagonal of a polyhedron | interquartile range |
| algorithm | diameter | intersection |
| alternate exterior angles | difference | inverse variation |
| alternate interior angles | digit | irrational number |
| altitude (height) | digit-sum | isosceles |
| apex | direct variation | lateral edge |
| area | dividend | lateral surface area |
| arithmetic mean | divisible | lattice point(s) |
| arithmetic sequence | divisor | LCM |
| base 10 | dodecagon | linear equation |
| binary | dodecahedron | mean |
| bisect | domain of a function | median of a set of data |
| box-and-whisker plot | edge | median of a triangle |
| center | endpoint | midpoint |
| chord | equation | mixed number |
| circle | equiangular | mode(s) of a set of data |
| circumference | equidistant | multiple |
| circumscribe | equilateral | multiplicative inverse (reciprocal) |
| coefficient | evaluate | natural number |
| collinear | expected value | nonagon |
| combination | exponent | numerator |
| common denominator | expression | obtuse angle |
| common divisor | exterior angle of a polygon | octagon |
| common factor | factor | octahedron |
| common fraction | factorial | odds (probability) |
| common multiple | finite | opposite of a number (additive inverse) |
| complementary angles | formula | ordered pair |
| composite number | frequency distribution | origin |
| compound interest | frustum | palindrome |
| concentric | function | parallel |
| cone | GCF | parallelogram |
| congruent | geometric mean | Pascal's Triangle |
| convex | geometric sequence | pentagon |
| coordinate plane/system | height (altitude) | percent increase/decrease |
| coordinates of a point | hemisphere | perimeter |
| coplanar | heptagon | permutation |
| corresponding angles | hexagon | perpendicular |
| counting numbers | hypotenuse | planar |
| counting principle | image(s) of a point (points) (under a transformation) | polygon |
| cube | improper fraction | polyhedron |
| cylinder | inequality | prime factorization |

| | | |
|-------------------------------------|-------------------------|----------------------------------|
| prime number | remainder | supplementary angles |
| principal square root | repeating decimal | system of equations/inequalities |
| prism | revolution | tangent figures |
| probability | rhombus | tangent line |
| product | right angle | term |
| proper divisor | right circular cone | terminating decimal |
| proper factor | right circular cylinder | tetrahedron |
| proper fraction | right polyhedron | total surface area |
| proportion | right triangle | transformation |
| pyramid | rotation | translation |
| Pythagorean Triple | scalene triangle | trapezoid |
| quadrant | scientific notation | triangle |
| quadrilateral | sector | triangular numbers |
| quotient | segment of a circle | trisect |
| radius | segment of a line | twin primes |
| random | semicircle | union |
| range of a data set | sequence | unit fraction |
| range of a function | set | variable |
| rate | significant digits | vertex |
| ratio | similar figures | vertical angles |
| rational number | simple interest | volume |
| ray | slope | whole number |
| real number | slope-intercept form | x-axis |
| reciprocal (multiplicative inverse) | solution set | x-coordinate |
| rectangle | sphere | x-intercept |
| reflection | square | y-axis |
| regular polygon | square root | y-coordinate |
| relatively prime | stem-and-leaf plot | y-intercept |
| | sum | |

The list of formulas below is representative of those needed to solve MATHCOUNTS problems but should not be viewed as the only formulas that may be used. Many other formulas that are useful in problem solving should be discovered and derived by Mathletes.

CIRCUMFERENCE

Circle $C = 2 \times \pi \times r = \pi \times d$

AREA

Circle $A = \pi \times r^2$

Square $A = s^2$

Rectangle $A = l \times w = b \times h$

Parallelogram $A = b \times h$

Trapezoid $A = \frac{1}{2}(b_1 + b_2) \times h$

Rhombus $A = \frac{1}{2} \times d_1 \times d_2$

Triangle $A = \frac{1}{2} \times b \times h$

Triangle $A = \sqrt{s(s-a)(s-b)(s-c)}$

Equilateral triangle $A = \frac{s^2\sqrt{3}}{4}$

SURFACE AREA AND VOLUME

Sphere $SA = 4 \times \pi \times r^2$

Sphere $V = \frac{4}{3} \times \pi \times r^3$

Rectangular prism $V = l \times w \times h$

Circular cylinder $V = \pi \times r^2 \times h$

Circular cone $V = \frac{1}{3} \times \pi \times r^2 \times h$

Pyramid $V = \frac{1}{3} \times B \times h$

Pythagorean Theorem $c^2 = a^2 + b^2$

Counting/
Combinations ${}_n C_r = \frac{n!}{r!(n-r)!}$

ANSWERS

In addition to the answer, we have provided a difficulty rating for each problem. Our scale is 1-7, with 7 being the most difficult. These are only approximations, and how difficult a problem is for a particular student will vary. Below is a general guide to the ratings:

- Difficulty 1/2/3 - One concept; one- to two-step solution; appropriate for students just starting the middle school curriculum.
- 4/5 - One or two concepts; multistep solution; knowledge of some middle school topics is necessary.
- 6/7 - Multiple and/or advanced concepts; multistep solution; knowledge of advanced middle school topics and/or problem-solving strategies is necessary.

Warm-Up 1

| Answer | Difficulty | | |
|---------|------------|------------|-----|
| 1. 5 | (1) | 6. 12 | (3) |
| 2. 8 | (2) | 7. $9/20$ | (4) |
| 3. 8 | (2) | 8. 78 | (4) |
| 4. 6:38 | (2) | 9. 0.05 | (3) |
| 5. 1.75 | (2) | 10. August | (1) |

Warm-Up 2

| Answer | Difficulty | | |
|-----------|------------|-------------|-----|
| 11. 11 | (2) | 16. 666,666 | (2) |
| 12. 24 | (2) | 17. $4/3$ | (4) |
| 13. 3 | (3) | 18. May | (3) |
| 14. March | (2) | 19. 36 | (3) |
| 15. 2 | (2) | 20. 66 | (4) |

Workout 1

| Answer | Difficulty | | |
|-----------------|------------|------------------|-----|
| 21. 1.5 | (1) | 26. 270 | (2) |
| 22. 2.72 | (2) | 27. $\sqrt{119}$ | (4) |
| 23. $4\sqrt{3}$ | (5) | 28. 5.57 | (4) |
| 24. 77.40 | (3) | 29. $1/4$ | (3) |
| 25. 10 | (3) | 30. 16,865 | (3) |

Warm-Up 3

| Answer | Difficulty | | |
|------------|------------|-----------|-----|
| 31. $14/3$ | (2) | 36. $3/4$ | (2) |
| 32. $3/4$ | (2) | 37. 6 | (4) |
| 33. 97 | (3) | 38. $1/6$ | (3) |
| 34. 64 | (4) | 39. 7 | (3) |
| 35. $11/9$ | (4) | 40. 32 | (4) |

Warm-Up 4

| Answer | Difficulty | | |
|------------|------------|------------|-----|
| 41. -8 | (3) | 46. 1^* | (3) |
| 42. 36 | (3) | 47. 15 | (3) |
| 43. 65,000 | (2) | 48. 9 | (4) |
| 44. 1 | (2) | 49. $1/27$ | (4) |
| 45. 235 | (4) | 50. $18x$ | (2) |

Workout 2

| Answer | Difficulty | | |
|---------|------------|---|-----|
| 51. -7 | (4) | 56. 41 | (5) |
| 52. 4 | (3) | 57. 24 | (2) |
| 53. 0 | (3) | 58. 84 | (4) |
| 54. 10 | (3) | 59. 144 | (4) |
| 55. 1.6 | (5) | 60. $16 + 16\sqrt{3}$ or $16\sqrt{3} + 16$ | (4) |

* The plural form of the units is always provided in the answer blank, even if the answer appears to require the singular form of the units.

Warm-Up 5

| Answer | Difficulty | | |
|-------------------|------------|--------------------|-----|
| 61. 45 | (3) | 66. 9 | (4) |
| 62. 8 | (3) | 67. 62 | (4) |
| 63. 2:00 | (2) | 68. 13 | (3) |
| 64. 10 | (3) | 69. 18 | (5) |
| 65. $\frac{2}{3}$ | (3) | 70. $\frac{1}{10}$ | (5) |

Warm-Up 6

| Answer | Difficulty | | |
|-------------------|------------|---------------------|-----|
| 71. 2 | (4) | 76. -1 | (4) |
| 72. (-6, -12) | (4) | 77. 30 | (4) |
| 73. 120 | (3) | 78. 4800 or 4800.00 | (3) |
| 74. 9 | (3) | 79. 27 | (3) |
| 75. $\frac{1}{4}$ | (4) | 80. 134 | (2) |

Workout 3

| Answer | Difficulty | | |
|------------|------------|-------------------|-----|
| 81. 281.32 | (4) | 86. 40,431 | (3) |
| 82. 2.25 | (4) | 87. $(165\pi)/2$ | (3) |
| 83. 1320 | (4) | 88. 22 | (4) |
| 84. 0.82 | (4) | 89. $\frac{3}{4}$ | (3) |
| 85. 297.44 | (3) | 90. 67.88 | (4) |

Warm-Up 7

| Answer | Difficulty | | |
|--------------------|------------|----------------------|-----|
| 91. 6 | (2) | 96. 6 | (3) |
| 92. $\frac{8}{9}$ | (4) | 97. $9\frac{11}{12}$ | (3) |
| 93. $\frac{1}{24}$ | (4) | 98. $\frac{1}{6}$ | (4) |
| 94. $\frac{7}{4}$ | (3) | 99. 800 | (4) |
| 95. 7 | (3) | 100. 8000 | (4) |

Warm-Up 8

| Answer | Difficulty | | |
|---------------------|------------|--------------|-----|
| 101. 17 | (2) | 106. 8 | (3) |
| 102. 36 | (4) | 107. $3x/10$ | (4) |
| 103. $\frac{5}{4}$ | (4) | 108. 110 | (5) |
| 104. $2\frac{2}{3}$ | (4) | 109. 122 | (4) |
| 105. 7 | (2) | 110. 6 | (4) |

Workout 4

| Answer | Difficulty | | |
|-------------|------------|------------|-----|
| 111. 203.45 | (3) | 116. 63 | (4) |
| 112. 3 | (3) | 117. 329 | (3) |
| 113. 299 | (6) | 118. 11.56 | (3) |
| 114. 3.02 | (6) | 119. 400 | (4) |
| 115. 123.50 | (3) | 120. 75.4 | (4) |

Warm-Up 9

| Answer | Difficulty | | |
|------------------|------------|-------------|-----|
| 121. 1925 | (3) | 126. 11 | (3) |
| 122. 300 | (2) | 127. 20 | (4) |

| 294. 1.04 | (3) | 299. $1/124$ | (5) |
| 295. $27/8$ | (4) | 300. 24,786 | (6) |

SOLUTIONS

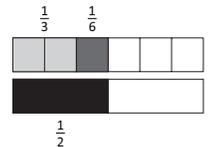

The solutions provided here are only *possible* solutions. It is very likely that you or your students will come up with additional—and perhaps more elegant—solutions. Happy solving!

Warm-Up 1

1. The hypotenuse of a right triangle is the side that is opposite the right angle, and it is always the longest side. In the figure, the hypotenuse starts at the 2-cm mark and ends at the 7-cm mark, so it is $7 - 2 = 5$ cm long.
2. A ratio is a comparison by division. If we compare the known length of 18 cm to the unknown width of x cm, the ratio needs to equal $9/4$, as given. In other words, $18/x = 9/4$. Since 18 is twice 9, x must be twice 4, which means the width is **8** cm.
3. With 2 pounds of rice, Mike can completely fill $2 \div (1/3) = 2 \times 3 = 6$ bins. Since $(3/4) \div (1/3) = (3/4) \times 3 = 9/4 = 2 \frac{1}{4}$, Mike can completely fill another 2 bins with rice. Therefore, Mike can completely fill $6 + 2 = 8$ bins.
4. If Jessie left for the movie at 4:05 p.m., he arrived at the theater at $4:05 + 0:15 = 4:20$ p.m., and the movie started at $4:20 + 0:10 = 4:30$ p.m. The movie ended at $4:30 + 1:43 = 5:73 = 6:13$, and he got home at $6:13 + 0:25 = 6:38$ p.m. Alternatively, we can add the four times to find that he was gone for a total of $0:15 + 0:10 + 1:43 + 0:25 = 1:93 = 2:33$, which is 2 hours 33 minutes after 4:05, or **6:38** p.m.
5. Without the savings of \$2.50, the 10 carnival rides would cost $15 + 2.50 = \$17.50$. Dividing \$17.50 by 10 rides, we get a price per ride of **\$1.75**.
6. Adding the two equations, we get $(x + y) + (x - y) = 7 + 1 \rightarrow 2x = 8 \rightarrow x = 4$. Substituting this into the first equation, we see that $4 + y = 7 \rightarrow y = 3$. Therefore, $xy = 3 \times 4 = 12$. We could also approach the solution a different way. The algebra tells us that the sum of two numbers is 7 and their difference is 1. Suppose the bigger number is decreased by 1. Then we would have two equal numbers that add up to 6, which would be 3 and 3. The two numbers must be $x = 4$ and $y = 3$, and the product $xy = 3 \times 4 = 12$.
7. We should use the least common multiple of 5 and 3 to make equivalent ratios with the same number of peppermints. We rewrite the ratio of peppermints to chocolates (5:3) as $15/9$ and the ratio of peppermints to gummies (3:4) as $15/20$. This means that for every 15 peppermints there are 9 chocolates and 20 gummies. The desired ratio is **9/20**.
8. In an arithmetic progression, the difference between consecutive terms is constant. If we let d represent the difference between successively larger angles, then the three angles would be 42 degrees, $(42 + d)$ degrees and $(42 + d + d)$ degrees. The sum of the angles in a triangle is 180 degrees, so we know that $3 \times 42 + 3d = 180$. This means $3d = 180 - 3 \times 42 = 180 - 126 = 54$, and $d = 54 \div 3 = 18$. The three angles are 42 degrees, $42 + 18 = 60$ degrees and $60 + 18 = 78$ degrees, the largest being **78** degrees.
9. The total probability must be 1, so the probability that a book on historical fiction is selected at random is $1 - 0.55 - 0.4 = 0.05$.
10. The number of daylight hours in April appears to be a little more than 14 hours 24 minutes. If we look to the right along the same horizontal line, we see that the dot representing the daylight hours in **August** is about the same.

Warm-Up 2

11. The numbers that are in set B or set C, or both, are {2, 10, 11, 14, 18}. Beginning with the largest number, we see that neither 18 nor 14 is an element in set A. Therefore, the greatest number in either of sets B or C is **11**.
12. The temperature decreased 3 °F during each of the last 8 hours for a total drop of $3 \times 8 = 24$ °F. It is 0 °F now, so it must have been **24** °F before the drop.
13. We are looking for two unit fractions that add up to $1/2$. One of the fractions has twice the denominator of the other, so it is half the size. If we divide $1/2$ into three equal parts, we will have what we need. These parts are sixths, so $1/x = 1/3 = 2/6$ and $1/(2x) = 1/6$. The value of x is **3**.

Algebraically, we can write the equation $1/x + 1/(2x) = 1/2$. Rewriting the left-hand side with the common denominator $2x$ and simplifying, we have $2/(2x) + 1/(2x) = 1/2 \rightarrow 3/(2x) = 1/2$. Crossmultiplying and solving for x , we get $2x = 6 \rightarrow x = 3$.

14. Forty-five months is equivalent to 3 years and $45 - 36 = 9$ months, or 3 months less than 4 years. We can count 9 months forward from June or 3 months backward from June to arrive at **March**.
15. Each of the three rooms has a floor with area $20 \times 15 = 300$ ft². That's a total area to be waxed of $3 \times 300 = 900$ ft². Each bucket contains enough floor wax to cover an area of 600 ft². Therefore, to wax the floors in the three rooms, **2** buckets of floor wax must be purchased, and there will be enough floor wax left over to wax another room of the same size.

16. In each example given, the single digit in the center of the palindrome on the right side is both the digit that is repeated and the number of times it appears in the numeral. The middle digit in the palindrome 12,345,654,321 is 6. So, $n = 666,666$. Note that this pattern will fail after nine 9s, because there will be some numbers that “carry” into the next place.

17. The increase of 20% on imports means that imports were 120%, or $12/10$, of what they had been at the beginning of the year. The decrease of 10% on exports means that exports were 90%, or $9/10$, of what they had been. The ratio of imports to exports was $(12/10)/(9/10) = (12/10) \times (10/9) = 12/9 = 4/3$ times what it had been at the beginning of the year.

18. The table shows the amount James saves each month and the sum of his monthly savings. As shown, James will have enough to buy the cell phone once he has saved \$155, which will occur in **May**.

| James | Jan | Feb | Mar | Apr | May |
|-----------------|-----|------|------|------|-------|
| Monthly Savings | \$5 | \$10 | \$20 | \$40 | \$80 |
| Total Savings | \$5 | \$15 | \$35 | \$75 | \$155 |

19. Triangles ABC and ADE are similar (Angle-Angle Theorem). Using the Pythagorean Theorem, we can determine the length of segment BC, represented by x . We have $x^2 + 4^2 = 5^2 \rightarrow x^2 + 16 = 25 \rightarrow x^2 = 9 \rightarrow x = 3$ cm. You may have recognized, without using the Pythagorean Theorem, that the lengths of the sides of $\triangle ABC$ are the Pythagorean Triple 3-4-5. Because corresponding sides of similar triangles are in proportion, we know that the side lengths of $\triangle ADE$ are a multiple of 3-4-5. Since $DE/BC = 9/3$, it follows that $DE = 3 \times BC$. That means $AD = 3 \times AB = 3 \times 4 = 12$ cm, and $AE = 3 \times AC = 3 \times 5 = 15$ cm. The perimeter of $\triangle ADE$ is $AD + DE + AE = 12 + 9 + 15 = 36$ cm.

20. Based on the table data, we see that a total of 100 people (50 males and 50 females) were surveyed. Six of those people were females who preferred the Flume. Think of the 1100 people at the fair as 11 groups of 100 people. We would expect that 6 females out of each of the 11 groups of 100 people prefer the Flume. That would be $6 \times 11 = 66$ females.

Workout 1

21. If we divide the number of hours by the number of lawns, we get the average number of hours it takes to mow each lawn. In this case, we get $9 \div 6 = 1.5$ hours per lawn.

22. To find this value, you should find the π (pi) key on your calculator and learn how to raise a number to a power. Depending on the calculator, you might have a key that shows x^y or y^x , or you might have the symbol \wedge . If you have never seen fractional exponents before, now is a good time to learn that a base raised to the m/n is equivalent to the n th root of the m th power of the base. In this problem, we have the $1/6$ power, which is the sixth root. If you enter this correctly on your calculator, you should get **2.72**, to the nearest hundredth.

23. First we will use the Pythagorean Theorem to find the length of a surface diagonal: $4^2 + 4^2 = c^2 \rightarrow c = \sqrt{32}$. Now, with this surface diagonal and an edge of the cube, we have another right triangle, so we use the Pythagorean Theorem again: $4^2 + (\sqrt{32})^2 = d^2 \rightarrow d^2 = 16 + 32 \rightarrow d = \sqrt{48}$. Now we write this value in simplest radical form as follows: $\sqrt{48} = \sqrt{16 \times 3} = \sqrt{16} \times \sqrt{3} = 4\sqrt{3}$ cm. Notice that the length of this space diagonal is $\sqrt{3}$ times the edge length of the cube. This is true in general.

24. When an item is sold at 20% off, the customer pays $100 - 20 = 80\%$ of the original cost. To calculate with percents, we have to convert them to either a fraction or a decimal. The discounted price is $\$90 \times 0.80 = \72 . Then we add a tax of 7.5% to the discounted price. One nice shortcut is to calculate 107.5% directly so that we won't have to add the tax amount to the price. Multiplying $\$72$ by 1.075, we see that, after tax, Carol paid **\$77.40** for the pair of jeans.

25. Since $1 + 1 = 2$, we need to determine how to write 2 in base 2, which uses only two digits, 0 and 1. Every number is represented by a string of one or more of these digits. As in base 10, the right-most digit is the units digit, which tells us how many units there are. The next place, to the immediate left of the units place, is the twos place, which tells us how many twos there are. So to write 2 in base 2, we need a 1 in the twos place to indicate that there is one of the value of that place, and we need a 0 in the units place to indicate that there are no units. Therefore, 2 in base 10 is equivalent to **10** in base 2, also written $2_{10} = 10_2$.

26. Every U.S. dollar was equal to 1.08 euros. At this rate, 250 U.S. dollars could be exchanged for $250 \times 1.08 = 270$ euros.

27. The triple 5-12-13 is a well-known “Pythagorean Triple,” which is a set of three positive integers that satisfy the Pythagorean Theorem. In other words, since $5^2 + 12^2 = 13^2$, we know that three segments of lengths 5, 12 and 13 units can be used to form a right triangle. But we are told that 13 is *not* the length of the hypotenuse. Since the hypotenuse is the longest side of a right triangle, it follows that 12 units is the length of the hypotenuse. If we call the missing side length a , then we have $a^2 = 12^2 - 5^2 \rightarrow a^2 = 144 - 25 \rightarrow a^2 = 119 \rightarrow a = \sqrt{119}$. Since $119 = 7 \times 17$ has no perfect square factors, the length of the third side, in simplest radical form, is **$\sqrt{119}$** units.

28. The area of the square part of the window is $2 \times 2 = 4$ ft². The area of the top part of the window is one-half of the area of a circle with a radius of 1 foot, or $1/2 \times \pi \times 1^2 = \pi/2 \approx 1.57$. Thus, the entire window has a total area of **5.57** ft².

29. A coin can land with either of 2 sides up, and a die can land with any one of 6 sides up, so there are $2 \times 6 = 12$ possible outcomes. Of these 12 outcomes, the 3 ways to get a favorable outcome are (heads up, 2), (heads up, 3) and (heads up, 5). The probability of getting one of these outcomes is $3/12$, or **$1/4$** . Recall that the number 1 is neither prime nor composite; it is the multiplicative identity.

30. Bailey's estimate was $3 \times 3 \times 3 = 27$ ft³. Since each 3-foot side is equal to 36 inches, the estimate is equivalent to $36 \times 36 \times 36 = 46,656$ in³. Since 2 feet 7 inches is equivalent to $24 + 7 = 31$ inches, the actual volume is $31 \times 31 \times 31 = 29,791$ in³. The absolute difference between the estimate and the actual volume is $46,656 - 29,791 = 16,865$ in³.

Warm-Up 3

31. If $a/b = 7/3$, $a = (7/3)b$ and $2a = (14/3)b$. So, the ratio $2a/b = 14/3$. Or simply, the ratio of $2a$ to b is twice the ratio of a to b , or $2(7/3) = 14/3$.
32. The dart closest to the center is equally likely to be any of the four darts. Since Remy threw three darts, the probability that a dart thrown by Remy is closest to the center is $3/4$ (and the probability that Rita's dart is closest is $1/4$).
33. Since the average of Grace's first three test scores was 89, the sum of the three scores was $89 \times 3 = 267$. With an average of 91 after the fourth test, the sum of all four test scores was $91 \times 4 = 364$. The difference between these two sums is Grace's fourth test score. So, Grace scored $364 - 267 = 97$ on her fourth test.
34. There are 6 faces on a cube, so the area of each face must be $96 \div 6 = 16 \text{ cm}^2$. Since each face is a square with side length x , we have $x^2 = 16$, and the cube has edges of length $x = 4 \text{ cm}$. The volume of the cube must be $4 \times 4 \times 4 = 64 \text{ cm}^3$.
35. If 45% percent of the students were born at South Park Hospital, then the remaining 55% were not born there. Notice that the question asks for the ratio of the number of students *not* born there to the number of students born there, which is $55/45 = 11/9$.
36. If we rewrite 4 as $4/1$, it's easier to see that if $c/d = 4/1$, the reciprocal is $d/c = 1/4$. Now we add $1/4$ to $1/2$ and get $1/4 + 2/4 = 3/4$.
37. We know that 7 animals are neither dogs nor white. We are told that there are 15 white animals, 5 of which are dogs. That leaves 10 animals that are white but not dogs. Since $10 + 7 = 17$ of the animals at the store are not dogs, it follows that the pet store has $23 - 17 = 6$ dogs.
38. From 2:00 to 2:15 is 15 minutes. There are 90 minutes from 2:00 to 3:30. The probability that Yoon will get the call before 2:15 is $15/90 = 1/6$.
39. The question asks for a number of quarts, so we should convert all values to quarts. There are $1/2$ gallon = 2 quarts of apple juice, 3 cups = $3/4$ quart of lemon-lime soda, 64 fluid ounces = 2 quarts of pineapple juice, 2 quarts of cold water and 1 cup = $1/4$ quart of lemon juice. The total is $2 + 3/4 + 2 + 2 + 1/4 = 7$ quarts of punch.
40. Let's say that Jude ate x cookies on the first day. Then he ate $x + 6$ on the second day, $x + 12$ on the third day, $x + 18$ on the fourth day and $x + 24$ on the fifth day. The total for the five days is $5x + 60$ and we know that he ate a total of 100 cookies. That means that $5x$ must be 40 and x must be 8. On the fifth day, Jude ate $x + 24$ cookies, or $8 + 24 = 32$ cookies.

Warm-Up 4

41. Any point (a, b) has image $(a, -b)$ when it is reflected across the x -axis. So, when reflected across the x -axis, the point $(-3, 5)$ has the image $(-3, -5)$. The sum of the image's coordinates is $-3 + (-5) = -8$.
42. To calculate $@3@$, we first must determine the factors of $2 \times 3 = 6$. The factors of 6 are 1, 2, 3 and 6, and their product is $1 \times 2 \times 3 \times 6 = 36$.
43. If you were to start at the bottom of the Mariana Trench and climb to the height of Mount Everest, you would travel 36,201 feet up to sea level and then an additional 29,000 feet. That's a total of $36,201 + 29,000 = 65,201$ feet in elevation, which, rounded to the nearest thousand, is **65,000** feet.
44. To determine the arithmetic mean, or average, we add the numbers and divide by 5. In this case, we have some positive numbers and some negative numbers. The sum of the positive numbers is $7 \frac{1}{2} + 4 + 2 = 13 \frac{1}{2}$. The sum of the negative numbers is $-3 \frac{1}{4} + (-5 \frac{1}{4}) = -8 \frac{1}{2}$. The sum of all the numbers is $13 \frac{1}{2} + (-8 \frac{1}{2}) = 5$. Dividing 5 by 5, we get a mean of **1**.
45. Since $45 + 4 = 49$, the value of \sqrt{c} must be 4. Squaring 4, we find that the value of c must be 16. Now we have to calculate $c^2 - 21$, which is $16^2 - 21 = 256 - 21 = 235$.
46. If Janelle spends \$100 every minute, then she will spend $100 \times 60 = \$6000$ every hour, $6000 \times 24 = \$144,000$ every day and $144,000 \times 7 = \$1,008,000$ every week. It will take just **1** week.
47. Filling in the missing addends, we see that we are calculating the sum of 15 integers. If we add pairs of these integers beginning with the 1st and 15th integers, then the 2nd and 14th, and so on, we see that the sum of each pair is 2, with the 8th addend, 1, not being paired. That's 7 sums of 2, plus 1, or $7 \times 2 + 1 = 15$.
48. The area of a triangle equals $(1/2)bh$, where b and h represent the length of the triangle's base and its height, respectively. Suppose this right triangle has as its base the leg of length 8 cm. Its height is the length of the other leg, and we can write $(1/2)(8)h = 36 \rightarrow 4h = 36 \rightarrow h = 9$. The length of the other leg, then, is **9** cm.
49. Because there is a $2/3$ chance of rain on any given day, there is a $1 - 2/3 = 1/3$ chance that it will not rain. The probability that it will not rain on any of those days is $1/3 \times 1/3 \times 1/3 = 1/27$.

50. Square A, with side length x units, has 3 sides that account for $3x$ of the figure's perimeter. Square B, with side length $2x$ units, has 2 complete sides and half of a side that make up $2x + 2x + x = 5x$ units of the perimeter. Square C, with side length $3x$ units, has 3 complete sides and a third of another side that make up $3x + 3x + 3x + x = 10x$ units of the perimeter. The perimeter of the entire figure is $3x + 5x + 10x = 18x$ units.

Workout 2

51. The slope of the line passing through $(4, 3)$ and $(7, -2)$ is $(-2 - 3)/(7 - 4) = -5/3$. A line parallel to this line must have the same slope, so we can write the equation $(3 - c)/(-5 - 1) = -5/3$. To solve this, we multiply both sides of the equation by -6 to get $3 - c = 10$. The value of c must be -7 , since $3 - (-7) = 10$.

52. Since 4.88 seconds is equivalent to $4.88/60$ minutes, we can write the rate as $29.5 \div (4.88/60)$ ft/min. To climb to the top of the Empire State Building at this rate would take $1454 \div (29.5 \div (4.88/60)) \approx 4.0088 \approx 4$ minutes.

53. The four-pack of 16-oz cans of soup contains a total of $4 \times 16 = 64$ oz, with a unit price of $3.20 \div 64 = \$0.05$ per ounce. The three-pack of 24-oz cans of soup contains a total of $3 \times 24 = 72$ oz, with a unit price of $3.60 \div 72 = \$0.05$ per ounce. The absolute difference in unit prices is **0** cents.

54. Knowing the powers of 2 can be very useful. The first ten powers of 2 are 2, 4, 8, 16, 32, 64, 128, 256, 512 and 1024. Because 1024, which is 2^{10} , is very close to 1000, it follows that x is very close to **10**. (In fact the value of x is about 9.966.)

55. Eighteen seconds is $18/60 = 3/10$ minute. That means it takes 3 complete revolutions for the wheel to travel 15 feet, and in 1 revolution it travels $15/3 = 5$ feet. Since the distance traveled in a revolution is equivalent to the wheel's circumference, we can solve $\pi d = 5$ to determine that the wheel's diameter is $d = 5/\pi \approx 1.6$ feet.

56. Although we can't know the individual ages of the 12 people, we know that the sum of their ages is $12 \times 26 = 312$ years. When the 8 people are added, the sum of the ages is $20 \times 32 = 640$ years. The difference of $640 - 312 = 328$ must be the sum of the ages of the 8 new people. It follows that the average age for the 8 new people is $328 \div 8 = 41$ years.

57. If 9 is 3 less than half of Connie's number, then, working backward, she must have said $(9 + 3) \times 2 = 12 \times 2 = 24$.

58. If we subtract the combined weight of Arnold and Benji from the weight of all three people, we will get the weight of Celal, which is $250 - 158 = 92$ pounds. Now we can subtract Celal's weight from the combined weight of Benji and Celal to get Benji's weight, which is $176 - 92 = 84$ pounds.

59. If we look at the possible values for each of the three digits, we see that there are 4 possible values for the hundreds digit (1, 2, 3, 4). There are 9 possible values for the tens digit (0, 1, 2, 3, 4, 6, 7, 8, 9), and there are 4 possible values for the units digit (1, 3, 7, 9). That's a total of $4 \times 9 \times 4 = 144$ odd numbers that do not contain a 5.

60. Using the formula for the area of an equilateral triangle, we see that each triangle has an area of $(s^2\sqrt{3})/4 = (4^2\sqrt{3})/4 = (16\sqrt{3})/4 = 4\sqrt{3}$ in². The total area of all four triangles is $4 \times 4\sqrt{3} = 16\sqrt{3}$ in². The area of a square with side length 4 inches is $4 \times 4 = 16$ in². Thus, the area of the entire figure is **16 + 16√3** in².

Warm-Up 5

61. The current sum is $5 + 10 + 15 + 20 + 25 = 75$, so the mean (average) of the 5 numbers is $75/5 = 15$. If we want the mean to become 20 when we add another number, we will need a sum of $6 \times 20 = 120$. The new number has to be $120 - 75 = 45$.

62. If we multiply both sides of the equation $y = c/x$ by x , we get $xy = c$. In other words, c is the constant product of x and y . Looking at the table, we can see that the product for each pair (x, y) is $(-1/2) \times (-16) = (-1) \times (-8) = (-2) \times (-4) = (-4) \times (-2) = 8$.

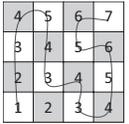

63. It will take Sinclair $90 \div 45 = 2$ hours to drive 90 miles at an average speed of 45 mi/h. If she needs to arrive in New York at 4:00 p.m., she should leave at $4:00 - 2:00 = 2:00$ p.m.

64. When we substitute the given values into the formula and calculate, we get $r = sv(m/a) = 30 \times \sqrt{(12/108)} = 30 \times \sqrt{(1/9)} = 30 \times (1/3) = 10$. Therefore, the model ship should travel at **10** knots.

65. Sixty percent of 50 is 30, and 30 is $30/45 = 2/3$ of 45.

66. To get the greatest possible value of y/x , we would like to have the greatest possible numerator, which is $17 + 18 + 19 = 54$, and the least possible denominator, which is $1 + 2 + 3 = 6$. So we have $54/6 = 9$.

67. After trying a few routes through the grid, you'll see that it is not possible to move from the 1 to the 7 by passing through every cell. Notice that each move is from an unshaded cell to a shaded cell, or vice versa. To pass through all 16 cells, you would need to end on a shaded cell if you began on an unshaded cell. However, the cells with the 1 and the 7 are both unshaded, so it is impossible to move from the 1 to the 7 by passing through all 16 cells. But there are many ways to pass through all but one of the squares. Since we want to maximize the sum and we have to start with the 1, we should choose to leave out one of the 2s. One possible route is shown at right. The sum of the numbers we pass through is **62**.

68. Three minutes is $3 \times 60 = 180$ seconds. In 40 seconds, 3 pages are printed. In 180 seconds, 3 pages will be printed $180 \div 40 = 4.5$ times, for a total of 13.5 pages. That's **13** complete pages.

69. The sum of an interior angle and an exterior angle has to be 180 degrees since they form a straight angle. If we take the 8 parts on the interior and the 1 part on the exterior, then the 9 parts must each be $180 \div 9 = 20$ degrees. Since the polygon is regular, all of the exterior angles must be 20 and they have to total 360 degrees. There must be $360 \div 20 = \mathbf{18}$ sides on this polygon.

70. Four-digit palindromes must have the form ABBA. Since A cannot be zero and B can be any digit, there are $9 \times 10 = 90$ four-digit palindromes. Five-digit palindromes must have the form ABCBA. There are the same 90 possibilities for A and B, and C can be any of the 10 digits. This means there are $90 \times 10 = 900$ five-digit palindromes. The desired ratio is $90/900 = \mathbf{1/10}$.

Warm-Up 6

71. Since 1 raised to any power is 1, we know that $x = 1$ satisfies $x^{2x} = 1$. Also, since -1 raised to any even power is 1, we know that this equation is also satisfied when $x = -1$. These are the only **2** values for x that satisfy the equation.

72. Since we want to have $y = 2x$, we can substitute to get the following equation: $2x = 3x + 6$. Solving, we get $x = -6$. We expect y to be $2 \times (-6) = -12$. Substituting, we confirm that when $x = -6$, $y = 3(-6) + 6 = -18 + 6 = -12$. The ordered pair is **$(-6, -12)$** .

73. Of the 24 hours in a day, 8 hours represents $8/24 = 1/3$ of the hours. So the section of the pie chart labeled *Sleeping* would take up $1/3$ of the circle. Since a circle has 360 degrees, it follows that the central angle for this section measures $360 \times (1/3) = \mathbf{120}$ degrees.

74. Because the average of a , b and c is 15, the sum of the three numbers is $3 \times 15 = 45$. Similarly, the sum of a and b must be $2 \times 18 = 36$. The value of c must be $45 - 36 = \mathbf{9}$.

75. There are $4! = 4 \times 3 \times 2 \times 1 = 24$ ways to place the four letters in the four envelopes. If we are going to have exactly two of the letters in wrong envelopes, then let's imagine that the letters are all in the correct envelopes and that we are choosing two of them to swap. To calculate "4 choose 2," we imagine that we could select any of the 4 letters first and then any of the 3 remaining letters second. We divide these $4 \times 3 = 12$ choices by 2, because every pair of letters is counted twice. This means there are 6 out of 24 ways to get two letters in the right envelopes and two letters in wrong envelopes. The probability is $6/24 = \mathbf{1/4}$.

76. Let's examine the slope, or rise/run, of the line containing the points A(-2, 5) and C(5, -16). From A to C, the rise is $-16 - 5 = -21$ and the run is $5 - (-2) = 7$, giving us a slope of $-21/7 = -3$. Since the point B(0, y) is also on this line, the rise/run from A to B, $(y - 5)/(0 - (-2)) = (y - 5)/2$, also must be -3 . We have $(y - 5)/2 = -3 \rightarrow y - 5 = -6 \rightarrow y = \mathbf{-1}$.

77. Notice that the left-hand side of the equation has the form $(a - b)(a + b)$. Recall this is equivalent to $a^2 - b^2$. So we can rewrite the equation as $(2x)^2 - 5^2 = 5 \rightarrow 4x^2 - 25 = 5 \rightarrow 4x^2 = \mathbf{30}$.

78. We know that after two months Arturo will have less money than his initial investment, because the loss of 20% is a greater dollar amount than the gain of 20%. At the end of the first month, Arturo has 100% of his initial \$5000, plus 20% of the \$5000, or 1.2 times as much, which is $1.2 \times 5000 = \$6000$. At the end of the second month, Arturo has 20% less than this new amount of \$6000, or 80% of \$6000, which is $0.8 \times 6000 = \mathbf{\$4800}$.

79. An interesting feature of the decimal expansion of $1/7$, $2/7$, $3/7$, $4/7$, $5/7$ and $6/7$ is that they all have the same six-digit repeating pattern; the pattern just starts in different places. For the decimal expansion of $4/7$, which is $0.\overline{571428}$, the six digits that repeat are 5, 7, 1, 4, 2 and 8. Since 36 is a multiple of 6, we know that the 36th digit to the right of the decimal point is 8. It follows, then, that the 31st through 36th digits to the right of the decimal point consist of all six repeating digits, and the sum of the digits is $5 + 7 + 1 + 4 + 2 + 8 = \mathbf{27}$. In fact, since the decimal repeats every six consecutive digits, this will be the sum of any six consecutive digits to the right of the decimal point.

80. Let's convert the base-5 number 332_5 to base 10 and then convert the base-10 number to base 8. In base 5, from right to left the place values are units, fives, twenty-fives, and so on, and in base 8, they are units, eights, sixty-fours, and so on. So, $332_5 = (3 \times 25) + (3 \times 5) + (2 \times 1) = 92$ in base 10. Starting with the greatest power of 8, less than 92, we see that $92 = (\underline{1} \times 64) + (\underline{3} \times 8) + (\underline{4} \times 1)$. So in base 8, 332_5 is written as **134_8** .

Workout 3

81. The pilot must have taken about $720/295 = 144/59$ hours to get to the city. Since the pilot logged 5 hours total, the return trip must have taken approximately $5 - (144/59) = (295/59) - (144/59) = 151/59$ hours. His average speed for the return trip must have been about $720/(151/59) = 720 \times 59/151 = 42,480/151 \approx \mathbf{281.32}$ mi/h.

82. Because $c = 2b$ and $b = (1/3)a$, $c = 2(1/3)a$ and $a/c = 3/2$. Therefore, $a^2/c^2 = 9/4 = \mathbf{2.25}$.

83. We don't actually need to know the length and width of the original rectangular basketball court to find the area of the new court. Since one dimension increased by 40% and the other increased by 50%, the area of the new court is $1.4 \times 1.5 = 2.1$ times as large as the original court. So the area of the new basketball court is $2.1 \times 1200 = 2520$ ft². That's an increase of $2520 - 1200 = \mathbf{1320}$ ft².

84. Because 28 of the 300 eighth-graders are in Mr. Jackson's Algebra 1 class, $300 - 28 = 272$ students are not in that class. The probability that neither of the students selected will be from that class is $(272/300) \times (271/299) \approx \mathbf{0.82}$ to the nearest hundredth.

85. Matthew earns $40 \times 8.80 = \$352$ for the first 40 hours and $8 \times 1.5 \times 8.80 = \105.60 for the 8 hours of overtime. Thus his gross pay is $\$352 + \$105.60 = \$457.60$. Since 35% of this amount gets deducted from his pay, Matthew gets to keep the other 65%, which is $0.65 \times \$457.60 = \mathbf{\$297.44}$. The overtime pay of 1.5 times as much money is sometimes referred to as "time-and-a-half" pay. In other words, Matthew gets paid as if he worked $40 + 1.5 \times 8 = 52$ hours at his normal hourly rate. Multiplying 52 by $\$8.80$ per hour, we get the same $\$457.60$ in gross pay.

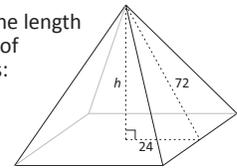

86. There are $365 \text{ days} \times 24 \text{ hours/day} \times 60 \text{ minutes/hour} = 525,600$ minutes in a non-leap year such as 2014. If a new book is published every 13 minutes, then we can expect about $525,600 \div 13 \approx \mathbf{40,431}$ books to be published in 2014.

87. The distance around a circle is a little more than three times the distance across the circle. More specifically, the circumference is π times the diameter. Since Stephen was 15 feet from the center of the merry-go-round, the diameter of the circular path he traveled was $2 \times 15 = 30$ feet. Multiplying this diameter by π and by the $2\frac{3}{4}$ revolutions, we see that Stephen traveled $(165\pi)/2$ feet.

88. The sum of the measures of an angle and its supplement is 180 degrees. In other words, if an angle has degree measure x , then the supplement of x has degree measure $180 - x$. We are told that the difference in measure between an angle and its supplement is 136 degrees. From the information given, we can determine that $(180 - x) - (x) = 136 \rightarrow 180 - 2x = 136 \rightarrow 2x = 44 \rightarrow x = \mathbf{22}$ degrees.

89. Consider when neither hand is in the upper half of an analog clock. This occurs between 15 minutes and 45 minutes after the hour, every hour from 3:00 p.m. to 9:00 p.m. and from 3:00 a.m. to 9:00 a.m. That's a total of $12 \times 30 = 360$ minutes out of the $24 \times 60 = 1440$ minutes in a day, which is $360/1440 = 1/4$ of the day. That means during the other $\mathbf{3/4}$ of the day, at least one hand is in the upper half of the clock.

90. To find the height, h , of the pyramid, we visualize a right triangle with its right angle at the center of the square base. The length of one leg of this triangle is half the side length of the square, or 24 m, and the length of the hypotenuse is the slant height of 72 m. The height of the pyramid is the length of the other leg, which we can find using the Pythagorean Theorem as follows: $24^2 + h^2 = 72^2 \rightarrow 576 + h^2 = 5184 \rightarrow h^2 = 5184 - 576 \rightarrow h^2 = 4608 \rightarrow h = \sqrt{4608}$. Using the square root button on a calculator, we get a height of about $\mathbf{67.88}$ m.

Warm-Up 7

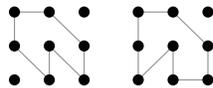

91. It turns out that the least two primes work. When $p = 2$ and $q = 3$, $p + q = 2 + 3 = 5$. The value of pq is $2 \times 3 = \mathbf{6}$.

92. The area of the larger circle is $\pi \times (3x)^2 = 9x^2\pi$, and the area of the smaller circle is $x^2\pi$. The absolute difference of their areas is $|9x^2\pi - x^2\pi| = 8x^2\pi$. This difference is exactly $(8x^2\pi)/(9x^2\pi) = \mathbf{8/9}$ of the area of the larger circle.

93. There are $4! = 4 \times 3 \times 2 \times 1 = 24$ ways to order the four different digits, but only one of them can be used to unlock her device. Therefore, the probability that the security code Raynelle enters will unlock her device is $\mathbf{1/24}$.

94. Since the number of apples, $4x$, and the number of oranges, $7y$, are the same, we can equate the two expressions to get the equation $4x = 7y$. To solve for the ratio x/y , we divide both sides of the equation by 4, and then by y , and we see that $x/y = \mathbf{7/4}$.

95. Two examples are given of polygons with 7 sides.

96. $f(-2) = (-2)^2 + 3(-2) - 4 = 4 - 6 - 4 = -6$, and $g(-8) = (3/4)(-8) + 6 = -6 + 6 = 0$, so $g(-8) - f(-2) = 0 - (-6) = \mathbf{6}$.

97. Gregory falls asleep $30 + 15 + 8 = 53$ minutes after 9:12 p.m., which is 10:05 p.m. From 10:05 p.m. to 8:05 a.m. is 10 hours, but we need to subtract 5 minutes since Gregory woke at 8:00 a.m. That means Gregory slept for 9 hours 55 minutes, which is $\mathbf{9\frac{11}{12}}$ hours.

98. If we divide x/z by x/y , we will get the ratio y/z , which is $(1/8) \div (3/4) = (1/8) \times (4/3) = \mathbf{1/6}$.

99. Let c represent the cost of a computer and p represent the cost of a printer. Since it costs $\$10,000$ to purchase 10 computers and 10 printers or 12 computers and 2 printers, we can write the following equation: $10c + 10p = 12c + 2p$. Solving for c , we get $c = 4p$, which we can substitute into the equation $10c + 10p = 10,000$ to get $10(4p) + 10p = 10,000 \rightarrow 40p + 10p = 10,000 \rightarrow 50p = 10,000$. Solving, we see that $p = \$200$. So the cost of a computer is $4 \times 200 = \mathbf{\$800}$.

100. If we add the fractions that are given, we see that from the beginning of January to the end of September, David earned $1/12 + 1/6 + 1/2 = 1/12 + 2/12 + 6/12 = 9/12 = 3/4$ of his total income last year. Therefore, the $\$2000$ David earned during October, November and December represents $1 - 3/4 = 1/4$ of his total income. It follows, then, that his total income for last year was $4 \times 2000 = \mathbf{\$8000}$.

Warm-Up 8

- 101.** Since there are 100 cm in a meter, 1.75 m equals 175 cm, and $175 \div 10 = 17.5$. So Sebi can cut at most **17** segments of length 10 cm from the string, and there will be a 5-cm segment left over.
- 102.** There are 9 different flavors to choose from for the first scoop and then 8 different flavors for the second scoop. There are $9 \times 8 = 72$ possible ways to make a double-scoop cone. This includes the double-scoop cone with Flavor A as the first scoop and Flavor B as the second scoop, as well as the cone with these scoops reversed. However, we are told that none of the children purchased the same two flavors. That means the total number of two-flavor combinations is $72 \div 2 = 36$ combinations. Therefore, the group consisted of **36** children.
- 103.** Let's call the unknown number n . Then we have $5n = 5 + n$. Solving for n , we see that $4n = 5 \rightarrow n = 5/4$.
- 104.** Let l and w represent the length and width of the rectangle, respectively. Then the perimeter of the rectangle is $2l + 2w = 2 \times 8 + 2w = 16 + 2w$ feet. The area of the rectangle is $lw = 8w$ ft². It should be noted that these two quantities are very different: perimeter is a length and area is a measure of surface. However, since the two are numerically equal, we can write the equation $16 + 2w = 8w$. Solving for w , we get $6w = 16 \rightarrow w = 16/6 = 8/3 = 2\frac{2}{3}$ feet.
- 105.** Let a, b, c, d, e, f and g be the numbers of books in lockers A through G, respectively. For lockers A and C, $a \neq 0$ and $c \neq 0$; otherwise we would have $a + b = 5$ or $b + c = 5$, and one of the other lockers contains 5 books. Similarly, for lockers E and G, $e \neq 0$ and $g \neq 0$. Therefore, $d = 0$, which means neither c nor e can equal 5 or 2. That means the combined number of books in lockers A and G must be $2 + 5 = 7$ books.
- 106.** When a circle touches a line at just one point, we say the line is *tangent* to the circle. A line tangent to a circle is perpendicular to the radius that is drawn from the center of the circle to the point of tangency. In the coordinate plane, it is clear that the radius perpendicular to the y -axis is the horizontal segment from the center $(-8, -3)$ to the point of tangency at $(0, -3)$. So, the length of this radius is **8** units.
- 107.** There are 30 days in June, so that month Barbara will receive allowance in the amount of $30x$ cents. Since there are 100 cents in a dollar, that's $30x/100 = 3x/10$ dollars.
- 108.** If the perimeter of a rectangle is 46 units, then its semiperimeter (half the perimeter) is $46 \div 2 = 23$ units. The rectangle with integer side lengths and with a perimeter of 46 units that has the least area is a 1-unit by 22-unit rectangle, with area $1 \times 22 = 22$ units². The rectangle with the same perimeter that has the greatest area is the one with dimensions closest to those of a square. With integer side lengths, the closest we can get to a square is an 11-unit by 12-unit rectangle, with an area of $11 \times 12 = 132$ units². The absolute difference between these two areas is $|22 - 132| = 110$ units².
- 109.** If 32 women had been added to the group, it would have had $212 + 32 = 244$ people, half of them men and half of them women. It follows, then, that the actual group had $244 \div 2 = 122$ men (and $122 - 32 = 90$ women).
- 110.** If the first three socks selected are three different colors, the fourth sock selected will create a matching pair with one of them. It is possible that the fifth sock selected is the same color as the fourth sock selected. With only one matching pair, we need to select another sock from the drawer. The sixth sock we select will be the same color as the fifth sock selected, or it will be the same color as one of the other first three socks selected. In either case, there will be another matching pair after the sixth sock is selected. Suppose, on the other hand, that the first three socks selected are all the same color, and the fourth and fifth socks selected are each a different one of the other two colors. Again, the sixth sock selected will be the same color as the first three socks selected, or it will match the fourth or fifth sock selected, resulting in a second matching pair. Therefore, the minimum number of socks that must be selected is **6** socks.

Workout 4

- 111.** In 2001, the total snowfall increased 10% from the previous year. That was an additional $200 \times 0.10 = 20$ inches, for a total of $200 + 20 = 220$ inches. In 2002, the total snowfall decreased 5%, or $220 \times 0.05 = 11$ inches, resulting in a total snowfall of $220 - 11 = 209$ inches. In 2003, the total snowfall decreased 10%, or $209 \times 0.10 = 20.9$ inches, resulting in a total snowfall of $209 - 20.9 = 188.1$ inches. In 2004, the total snowfall increased 4%, or $188.1 \times 0.04 = 7.524$ inches, resulting in a total snowfall of $188.1 + 7.524 = 195.624$ inches. It would take just over 4.5 inches of additional snowfall to have a total snowfall over 200 inches. In 2005, the total snowfall again increased 4%, or $195.624 \times 0.04 = 7.82496$ inches. Therefore, in 2005, when the total snowfall first exceeded 200 inches, the total snowfall was about **203.45** inches.

| Games | 1 | 2 | 3 | 4 | 5 |
|-----------------------------|------|-------|-------|-------|-------|
| Country Bowl $4n + 2.60$ | 6.60 | 10.60 | 14.60 | 18.60 | 22.60 |
| Super Bowl $2.5n + 7.10$ | 9.60 | 12.10 | 14.60 | 17.10 | 19.60 |

- 112.** Creating the table shown, we can compare the cost of bowling n games at Country Bowl and Super Bowl. According to the table, the cost is the same at Country Bowl and Super Bowl for **3** games. An algebraic approach would be to set the expression for the cost of bowling n games at Country Bowl, $4n + 2.60$, equal to the expression for the cost of bowling n games at Super Bowl, $2.5n + 7.10$. Doing so, we have $4n + 2.60 = 2.5n + 7.10 \rightarrow 1.5n = 4.5 \rightarrow n = 3$. After solving, we see that the cost to bowl **3** games is the same at the two places.

- 113.** Let us consider the number of difference dates each month during the 21st century. Since January has 31 days, the greatest difference is $31 - 1 = 30$. That's 30 difference dates, one each January from 2001 through 2030. The greatest difference in February is $29 - 2 = 27$, but 2027 is not a leap year. So, the greatest difference is $28 - 2 = 26$. That's 26 difference dates, one each February from 2001 through 2026. The number of difference dates per month is summarized in this table. So, from 2001 through 2030, there are 287 difference dates. But we also need to count the 12 difference dates in 2100: 1/1, 2/2, 3/3, 4/4, 5/5, 6/6, 7/7, 8/8, 9/9, 10/10, 11/11, 12/12. So, in the 21st century, $287 + 12 = 299$ dates can be classified as difference dates.

| | MAX DIFFERENCE | DIFFERENCE DATES |
|---------------|----------------|------------------|
| January | 31 - 1 | 30 |
| February | 28 - 2 | 26 |
| March | 31 - 3 | 28 |
| April | 30 - 4 | 26 |
| May | 31 - 5 | 26 |
| June | 30 - 6 | 24 |
| July | 31 - 7 | 24 |
| August | 31 - 8 | 23 |
| September | 30 - 9 | 21 |
| October | 31 - 10 | 21 |
| November | 30 - 11 | 19 |
| December | 31 - 12 | 19 |
| TOTAL: | | 287 |

114. Since the set contains six numbers, the median is the average of the two middle numbers, x and $11.5x$. We can write the equation $(x + 11.5x)/2 = 2 \rightarrow x + 11.5x = 4 \rightarrow 12.5x = 4$. Solving, we see that $x = 4/12.5 = 0.32$. It follows that $(2/5)x = (2/5) \times 0.32 = 0.128$, and $11.5x = 11.5 \times 0.32 = 3.68$. Therefore, the mean of the set is $(0 + 0.128 + 0.32 + 3.68 + 5 + 9)/6 = 18.128/6 \approx 3.02$.

115. The price \$133.38 is 108% of the cost of the software since it is 100% of the price plus the 8% tax. Dividing 133.38 by 1.08, we find that the price of the software was \$**123.50**.

116. Every square foot of floor space will require $2 \times 2 = 4$ of the 6-inch by 6-inch tiles. The floor has an area of $12 \times 13 = 156 \text{ ft}^2$, so $156 \times 4 = 624$ tiles will be needed. Since there are 10 tiles in each box and $624 \div 10 = 62.4$ boxes, the minimum number of boxes required is **63** boxes.

117. The 49.35 pounds of bamboo leaves and stems must be 15% of the panda's weight. It follows that the panda weighs $49.35 \div 0.15 =$ **329** pounds.

118. The 502 feet that Cecil Fielder hit his home run is $502/450 \approx 1.1156$, or 111.56%, of the length of yarn in the baseball. The percent by which the home run exceeds the length of the yarn is $111.56\% - 100\% =$ **11.56%**.

119. The area of a square with a side length of 4 m is $4 \times 4 = 16 \text{ m}^2$. Substituting into $P = F/A$, we have $25 = F/16$. Solving, we see that the maximum force that can be applied to 16 m^2 without exceeding 25 newtons per square meter is $F = 25 \times 16 =$ **400** newtons.

120. If you unwrapped the label from the cylindrical can, you would find that the label is a rectangle with a width equal to the height of the can and a length equal to the circumference of the can. The circumference of a circle is πd , so this can has a circumference of 4π inches. Therefore, the label has area $4\pi \times 6 = 24\pi \approx$ **75.4** in².

Warm-Up 9

121. If a human were able to jump 350 times his or her height, the average American, at 5 feet 6 inches, would be able to jump $350 \times 5.5 =$ **1925** feet. By way of comparison, that's more than the height of the Empire State Building in New York City.

122. One percent of 3 million people is $3,000,000 \times 0.01 = 30,000$ people. One percent of 30,000 people is $30,000 \times 0.01 =$ **300** people.

123. There are two walls that are 12 feet by 8 feet, two walls that are 15 feet by 8 feet and the ceiling is 12 feet by 15 feet. If there were no windows and doors, there would be an area of $2 \times (12 \times 8) + 2 \times (15 \times 8) + (12 \times 15) = 192 + 240 + 180 = 612 \text{ ft}^2$ to paint. Since 30 inches is 2.5 feet, and 60 inches is 5 feet, we can calculate the area of the 4 windows as $4 \times (2.5 \times 5) = 50 \text{ ft}^2$. The area of the 2 doors is $2 \times (3 \times 7) = 42 \text{ ft}^2$. The total area to be painted is $612 - 50 - 42 = 520 \text{ ft}^2$. If each can of paint covers an area of 100 ft^2 , we get $520 \div 100 = 5.2$. So, **6** cans of paint are needed.

124. If Shanita has s dollars, then Brianna has $2s + 3$ dollars. Together, they have $s + 2s + 3 = 3s + 3$ dollars. We are told this amount is \$24, so we have $3s + 3 = 24 \rightarrow 3s = 21$. Solving, we see that Shanita has $s = 7$ dollars, and Brianna has $2 \times 7 + 3 = 17$ dollars. Brianna has $17 - 7 =$ **10** dollars more than Shanita has.

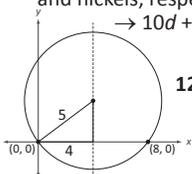

125. Because corresponding angles in $\triangle ABC$ and $\triangle ADE$ are equal, the two triangles are similar. That means that the ratios of corresponding sides are equal. It also means that the ratio of their areas is the square of the ratio of their perimeters. If we let p represent the perimeter of $\triangle ABC$, we can set up the proportion $p^2/55^2 = 98/50 \rightarrow p^2/55^2 = 49/25$. Taking the square root of both sides yields $p/55 = 7/5 \rightarrow 5p = 385 \rightarrow p =$ **77** m.

126. In order for the fraction to be less than one, the numerator must be less than the denominator. The fractions less than one that can occur when each of the possible numerators is rolled are:

- 1: $1/2, 1/3, 1/4, 1/5, 1/6$
- 2: $2/3, 2/5$ ($2/4 = 1/2$ and $2/6 = 1/3$ included above)
- 3: $3/4, 3/5$ ($3/6 = 1/2$ included above)
- 4: $4/5$ ($4/6 = 2/3$ included above)
- 5: $5/6$

That's a total of **11** fractions.

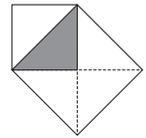

127. If the \$3.55 were entirely nickels, there would be $355 \div 5 = 71$ coins. If we trade two nickels for one dime, we keep the same amount of money but lose one coin. We need to make 20 of these trades to get from 71 coins down to 51 coins, so Rayshon must have **20** dimes (and $71 - 2 \times 20 = 31$ nickels). Algebraically, we can write the equations $10d + 5n = 355$ and $d + n = 51$, where d and n represent the number of dimes and nickels, respectively. Solving the second equation for n yields $n = 51 - d$. Substituting this into the first equation, we have $10d + 5(51 - d) = 355$
 $\rightarrow 10d + 255 - 5d = 355 \rightarrow 5d = 100 \rightarrow d = 20$. Rayshon has **20** dimes.

128. The chord connecting the two given points $(0, 0)$ and $(8, 0)$ is 8 units long. The perpendicular bisector of this chord, shown here as a dashed line, passes through the center of the circle and, with the help of this line, we can form a 3-4-5 right triangle. The center of the circle is at **(4, 3)**.

129. First, we will determine the maximum value of $f(x)$. Let's start by considering $x - 1$. Since the expression will be squared, we know $(x - 1)^2 \geq 0$, and when $x = 1$, $(x - 1)^2 = 0$. Now, examining the expression $-(x - 1)^2$, we notice that $-(x - 1)^2 \leq 0$. That means when $-(x - 1)^2 = 0$, we will get the maximum value of $f(x)$, which is 2. So, the greatest value of $f(x) + 3$ would be $2 + 3 =$ **5**.

130. Let's extend two sides of the unit square until they intersect two vertices of the larger square, as shown. We see that the larger square is composed of four triangles congruent to the one shaded, while the smaller square is composed of only two of those triangles. That means the larger square has an area that is twice that of the smaller square, or **2 units²**.

Warm-Up 10

131. At the start, the 2-cup mixture contains $\frac{2}{3}$ cup of flour and $\frac{4}{3}$ cups of nuts. When $\frac{3}{3}$ cup of flour is added, the mixture is now $\frac{5}{3}$ cups of flour and $\frac{4}{3}$ cups of nuts. We now have 5 parts flour out of $5 + 4 = 9$ parts, so the mixture is **$\frac{5}{9}$ flour**.

132. The difference between Marshall's and Cody's ages is $53 - 17 = 36$ years. In any other year (at this time of year), this difference is the same. When Marshall was four times as old as Cody, the difference of 36 would have been three times Cody's age, so Cody must have been $36 \div 3 = 12$ years old, and Marshall must have been $4 \times 12 = 48$ years old. That was $17 - 12 = 5$ years ago.

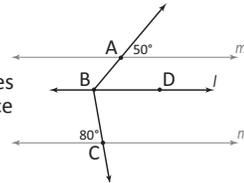

133. The hundreds digit of a house number can be either 7 or 9, so there are 2 possibilities for each of the following cases. Case 1: If the tens digit is even, there are 4 possibilities (zero is not allowed) followed by 5 possible odd digits for the units place. Case 2: If the tens digit is odd, there are 5 possibilities followed by 4 possible even digits for the units place. The greatest number of houses that could be on Main Street is $2 \times (4 \times 5) + 2 \times (5 \times 4) = 40 + 40 = \mathbf{80}$ houses.

134. The cyclist spends twice as much time biking up the hill at a rate of 6 mi/h as biking down the hill at a rate of 12 mi/h, so the average speed will be closer to 6 mi/h than to 12 mi/h; it's *not* 9 mi/h. The uphill time can be written $t_1 = d/6$. The downhill time can be written $t_2 = d/12$. The total time is $t_1 + t_2 = d/6 + d/12 = 2d/12 + d/12 = 3d/12 = d/4$. The total distance is $2d$. So, if the average rate of the total trip is r_T , we have $r_T(d/4) = 2d \rightarrow r_T = 2d \times (4/d) = \mathbf{8}$ mi/h.

135. The distance of $11 \frac{1}{4} = 45/4$ inches on the map represents $45/4 \times 16 = 180$ miles. Averaging 60 mi/h, the trip will take $180 \div 60 = \mathbf{3}$ hours.

136. Rewrite the expression as $\left(\frac{1.4 \times 2.4}{1.2}\right) \left(\frac{10^{-7} \times 10^8}{10^9}\right)$. Simplifying, we have $(1.4 \times 2)(10^{-7} \times 10^{-1}) = \mathbf{2.8 \times 10^{-8}}$.

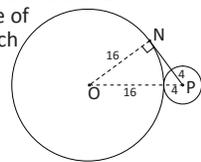

137. Draw line l parallel to lines m and n and through the vertex of $\angle ABC$ and point D, as shown. Line l divides $\angle ABC$ into angles ABD and CBD. Since $l \parallel m$, $\angle ABD$ corresponds to the angle with measure 50 degrees. Thus, $m\angle ABD = 50$ degrees. Similarly, since $l \parallel n$, $\angle CBD$ and the 80-degree angle are alternate interior angles, which means $m\angle CBD = 80$ degrees. Now we have $m\angle ABC = m\angle ABD + m\angle CBD = 50 + 80 = \mathbf{130}$ degrees.

138. The five new students increased the class by $3/2 - 2/2 = 1/2$. Because five students equal half the original number of students, it follows that before the five students were added, Sally's class had $5 \times 2 = \mathbf{10}$ students.

139. Let c and b represent the costs of 1 cobble and 1 burrey, respectively. The first two sentences of the problem translate to the following algebraic equations, respectively: $2c + 3b = 19$ and $37 - 5c = 4b$. The second statement can be rewritten as $5c + 4b = 37$. Now we can add the two equations to get $(2c + 3b) + (5c + 4b) = 19 + 37 \rightarrow 7c + 7b = 56$. So 7 cobbles and 7 burreys cost 56 slugs. Dividing both sides of the equation by 7, we see that $1c + 1b = 8$. Thus, the cost of 1 cobble and 1 burrey is **8** slugs. If we wanted to verify this, we could solve the system of equations and see that $b = 3$ slugs and $c = 5$ slugs, so $1c + 1b$ does, in fact, equal 8 slugs.

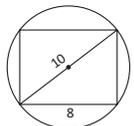

140. As shown, segment ON, drawn perpendicular to segment NP, is a radius of circle O, and, therefore, has length 16 cm. A radius of circle O and a radius of circle P, together, form segment OP, and $OP = 16 + 4 = 20$ cm. $\triangle ONP$ is a right triangle with a 16-cm leg and a hypotenuse of 20 cm. Using the Pythagorean Theorem, we can write $16^2 + NP^2 = 20^2 \rightarrow 256 + NP^2 = 400 \rightarrow NP^2 = 144$. Taking the square root of each side, we see that $NP = \mathbf{12}$ cm. You may also have recognized that 12-16-20 is a multiple of the 3-4-5 Pythagorean Triple.

Workout 5

141. The volume of the smaller cube is $10 \times 10 \times 10 = 1000$ units³. It follows, then, that the volume of the larger cube is $1000 + 728 = 1728$ units³. That means the edge length of the larger cube is $\sqrt[3]{1728} = \mathbf{12}$ units.

142. A rectangle is inscribed in a circle, as shown. The rectangle's diagonal, which divides it into two congruent right triangles, is also a diameter of the circle. This circle, with radius 5 cm, has diameter 10 cm. That means both of the right triangles have a hypotenuse of length 10 cm and a leg of length 8 cm. You may recognize that the side lengths of the right triangles are a multiple of the Pythagorean Triple 3-4-5 and, therefore, conclude that the other leg has length 6 cm. If not, the Pythagorean Theorem can be used to determine the length of the triangle's shorter leg, w . We have $8^2 + w^2 = 10^2 \rightarrow 64 + w^2 = 100 \rightarrow w^2 = 36 \rightarrow w = 6$ cm. Therefore, the rectangle has area $6 \times 8 = \mathbf{48}$ cm².

143. Because each person will get $1/3$ of the original \$234 million, that's $234 \div 3 = \$78$ million before taxes. We are told that they each will receive \$53 million after taxes, which means that, for each of them, $78 - 53 = \$25$ million will be deducted for taxes. Thus, each winner will pay about $25 \div 78 \times 100\% \approx \mathbf{32\%}$ in taxes.

144. To calculate a reduction of 20%, we will multiply by 0.8. To calculate an increase of 20%, we will multiply by 1.2. After six price changes, the item will cost $0.8 \times 1.2 \times 0.8 \times 1.2 \times 0.8 \times 1.2 = 0.884736 \approx 88.5\%$ of its original price. Thus, $a = \mathbf{88.5}$.

145. In a right triangle, one angle measures 90 degrees, so it follows that the sum of the other two angles is $180 - 90 = 90$ degrees. The value of the quotient $90 \div 8$ is **11.25** degrees.

146. The area of the rectangular pizza is $18 \times 24 = 432$ in². The area of the large round pizza is $\pi \times 12^2 = 144\pi$ in². For the same amount of money, with the large round pizza you get $144\pi - 432 \approx 20$ in² more pizza.

147. Because the cost of air conditioning varies directly with the average temperature, we can set up a proportion to solve for the unknown cost c as follows: $32.40/81 = c/96 \rightarrow 81c = 96 \times 32.40 \rightarrow c = 96 \times 32.40 \div 81 \rightarrow c = 38.40$. Kate's air conditioning bill for that particular week in August will be **\$38.40**.

148. Columbus ran $40 + 70 + 40 + 70 = 220$ feet. The length of the diagonal that Pythagoras ran is $\sqrt{70^2 + 40^2} = \sqrt{4900 + 1600} = \sqrt{6500} = 10\sqrt{65}$ feet. Pythagoras ran $2 \times 10\sqrt{65} = 20\sqrt{65}$ feet. Columbus ran $220 - 20\sqrt{65} \approx 58.8$ feet farther than Pythagoras.

149. We will compute a "weighted average" as follows: $[(20 \times 0) + (20 \times 1) + (30 \times 2) + (20 \times 3) + (8 \times 4) + (2 \times 5)] \div 100 = 182/100 = 1.82 \approx 2$. So, on average, a couple getting married today can be expected to have **2** children.

150. If we let n be the number of nickels, then $5n$ is the value of those nickels in cents. Using d for the number of dimes and q for the number of quarters, we can write the following equation for the collection of coins: $5n + 10d + 25q = 530$. If we find an expression for n in terms of q and an expression for d in terms of q , we can substitute those expressions into the previous equation and solve for q . We are told that the number of dimes is 2 more than the number of nickels, so we have $d = n + 2$. Also, the number of quarters is four more than the number of dimes, so $q = d + 4$. We can rewrite this equation as $d = q - 4$, and we have these two equations: $d = n + 2$ and $d = q - 4$. We can set these two equations equal to one another to get an equation for n in terms of q . We have $n + 2 = q - 4 \rightarrow n = q - 6$. Now in the equation $5n + 10d + 25q = 530$, we can replace n and d with $q - 6$ and $q - 4$, respectively. Doing so yields $5(q - 6) + 10(q - 4) + 25q = 530 \rightarrow 5q - 30 + 10q - 40 + 25q = 530 \rightarrow 40q - 70 = 530 \rightarrow 40q = 600 \rightarrow q = 15$. The collection of coins has **15** quarters.

Warm-Up 11

151. If each of the seven numbers is doubled, the sum of the seven numbers will be doubled. Therefore, the mean of the seven numbers also will be doubled. The new mean will be **18**.

152. To find the decimal equivalent of $1/7$, we divide 1 by 7. We get the following 6 repeating digits after the decimal point: $1/7 = 0.\overline{142857}$. Dividing 2013 by 6, we get 335 with a remainder of 3. This means that there will be 335 complete sets of the 6 digits, and the 2013th digit will be the 3rd of the 6 repeating digits, which is **2**.

153. When $z = 1, 2, 3$ or 4 , we have $19/1 = 19 \geq 1$; $19/2 = 9 \frac{1}{2} \geq 2$; $19/3 = 6 \frac{1}{3} \geq 3$; $19/4 = 4 \frac{3}{4} \geq 4$. But for $z > 4$, it is always true that $19/z < z$. Therefore, since $19/z \geq z$ for 4 of the 19 positive integers less than 20, the probability that $19/z \geq z$ is **4/19**.

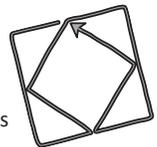

154. First, to find the value of a , consider the proportion $3/4 = a/36$. Cross-multiplying and solving, we see that $4a = 3 \times 36 \rightarrow 4a = 108 \rightarrow a = 27$. Next, to find the value of b , we'll use the proportion $3/4 = 36/b$. Cross-multiplying and solving, we see that $3b = 4 \times 36 \rightarrow 3b = 144 \rightarrow b = 48$. Thus, the value of $a + b$ is $27 + 48 = 75$.

155. Since Pat's share was \$2.25, which represents $2.25/10.80 = 5/24$ of the pizza's total cost, it follows that her part was $5/24$ of the pizza's total area. Therefore, the central angle of Pat's fractional part of the pizza was $(5/24) \times 360 = 5 \times 15 = 75$ degrees.

156. We know that 20 blocks is equivalent to 1 mile, so 60 blocks is $60 \div 20 = 3$ miles. Traveling at an average rate of 3 mi/h, a pedestrian takes 1 hour, or 60 minutes, to travel 60 blocks. At a rate of 30 mi/h, the subway train takes $3 \div 30 = 1/10$ hour = 6 minutes to travel 60 blocks. Compared to the subway train, it takes a pedestrian $60 - 12 = 54$ minutes more to travel 60 blocks.

157. There are $9 \text{ choose } 2 = 9 \times 8 \div 2 = 36$ ways to choose two different positive integers less than 10. Pairing 1 with a perfect square would result in a perfect square product. That gives us $1 \times 4 = 4$ and $1 \times 9 = 9$. We can also get $4 \times 9 = 36$ and $2 \times 8 = 16$. That's 4 out of 36, so the probability is $4/36 = 1/9$. Perhaps you think we should count the products 1×4 and 4×1 separately. In this case, there are a total of 72 ways to choose two different positive integers less than 10 in a particular order. The 8 ordered pairs that have a product that is a perfect square are $1 \times 4, 4 \times 1, 1 \times 9, 9 \times 1, 4 \times 9, 9 \times 4, 2 \times 8$ and 8×2 . Therefore, the probability is $8/72 = 1/9$.

158. We know that the side length of the outer square is 12 inches. Each side of the inner square is the hypotenuse of a 45-45-90 right triangle, with legs of length $12 \div 2 = 6$ inches. We can use the Pythagorean Theorem to determine the length of the hypotenuse. Or you may recall that for a 45-45-90 right triangle with legs of length a , the length of the hypotenuse is $a\sqrt{2}$. That means the inner square has sides of length $6\sqrt{2}$ inches. Therefore, the shortest length of yarn needed to create the figure using a single piece of yarn, as shown, is $(4 \times 12) + (4 \times 6\sqrt{2}) = 48 + 24\sqrt{2}$ inches.

159. Since $r = d/t$, rate (or speed) and time are inversely proportional. That means Rich would have had to drive at $5/3$ his current speed to cover the same distance in $3/5$ the time. If this could be accomplished by increasing his speed 20 mi/h, then 20 mi/h represents $(5/3) - 1 = 2/3$ of his current speed. It follows, then, that Rich's current speed is $(3/2) \times 20 = 30$ mi/h.

160. Since the sum of the angle measures in $\triangle XYZ$ is 180 degrees, we can write the equation $x + 12 + 3x + 2x = 180 \rightarrow 6x + 12 = 180$. Solving for x yields $6x = 168 \rightarrow x = 28$. We can now find the supplement of $\angle XZY$, which is $180 - 3x = 180 - 3 \times 28 = 96$ degrees. Since $\triangle WXZ$ is isosceles, the remaining $180 - 96 = 84$ degrees is divided equally between $\angle W$ and $\angle WXZ$. Therefore, the measure of $\angle W$ is $84 \div 2 = 42$ degrees.

Warm-Up 12

161. Recall that $1000 = 10^3$. We can set up the proportion $10^3/0.02 = 10^8/x$. Cross-multiplying and solving, we have $10^3x = 0.02 \times 10^8 \rightarrow x = (0.02 \times 10^8)/10^3 \rightarrow x = 0.02 \times 10^5 \rightarrow x = 2000$. (Many students will solve this problem by simply moving the decimal point of 0.02 km^2 five places to the right.) This means the amount of soil that 10^8 cubic meters of pine mulch can fertilize is **2000** km^2 .

162. Using the laws of exponents, 9^c can be rewritten as follows: $9^c = (3^2)^c = 3^{2c}$. Similarly, $27^{c-1} = (3^3)^{c-1} = 3^{3(c-1)} = 3^{3c-3}$. So we have $3^{2c} = 3^{3c-3}$. Now that each expression is a power of 3, we can conclude that $2c = 3c - 3 \rightarrow c = 3$.

163. Continuing each sequence for a few more terms, we have 2, 4, 8, 16, 32, 64, ... for the first sequence and 10, 20, 30, 40, 50, 60, ... for the second sequence. We quickly see that the first time that the n th term of the first sequence is greater than the n th term of the second sequence occurs when $n = 6$.

164. Mrs. Treble can choose any of 20 pieces first, followed by any of the remaining 19 pieces second, then any of 18 third and any of 17 fourth. If the order of selections mattered, there would be $20 \times 19 \times 18 \times 17 = 116,280$ ways this could happen. But the problem states only that Mrs. Treble will *select* 4 pieces of music, with no mention of the order in which they will be played. In addition, the use of the word *combinations* tells us that order is not important. Since every 4-piece combination can be ordered in $4! = 4 \times 3 \times 2 \times 1 = 24$ ways, we need to divide 116,280 by 24. Doing so, we see there are $116,280 \div 24 = 4845$ combinations.

165. Since 3, 4 and 5 are relatively prime, any number that is a multiple of all three numbers must be a multiple of their product, which is $3 \times 4 \times 5 = 60$. Since $500 \div 60 = 8 \frac{2}{3}$, there are **8** integers less than 500 that are positive and multiples of all three integers 3, 4 and 5, namely 60, 120, 180, ..., 480.

166. From 2:45 to 3:15 p.m., the minute hand sweeps through an arc of 180 degrees, or 0.5 times around. From 3:15 to 7:15 p.m., it sweeps 4 times around. That's a total of 4.5 times around. The circumference of a circle with a radius of 4 inches is $2 \times 4 \times \pi = 8\pi$ inches. The tip of the minute hand must have traveled $4.5 \times 8\pi = 36\pi$ inches.

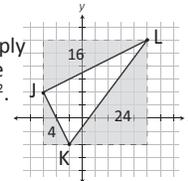

167. Since Elias, Frederico and Gina must be on different teams, we'll start by creating three teams and assigning Elias, Frederico and Gina each to a different one of those three teams. Since Frederico must be with Hsin-Hsin or Illiana, there will not be room on his team for the pair of Chico and Danzig, who must stay together. We also cannot put Chico and Danzig with Gina, because Danzig cannot be on a team with Gina as captain, and neither Chico nor Danzig can be captain. That means Chico and Danzig must be placed with Elias, and **Elias** must be the third captain. The following teams satisfy all conditions:

- Team 1 - Elias (Captain), Chico, Danzig
- Team 2 - Barry (Captain), Frederico, Hsin-Hsin
- Team 3 - Alana (Captain), Gina, Illiana

168. Each square has area $4 \times 4 = 16 \text{ ft}^2$. Each circle in Figure 1 has a radius of 1 ft and an area of $\pi \text{ ft}^2$. So the total area of the 4 circles in Figure 1 is $4 \times \pi = 4\pi \text{ ft}^2$. The shaded area in Figure 1, then, is $16 - 4\pi \text{ ft}^2$. Each circle in Figure 2 has a radius of $1/2$ foot and an area of $\pi/4 \text{ ft}^2$. So the total area of the 16 circles in Figure 2 is $16 \times \pi/4 = 4\pi \text{ ft}^2$. The shaded area in Figure 2 is $16 - 4\pi \text{ ft}^2$. The absolute difference in the shaded areas in Figure 1 and Figure 2 is **0** ft^2 .

169. Squaring both sides of the equation, we get $x^4 + 2 + 1/x^4 = 9$. When we subtract 2 from each side of the equation, we see that $x^4 + 1/x^4 = 7$.

170. Construct the 8-unit by 8-unit square that circumscribes $\triangle JKL$, as shown. Notice that the area of the non-shaded triangle is simply the area of the square, $8 \times 8 = 64 \text{ units}^2$, minus the areas of the three shaded right triangles. The areas of the three right triangles are $(1/2) \times 8 \times 4 = 16 \text{ units}^2$, $(1/2) \times 6 \times 8 = 24 \text{ units}^2$ and $(1/2) \times 2 \times 4 = 4 \text{ units}^2$. Therefore, the area of $\triangle JKL$ is $64 - 16 - 24 - 4 = 20 \text{ units}^2$.

Workout 6

171. If Juwan wants his price to be 60% more than he paid, his price will be 160% of the price he paid to the manufacturer. Juwan should multiply the manufacturer's price by **1.6**, which is the decimal equivalent of 160%.

172. A cube exists in three-dimensional space, so the edge length of the new cube will be 150% of the old edge length in all three dimensions. The new volume will be $1.5^3 = 1.5 \times 1.5 \times 1.5 = 3.375$ times as great as the old volume. That's 337.5% of the old volume, which is an increase of $337.5 - 100 = 237.5\%$.

173. With a radius of 7 inches, the pizza has a circumference of 14π inches. Since 60 degrees is $1/6$ of 360 degrees, the curved side of the slice is $1/6$ of the pizza's circumference, which is $(1/6) \times 14\pi = (7/3)\pi$ inches. The perimeter of the pizza slice is $7 + 7 + (7/3)\pi \approx 21.3$ inches.

174. Triangle ABC is a 5-12-13 right triangle. This is a well-known Pythagorean Triple, in which these integer values satisfy the Pythagorean Theorem ($5^2 + 12^2 = 13^2$). Given that the coordinates of point B are $(-4, 0)$, we can subtract 5 from the x-coordinate to find that point A is at $(-9, 0)$. Now we have a triangle, similar to $\triangle ABC$, that has vertices $(-9, 0)$, $(0, 0)$ and $(0, k)$. The distance from point A to the origin is 9 units, and the distance from the origin to $(0, k)$ is k units. We can now set up the proportion $9/5 = k/12$. Cross-multiplying and solving, we see that $5k = 108 \rightarrow k = 21.6$.

175. Since we can't find the roots of the trinomial by factoring, we could use the quadratic formula to find m and n . But there is a nice shortcut we can use to find the sum of the reciprocals of the roots. In general, the sum of the reciprocals of two numbers equals the sum of the two numbers divided by their product. Algebraically, we have $1/m + 1/n = n/(mn) + m/(mn) = (m + n)/(mn)$. It also is helpful to recall that for a quadratic trinomial in the form $x^2 + bx + c$, $-b$ equals the sum of the trinomial's roots and c is their product. Therefore, for the trinomial $x^2 - 7x + 5$, we know that $m + n = 7$, $mn = 5$ and $1/m + 1/n = (m + n)/(mn) = 7/5$.

176. There are 25 choices for the first number, 24 choices for the second number and 23 choices for the third number. That's $25 \times 24 \times 23 = 13,800$ ways in which three different integers from 1 through 25 can be chosen. But to win this lottery, the order in which the three numbers are chosen doesn't matter. Each group of three numbers can be chosen in $3! = 6$ different orders. Dividing, we see that there are $13,800 \div 6 = 2300$ unique combinations of three different numbers that can be chosen for this lottery. Because Liam purchased 500 lottery tickets, each one with a unique three-number combination, his probability of winning is $500/2300 = 5/23 \approx 0.22$.

177. We will use b to represent the price of a belt and s to represent the price of a scarf. Jayden's purchase can be written algebraically as $2b + 4s = 59.70$, and Katrina's purchase can be written as $3b + 5s = 80.60$. This time let's try using elimination, rather than substitution, to solve this system of equations. Since we ultimately want to find the cost of a belt, let's eliminate s from both equations. If we multiply both sides of Jayden's equation by 5, we get $5 \times (2b + 4s) = 5 \times 59.70 \rightarrow 10b + 20s = 298.50$. Then if we multiply both sides of Katrina's equation by 4, we get $4 \times (3b + 5s) = 4 \times 80.60 \rightarrow 12b + 20s = 322.40$. Now we can subtract Jayden's equation from Katrina's equation and solve for b . We have $(12b + 20s) - (10b + 20s) = 322.40 - 298.50 \rightarrow 12b + 20s - 10b - 20s = 23.90 \rightarrow 2b = 23.90 \rightarrow b = 11.95$. The cost of one belt is **\$11.95**.

178. To get 15 pieces of wood, 14 cuts must be made. Since each cut eliminates $1/8$ inch of wood as sawdust, a total of $14 \times (1/8) = 14/8 = 1.75$ inches of wood will become sawdust. There will be 15 pieces of wood, each 2 inches in length. That will require $15 \times 2 = 30$ inches of wood. Therefore, the length of the original piece of wood must be $1.75 + 30 = 31.75$ inches.

179. We are looking for a sum of consecutive numbers $1 + 2 + 3 + \dots + n$ that equals (or is close to) 190. The sum of the positive integers from 1 to n is the n th triangular number. A formula for the n th triangular number is $n(n + 1)/2$. Setting this equal to 190, we get $n(n + 1)/2 = 190 \rightarrow n(n + 1) = 380$. Technically this is a quadratic equation and there are algebraic methods to solve it. On the other hand, if we consider that the left side of the equation shows a product of two consecutive numbers, we might realize that $19 \times 20 = 380$, so $n = 19$. So, in the last group there will be **19** penguins.

180. We are told that the circles in Figure 1 and Figure 2 both have a radius of 1 cm, which means that both circles have an area of $\pi \times 1^2 = \pi \text{ cm}^2$. Since the circle in Figure 1 is tangent to all four sides of the square, the diameter of the circle is the same length as each side of that square. So, the square in Figure 1 has side length $1 + 1 = 2$ cm, and its area is $2 \times 2 = 4 \text{ cm}^2$. It follows that the shaded area is $4 - \pi \text{ cm}^2$. Since the circle in Figure 2 intersects all four vertices of the inscribed square, the diameter of the circle is the same length as the square's diagonal. So, the square in Figure 2 has diagonal length 2 cm. In general, the diagonal of a square has length $s\sqrt{2}$, where s is the side length of the square. In this case we have $s\sqrt{2} = 2 \rightarrow s = 2/\sqrt{2} \rightarrow s = \sqrt{2}$. So, the square in Figure 2 has side length $\sqrt{2}$, and its area is $\sqrt{2} \times \sqrt{2} = 2 \text{ cm}^2$. It follows, then, that the shaded area in Figure 2 is $\pi - 2 \text{ cm}^2$. Subtracting, we see that the absolute difference between the shaded areas in Figures 1 and 2 is $|(\pi - 2) - (4 - \pi)| = \pi - 2 - 4 + \pi = 2\pi - 6 \approx 0.28 \text{ cm}^2$.

Warm-Up 13

181. With replacement, there are $10 \times 10 = 100$ different ordered pairs of tags that Sid can select from the bag. He can select two blue tags as follows: (blue 9, blue 9), (blue 10, blue 10), (blue 9, blue 10), (blue 10, blue 9). These are the only four ordered pairs of tags Sid can select that do not contain at least one red tag. Therefore, the number of ordered pairs of tags Sid can select that contain at least one red tag is $100 - 4 = 96$ ordered pairs.

182. Let's say the original height is h and the original width is w . Then the area of the original rectangle is hw . The new height is $(1/2)h$, and the new width is $(1/4)w$. The area of the new rectangle is $(1/2)h \times (1/4)w = (1/8)hw$. The ratio of the area of the new rectangle to the area of the old rectangle is $[(1/8)hw]/(hw) = 1/8$.

183. We are told that the points $(1, a)$, $(2, b)$ and $(4, 18)$ are on the graph of the linear equation. That means the slope of the line is constant between the different pairs of points. Using the points $(1, a)$ and $(2, b)$, we can write the slope as $(b - a)/(2 - 1) = b - a$. Using the points $(1, a)$ and $(4, 18)$, we can write the slope as $(18 - a)/(4 - 1) = (18 - a)/3$. Setting these expressions equal to each other, we have $b - a = (18 - a)/3 \rightarrow 3b - 3a = 18 - a \rightarrow 3b - 2a = 18$. Dividing both sides of the equation by 2 yields $(3/2)b - a = 9$.

Here's another solution with a different approach. This is an example of a problem with some freedom of choice. We can choose an arbitrary value for a or b and then find the value of the other. The value of the expression $(3/2)b - a$ will be invariant. For example, suppose $a = 0$. Then the slope of the line from $(1, 0)$ to $(4, 18)$ is $(18 - 0)/(4 - 1) = 18/3 = 6$. This slope means that the y -value increases by 6 as the x -value increases by 1, so the point $(2, b)$ must be $(2, 6)$ and $b = 6$. Now we can evaluate $(3/2)b - a$, which is $(3/2) \times 6 - 0 = 9$. Suppose instead that we make $a = 18$. Then the line from $(1, 18)$ to $(4, 18)$ has a slope of zero (0). This means that the point $(2, 18)$ is also on the line, so $b = 18$ also. Now the value of $(3/2)b - a$ is $(3/2) \times 18 - 18 = 27 - 18 = 9$. We can prove this more generally with the letters a and b . The slope of the line from $(1, a)$ to $(4, 18)$ is $(18 - a)/(4 - 1) = (18 - a)/3$. The value of b is exactly this amount greater than a , so $b = a + (18 - a)/3$, which simplifies as follows: $3a/3 + (18 - a)/3 = (2a + 18)/3$. Now we evaluate $(3/2)b - a$, using this value of b . We get $(3/2) \times (2a + 18)/3 - a = a + 9 - a = 9$. Often it helps to try some specific numbers before attempting a general solution to a problem.

184. The range of the girls' guesses was $360 - 300 = 60$. The fact that the biggest error was 49 tells us that the actual number of marbles is between 300 and 360. In fact, we should notice that $11 + 49 = 60$. So, either Sue's guess was off by 11 marbles and Donna's guess was off by 49 marbles, or vice versa. Therefore, the number of marbles in the jar is either $300 + 11 = 311$ marbles, or $300 + 49 = 349$ marbles. If there are 311 marbles in the jar, then Kim's guess of 325 would be off by $325 - 311 = 14$ marbles. However, since we are told that Kim's guess is off by 24 marbles, the number of marbles in the jar must be **349** marbles. One final check, $349 - 325 = 24$, and we have verified our answer.

185. The largest sphere that can fit in the cylinder will have a diameter of 8 inches. We will use the radius of 4 inches to determine the volume of the sphere with the formula $V = (4/3)\pi r^3$. We have $(4/3)\pi(4^3) = (256/3)\pi$. Since $(256\pi)/3 = \pi x/3$, it follows that $x = 256$.

186. Let's say that each junior associate received x dollars. Then, together, the junior associates received a total of $4x$ dollars. Each full-time associate received $2x$ dollars. So, together, the five full-time associates received a total of $5 \times 2x = 10x$ dollars. The sales manager received $3 \times 2x = 6x$ dollars. The total amount divided among the employees was $4x + 10x + 6x = 20x$ dollars. So we have $20x = 1000 \rightarrow x = \50 . Since each junior associate received $\$50$, it follows that the sales manager received $6 \times 50 = \$300$.

187. The expression $x^2 + 2xy + y^2$ is a perfect square trinomial and can be rewritten as $(x + y)^2$. So $(x + y)^2 = 81$, and since $x > 0$ and $y > 0$, it follows that $x + y = 9$. Therefore, the average of x and y is $9/2 = 4.5$.

188. Using the order of operations, we evaluate all the exponents and then do multiplication, then addition and subtraction to get $1 - 5 \times 2 + 10 \times 2^2 - 10 \times 2^3 + 5 \times 2^4 - 2^5 = 1 - 5 \times 2 + 10 \times 4 - 10 \times 8 + 5 \times 16 - 32 = 1 - 10 + 40 - 80 + 80 - 32 = -1$. Those familiar with binomial expansion will recognize the coefficients 1, 5, 10, 10, 5, 1 as the coefficients when a 5th degree binomial $(a + b)^5$ is expanded. Notice that when $a = 1$ and $b = -2$, we have $1a^5b^0 + 5a^4b^1 + 10a^3b^2 + 10a^2b^3 + 5a^1b^4 + 1a^0b^5 = 1(1^5)(-2)^0 + 5(1^4)(-2)^1 + 10(1^3)(-2)^2 + 10(1^2)(-2)^3 + 5(1^1)(-2)^4 + 1(1^0)(-2)^5 = 1 - 5(2) + 10(2^2) - 10(2^3) + 5(2^4) - 2^5$. We can easily determine the value of this expression by evaluating $(1 - 2)^5 = (-1)^5 = -1$.

189. The number of bricks at each level is the product of the level number and the number one more than the level number. In other words, there are $n(n + 1)$ bricks on level n . We need to find the sum of the numbers of bricks on all levels of a structure with 12 levels. The values are shown in the table below, with a final answer of **728** bricks.

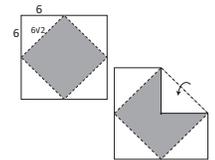

| Level | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|---------|---------|---------|----------|----------|----------|----------|----------|----------|-----------|-------------|-------------|-------------|
| # Added | 1×2 = 2 | 2×3 = 6 | 3×4 = 12 | 4×5 = 20 | 5×6 = 30 | 6×7 = 42 | 7×8 = 56 | 8×9 = 72 | 9×10 = 90 | 10×11 = 110 | 11×12 = 132 | 12×13 = 156 |
| Total | 2 | 8 | 20 | 40 | 70 | 112 | 168 | 240 | 330 | 440 | 572 | 728 |

190. Since the cube has volume 27 in^3 , it follows that it has edges with length $\sqrt[3]{27} = 3$ inches. Notice that each side of $\triangle ABC$ is a diagonal of a face of the cube. Therefore, $\triangle ABC$ is an equilateral triangle with sides of length $3\sqrt{2}$ inches. We can use the formula for the area of an equilateral triangle, $(s^2\sqrt{3})/4$, to determine the area of $\triangle ABC$. We have $[(3\sqrt{2})^2(\sqrt{3})]/4 \rightarrow (18\sqrt{3})/4 \rightarrow (9\sqrt{3})/2 \text{ in}^2$. Therefore, $\triangle ABC$ has area **$(9\sqrt{3})/2 \text{ in}^2$** .

Warm-Up 14

191. Let's start by evaluating the first few factorials in the sum. Doing so yields $1! = 1$, $2! = 2$, $3! = 6$, $4! = 24$, $5! = 120$, $6! = 720$. We notice that beginning with $5!$, the units digit of the remaining addends will be zero. Therefore, to determine the units digit of the sum, we need only consider the first four terms. The sum of their units digits is $1 + 2 + 6 + 4 = 13$, which means the units digit of the entire sum will be **3**.

192. The region of the square where points are closer to the center than they are to any vertex is bounded by a square with vertices that are the midpoints of each side of the original square, as shown. This square has side length $6\sqrt{2}$ units, so the area of the bounded region is $(6\sqrt{2})^2 = 72$ units². This is exactly half the area of the original square. By folding so that all of the vertices of the original square meet at the square's center, it's easy to see that the unshaded region exactly covers the shaded region, so they must have the same area.

193. Let's rewrite the product of the integers from 1 to 10 using only prime numbers: $1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9 \times 10 = 2 \times 3 \times (2 \times 2) \times 5 \times (2 \times 3) \times 7 \times (2 \times 2 \times 2) \times (3 \times 3) \times (2 \times 5)$. We see that there are 8 factors of 2, so $a = 8$. There are 4 factors of 3, so $b = 4$. Therefore, the value of $a + b$ is $8 + 4 = 12$.

194. We can use the formula $d = rt \rightarrow t = d/r$ to determine Ava's rate. The amount of time it took Ava to go 150 km at a rate of r km/h was $150/r$ hours. The amount of time it took Lizzy to go 180 km at a rate of $r + 2$ km/h (2 km/h faster than Ava) was $180/(r + 2)$ hours. Since it took Ava and Lizzy the same amount of time, we have $150/r = 180/(r + 2)$. Cross-multiplying and solving for r , we get $180r = 150(r + 2) \rightarrow 180r = 150r + 300 \rightarrow 30r = 300 \rightarrow r = 10$. Therefore, Ava's rate was **10** km/h.

195. A prime number is positive and is only divisible by 1 and itself, so we can't multiply any primes or composites together to create this product. We'll need 1 and -1 to be two of the first three terms of the sequence. Initially, we might consider $-1, 0, 1$ to be the first three terms of this sequence. However, we are told that the product of the three terms is a prime number, and the product $-1 \times 0 \times 1 = 0$. Since the difference between -1 and 1 is 2, the third number must be 2 greater than 1 or 2 less than -1 . The first three terms of the sequence are either $-1, 1, 3$ with a product of -3 or $-3, -1, 1$ with a product of 3. Since 3 is prime, and -3 is not, the sequence begins with $-3, -1, 1$ or $1, -1, -3$, depending on whether the sequence is increasing or decreasing. In either case, the sum of the first three terms is $-3 + (-1) + 1 = -3$.

196. The area of the triangle is currently $(1/2) \times 3 \times 6 = 9 \text{ ft}^2$, and the product of the base and the height is $3 \times 6 = 18 \text{ ft}^2$. If the area is increased to 35 ft^2 , the product of the base and height will be 70. We need to add the same number to both 3 and 6 and get a product of 70. In other words, we need to find a number k such that $(3 + k) \times (6 + k) = 70$. If we just try $k = 1, 2, 3, 4$, we find that when $k = 4$, we get $7 \times 10 = 70$. The sum of the new base and height is $7 + 10 = 17$ feet. Those familiar with solving quadratic equations by factoring might multiply the binomials in the equation $(3 + k) \times (6 + k) = 70$ to get $k^2 + 9k + 18 = 70 \rightarrow k^2 + 9k - 52 = 0$. Factoring, we have $(k + 13)(k - 4) = 0 \rightarrow k = -13$ or $k = 4$. In this case, $k = 4$.

197. Let's start with the sum $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$. Then we can combine addends into larger powers of 2 as follows:

$$\begin{array}{c|c|c|c|c} 1+1+1+1+1+1+1+1+1 & 2+2+1+1+1+1+1 & 2+2+2+2+1 & 4+2+1+1+1 & 4+4+1 \\ 2+1+1+1+1+1+1+1 & 2+2+2+1+1+1 & 4+1+1+1+1+1 & 4+2+2+1 & 8+1 \end{array}$$

That's a total of **10** lists.

198. The sum of Anthony's scores on his five physics tests is $5 \times 85 = 425$ points. Since the median is 87 and the unique mode is 92, we know that the five numbers must be $\underline{\quad}, \underline{\quad}, 87, 92, 92$. The test scores known at this point have a sum of $87 + 92 + 92 = 271$. That means the remaining two test scores have a sum of $425 - 271 = 154$. If we want to make one of the two scores as low as possible, then we need to make the other score as high as possible. In this case, it can't be 87 because we are told that 92 is the only mode. So we go to the greatest integer less than 87, which is 86. Therefore, the lowest possible test score Anthony could have for one of his tests is $154 - 86 = \mathbf{68}$.

199. Let S represent the number of marbles Sara has and J represent the number of marbles Jo has. The first statement leads to the equation $S + 3 = 2(J - 3)$, which simplifies to $S + 3 = 2J - 6 \rightarrow S = 2J - 9$. The second statement leads to the equation $2(S - 2) = J + 2$, which simplifies to $2S - 4 = J + 2 \rightarrow 2S - 6 = J$. We can now substitute $2S - 6$ for J in the first equation to get $S = 2(2S - 6) - 9 \rightarrow S = 4S - 12 - 9 \rightarrow S = 4S - 21 \rightarrow 3S = 21 \rightarrow S = 7$. So Sara has **7** marbles.

200. Since 4 of 12 candies have vanilla crême filling, the probability is $4/12$ that the first candy Angel picks has vanilla filling. The probability that her second pick also has vanilla filling is $3/11$. The probability that these two events happen in succession is $4/12 \times 3/11 = \mathbf{1/11}$.

Workout 7

201. Because 4 people did not contribute, $20 - 4 = 16$ people must share the cost. If they each pay an extra \$1.50, the amount the 4 people did not pay must have been $16 \times \$1.50 = \24 . The contribution of each of the 4 people would have been $\$24 \div 4 = \6 . Based on contributions of \$6 each from all 20 people, the total needed for the gift must be $20 \times \$6 = \mathbf{\$120}$.

202. We'll use three of the laws of exponents to simplify the expression: (1) $x^m x^n = x^{m+n}$, (2) $x^m / x^n = x^{m-n}$ and (3) $(x^m)^n = x^{mn}$. We have $\frac{(a^2 b^{-3} c)^2 (a^{-1} b^3 c^3)^{-3}}{(a^{-1} b^3 c^{-2})^2 (a^4 b c^{-3})^4} = \frac{(a^4 b^{-6} c^2)(a^3 b^{-9} c^{-9})}{(a^{-2} b^6 c^{-4})(a^{16} b^4 c^{-12})} = \frac{a^7 b^{-15} c^{-7}}{a^{14} b^{10} c^{-16}} = a^{-7} b^{-25} c^9$. So $x = -7$, $y = -25$ and $z = 9$, and $x + y + z = -7 + (-25) + 9 = \mathbf{-23}$.

203. First we subtract, $48 - 25 = 23$, to see that Archer earned \$23 for the miles driven. To earn \$23 at \$0.08 per mile, he drove $23 \div 0.08 = \mathbf{287.5}$ miles.

204. There are 6 sets of 10 seconds in 1 minute, so Albert would have skipped $128 \times 6 = 768$ times in 1 minute at the same rate. There are 60 minutes in an hour, so he would have skipped $768 \times 60 = \mathbf{46,080}$ times in 1 hour at that rate.

205. Since Andrew and Beth each have 10 numbers from which to choose, there are $10 \times 10 = 100$ pairs of numbers they could choose. If Andrew chooses 1, any number Beth chooses will be relatively prime to 1. That's 10 pairs of relatively prime numbers. If Andrew chooses 2, there are 5 numbers (1, 3, 5, 7, 9) Beth could choose that are relatively prime to 2. We can continue this process through the scenario when Andrew chooses 10. The table shows how many numbers from 1 through 10 are relatively prime to each of the numbers 1 through 10. That's a total of $10 + 5 + 7 + 5 + 8 + 3 + 9 + 5 + 7 + 4 = 63$ pairs of relatively prime numbers among the integers from 1 through 10. Therefore, the probability that the numbers chosen by Andrew and Beth will be relatively prime is **63/100**.

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----|---|---|---|---|---|---|---|---|----|
| 10 | 5 | 7 | 5 | 8 | 3 | 9 | 5 | 7 | 4 |

206. Because the number of bacteria increases by 50% every 3 hours, after 3 hours, the number of bacteria is 1.5 times what it was 3 hours ago. Initially, the number of bacteria is 960. After 3 hours, the number of bacteria would have increased to $1.5 \times 960 = 1440$. After 6 hours, it would have increased to $1.5 \times 1440 = 2160$ bacteria. After 9 hours, it would have increased to $1.5 \times 2160 = 3240$ bacteria. Finally, after **12** hours, the number of bacteria would have increased to $1.5 \times 3240 = 4860$ bacteria.

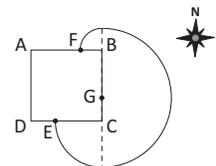

207. The volume of clay is $10 \times 10 \times 10 = 1000 \text{ cm}^3$. With radius 2 cm, each sphere has volume $(4/3) \times \pi \times 2^3 = (4/3) \times \pi \times 8 = (32/3)\pi \text{ cm}^3$. Dividing, $1000 \div (32/3)\pi \approx 29.84$. This means there is enough clay to make **29** spheres of radius 2 cm, but not quite enough to make a 30th sphere.

208. There are 60 seconds per minute, 60 minutes per hour, 24 hours per day and 7 days per week. So in 6 weeks, there are $6 \times 60 \times 60 \times 24 \times 7$ seconds. We are looking for $n!$ equivalent to this amount. We know that $24 = 4!$, so $n > 4$. The 6 and 7 in the product pretty much guarantee that $n > 7$. But we'll still rewrite the expression $6 \times 60 \times 60 \times 7$ as a product of primes and see how many consecutive integers greater than 4 are in the product. Since $6 = 2 \times 3$, 7 is prime and $60 = 2 \times 2 \times 3 \times 5$, we have $6 \times 60 \times 60 \times 7 = 2 \times 2 \times 2 \times 2 \times 3 \times 3 \times 3 \times 5 \times 5 \times 7$. In the expression below, the primes have been regrouped to show that $6 \times 60 \times 60 \times 24 \times 7 = 10!$, and $n = \mathbf{10}$. Of course we could take a more direct approach and multiply $6 \times 60 \times 60 \times 24 \times 7$ to get 3,628,800. Then we'd need to determine which $n!$ is closest to this value.

$$1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9 \times 10$$

$$\underbrace{2 \times 2}_{2^2} \times 5 \times \underbrace{2 \times 3}_{2 \times 3} \times 7 \times \underbrace{2 \times 2 \times 2}_{2^3} \times \underbrace{3 \times 3}_{3^2} \times \underbrace{2 \times 5}_{2 \times 5}$$

209. The figure shows how the goat can cover the area of one-half of a circle with a radius of 3 m to the east of the building. Then to the north of the building, it can cover the area of one-quarter of a circle with radius of 1 m. Finally, the goat can cover the area of one-quarter of a circle with a radius of 2 m. The total area that can be covered by the goat is $[(1/2) \times \pi \times 3^2] + [(1/4) \times \pi \times 2^2] + [(1/4) \times \pi \times 1^2] = 9\pi/2 + \pi + \pi/4 = (9/2 + 1 + 1/4) \times \pi = (23/4) \times \pi \approx \mathbf{18 \text{ m}^2}$.

210. A single-digit number has one or two prime factors (otherwise, it is 1 or 0, and 1 is relatively prime to every integer, while 0 is not relatively prime to any integer). Suppose the first digit of our number is pq , the product of two primes p and q . Then the second digit of our number has to share one of these factors, say p , so that it is not relatively prime to pq . Suppose the second digit is just the prime p . Then there is no possibility for the third digit, which must share a prime factor with p but not with pq . This means the second digit must be pr , the prime p times a different prime factor r . Now the third digit can be rs , bringing in another prime s , so that it shares a prime factor with pr but not with pq . This logic might continue, leading to a fourth digit st , which is again the product of two primes, except that we quickly run out of small prime factors, and these products of two distinct primes cannot be single-digit numbers. In fact, the only single-digit number that is a product of two distinct primes is $6 = 2 \times 3$. This means that we must place 6 in the middle and place single-digit numbers on either side that have either the common factor of 2 or the common factor of 3. The options are 263, 362, 364, 463, 368, 863, 269, 962, 469, 964, 869 and 968. The greatest is **968**.

Warm-Up 15

211. An increase in water depth of 1 foot (from 34 feet to 35 feet) took $12 - 8 = 4$ hours. So, we would expect an increase in water depth of 2 feet of water (from 35 feet to 37 feet) to take twice as long, or $2 \times 4 = 8$ hours. The total elapsed time would be $12 + 8 = 20$ hours.

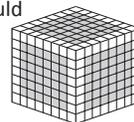

212. If we work this problem backwards we find that the closing price on Wednesday was $72,000 \div 10 = \$7200$, the closing price on Tuesday was $7200 \div 3 = \$2400$, and the closing price on Monday was $2400 \div 2 = \$1200$.

213. We know each lateral face of the pyramid is an isosceles triangle with two sides of length 50 yards and a base of 60 yards. If we draw a line on a lateral face from the apex of the pyramid and perpendicular to the base edge of the pyramid, we create two right triangles. Now each triangle has a shorter leg of 30 yards and a hypotenuse of 50 yards. Notice that the length of the longer leg of this triangle has length 40 yards, since its side lengths are a multiple of the 3-4-5 Pythagorean Triple. We are asked to determine the total lateral surface area, in square feet. Before substituting these values into the area formula, let's convert our yards to feet: 60 yards is $60 \times 3 = 180$ feet, and 40 yards is $40 \times 3 = 120$ feet. Now each of the four lateral faces has area $(1/2) \times 180 \times 120 = 10,800 \text{ ft}^2$. Thus, the total surface area of all four lateral faces is $4 \times 10,800 = 43,200 \text{ ft}^2$.

214. There are five lines in the star. There are four ways to place markers on three of the four points on each line. Therefore, there are $5 \times 4 = 20$ arrangements with which a player can win the game.

215. Using the laws of exponents, we can simplify the expression to get $2^k = (64^8)/(32^{-3}) = [(2^6)^8]/[(2^5)^{-3}] = (2^{48})/(2^{-15}) = 2^{48} \times 2^{15} = 2^{63}$. Thus, $k = 63$.

216. Since the cube can be cut into n^3 unit cubes, the volume of the cube is n^3 cubic units, and the edge length of the cube is $\sqrt[3]{n^3} = n$ units. So, in finding the value of n , we are actually trying to determine the cube's edge length. The unit cubes that are painted on only one face would be located on each face of the original cube, away from its edges. If we divide 216 by 6, we see that there must be $216 \div 6 = 36$ of these cubes, covering an area of 6 units by 6 units, on each face. That would make the actual dimensions of each face of the cube 8 units by 8 units. Therefore, the value of n is **8**.

217. A line tangent to a circle must be perpendicular to the radius that intersects the point of tangency. This radius has endpoints (1, 4) and (3, 7), and its slope is $(7 - 4)/(3 - 1) = 3/2$. The slope of the tangent line, which is perpendicular to this radius, must be the negative reciprocal of $3/2$, which is $-2/3$.

218. When the output of a function is then used as an input, the process is called "iteration" and some very interesting mathematics can result. In this case, we want the 13th iteration of the input 13. Beginning with $f(13)$, we get $f(13) = 14 \rightarrow f(14) = 15 \rightarrow f(15) = 16 \rightarrow f(16) = 4 \rightarrow f(4) = -8 \rightarrow f(-8) = 64 \rightarrow f(64) = 8 \rightarrow f(8) = -6 \rightarrow f(-6) = 36 \rightarrow f(36) = 6 \rightarrow f(6) = -7 \rightarrow f(-7) = 49 \rightarrow f(49) = 7$.

219. One might conclude that the maximum number of days between ides would occur when there is an ides on the 13th of a 31-day month, followed by an ides on the 15th of the next month. However, this never occurs. Each of the months before March, May, July and October (months in which ides occur on the 15th) is a short month, with 28, 29 or 30 days. The best we can do is a 30-day month in which ides occur on the 13th followed by a month in which ides occur on the 15th. From the 14th to the 30th is 17 days, and from the 1st to the 14th of the following month is 14 days. That's $17 + 14 = 31$ days. This exact scenario occurs between the ides in April and May, June and July, and September and October.

220. For each triangle, we know the length of the shorter leg is $a = 9$ units, so let b and c represent the lengths of the longer leg and hypotenuse, respectively. Substituting into the Pythagorean Theorem, we get $9^2 + b^2 = c^2 \rightarrow 9^2 = c^2 - b^2 \rightarrow 81 = (c - b)(c + b)$. We are looking for two integers, $c - b$ and $c + b$, whose product is 81. The factor pairs of 81 are 3×27 , 9×9 and 1×81 . We can exclude the pair 9×9 since $c - b \neq c + b$. Adding the equations $c - b = 3$ and $c + b = 27$, we get $2c = 30$. So $c = 15$ and $b = 12$, giving us the 9-12-15 Pythagorean Triple. Next, adding $c - b = 1$ and $c + b = 81$, we get $2c = 82$. So $c = 41$ and $b = 40$, giving us the 9-40-41 Pythagorean Triple. For these two right triangles, the sum of their longer legs is $12 + 40 = 52$ units.

Warm-Up 16

221. It happens that a prime denominator leads to a special kind of repeating decimal pattern in which the digits of the second half of the pattern are the 9s complement of the corresponding digits in the first half of the pattern, whenever the number of digits in the pattern is even. (This is known as Midy's Theorem.) The m in the first half corresponds to a 1 in the second half, so m must be $9 - 1 = 8$. We could also just divide a 1 by 17 to confirm that $m = 8$.

222. Triangle PQR is a 30-60-90 triangle. Serious Mathletes should know well the ratios of the sides of 30-60-90 triangles. If we say that the length of the hypotenuse PR is 1 unit, then the length of the short leg PQ is $1/2$ unit. (We know this because two 30-60-90 triangles placed side by side can make an equilateral triangle.) The length of the long leg QR is $(\sqrt{3})/2$ units. (We can confirm this with the Pythagorean Theorem as follows: $(1/2)^2 + ((\sqrt{3})/2)^2 = 1/4 + 3/4 = 1$.) We know $m\angle PCQ = 90$ degrees, and we'll let $m\angle PQC = a$, which means $m\angle CPQ = 90 - a$. Notice that the terminal side for angles PQC and RQD form a line. Since $m\angle PQC = a$, and $m\angle PQR = 90$ degrees, it follows that $m\angle DQR = 90 - a$ and $m\angle DRQ = a$. So, triangles PQC and QRD are similar, and PQ and QR are corresponding sides. The ratio of the areas of similar triangles is proportional to the square of the ratio of their sides. Therefore, the ratio of the areas of triangles PQC and QRD is $(1/2)^2 : ((\sqrt{3})/2)^2 = (1/4) : (3/4) = 1/3$.

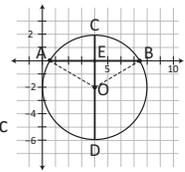

223. Seeing $n^2 - n$ as simply the difference between the square of a number and the number itself, some students will recognize that $8^2 - 8 = 64 - 8 = 56$ works, and they will conclude that $n = 8$. Alternatively, some students may factor out an n as follows: $n^2 - n = n(n - 1)$. The expression on the right shows the product of two consecutive numbers with the larger number first. Again, some students will realize that 8×7 works, so $n = 8$. Other students will write the quadratic equation $n^2 - n = 56 \rightarrow n^2 - n - 56 = 0$ and then find two numbers with a product of -56 and a difference of 1. Doing so likely will lead to the factored quadratic $(n - 8)(n + 7) = 0$, with solutions $n = 8$ or -7 . The number of teams can't be negative, so there must be **8** teams in the league.

224. Odds are part-to-part ratios and probabilities are part-to-whole ratios. Since the odds against the Patriots playing are 4:1, the probability that they will not play is $4/5$, and the probability that they will play is $1/5$. Since the odds against the Texans playing are 7:1, the probability that they will not play is $7/8$ and the probability that they will play is $1/8$. Because the two events are independent, the probability that these two teams will meet in the championship game is $(1/5) \times (1/8) = 1/40$.

225. Many Mathletes will have learned how to use the prime factorization of a number to determine how many factors the number has. The prime factorization of 144 is $2^4 \times 3^2$. We increase each exponent by 1 and multiply 5×3 to determine that there are 15 positive factors of 144. These factors can be made into 7 pairs of 2 different numbers with a product of 144 and one pair that is a repeat factor, namely (12, 12). Although the commutative property tells us that the product xy is equal to the product yx , the ordered pair (x, y) is not the same as the ordered pair (y, x) . So, each of the 7 pairs with 2 different factors of 144 can be written in two different ways, which means there are $2 \times 7 + 1 = 15$ ordered pairs of positive integers (x, y) that satisfy $xy = 144$. And don't forget the 15 ordered pairs in which both values are negative. That brings the total to 30 ordered pairs in all.

226. Since one person must row the boat back across the river, only two people can be ferried across the river on each trip until the final trip, when all three people can stay on the other side. If we subtract these last three people from the nine people in the group, we get six people who must be ferried across two at a time. That's 3 round-trips across the river, for a total of 6 times across. Add to that the final trip, with the last three people, and we see that the boat must cross the river at least $6 + 1 = 7$ times. Each time across the river, the boat travels 20 yards. So the minimum distance the boat must travel to get nine people across the river is $20 \times 7 = 140$ yards.

227. Let E be the point (4, 0), where diameter CD intersects the x-axis. Point A is 4 units from center O, because the radius is 4 units. Point E is 2 units from center O. Because the length of the hypotenuse of right triangle AEO is twice the length of the shorter leg, we recognize that it is a 30-60-90 right triangle. The measure of $\angle AOE$ is 60 degrees, and by symmetry the measure of $\angle BOE$ is also 60 degrees. Thus, the measure of central angle AOB is $60 + 60 = 120$ degrees. The central angle measure is the same as the degree measure of arc ACB. The degree measure of arc ADB, then, is $360 - 120 = 240$ degrees, and the ratio of the arc lengths is $120/240 = 1/2$.

228. Michael had to draw either a T and then a Y or a Y and then a T. In the bag described, there are 3 Ts and 1 Y out of 56 tiles, so the probability of getting a T and a Y when 2 tiles are randomly selected from the bag of tiles is $3/56 \times 1/55 + 1/56 \times 3/55 = 6/3080 = 3/1540$.

229. Using only the 5-gallon and 20-gallon jugs, we can measure 5, 10, 15, 20 or 25 gallons of water. The sum of these values is 75 gallons.

230. We'll begin on June 30th and work backward to determine the number of cars in Noah's sales quota for June. On June 30th, Noah reached his monthly sales quota when he sold 1 more than half of the number of cars he still needed to sell to reach his quota. That means 1 car was half of the number of cars Noah needed to sell to reach his quota. So, on June 30th, Noah must have started the day with 2 cars left to sell in June, and after he sold 2 cars he had 0 cars left to sell. On June 29th, Noah started the day with $(2 + 1) \times 2 = 3 \times 2 = 6$ cars left to sell in June, and he ended the day after having sold 1 more than half that, or $(6 \div 2) + 1 = 3 + 1 = 4$ cars. On June 28th, Noah started the day with $(6 + 1) \times 2 = 7 \times 2 = 14$ cars left to sell in June, and he ended the day after having sold 1 more than half that, or $(14 \div 2) + 1 = 7 + 1 = 8$ cars. So, to recap, on June 28th, 29th and 30th, Noah sold 8 cars, 4 cars and 2 cars, respectively. So, each day, Noah sold half as many cars as he sold the previous day. The table shows the number of cars Noah sold each day, beginning with June 30th and working back to June 25th. So, Noah's sales quota for June was $2 + 4 + 8 + 16 + 32 + 64 = 126$ cars.

| Day of June | 30th | 29th | 28th | 27th | 26th | 25th |
|---------------------|------|------|------|------|------|------|
| Number of Cars Sold | 2 | 4 | 8 | 16 | 32 | 64 |

Workout 8

231. The median of an arithmetic sequence is the same as the mean, so the sum of the six numbers must be $20.75 \times 6 = 124.5$. We could go a step further and find all six numbers. If we use d to represent the constant difference between terms, the six terms are 12, $12 + d$, $12 + 2d$, $12 + 3d$, $12 + 4d$ and $12 + 5d$. Their sum is $12 \times 6 + 15d$, which has to equal 124.5. This means $15d = 124.5 - 72 = 52.5$. Dividing 52.5 by 15, we find that $d = 3.5$. The numbers must be 12, 15.5, 19, 22.5, 26, and 29.5.

232. Narrowing down 51 contestants to a first-, second- and third-place finalist can occur in $51 \times 50 \times 49 = 124,950$ ways.

233. We can think of the times to run each mile as a geometric sequence with 26 terms, with the first term being 5 and with the common ratio 1.01. There is a formula we can use to determine the sum of these 26 terms: $S_n = \frac{a_1(1 - r^n)}{1 - r}$, where S_n is the sum of the first n terms, a_1 is the first term and r is the common ratio. In this case we have $a = 5$, $n = 26$ and $r = 1.01$. Substituting, we have $S_{26} = \frac{5(1 - 1.01^{26})}{1 - 1.01} \rightarrow S_{26} = \frac{5(1 - 1.01^{26})}{-0.01} \rightarrow S_{26} = 500(1.01^{26} - 1) \rightarrow S_{26} \approx 148$ minutes.

234. First, let's consider combinations of coins that include one coin worth 32¢. There are 7 such combinations.

$$\begin{array}{cccc}
 32 + 16 + 2 & 32 + 8 + 8 + 2 & 32 + 8 + 4 + 4 + 2 & 32 + 8 + 4 + 2 + 2 + 1 + 1 \\
 32 + 16 + 1 + 1 & 32 + 8 + 8 + 1 + 1 & 32 + 8 + 4 + 4 + 1 + 1 &
 \end{array}$$

Next, let's consider combinations of Bina's coins that include two coins worth 16¢ each. There are 5 such combinations.

$$\begin{array}{ccc}
 16 + 16 + 8 + 8 + 2 & 16 + 16 + 8 + 4 + 4 + 2 & 16 + 16 + 8 + 4 + 2 + 2 + 1 + 1 \\
 16 + 16 + 8 + 8 + 1 + 1 & 16 + 16 + 8 + 4 + 4 + 1 + 1 &
 \end{array}$$

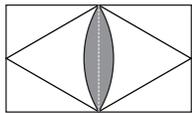

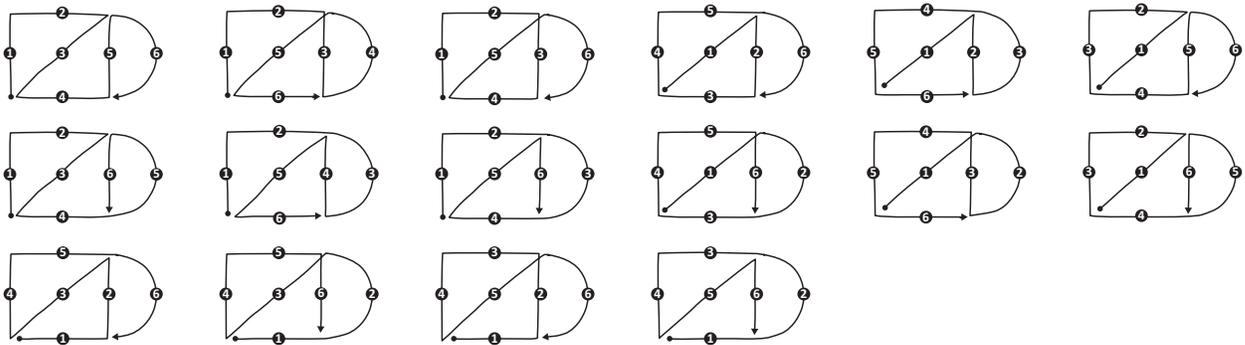

So, there are $7 + 5 = 12$ combinations of Bina's coins that have a combined value of 50¢.

235. The perimeter of the original photo is $2 \times (8 + 10) = 2 \times 18 = 36$ inches. The area of the original photo is $8 \times 10 = 80$ in². After John reduces the size of the photo, the new perimeter will be $27/36 = 3/4$ that of the original photo. In fact, each of the new photo's linear measurements will be $3/4$ that of the original. The area of the new photo will be $(3/4)^2 = 9/16$ that of the original photo. So, the area of the new photo will be $80 \times 9/16 = 45$ in².

236. If we let w represent the width of the each rectangle, then the length is $3w + 1$ and the perimeter is $2 \times (w + 3w + 1) = 8w + 2$. The perimeter is less than or equal to 150 cm. We can write the inequality $8w + 2 \leq 150$. Solving for w , we have $8w \leq 148 \rightarrow w \leq 18.5$ cm. Thus, the maximum width is **18.5** cm.

237. To calculate with percents, we convert them to decimals (or to fractions) and the word *of* translates to multiplication, so 2% of 5% of $3x$ is $0.02 \times 0.05 \times 3x = 0.003x$. This is three thousandths of x , or **0.3%** of x .

238. The figure can be drawn in one continuous pen stroke only if it begins at D and ends at C, or vice versa. They are the only two points that have an odd number of paths in and out. At the starting point, there is one more path departing than arriving, while at the ending point there is one less path departing than arriving. This explains why the number of paths in and out of these points must be odd. If a point is not the beginning or end of our stroke, the path must depart that point the same number of times it arrives at the point. Shown here are the 16 continuous pen strokes starting at D and ending at C. But since we also can make these 16 continuous pen strokes by starting at C and ending at D, that's another 16 ways, for a total of **32** ways.

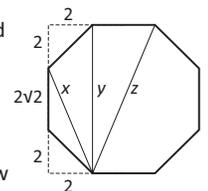

239. If we draw a vertical line to cut the shaded region in half, we can see that each half is the difference between the area of $1/6$ of a circle and the area of an equilateral triangle with a side length equal to the radius. The area of a 60-degree sector of a circle with radius 2 units is $(1/6) \times \pi \times 2^2 = 4\pi/6 = 2\pi/3$ units². The area of an equilateral triangle with a base of 2 units and height of $\sqrt{3}$ units is $(1/2) \times 2 \times \sqrt{3} = \sqrt{3}$ units². The difference is $2\pi/3 - \sqrt{3}$ units². This is only half the shaded area, so we need to double it to $(4\pi/3) - 2\sqrt{3}$, which is approximately **0.72** units².

240. The probability that at least two people pick the same integer is $1 - P(\text{all four people pick different numbers})$. The first person can pick any number. The second person has a $9/10$ chance of picking a different number, the third person has an $8/10$ chance of picking a different number and the fourth person has a $7/10$ chance of picking a different number. The probability that all four pick different numbers is $1 \times 9/10 \times 8/10 \times 7/10 = 504/1000$. The probability that at least two people pick the same number is $1 - 0.504 = 0.496$ or **49.6%**.

Warm-Up 17

241. We let n represent the number of students with one or more younger siblings. Then we can set up the proportion $6/5 = n/180$. Cross-multiplying and solving for n , we see that $5n = 6 \times 180 \rightarrow 5n = 1080 \rightarrow n = 216$ students at the school have one or more younger siblings. Another way to interpret the given ratio is that the number of students who have one or more younger siblings is $6/5$ of the number of students who do not. So, $(6/5) \times 180 = 216$ students have one or more younger siblings.

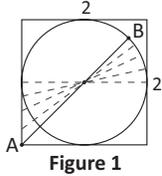

242. An octagon has 8 vertices, and each vertex shares a diagonal with each of 5 other vertices (excludes the vertex itself and the two adjacent vertices). Although there are $8 \times 5 \div 2 = 20$ diagonals in an octagon, there are only three possible lengths for these diagonals, as shown. We'll let x , y and z represent these three lengths, in inches. There are 8 diagonals of length x inches, 8 diagonals of length y inches and 4 diagonals of length z inches. We are asked to find the median length, which, in this case, is the average between the 10th and 11th lengths in an ordered list of the 20 lengths. Since $x < y < z$, were we to actually write out the lengths of the 20 diagonals in ascending order, we would observe that the 10th length is y inches, as is the 11th length. So, we need to determine the value of y . All we know is the side length of the octagon, $2\sqrt{2}$ inches. Let's imagine the octagon is inscribed in a square, as shown. Then each of the four corners of the square, located on the exterior of the octagon, is a 45-45-90 right triangle with hypotenuse of length $2\sqrt{2}$ inches. It follows, then, that the triangle's legs have length 2 inches. Thus, the inscribing square has side length $2 + 2\sqrt{2} + 2 = 4 + 2\sqrt{2}$ inches. Since the diagonal of length y inches is the same length as a side of the square, we now know that $y = 4 + 2\sqrt{2}$ inches, which is the median length of all the diagonals.

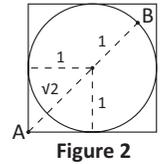

243. To stamp the integers 1 through 19, Kevin and Evan will make 12 impressions of the digit 1 and 2 impressions of each of the digits 2 through 9. To stamp the integers from 20 through 29, they will make an impression of the digits 0 through 9 for the units digit of each integer, and they will make an additional 10 impressions of the 2 for the tens digit of each integer. If they continue in this manner, after they stamp the integer 99, they will have exhausted all 20 impressions for each stamp except the stamp for the digit 0. Therefore, the last number Kevin and Evan can stamp is **99**.

244. There are $4! = 4 \times 3 \times 2 \times 1 = 24$ ways to place the four operation symbols in the four boxes. Since the numbers cannot be reordered and no grouping symbols are permitted, we will attempt to minimize the absolute value by placing the multiplication sign in the space between the 1 and 2. Also, we should try the division sign last so that we divide 4 by 5. That leaves two possibilities for placing the addition and subtraction signs into the expression. Our best option to minimize the absolute value is inserting the operation symbols to create the expression $1 \times 2 - 3 + 4 \div 5 = -0.2$, which has an absolute value of **0.2**. We have included a table which shows that none of the other possible 23 values is less than 0.2.

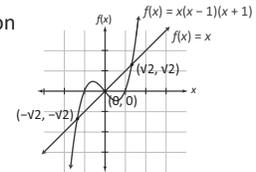

| | | | |
|--------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| $1 + 2 - 3 \times 4 \div 5 = 0.6$ | $1 - 2 + 3 \times 4 \div 5 = 1.4$ | $1 \times 2 + 3 - 4 \div 5 = 4.2$ | $1 \div 2 + 3 - 4 \times 5 = -16.5$ |
| $1 + 2 - 3 \div 4 \times 5 = -0.75$ | $1 - 2 + 3 \div 4 \times 5 = 2.75$ | $1 \times 2 + 3 \div 4 - 5 = -2.25$ | $1 \div 2 + 3 \times 4 - 5 = 7.5$ |
| $1 + 2 \times 3 - 4 \div 5 = 6.2$ | $1 - 2 \times 3 + 4 \div 5 = -4.2$ | $1 \times 2 - 3 + 4 \div 5 = -0.2$ | $1 \div 2 - 3 + 4 \times 5 = 17.5$ |
| $1 + 2 \times 3 \div 4 - 5 = -2.5$ | $1 - 2 \times 3 \div 4 + 5 = 4.5$ | $1 \times 2 - 3 \div 4 + 5 = 6.25$ | $1 \div 2 - 3 \times 4 + 5 = -6.5$ |
| $1 + 2 \div 3 - 4 \times 5 = -18.33$ | $1 - 2 \div 3 + 4 \times 5 = 20.33$ | $1 \times 2 \div 3 + 4 - 5 = -0.33$ | $1 \div 2 \times 3 + 4 - 5 = 0.5$ |
| $1 + 2 \div 3 \times 4 - 5 = -1.33$ | $1 - 2 \div 3 \times 4 + 5 = 3.33$ | $1 \times 2 \div 3 - 4 + 5 = 1.67$ | $1 \div 2 \times 3 - 4 + 5 = 2.5$ |

245. As Figure 1 shows, the distance from the circle's center to the circle remains $r = 1$ unit. However, the distances from the center of the circle to the square increase as we approach the corner of the square. Thus, the greatest distance is AB. By drawing two radii that intersect the square at the points of tangency on two adjacent sides of the circumscribing square, as shown in Figure 2, a small unit square is created. With sides of length 1 unit, the diagonal of this unit square has length $\sqrt{2}$ units. The greatest distance between a point on the circle and a point on the square is $1 + \sqrt{2}$ units.

246. We want to find values of x that satisfy the equation $x(x - 1)(x + 1) = x$. In general, dividing both sides of an equation by x should be avoided. A contradiction or a false solution could result since the value of x could, in fact, be 0. To play it safe, we'll expand the left side of the equation and then subtract x from both sides. Doing so yields $x(x - 1)(x + 1) = x \rightarrow x(x^2 - 1) = x \rightarrow x^3 - x = x \rightarrow x^3 - 2x = 0 \rightarrow x(x^2 - 2) = 0$. So, $x = 0$ or $x^2 - 2 = 0 \rightarrow x^2 = 2 \rightarrow x = \pm\sqrt{2}$. Since we were asked to consider only nonzero real numbers for x , we will disregard the solution $x = 0$ and determine the value of the product $(\sqrt{2}) \times (-\sqrt{2}) = -2$. The graph shows the intersection of the cubic function $f(x) = x(x - 1)(x + 1)$ and the line $f(x) = x$.

247. We will let p , q and r represent the side lengths of the triangle, with $p < q < r$. We know that $p:q:r = 3:4:6$ and $p + q + r = 26$ inches. Let's suppose $p = 3$ inches, $q = 4$ inches and $r = 6$ inches. Then the perimeter would be $3 + 4 + 6 = 13$ inches, which is half of 26 inches. If we double each of the three side lengths, we have $(3 \times 2) + (4 \times 2) + (6 \times 2) = 6 + 8 + 12 = 26$ inches. Therefore, the length of the longest side is **12** inches.

248. It appears that Marlow walks twice as fast as the moving sidewalk moves, since it takes her $90/180 = 1/2$ of the time to travel the same distance walking alongside the moving sidewalk that it does standing on the moving sidewalk. If she walks on the moving sidewalk, she would be traveling at her walking speed plus the speed of the moving sidewalk, which is half her walking rate. She would be going $3/2$ of her normal walking speed, so it would take $2/3$ the time, or $2/3 \times 90 = 60$ seconds.

249. We will let f , t and w represent the number of five-, ten- and twenty-dollar bills, respectively. From the information provided, we can write several equations. First, since Sam received \$440, we have $5f + 10t + 20w = 440$. Next, since he received 30 bills, it follows that $f + t + w = 30$. And finally we have $4f = w$ because Sam received four times as many twenty-dollar bills as five-dollar bills. Substituting $4f$ for w in the first equation yields $5f + 10t + 20(4f) = 440 \rightarrow 5f + 10t + 80f = 440 \rightarrow 85f + 10t = 440$. Similarly, substituting $4f$ for w in the second equation yields $f + t + 4f = 30 \rightarrow 5f + t = 30$. If we multiply each term in the equation $5f + t = 30$ by 10, we get $50f + 10t = 300$. Now we can subtract the two equations to get $(85f + 10t) - (50f + 10t) = 440 - 300 \rightarrow 35f = 140 \rightarrow f = 4$ five-dollar bills. If Sam received 4 five-dollar bills, it follows that $5 \times 4 + t = 30 \rightarrow 20 + t = 30 \rightarrow t = 10$. So, Sam received **10** ten-dollar bills.

250. We only need to find one three-letter word to rule out a number. The number cannot be 222, since this can be used to spell CAB. It cannot be 223, since this can spell BAD. It cannot be 224, since this number can be used to spell BAG. When we get to **225**, however, there are no words among the $3 \times 3 \times 3 = 27$ possible three-letter selections, which follow: AAJ, AAK, AAL, ABJ, ABK, ABL, ACJ, ACK, ACL, BAJ, BAK, BAL, BBJ, BBK, BBL, BCJ, BCK, BCL, CAJ, CAK, CAL, CBJ, CBK, CBL, CCJ, CCK, CCL.

Warm-Up 18

251. There are 12 girls and 10 boys in Mrs. Rodriguez's class. Looking at the two graphs, the only way a girl and a boy can be chosen with the same number of letters in their names is if those chosen have first names with 5, 9, 10 or 11 letters. There are no students in Mrs. Rodriguez's class that have first names with only 1 letter or with 3 letters. While one or more girls in the class have a first name with 2, 4, 8 or 12 letters, no boys do. And though some boys in the class have a first name with 6 or 7 letters, no girls do. The table shows the probabilities of choosing a girl with N letters in her name, choosing a boy with N letters in his name, and choosing a girl and a boy, both with N letters in their names, where N is 5, 9, 10 or 11. The probability of the girl and boy who are chosen having the same number of letters in their names is $1/120 + 1/120 + 4/120 + 2/120 = 8/120 = 1/15$.

| | N | | | |
|--------------------------|-------|-------|-------|-------|
| | 5 | 9 | 10 | 11 |
| P(Girl & N letters) | 1/12 | 1/12 | 2/12 | 2/12 |
| P(Boy & N letters) | 1/10 | 1/10 | 2/10 | 1/10 |
| P(Girl, Boy & N letters) | 1/120 | 1/120 | 4/120 | 2/120 |

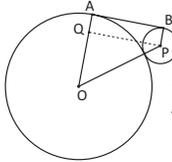

252. The domain of a function is the set of input values for which the function produces an output value. Typically it is described as the set of all x for which $f(x)$ exists. The given function has $\sqrt{12 - x}$ in the numerator and $4 - x^2$ in the denominator, and we are asked to determine for how many positive integers $f(x)$ exists. In the numerator, we want to avoid getting a negative number underneath the radical. To do that, we must restrict the domain to values that satisfy $x \leq 12$. We also want to avoid getting a denominator of zero. That means x cannot equal 2 or -2 . Thus, the **11** positive integers in the domain of $\sqrt{12 - x}/(4 - x^2)$ are 1, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12.

253. The possible even sums greater than 7 are 8, 10 and 12. If (a, b) represents an ordered pair of dice numbers with these sums, the 9 possible rolls are: (2, 6), (3, 5), (4, 4), (5, 3), (6, 2), (4, 6), (5, 5), (6, 4) and (6, 6). Both dice are even in 6 out of 9 of these, so the probability is $6/9 = 2/3$.

254. The surface of a cylinder consists of two circular bases and a rectangular wrap around the middle. The area of the bases is $2 \times \pi \times r^2 = 2\pi r^2$, and the area of the rectangle is the height of the cylinder times the circumference of the base, which is $h \times 2\pi r$. In this case, the height is equal to the radius, so the rectangle's area is $2\pi r^2$. The surface area is $2\pi r^2 + 2\pi r^2 = 4\pi r^2$ units². Since the surface area is 100π units², we have $4\pi r^2 = 100\pi$, which means $r^2 = 25 \rightarrow r = 5$ units. The volume of the cylinder is the area of the base times the height, so we get $\pi \times 5^2 \times 5 = 125\pi$ units³.

255. In the quadratic equation $x^2 + nx + 24 = 0$, the value of n is the sum of two numbers whose product is 24. The 4 possibilities involving positive integers are $1 + 24 = 25$, $2 + 12 = 14$, $3 + 8 = 11$ and $4 + 6 = 10$. Therefore, the probability that a number n chosen at random from the set will lead to integer solutions is $4/25$.

256. Silas's clock runs 5 quarters of an hour in 4 quarters of an hour, so the 6 hours that his clock shows from 10:00 p.m. to 4:00 a.m. was really only $6 \times 4/5 = 24/5 = 4\ 4/5$ hours. The actual time at the moment the clock stopped was 2:48 a.m. Silas woke up 4 hours later, which was **6:48 a.m.**

257. We will draw segments OA, OP and BP. We will also draw a segment PQ, which is parallel to segment AB and 2 cm below it. Since tangent line AB is perpendicular to radius OA, and segments QP and AB are parallel, we know that $\triangle OQP$ is a right triangle. The length OQ is $8 - 2 = 6$ cm, and OP is $8 + 2 = 10$ cm. Using the Pythagorean Theorem, we find that QP is $\sqrt{10^2 - 6^2} = \sqrt{100 - 36} = \sqrt{64} = 8$ cm. Since segment PB is perpendicular to segments AB and QP, segment AB is the same length as segment QP, so it's **8 cm**.

258. There are ${}_6P_3 = 6 \times 5 \times 4 = 120$ ways to pick three of the integers when order matters. If we pick the 1 first, the increasing arithmetic sequences are 1, 3, 5 or 1, 5, 9. If we pick the 3 first, we can get 3, 5, 7 or 3, 7, 11. If we pick the 5 first, we can get 5, 7, 9. If we pick the 7 first, we can get 7, 9, 11. Each of these 6 increasing sequences can be reversed to make a decreasing sequence, so there are 12 possible arithmetic sequences. The probability is thus $12/120 = 1/10$.

259. The difference between consecutive terms must always be the same, so $6 - p = (2p - 3) - 6$. Solving this for p , we get $6 - p = 2p - 9$, then $15 = 3p$ and finally $p = 5$. Plugging this value in, we find that the first three terms of the sequence are simply 5, 6 and 7. The common difference is 1. Thus, the tenth term must be $5 + 9 = 14$.

260. We might notice first that the digit represented by R must be small, either 1 or 2, since multiplying this four-digit number by 4 does not produce a five-digit number. But no multiple of 4 can end in 1, so $R = 2$. Now we notice that $4 \times S$ ends in a 2, so S is either 3 or 8. It can't be 3, since 4 times the 2 in the thousands place is at least 8000. This means that $S = 8$ and that A must be small so that nothing carries from the hundreds to the thousands place. Now we consider the T in the tens place of RATS. This will be multiplied by 4 and then 3 will be added (from the carry) to produce the A in STAR, so A must be odd. Since A also has to be small, it can only be 1. Since the digit 2 has been taken, we find that T must equal 7 so that $4 \times 7 + 3$ leaves a 1 in the tens place. Everything now works, and the multiplication problem is $2178 \times 4 = 8712$. The sum $S + T + A + R$ is $8 + 7 + 1 + 2 = 18$.

Workout 9

261. Notice that when the result of $m - 34$ is subtracted from the result of $263 - n$, the result is 104. So we have $(263 - n) - (m - 34) = 104$. When we simplify this equation, we get $263 - n - m + 34 = 104 \rightarrow 297 - n - m = 104 \rightarrow n + m = 193$.

262. We know that 1024 is 2^{10} . It can also be written as $(2^2)^5 = 4^5$ or as $(2^5)^2 = 32^2$. Since we must satisfy $a < b < c$, we must have $a = 1$, $b = 3$ and $c = 5$, so we get $(1 + 3)^5 = 1024$. The value of b is **3**.

263. If we substitute 200 for d into the formula, we get $t = 0.45\sqrt{200} \approx 6.36396 \approx 6.4$ seconds.

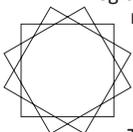

264. The two semicircles of radius 2 units can be put together to form a full circle with an area of $\pi \times 2^2 = 4\pi$ units². The shaded area in the middle would be $2 \times 4 = 8$ units², but two semicircles of radius 1 have been removed, for a loss of π units². The total area is $4\pi + 8 - \pi \approx 17.42$ units².

265. To find the surface area of the cone, we first need to find the *slant height*, s , with the help of the Pythagorean Theorem as follows: $s = \sqrt{5^2 + 1.5^2} = \sqrt{25 + 2.25} = \sqrt{27.25}$ inches. The surface area of the cone is πrs , not including the circular base. The ice cream cone is covered with $\pi \times 1.5 \times \sqrt{27.25} \approx 24.6$ in² of chocolate.

266. The probability of winning on the draw from Bag A is $1/10$. If a red ball is drawn from Bag B, it is returned to Bag B, before another ball is drawn. This makes it a bit tricky to directly calculate the probability of winning with Bag B. It's best if we consider that the probability of winning with Bag B equals $1 - P(\text{not winning in 20 draws from Bag B}) = 1 - (99/100)^{20}$. Therefore, the absolute difference between the probabilities of winning with Bags A and B is $|(1/10) - (1 - (99/100)^{20})| = |(-9/10) + (99/100)^{20}| \approx 0.082$.

267. We could substitute the 11 values of x into the expression $x^2 - 2x + 1$ to find our answer. But if we recognize that $x^2 - 2x + 1 = (x - 1)^2$, our calculations are much easier. Substituting into either expression, we find that the 7 elements in the set are 0, 1, 4, 9, 16, 25 and 36.

268. In the figure that accompanies the problem, notice that there are 6 distinct points of intersection among the three squares, which results in 7 regions. Further investigation with these squares will show that n points of intersection result in $n + 1$ regions. So, we need to maximize the number of distinct points of intersection among the squares. To do that, we need to make sure that each square intersects each side of the other two squares, unlike the example provided with the problem. By rotating the squares, we can actually have each square intersect each of the other two squares at two different points per side. It is not possible for a square to intersect either of the other squares at more than two points on a side. So if Square 1 intersects Square 2 at most twice per side, that's $2 \times 4 = 8$ distinct points of intersection. The same is true for intersections between Square 2 and Square 3 and intersections between Square 1 and Square 3. That's a total of $8 + 8 + 8 = 24$ distinct points of intersection, and $24 + 1 = 25$ regions, as shown in the figure.

269. Figure 1 shows the sums for the 36 outcomes when rolling two standard, fair dice. The 11 different sums have been circled to illustrate the distribution of the sums. If we number the faces of one die 0, 1, 2, 3, 4 and 5, and number the faces of the other die 2, 3, 4, 5, 6 and 7, we can achieve the same probability distribution for the sums, as shown in Figure 2. The sum of the integers on the faces of one of the nonstandard dice is $a = 0 + 1 + 2 + 3 + 4 + 5 = 15$. The sum of the integers on the faces of the other nonstandard die is $b = 2 + 3 + 4 + 5 + 6 + 7 = 27$. Thus, $a \times b = 15 \times 27 = 405$.

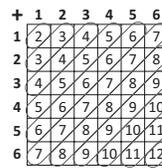

Figure 1

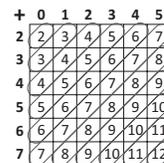

Figure 2

270. Using only the digits 0, 1, 2 and 4 to create a positive, four-digit integer, there are 3 choices for the thousands digit (1, 2 and 4 only). Then 3 choices remain for the hundreds digit. For the tens digit, there are 2 digits left to choose from, which leaves only one option for the units digit. Using the Fundamental Counting Principle, we see that there are $3 \times 3 \times 2 \times 1 = 18$ different positive, four-digit integers containing just the digits 0, 1, 2 and 4. They are included here in an organized list:

| | | |
|------|------|------|
| 1024 | 2014 | 4012 |
| 1042 | 2041 | 4021 |
| 1204 | 2104 | 4102 |
| 1240 | 2140 | 4120 |
| 1402 | 2401 | 4201 |
| 1420 | 2410 | 4210 |

These 18 integers have a sum of 45,108 and an arithmetic mean of $45,108 \div 18 = 2506$.

Surface Area & Volume Stretch

271. We are given the measurements $l = 34$ inches, $h = 30$ inches and $s = 32$ inches, where l , h and s represent the pyramid's slant height, the pyramid's height and the side length of the base. Since $s = 32$ inches, it follows that $B = 32 \times 32 = 1024 \text{ in}^2$ and $P = 32 \times 4 = 128$ inches. So, we have $SA = B + (1/2)Pl = 1024 + (1/2) \times 128 \times 34 = 1024 + 2176 = 3200 \text{ in}^2$, and $V = (1/3)Bh = (1/3) \times 1024 \times 30 = 10,240 \text{ in}^3$.

272. Since the base of the prism is a 4-cm by 5-cm rectangle, it has area $B = 4 \times 5 = 20 \text{ cm}^2$ and perimeter $P = 2 \times (4 + 5) = 2 \times 9 = 18 \text{ cm}$. With $h = 10 \text{ cm}$, we have $SA = 2B + Ph = 2 \times 20 + 18 \times 10 = 40 + 180 = 220 \text{ cm}^2$, and $V = Bh = 20 \times 10 = 200 \text{ cm}^3$.

273. For this cylinder, $h = 9 \text{ m}$ and $r = 5 \text{ m}$. So, $SA = 2\pi r^2 + 2\pi rh = 2\pi \times (5^2 + 5 \times 9) = 2\pi \times (25 + 45) = 2\pi \times 70 = 140\pi \text{ m}^2$, and $V = \pi r^2 h = \pi \times 5^2 \times 9 = \pi \times 25 \times 9 = 225\pi \text{ m}^3$.

274. For this cone, $h = 12 \text{ cm}$ and $r = 9 \text{ cm}$. Before we can determine the cone's surface area, we must first find its slant height. The altitude, radius and slant height of the cone form a right triangle in which the values of h , r and l are the lengths of the long leg, short leg and hypotenuse, respectively. We can use the Pythagorean Theorem to determine l . We have $l^2 = 12^2 + 9^2 \rightarrow l^2 = 144 + 81 \rightarrow l^2 = 225 \rightarrow l = \sqrt{225} \rightarrow l = 15 \text{ cm}$. So, $SA = \pi r^2 + \pi rl = \pi \times (9^2 + 9 \times 15) = \pi \times (81 + 135) = 216\pi \text{ cm}^2$, and $V = (1/3)\pi r^2 h = (1/3)\pi \times 9^2 \times 12 = (1/3)\pi \times 81 \times 12 = 324\pi \text{ cm}^3$.

275. With $r = 6 \text{ ft}$, we have $SA = 4\pi r^2 = 4\pi \times 6^2 = 4\pi \times 36 = 144\pi \text{ ft}^2$, and $V = (4/3)\pi r^3 = (4/3)\pi \times 6^3 = (4/3)\pi \times 216 = 288\pi \text{ ft}^3$.

276. The surface area of the pyramid is the sum of its base area and its lateral surface area. In the case of this square pyramid, the area of the base is the square of the side length, or s^2 , and its lateral surface area is $(1/2)Pl = (1/2) \times 4s \times 10 = 20s$. Since we are told that the surface area of the pyramid is 96 cm^2 , we have $s^2 + 20s = 96 \rightarrow s^2 + 20s - 96 = 0$. This quadratic equation can be solved by factoring to get $(s + 24)(s - 4) = 0 \rightarrow s + 24 = 0$ or $s - 4 = 0$. Since the length cannot be negative, $s = 4 \text{ cm}$.

277. We are told that this cylinder with height 10 cm has a volume of $250\pi \text{ cm}^3$. That means $\pi \times r^2 \times 10 = 250\pi \rightarrow 10r^2 = 250 \rightarrow r^2 = 25 \rightarrow r = 5 \text{ cm}$. The surface area of the cylinder is $2\pi r^2 + 2\pi rh = 2\pi \times (5^2 + 5 \times 10) = 2\pi \times 75 = 150\pi \text{ cm}^2$.

278 a. For this pyramid, $B = 64 \text{ cm}^2$ and $h = 12 \text{ cm}$. The volume of the pyramid, then, is $V = (1/3)Bh = (1/3) \times 64 \times 12 = 256 \text{ cm}^3$. If a plane perpendicular to its height slices through the pyramid 3 cm from its apex, the portion of the pyramid above this plane is a smaller pyramid with $h = 3 \text{ cm}$. We need to determine the area of this smaller pyramid's base. One very important theorem pertaining to similar figures tells us that if two similar figures have corresponding lengths in the ratio $a:b$, then the ratio of their areas is $a^2:b^2$, and the ratio of their volumes is $a^3:b^3$. Since the heights of the smaller pyramid and the original pyramid are in the ratio $3/12 = 1/4$, it follows that the areas of their bases are in the ratio $1^2/4^2 = 1/16$. Therefore, the smaller pyramid's base has an area that is $1/16$ that of the original pyramid, or $1/16 \times 64 = 4 \text{ cm}^2$. So, the smaller pyramid has volume $V = (1/3)Bh = (1/3) \times 4 \times 3 = 4 \text{ cm}^3$. Subtracting the volume of the smaller pyramid from the volume of the original pyramid gives us the volume of the frustum. Thus, the volume of the frustum is $256 - 4 = 252 \text{ cm}^3$.

b. We can find the surface area of the frustum by subtracting the surface area of the lateral faces of the smaller pyramid from the surface area of the original pyramid, and then adding to the result the area of the smaller pyramid's base (which is the same as the area of the top base of the frustum). Before we can determine the surface area of the original pyramid, we need to find its perimeter and slant height. With $B = 64 \text{ cm}^2$, it follows that the pyramid's base has side length $\sqrt{64} = 8 \text{ cm}$ and perimeter $8 \times 4 = 32 \text{ cm}$. To find the slant height, we will use the right triangle created by the pyramid's slant height, height and the segment drawn on the base from the center of the base perpendicular to the pyramid's base edge. Using the Pythagorean Theorem, we have $l^2 = 4^2 + 12^2 \rightarrow l^2 = 16 + 144 \rightarrow l^2 = 160 \rightarrow l = \sqrt{160} \rightarrow l = 4\sqrt{10} \text{ cm}$. So, for the original pyramid, $SA = B + (1/2)Pl = 64 + (1/2) \times 32 \times 4\sqrt{10} = 64 + 64\sqrt{10} \text{ cm}^2$. Again, using the ratio $1/16$, we know the smaller pyramid has surface area $(1/16) \times (64 + 64\sqrt{10}) = 4 + 4\sqrt{10} \text{ cm}^2$. Notice that 4 cm^2 is the area of the smaller pyramid's base and $4\sqrt{10} \text{ cm}^2$ is the combined surface area of the four lateral faces. So from the surface area of the original pyramid, we need to subtract $4\sqrt{10} \text{ cm}^2$ and add 4 cm^2 to get the surface area of the frustum. Doing so, we see that the surface area of the frustum is $64 + 64\sqrt{10} - 4\sqrt{10} + 4 = 68 + 60\sqrt{10} \text{ cm}^2$.

279 a. If we find the volume of the original cone and subtract the volume of the smaller cone above the plane that divides the original cone, we'll have the volume of the resulting frustum. With a radius of 18 inches and a height of 24 inches, the original cone has volume $V = (1/3)\pi r^2 h = (1/3)\pi \times 18^2 \times 24 = 2592\pi \text{ in}^3$. Since the ratio of the height of the smaller cone to the height of the original cone is 1:2, it follows that the ratio of their volumes is $1^3:2^3 = 1:8$. Therefore, the volume of the smaller cone is $(1/8) \times 2592\pi = 324\pi \text{ in}^3$, and the volume of the frustum is $2592\pi - 324\pi = \mathbf{2268\pi \text{ in}^3}$.

b. The lateral height of the original cone is equivalent to the length of the hypotenuse of a right triangle with legs 18 inches and 24 inches. This right triangle has side lengths that are 6 times the 3-4-5 Pythagorean Triple, namely 18-24-30. So $l = 30$ inches. Recall that the surface area of a cone is the sum of the area of its base and its lateral surface area. For the original cone, we have $\pi r^2 + \pi rl = (\pi \times 18^2) + (\pi \times 18 \times 30) = 324\pi + 540\pi = 864\pi \text{ in}^2$. From this we can subtract the lateral surface area of the smaller cone, then add to it the area of the smaller cone's base (area of the top base of the frustum). Again, since the ratio of the radius of the smaller cone to that of the original cone is 1:2, it follows that the ratio of their areas is $1^2:2^2 = 1:4$. Therefore, the smaller cone has base area $(1/4) \times 324\pi = 81\pi \text{ in}^2$ and lateral surface area $(1/4) \times 540\pi = 135\pi \text{ in}^2$. The surface area of the frustum is $864\pi - 135\pi + 81\pi = \mathbf{810\pi \text{ in}^2}$.

280. Since the original cone had a diameter of 18 m, its radius was 9 m. We are also told that it had height 9 m, and since it was sliced 3 m from the base, the smaller cone that was removed had height 6 m. The ratio of the heights of the smaller cone and the original cone is $6:9 = 2:3$. The volume of the original cone was $(1/3)\pi r^2 h = (1/3)\pi \times 9^2 \times 9 = 243\pi \text{ m}^3$. The ratio of the volumes of the smaller cone and the original cone is $2^3:3^3 = 8:27$. Therefore, the smaller cone had volume $(8/27) \times 243\pi = 72\pi \text{ m}^3$. So, again to get the volume of the frustum, we simply subtract the volume of the smaller cone from the volume of the original cone to get $243\pi - 72\pi = \mathbf{171\pi \text{ m}^3}$.

Data & Statistics Stretch

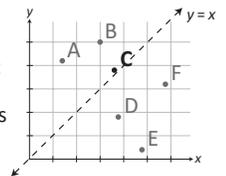

281. The results from the 20 survey respondents have been organized in a line plot. In the line plot, each X represents one survey response. For example, by counting the Xs, we quickly discover that of those pet owners who responded, 4 indicated that they own two pets and 1 reported owning five pets. The median of these 20 responses is the average of the 10th and 11th responses when all are arranged in ascending or descending order. In this case, we can see from the line plot that both the 10th and 11th responses are three pets. Thus, the median is 3. It is quite easy to determine the mode from the line plot, because the response with the most Xs is 3, which means 3 is the mode. Since the median and mode both have a value of 3, it follows that their mean also is **3** pets.

282. We need to determine the mean and median of the 20 roller coaster speeds in the stem-and-leaf plot. Using a calculator, add the 20 values and get a sum of 2378. Therefore, the mean of the roller coaster speeds is $2378 \div 20 = 118.9 \text{ mi/h}$. As in the previous problem, with 20 values, the median is the average of the two middle values. In this case, the 10th and 11th values are 119 and 120, and their average is 119.5. Thus, the absolute difference between the mean and median is $|118.9 - 119.5| = |-0.6| = \mathbf{0.6 \text{ mi/h}}$.

If you don't have a calculator handy, there is a way to make finding the sum of the 20 numbers less time consuming. Instead of adding $90 + 92 + 93 + 95 + \dots$, we can regroup to make the arithmetic a little easier to manage. For each stem, we can multiply its value by the number of leaves, and then add the sum of the leaves. For example, the stem 9, which represents 90, has 5 leaves with a sum of $0 + 2 + 3 + 5 + 6 = 16$. So, we have $(90 \times 5) + 16 = 450 + 16 = 466$. Once we have the total associated with each stem, we then can add those to get the sum of the data. While there is still arithmetic to do, this method requires fewer calculations so there are fewer opportunities to make an error.

283. According to the graph, the driver's speed was not constant throughout the hour from 10:30 to 11:30. During that time, the driver's speed decreased from 50 mi/h to 40 mi/h. The driver's speed decreased at a constant rate of change from 10:30 to 11:00. So, the average speed from 10:30 to 11:00 was $(50 + 40)/2 = 45 \text{ mi/h}$. Then from 11:00 to 11:30 the driver's speed remained constant at 40 mi/h. From 10:30 to 11:30, the driver's average speed was $(45 + 40)/2 = \mathbf{42.5 \text{ mi/h}}$.

284. To determine which point on the graph represents the highest-quality conversation, we need to determine for which point (x, y) , the ratio x/y is closest to 1. Since this graph has no scale and we don't know the exact coordinates of any of the points representing conversations A through F, we'll see which point is closest to the line $y = x$. As shown in the figure, point **C** represents the conversation with the highest quality.

285. The mean of the five values equals the sum of the five values, S , divided by 5. Algebraically, we have $S/5 = 27 \rightarrow S = 27 \times 5 \rightarrow S = \mathbf{135}$.

286. Again, we'll let S represent the sum of the five numbers. When each of the five numbers is doubled, the sum is also doubled. So, we have $2S/5 = 60 \rightarrow 2S = 300 \rightarrow S = 150$. The sum of the five original numbers was 150, and their mean was $150/5 = \mathbf{30}$. It makes sense that the mean that results when each number is doubled is twice the mean of the original five numbers since $2S/5 = 2(S/5)$.

287. Let S be the sum of the original 20 numbers. We can write $S/20 = 37 \rightarrow S = 740$. When two numbers, a and b , are removed, we have $[S - (a + b)]/18 = 38 \rightarrow S - (a + b) = 684 \rightarrow a + b = S - 684$. We know that $S = 740$, so it follows that $a + b = 740 - 684 = 56$. The average of the two numbers that were removed is $(a + b)/2 = 56/2 = \mathbf{28}$.

288. We will use the mean, median and unique mode to draw additional conclusions about these six numbers. Let a, b, c, d, e and f represent the six numbers, in ascending order. Since the sum of the six numbers is $a + b + c + d + e + f = S$, and the mean is 8, we can write $S/6 = 8 \rightarrow S = 48$. We now know that the six numbers have a sum of 48. Since we have a group of six numbers, and there is no middle number, the median is the mean of the two middle numbers. In this case the median, which is 7, is the mean of c and d . We can write $(c + d)/2 = 7 \rightarrow c + d = 14$. So, the sum of the two middle numbers is 14. Lastly, we know that 3 is the unique mode, which means at least two of our six numbers must be 3. Now our goal is to maximize the range of our six numbers, $f - a$. Since all six numbers are positive integers, the least possible value of one of these numbers is 1.

We'll let $a = 1$. Since at least two of the six numbers must be 3, we'll let $b = c = 3$. Since $c + d = 3 + d = 14$, it follows that the value of d must be 11. The sum of the four numbers we've identified is $1 + 3 + 3 + 11 = 18$. That means $e + f = 48 - 18 = 30$. Since we want the value of f to be as large as possible, we'll let the value of e be as small as possible, but not equal to d since 3 is the unique mode and only appears twice. Thus, $e = 12$ and $f = 30 - 12 = 18$. These six numbers 1, 3, 3, 11, 12, 18 have a mean, median and unique mode of 8, 7 and 3, respectively. The maximum range for six positive numbers with these characteristics is $18 - 1 = 17$.

289. We are told that the mean of the three terms is 10. In an arithmetic sequence with an odd number of terms, the middle term is both the mean and median of the sequence. If we let d represent the common difference between terms in this sequence, the three terms can be written as $10 - d$, 10 , $10 + d$. Since the mean of their squares is 394, we have $[(10 - d)^2 + 10^2 + (10 + d)^2]/3 = 394 \rightarrow (10 - d)^2 + 10^2 + (10 + d)^2 = 1182 \rightarrow 100 - 20d + d^2 + 100 + 100 + 20d + d^2 = 1182 \rightarrow 2d^2 + 300 = 1182 \rightarrow 2d^2 = 882 \rightarrow d^2 = 441 \rightarrow d = \pm 21$. Whether we use $d = -21$ or $d = 21$, the largest of the three original terms is $10 - (-21) = 10 + 21 = 31$.

290. Let the six different positive integers be, in ascending order, a, b, c, d, e, f , with a sum of 66. The mean of these six numbers is $66/6 = 11$ and is one of the six integers. Since all six numbers are different, we would expect the 11 to be somewhere near the median of the six numbers, maybe c or d . We want the value of f to be as large as possible, which means the other numbers need to be as small as possible. The least possible value is 1. So, let $a = 1$. We also know the range, $f - 1$, is in the set of six numbers, so $e = f - 1$. Now if we let $d = 11$ and make the values of b and c as small as possible, namely $b = 2$ and $c = 3$, we'll have the set $\{1, 2, 3, 11, f - 1, f\}$. It follows that $1 + 2 + 3 + 11 + f - 1 + f = 66 \rightarrow 17 + 2f - 1 = 66 \rightarrow 2f = 50 \rightarrow f = 25$, and $e = f - 1 = 25 - 1 = 24$. There are a few sets with six different positive integers that have a sum of 66 and that include both the mean and range among the six numbers. The sets $\{5, 10, 11, 12, 13, 15\}$ and $\{1, 8, 9, 11, 18, 19\}$ are among those sets, but the set $\{1, 2, 3, 11, 24, 25\}$ is the set containing the greatest possible number, **25**.

Geometric Proportions Stretch

291. Recall that if two similar figures have corresponding lengths in the ratio $a:b$, then the ratio of their areas is $a^2:b^2$, and the ratio of their volumes is $a^3:b^3$. We know the ratio of the lengths of corresponding edges of the smaller prism to the larger prism is 1:2, so the ratio of their volumes is $1^3:2^3 = 1:8$. That means the volume of the smaller prism is $1/8$ of the volume of the larger prism. Therefore, the number of smaller prisms with a combined volume equal to the volume of the larger prism is **8** smaller prisms.

292. Let's number the prisms so we can reference them more easily. From the previous problem, the larger prism will be prism #1, and the smaller prism #2. Prism #2 is divided into prism #3, which is $3/4$ of prism #2, and prism #4, which is $1/4$ of prism #2. So, the volume of prism #4, V_4 , is $1/4$ of the volume of prism #2, V_2 . In other words, $(1/4)V_2 = V_4 \rightarrow V_2 = 4V_4$. In the previous problem, we found that $V_2 = (1/8)V_1$. Substituting, we have $4V_4 = (1/8)V_1 \rightarrow V_4 = [(1/8)/4]V_1 \rightarrow V_4 = (1/32)V_1$. Thus, the smallest prism has a volume that is **$1/32$** of the volume of the largest prism. Note that prism #1 and prism #4 are not similar.

293. As a fraction, the ratio of the areas of the small and large circles is $1/9$. To determine the ratio of their radii, which is a measure of length, we take the square root of the ratio of their areas. Therefore, the ratio of the radius of the small circle to the radius of the large circle is $\sqrt{1/9} = 1/3$.

294. Since the ratio of the radii of the small and large circles is $1/3$, it follows that all other corresponding measures of length have the same ratio. We can set up the proportion $1/3 = c/3.12$, where c represents the length of the S-curve in the small circle. Cross-multiplying and solving, we get $3c = 3.12 \rightarrow c = 1.04$ cm.

295. Since the two pyramids are similar, we can write the ratio of their corresponding lengths, comparing the new pyramid and the old pyramid, as $30/20 = 3/2$. The ratio of their volumes, then, is $3^3/2^3 = 27/8$.

296. From the previous problem, we know that the ratio of the volume of the new pyramid, V_n , to that of the original pyramid, V_o , is $V_n/V_o = 27/8 \rightarrow V_n = (27/8)V_o$. Since the new pyramid's volume is $27/8$ of the original pyramid's volume, the difference in their volumes is $(27/8)V_o - V_o = (19/8)V_o$. So, we need to determine the time, t , in years, that it will take to add that volume to the original pyramid, considering it took 16 years to construct the original pyramid. We can set up the proportion $V_o/16 = [(19/8)V_o]/t$. Cross-multiplying and solving for t , we see that $V_o \times t = 16 \times (19/8) \times V_o \rightarrow t = 2 \times 19 = 38$ years is the time it will take for construction of the larger pyramid to be completed.

297. The sphere has a diameter of 2 inches, so its radius is 1 inch. The volume of the sphere is $(4/3)\pi r^3 = (4/3)\pi \times 1^3 = (4/3)\pi \approx 4.19$ in³.

298. The ratio of the diameter of the original sphere to that of the hollow sphere is $2/10 = 1/5$. So, the ratio of their surface areas is $1^2/5^2 = 1/25$.

299. We already determined that the volume of the glass is $(4/3)\pi$ in³. We need to determine the volume of the air in the finished hollow sphere. The ratio of the volume of the original sphere to that of the finished hollow sphere is $1^3/5^3 = 1/125$. Therefore, the volume of the finished hollow sphere is $(4/3)\pi \times 125 = (500/3)\pi$ in³. Since this is the combined volume of glass and air in the finished hollow sphere, it follows that the volume of the air in the sphere is $(500/3)\pi - (4/3)\pi = (496/3)\pi$ in³. Therefore, in the finished hollow sphere, the ratio of the volume of glass to the volume of enclosed air is $[(4/3)\pi]/[(496/3)\pi] = 4/496 = 1/124$.

300. Each of the triangular faces of the sculpture has area $4617 \div 20 = 230.85$ cm². So, since each triangular face on the model has area 2.85 cm², the ratio of the area of a face on the model to the area of a face on the actual sculpture is $2.85/230.85 = 1/81$. Thus, the ratio of corresponding lengths on the model and sculpture is $\sqrt{1/81} = 1/9$, and the ratio of their volumes is $1^3/9^3 = 1/729$. So, we can set up the proportion $34/V = 1/729$, where V represents the volume of the actual sculpture. Cross-multiplying and solving for V , we get $V = 729 \times 34 = 24,786$ cm³. Note: The area of each face of a model icosahedron with volume 34 cm³ is actually closer to 2.50 cm². The area 2.85 cm² was used to simplify calculations while still reinforcing the geometric proportions concepts.

MATHCOUNTS Problems Mapped to Common Core State Standards (CCSS)

Currently, 45 states have adopted the Common Core State Standards (CCSS). Because of this, MATHCOUNTS has concluded that it would be beneficial to teachers to see the connections between the CCSS and the *2013-2014 MATHCOUNTS School Handbook* problems. MATHCOUNTS not only has identified a general topic and assigned a difficulty level for each problem but also has provided a CCSS code in the Problem Index (pages 82-83). A complete list of the Common Core State Standards can be found at www.corestandards.org.

The CCSS for mathematics cover K-8 and high school courses. MATHCOUNTS problems are written to align with the NCTM Standards for Grades 6-8. As one would expect, there is great overlap between the two sets of standards. MATHCOUNTS also recognizes that in many school districts, algebra and geometry are taught in middle school, so some MATHCOUNTS problems also require skills taught in those courses.

In referring to the CCSS, the Problem Index code for each or the Standards for Mathematical Content for grades K-8 begins with the grade level. For the Standards for Mathematical Content for high school courses (such as algebra or geometry), each code begins with a letter to indicate the course name. The second part of each code indicates the domain within the grade level or course. Finally, the number of the individual standard within that domain follows. Here are two examples:

- *6.RP.3* → *Standard #3 in the Ratios and Proportional Relationships domain of grade 6*
- *G-SRT.6* → *Standard #6 in the Similarity, Right Triangles and Trigonometry domain of Geometry*

Some math concepts utilized in MATHCOUNTS problems are not specifically mentioned in the CCSS. Two examples are the Fundamental Counting Principle (FCP) and special right triangles. In cases like these, if a related standard could be identified, a code for that standard was used. For example, problems using the FCP were coded 7.SP.8, S-CP.8 or S-CP.9 depending on the context of the problem; SP → Statistics and Probability (the domain), S → Statistics and Probability (the course) and CP → Conditional Probability and the Rules of Probability. Problems based on special right triangles were given the code G-SRT.5 or G-SRT.6, explained above.

There are some MATHCOUNTS problems that either are based on math concepts outside the scope of the CCSS or based on concepts in the standards for grades K-5 but are obviously more difficult than a grade K-5 problem. When appropriate, these problems were given the code SMP for Standards for Mathematical Practice. The CCSS include the Standards for Mathematical Practice along with the Standards for Mathematical Content. The SMPs are (1) Make sense of problems and persevere in solving them; (2) Reason abstractly and quantitatively; (3) Construct viable arguments and critique the reasoning of others; (4) Model with mathematics; (5) Use appropriate tools strategically; (6) Attend to precision; (7) Look for and make use of structure and (8) Look for and express regularity in repeated reasoning.

PROBLEM INDEX

It is difficult to categorize many of the problems in the *MATHCOUNTS School Handbook*. It is very common for a MATHCOUNTS problem to straddle multiple categories and cover several concepts. This index is intended to be a helpful resource, but since each problem has been placed in exactly one category and mapped to exactly one Common Core State Standard (CCSS), the index is not perfect. In this index, the code **9 (3) 7.SP.3** refers to problem 9 with difficulty rating 3 mapped to CCSS 7.SP.3. For an explanation of the difficulty ratings refer to page 54. For an explanation of the CCSS codes refer to page 81.

2013-2014 ADDITIONAL STUDENTS REGISTRATION FORM

Step 1: Tell us about your school so we can find your original registration (please print legibly).

Teacher/Coach Name _____ Teacher/Coach E-mail _____ Teacher/Coach Phone _____
 School Name _____ Customer # (if known) **A** - _____
 School Mailing Address _____ City, State ZIP _____

Step 2: Tell us how many students you are adding to your school's registration. Following the instructions below.

Please circle the number of additional students you will enter in the Chapter Competition and the associated cost below (depending on the date your registration is postmarked). The cost is \$30 per student added, whether that student will be part of a team or will compete as an individual. The cost of adding students to a previous registration is not eligible for an Early Bird rate.

| | | | | | | | | | |
|--|------|------|-------|-------|-------|-------|-------|-------|-------|
| # of Students You Are Adding | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| Regular Rate <i>(postmarked by Dec. 13, 2013)</i> | \$30 | \$60 | \$90 | \$120 | \$150 | \$180 | \$210 | \$240 | \$270 |
| Late Registration <i>(postmarked after Dec. 13, 2013)</i> | \$50 | \$80 | \$110 | \$140 | \$170 | \$200 | \$230 | \$260 | \$290 |

My school qualifies for the 50% Title I discount, so the Amount Due in Step 4 will be half the amount I circled above. Principal signature required to verify Title I eligibility.
X _____

Step 3: Tell us what your school's FINAL registration should be (including all changes/additions).

| | | | | | | | | | | |
|--------------------------------|---------------------|--------------|--------------|---------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|
| TOTAL # of Registered Students | 1 (1 individual) | 2 (2 ind) | 3 (3 ind) | 4 (1 team) | 5 (1 tm, 1 ind) | 6 (1 tm, 2 ind) | 7 (1 tm, 3 ind) | 8 (1 tm, 4 ind) | 9 (1 tm, 5 ind) | 10 (1 tm, 6 ind) |
|--------------------------------|---------------------|--------------|--------------|---------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|

Step 4: Almost done... just fill in payment information and turn in your form!

Amount Due _____ Check (payable to MATHCOUNTS Foundation) Money order Purchase order # _____ *(must include P.O.)*
 Credit card (include all information) Name on card _____ Visa MasterCard Exp. _____
 Signature _____ Card # _____

Mail, e-mail a scanned copy or fax this completed form to:

MATHCOUNTS Registration | P.O. Box 441 | Annapolis Junction, MD 20701

E-mail: reg@mathcounts.org | Fax: 240-396-5602

Please call the Registration Office at **301-498-6141**.

**THE NATIONAL
MATHCLUB**
powered by **MATHCOUNTS®**

2013-2014 REGISTRATION FORM

Step 1: Tell us about your group. Check and complete only 1 option.

- U.S. school with students in 6th, 7th and/or 8th grade**

School Name: _____

There can be multiple clubs at the same U.S. middle school, as long as each club has a different Club Leader.

- Chapter or member group of a larger organization.**

(Can be non-profit or for profit)

Organization: _____

Chapter (or equivalent) Name: _____

*Examples of larger organizations:
Girl Scouts, Boy Scouts, YMCA,
Boys & Girls Club, nationwide
tutoring/enrichment centers.*

- A home school or group of students not affiliated with a larger organization.**

Club Name: _____

Examples: home schools, neighborhood math groups, independent tutoring centers

Step 2: Make sure your group is eligible to participate in The National Math Club.

Please check off that the following statements are true for your group:

- My group consists of at least 4 U.S. students.
 The students in my group are in 6th, 7th and/or 8th grade.
 My group has regular in-person meetings.

By signing below I, the Club Leader, affirm that all of the above statements are true and that my group is therefore eligible to participate in The National Math Club. I understand that MATHCOUNTS can cancel my membership at any time if it is determined that my group is ineligible.

Club Leader Signature: _____

Step 3: Get signed up.

Club Leader Name _____ Club Leader E-mail _____

Club Leader Phone _____ Club Leader Alternate E-mail _____

Club Mailing Address _____

City, State ZIP _____ Total # of participating students in club: _____

Previously participated in MATHCOUNTS. If previous participant, provide Customer # (if known): **A-** _____

How did you hear about MATHCOUNTS? Mailing Word-of-mouth Conference Internet E-mail Prior Participant

For schools only: School Type: Public Charter Private Home school Virtual

If your school is overseas: My school is a DoDDS OR State Department sponsored school. Country _____

Step 4: Almost done... just turn in your form.

Mail, e-mail a scanned copy or fax this completed form to:

MATHCOUNTS Registration | P.O. Box 441 | Annapolis Junction, MD 20701

E-mail: reg@mathcounts.org | Fax: 240-396-5602

2015
■ School Competition ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ If $3x + 2 = 17$, what is the value of x ?

2. \$ _____ A mountain bike, originally priced at \$650, is on sale for 20% off. After the fixed shipping cost of \$25 is added to the new price, what is the final cost of the bike?

3. _____ cm Point C divides line segment AB so that $\frac{AC}{AB} = \frac{1}{3}$. If $AC = 5$ cm, what is AB?

4. _____ games

Cooke County schools have 7 teams playing in a basketball tournament. How many games will be played if each team plays 3 games against every other team?

5. _____ ft^2 What is the area of the largest rectangular field that can be completely enclosed using 120 feet of fencing?

6. _____ The quotient of two positive integers is 21. The difference between the larger integer and this quotient is 21. What is the sum of the two integers?

7. _____ in^2 A sheet of paper 11 inches tall and $8\frac{1}{2}$ inches wide has 1-inch margins at the top and bottom and $\frac{3}{4}$ -inch margins at each side. If nothing is to be printed in the margins, what is the area of the printable region?

8. _____ What is the least positive integer n such that the product $65n$ is a perfect square?

9. _____ $\frac{\text{years}}{\text{old}}$ The sum of the ages of Kishia and her daughter is 48 years, and the difference of their ages is 20 years. How old is Kishia?

10. _____ A certain cube has volume n cubic inches and surface area n square inches. What is the value of n ?

11. _____ seconds Andrea is pouring water from a full bucket into an empty bucket. The full bucket initially contained 4800 ml of water, and Andrea pours at a steady rate of 100 ml per second. For how many seconds must Andrea pour to get the same amount of water in each bucket?

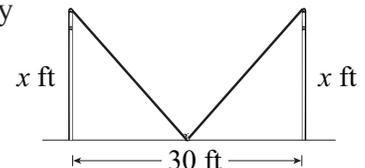

12. _____ hours According to a survey, 20 adults in Los Angeles watch an average of 3 hours of television per day, and 40 adults in San Francisco watch an average of 2 hours of television per day. On average, how many hours of television do the 60 adults surveyed watch per day? Express your answer as a mixed number.

13. unit cubes Twenty-seven unpainted unit cubes are used to construct a large $3 \times 3 \times 3$ cube. If five of the six faces of the large cube are then painted, how many of the unit cubes are painted on exactly two faces?

14. The sequence A_n is such that $a_n = 2a_{n-1} + 1$. If $a_6 = 191$ and $a_5 = 95$, what is the value of a_2 ?

15. The mean of five whole numbers is 12, and the unique mode is 13. If all five numbers are greater than 9 but less than 14, what is the median of the five numbers?

16. Two vertical poles are placed 30 feet apart, and the top of each pole is x feet above ground. The ends of a wire 34 feet in length are attached at the tops of the poles and its center is anchored to the ground halfway between the poles, as shown. What is the value of x ?

17. minutes A relay team consisting of four runners – Anne, Bryn, Carmen and Dahlia – completed a race in 72 minutes. Anne's leg of the race took $\frac{1}{5}$ of the total time; Bryn's took $\frac{1}{3}$ of the total time; and Carmen's took $\frac{3}{10}$ of the total time. How many minutes did Dahlia take to run her leg of the race?

18. If $ab = 1$, $bc = -9$, $c = -b$ and $c < -a$, what is the value of $a + b$? Express your answer as a mixed number.

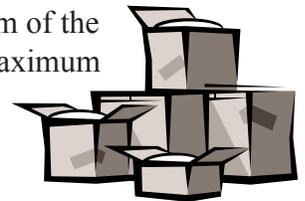

19. _____ coins Chad has \$1.80 in coins consisting of nickels and dimes only. If the total value of his nickels is twice that of his dimes, how many coins does Chad have?

20. _____ ounces A small bag of 10 identical apples weighs n ounces, and a large bag of n of these apples weighs less than 40 ounces, where n is an integer. In ounces, what is the greatest possible weight of the large bag? Express your answer as a mixed number.

21. _____ The sum of the first $n + 2$ counting numbers is 43 more than the sum of the first n counting numbers. What is the value of n ?

22. _____ What positive integer y satisfies $3x^2 + y^2 - 16 = 3(x^2 + 3)$?

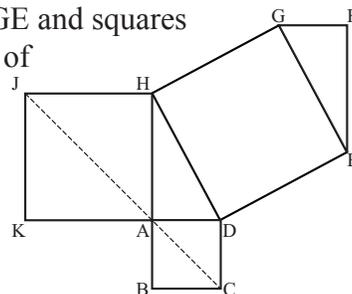

23. _____ in³ An internet sales company will ship a box for free if the sum of the length, width and height is 48 inches or less. What is the maximum volume of a box 24 inches in length that ships for free ?

24. _____ What is the sum of the first 200 terms of the arithmetic sequence 5, 12, 19, 26, ...?

25. _____ mi/h Maria starts out jogging from Ye Olde Bridge at 8:00 a.m. at a speed of 4 mi/h. Twelve minutes later, Nicole starts out from Ye Olde Bridge and follows the same route. At what constant rate in miles per hour must Nicole run to catch Maria at 8:42 a.m.? Express your answer as a decimal to the nearest tenth.

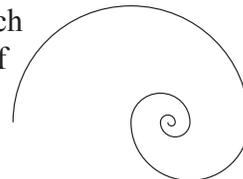

26. _____ The figure shows congruent right triangles ADH and FGE and squares AHJK, ABCD and DEGH. What is the ratio of the area of quadrilateral CDHJ to the area of hexagon ADEFGH? Express your answer as a common fraction.

27. _____ mg Jose took 500 mg of medication at 2:00 p.m., and then he took another 500 mg at 6:00 p.m. However, 80% of the medication is cleared from his body every 2 hours. How many milligrams of medication remain in his body at 8:00 p.m.?

28. _____ Given the function $f(x) = 6x^2$, what is the value of $\frac{f(a+b) - f(a-b)}{ab}$, when a and b are both positive?

29. _____ units The figure shows the beginning of a spiral created by starting with a semicircle of radius 1 unit and endlessly attaching semicircles that are each half the radius of the previous semicircle. What is the length of the whole spiral? Express your answer in terms of π .

30. _____ cm² Right triangle ABC has legs AB = 6 cm and AC = 8 cm. Square BCDE is drawn outside of the triangle along the hypotenuse. What is the area of triangle ADE?

MATHCOUNTS®

■ **School Competition** ■
Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

5. \$ _____

In Alaya's home state, an individual's income tax is calculated as follows:

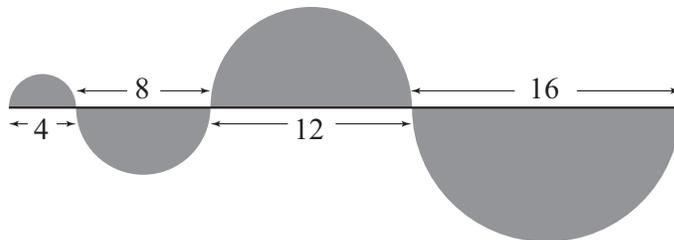

- 4% on any portion of income less than or equal to \$10,000, plus
- 5% on any portion of income greater than \$10,000 but less than or equal to \$30,000, plus
- 6% on any portion of income over \$30,000.

The figure shows how the state income tax is calculated for an income of \$42,000. If Alaya paid \$3200 in state income tax, what was his income?

6. _____ cm

Semicircles are formed on alternating sides of a 40 cm segment, as indicated below. In centimeters, what is the radius of a circle that has the same area as the shaded region? Express your answer as a decimal to the nearest tenth.

7. _____ cm

The square shown in Figure 1 has side length 24 cm. It is divided into four congruent quadrilaterals and rearranged to form the square in Figure 2. The square in the center of Figure 2 has side length 10 cm. What is the side length of the larger square in Figure 2?

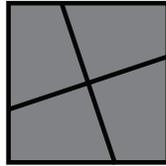

Figure 1

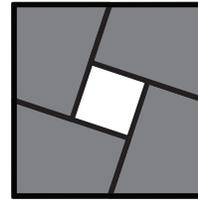

Figure 2

8. _____

Mr. Jared asked his math students to compute the numerical value of $(a + 3) \cdot (a + 6)$ for a particular positive value of a . Ruby accidentally copied the expression as $(a + 3) \cdot a + 6$, so even though she used the correct value for a and did all computations correctly, she got the wrong answer. Similarly, Amber mistakenly wrote the expression as $a + 3 \cdot (a + 6)$ and obtained an incorrect answer, despite making no other mistakes. Curiously, Ruby and Amber ended up with the same wrong answer! What was the correct answer to Mr. Jared's question?

1. _____

The counting numbers are listed in an array of six columns, labeled A through F, so that the rows alternate between counting from left to right and right to left. If this pattern continues, what number would be the 40th entry in column C?

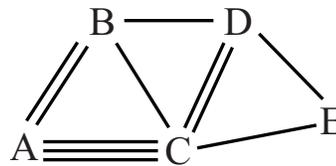

| A | B | C | D | E | F |
|----|----|----|----|----|----|
| 1 | 2 | 3 | 4 | 5 | 6 |
| 12 | 11 | 10 | 9 | 8 | 7 |
| 13 | 14 | 15 | 16 | 17 | 18 |
| 24 | 23 | 22 | 21 | 20 | 19 |
| 25 | 26 | 27 | 28 | 29 | 30 |

2. _____ marbles

Sally has a bag of marbles to share with her friends. Sue chooses first and takes $\frac{1}{3}$ of the marbles out of the bag. Next, Bill takes $\frac{1}{4}$ of the remaining marbles. Brian then gets $\frac{1}{2}$ of the remaining marbles, which leaves 75 marbles for Sally. How many marbles did Sally's friends take?

3. _____ routes

Each line segment in the diagram represents a distinct road between two cities. If the roads can only be used to go between cities in alphabetical order (but not every city must be visited), how many routes are there from A to E?

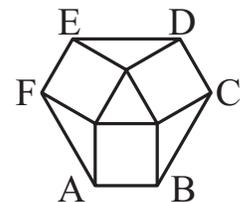

4. _____

The solution to $x^2 + bx + c = 0$ of least value is 4 more than the solution to $x^2 + 5x + 4 = 0$ of least value. The solution to $x^2 + bx + c = 0$ of greatest value is 4 more than the solution to $x^2 + 5x + 4 = 0$ of greatest value. What is the value of $b + c$?

5. _____ units

A square is constructed on each side of an equilateral triangle, and segments are drawn between adjacent external vertices of the three squares to form hexagon ABCDEF as shown. If the equilateral triangle has sides of length $\sqrt{3} - 1$ units, what is the perimeter of hexagon ABCDEF?

6. ways Six volleyball teams, each of which consists of three men and three women, are competing in a tournament. A reporter wants to interview one person from each team, being sure to have three men and three women total. How many ways can the six people to be interviewed be chosen?
7. All terms of an arithmetic sequence are integers. The first term is 535, the last term is 567, and the sequence has n terms. What is the sum of all possible values of n ?
8. What is the greatest integer that leaves the same remainder when divided into each of the integers 3712, 3814 and 3865?
9. Three fair standard six-sided dice are rolled. What is the probability that the sum of the three numbers rolled does not exceed 10? Express your answer as common fraction.
10. numbers How many numbers of the form $\frac{1}{a}$, where a is an integer such that $1 < a < 100$, can be written as a terminating decimal?

Sprint Round Answers

- | | | |
|------------------------|-----------------------------|--------------------------|

1. _____ If $\frac{a}{b} = \frac{3}{5}$ and $b = 10$, what is the value of a ?

2. _____ triangles Square ABCD, shown here, has diagonals AC and BD that intersect at E. How many triangles of any size are in the figure?

3. _____ When the integers 1 to 100 inclusive are written, what digit is written the fewest number of times?

4. _____ Danica wrote the digits from 1 to 8 across a sheet of paper, as shown, and then circled one digit. If the digits to the left of the circled digit had the same sum as those to the right of the circled digit, which digit did Danica circle?

1 2 3 4 5 6 7 8

5. \$ _____ Sally received a sum of money for her birthday. She spent one-third of that money on bus fare to travel downtown. She spent half of the money that remained to treat her best friend to a movie, after which Sally had \$12.00 remaining. How much money did Sally receive for her birthday?

6. _____ When six is added to a number, the result is three times the original number. What is the original number?

7. \$ _____

Each time one of Yuan's paintings sells, the gallery sends Yuan a payment equal to 60% of the purchase amount, and the gallery keeps the remainder. If three of Yuan's paintings sold recently for \$200, \$300 and \$500, he should expect to receive three payments totaling how many dollars from his gallery?

8. _____

If x is 15% of 500 and y is 200% of x , what is the value of the sum $x + y$?

9. _____

The square in Figure 1 is cut along its diagonals creating four congruent triangles that then are arranged to create Figure 2. What is the probability that a randomly chosen point within the boundary of Figure 2 is in any of the shaded triangles? Express your answer as a common fraction.

Figure 1

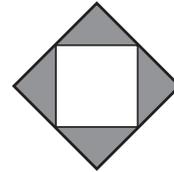

Figure 2

10. _____

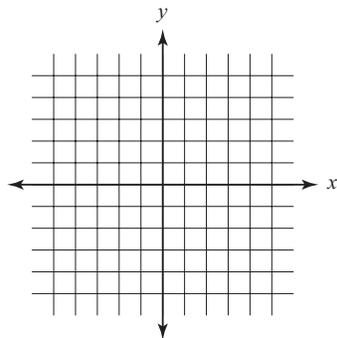

If $\sqrt[3]{b} = 5$, what is the value of $2b$?

11. \$ _____

This table shows every category of Martin's monthly expenses. Once completed, it will depict how 100% of Martin's monthly income is budgeted. Based on the information provided, what is Martin's monthly income?

| | Rent | Car Loan Payment | Utilities | Food | Gasoline | Savings |
|-------------------|------|------------------|-----------|------|----------|---------|
| Percent of Income | 35% | 15% | 20% | 15% | | 10% |
| Dollars of Income | | | | | \$80 | |

12. _____ units²

The points $A(-1, 2)$ and $B(3, 2)$ are graphed on a coordinate plane. Point C is the reflection of point A over the x -axis. What is the area of triangle ABC ?

13. _____ What is the greatest prime factor of the product $6 \times 14 \times 22$?

14. _____ If $\blacktriangle + \blacksquare = 5$ and $\blacktriangle - \blacksquare = 3$, what is the value of $\blacktriangle + \blacktriangle$?

15. _____ Ms. Spice tells her class that she is thinking of a positive common fraction. The product of the numerator and denominator is 60. When she adds 1 to the numerator and divides the denominator by 2, the resulting fraction is equal to 1. What common fraction is Ms. Spice thinking of?

16. _____ papers Working alone, a professor grades a paper every 10 minutes. The professor spends 20 minutes training an assistant. Then, working together, they grade 2 papers every 15 minutes. For how many graded papers is the amount of time it would take the professor working alone the same as the amount of time it would take the professor and her assistant working together, including the time required for training?

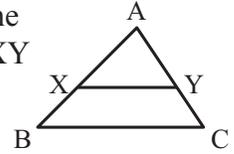

17. _____ If $b = a^2$ and $c = 3b - 2$, what is the product of all values of a for which $b = c$?

18. _____ A set of six distinct positive integers has a mean of 8, a median of 8 and no term greater than 13. What is the least possible value of any term in the set?

19. _____ If $x \uparrow y = (x + y)^2$ for positive integers x and y , what is the value of $(1 \uparrow 2) \uparrow 3$?

20. _____ Segment XY is drawn parallel to the base of triangle ABC . If the area of trapezoid $BCYX$ is 10 units² and the area of triangle AXY is 8 units², what is the ratio of XY to BC ? Express your answer as a common fraction.

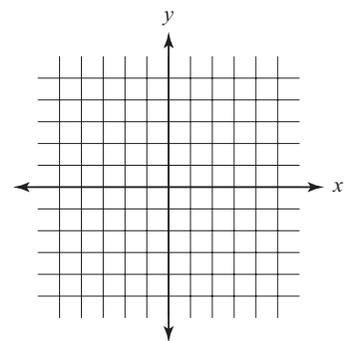

21. _____ What is the greatest possible absolute difference between the mean and the median of five single-digit positive integers? Express your answer as a common fraction.

22. _____ If f is a function such that $f(f(x)) = x^2 - 1$, what is $f(f(f(f(3))))$?

23. _____ If the sum of an arithmetic progression of six positive integer terms is 78, what is the greatest possible difference between consecutive terms?

24. _____ units² Points A , B and C have coordinates $(-4, 2)$, $(1, 2)$ and $(-1, 5)$, respectively. If triangle ABC is reflected across the y -axis, what is the area of the region that is the intersection of triangle ABC and its reflection? Express your answer as a decimal to the nearest tenth.

25. _____ On a standard die with six faces, each face contains a different number from 1 through 6. Jake has a non-standard die with six faces, and each face on Jake's die contains an expression with a different value from 1 through 6. In no particular order, the six expressions are $a + 1$, $2a - 5$, $3a - 10$, $b + 8$, $2b + 5$ and $3b + 10$. If a and b are integers, what is the value of the product $a \times b$?

26. _____ For a particular sequence $a_1 = 3$, $a_2 = 5$ and $a_n = a_{n-1} - a_{n-2}$, for $n \geq 3$. What is the 2015th term in this sequence?

27. _____  If Desi flips a fair coin eight times, what is the probability that he will get the same number of heads and tails? Express your answer as a common fraction.

28. _____ ordered pairs How many ordered pairs of integers (x, y) satisfy the equation $x + |y| = y + |x|$ if $-10 \leq x \leq 10$ and $-10 \leq y \leq 10$?

29. _____ When $\frac{1}{98}$ is expressed as a decimal, what is the 10th digit to the right of the decimal point?

30. _____ For positive integers n and m , each exterior angle of a regular n -sided polygon is 45 degrees larger than each exterior angle of a regular m -sided polygon. One example is $n = 4$ and $m = 8$ because the measures of each exterior angle of a square and a regular octagon are 90 degrees and 45 degrees, respectively. What is the greatest of all possible values of m ?

Forms of Answers

The following list explains acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: Express 8 divided by 12 as a common fraction. *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: Express 12 divided by 8 as a common fraction. *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}$, $1\frac{1}{2}$
Problem: Express the sum of the lengths of the radius and the circumference of a circle with a diameter of $\frac{1}{4}$ as a common fraction in terms of π . *Answer:* $\frac{1+2\pi}{8}$
Problem: Express 20 divided by 12 as a mixed number. *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}$, $\frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}$, $\frac{3}{\pi}$, $\frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}$, $\frac{1}{3}$, 3.5, 2:1

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: Evaluate $\sqrt{15}\times\sqrt{5}$. *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they may both be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent unless otherwise specified. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not perform any intermediate rounding (other than the “rounding” a calculator does) when calculating solutions. All rounding should be done at the end of the computation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: Write 6895 in scientific notation. *Answer:* 6.895×10^3

Problem: Write 40,000 in scientific notation. *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole number answers should be expressed in their whole number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

■ Chapter Competition ■
Target Round
Problems 1 & 2

Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

Team Round
Problems 1–10

School _____

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ times On Thursday, January 1, 2015, Devin cleaned his room and then went to the gym. Afterwards, Devin made the decision to go to the gym on alternating days and to clean his room every Thursday. If Devin maintains this schedule for the entire year, how many times during 2015 will he clean his room and go to the gym on the same day, including January 1st?

2. _____ cm The sum of the areas of two equilateral triangles is equal to twice the area of a third equilateral triangle. The side length of the first triangle is 3 cm, and the side length of the second triangle is 5 cm. What is the side length of the third triangle? Express your answer in simplest radical form.

3. _____ The cheetah, one of the fastest mammals, has a top speed of 75 miles per hour. The sloth, one of the slowest mammals, has a top speed of 13 feet per minute. By what factor must the sloth's top speed be multiplied to equal the cheetah's top speed? Express your answer to the nearest whole number.

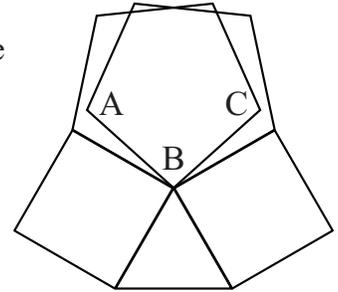

In the figure, $AB \parallel CD$, $m\angle ADC = 50$ degrees and $m\angle BAC = m\angle BCA$. What is the measure of $\angle BAD$?

5. _____ If $\frac{1}{x} + \frac{1}{y} = 2$ and $\frac{1}{xy} = 4$, what is the value of $\frac{x+y}{2}$? Express your answer as a common fraction.

6. _____ What is the greatest possible sum of the digits of a six-digit number that is a multiple of 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11?

7. _____ degrees In the figure, a side of each square coincides with a side of the equilateral triangle, and one side of each regular pentagon coincides with a side of one of the squares, as shown. What is the degree measure of $\angle ABC$?

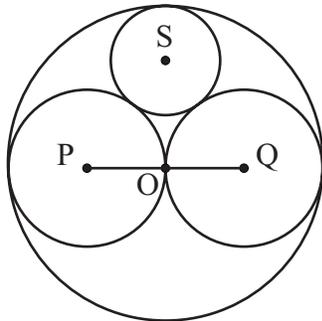

8. _____ integers If a *stairstep number* is defined as a number whose digits are strictly increasing in value from left to right, how many positive integers containing two or more digits are stairstep numbers?

9. _____ paths On a coordinate plane, a path consists of a series of moves in the positive x - or y -direction. If the first move is 1 unit in length, the second move is 2 units, the third move is 3 units, and so on, how many such paths exist that start at the origin and end at $(14, 14)$?

10. _____ cm

Congruent circles P and Q are internally tangent to circle O and externally tangent to each other at point O, as shown. Circle S is internally tangent to circle O and externally tangent to both circle P and circle Q. What is the diameter of circle S, when $PQ = 24$ cm?

1. _____ When $(x^6y^5z^3)^2$ is simplified, what is the sum of the exponents?
2. _____ (sides) Each exterior angle of a regular polygon measures 24° . How many sides does the polygon have?
3. _____ (\$) The total amount Edgar paid for a slice of pizza and a tip of exactly 24% was between \$2.50 and \$3.00. What was the price of the pizza slice?
4. _____ What is the probability that flipping a fair coin 15 times will yield equal numbers of heads and tails?
5. _____ What prime number is a factor of every four-digit palindrome?
6. _____ (integers) How many positive integers that contain each of the four digits 3, 4, 5 and 7 exactly once are multiples of 4?
7. _____ What is the value of $\frac{1}{2^2-1} + \frac{1}{3^2-1} + \frac{1}{4^2-1} + \frac{1}{5^2-1} + \frac{1}{6^2-1}$? Express your answer as a common fraction.
8. _____ What is the median of the data in the stem-and-leaf plot, shown here, where 3|9 represents 39?

| | |
|---|-----------|
| 3 | 9 9 |
| 4 | 0 3 5 6 |
| 5 | 0 3 7 7 7 |
| 6 | 8 8 9 9 |
| 7 | 4 5 |
9. _____ (pounds) A wholesaler mixes cashews, almonds and filberts in the ratio 2:3:4, respectively, by weight. How many pounds of almonds will be needed to make 540 pounds of this mixture?
10. _____ What is the sum of the odd numbers between 100 and 200?
11. _____ (codes) How many unique, six-character codes can be made using each of the characters A, B, C, 1, 2 and 3 exactly once?
12. _____ (percent) This weekend, there is a 30% chance it will rain Saturday and a 40% chance it will rain Sunday. If these are independent events, what is the percent chance it will rain at least one day during this weekend?

13. _____ (pounds) Sweet Delights Candy Company has fixed costs of \$300. Each pound of candy costs \$1 to produce and is sold for \$3. How many pounds of candy must be sold so that the company has no profit and no loss?
14. _____ (ft/s) Bob ran the first 1000 feet of a race in 250 seconds and the other 4000 feet in 750 seconds. What was his average speed, in feet per second, for the entire race?
15. _____ If n^* is defined as the product of all even factors of $2n$, for all integers n , where $n > 0$, what is the value of 11^* ?
16. _____ (points) During the first third of the basketball season, Katrina scored an average of 12 points per game. What is the average number of points she must score per game for the remaining two thirds of the season so that her average points scored per game for the entire season is 14 points?
17. _____ If the positive integers 15, 9, 5, 7 and x have a mean and median that are identical, what is the value of x ?
18. _____ If a and b both are whole numbers greater than 1, and $\frac{1}{a} + \frac{1}{2a} = \frac{1}{b}$, what is the smallest possible value for b ?
19. _____ What is the value of $\sqrt{10}(\sqrt{3} + \sqrt{10})$? Express your answer to the nearest whole number.
20. _____ What is the units digit of the product $1 \times 3 \times 5 \times \dots \times 2015$?
21. _____ What is the greatest possible product of three distinct positive integers that have a sum of 15?
22. _____ (people) On average, Diane makes 20 deliveries for a restaurant in a six-hour shift. What is the minimum number of people, each making deliveries at the same rate as Diane, needed to make 20 deliveries for the restaurant per hour?
23. _____ If $x + y = 5$ and $x^2 + y^2 = 20$, what is the value of xy ? Express your answer as a common fraction.

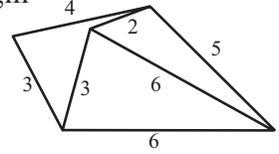

24. _____ (values) How many rational values of x are not integers and satisfy the following equation: $x^7 - 6x^6 + 5x^5 - 4x^4 + 3x^3 - 2x^2 + 1 = 0$?
25. _____ If $4n$ is subtracted from 48 and the difference then is divided by $2n$, the result is 10. What is the value of n ?
26. _____ If the mean of the six integers 6, 2, 10, 5, 12 and y is 7, what is the value of y ?
27. _____ (marks) The marks on a certain ruler are evenly spaced $\frac{1}{16}$ inch apart. The numbers on this ruler are evenly spaced 1 inch apart. How many marks on this ruler are strictly between the 2-inch mark and the 5-inch mark?
28. _____ If k represents the result when the sum of the first 30 positive odd integers is reduced by 1, what is the sum of the prime factors of k ?
29. _____ Edward is one of six people who each are writing 180 math problems. When he solves every problem, he gets an incorrect answer for 10% of the problems that he wrote and for 5% of the problems written by the others. For what fraction of the problems does Edward get the wrong answer? Express your answer as a common fraction.
30. _____ What is the value of $(\sqrt{8} + \sqrt{18})^2$?
31. _____ What is the sum of all the integer values of x that satisfy the following two conditions: $|x| < 4$ and $-x < 2$?
32. _____ When Colby rolls two fair standard dice, what is the probability that he rolls the same number on both dice or that the sum of the two numbers rolled is divisible by 3? Express your answer as a common fraction.
33. _____ Circle O has its center at $(-4, 1)$ and a radius of 5 units. What is the sum of the y -coordinates of the two points where circle O intersects the y -axis?
34. _____ When building a staircase, a builder uses the equation $57x - 95y = 0$ to represent the relationship between the height of each step, y , and the depth of each step, x . What is the slope of the staircase? Express your answer as a common fraction.

35. _____ The sum of one-fourth and five-eighths is equivalent to what common fraction?
36. _____ (integers) How many integers that contain each of the four digits 3, 5, 7 and 9 exactly once are prime?
37. _____ What is the remainder when the sum $2015^3 + 2015^2 + 2015^1 + 2015^0$ is divided by 5?
38. _____ What is the greatest common divisor of $4!$ and $5!$?
39. _____ (dollars) A driver switches car insurance companies and saves 15%, which results in a savings of \$450. How many dollars does the new insurance policy cost?
40. _____ (integers) In one board game, each player has a unique 4×4 grid with squares randomly labeled with each integer from 1 to 16. As the integers 1 to 16 are randomly called, each player puts an "X" in the square containing that integer. The first player with an "X" in all four squares in any row, column or diagonal wins. At most, how many integers must be called to get a winner?
41. _____ (dollars) If \$1000 is to be divided among the first-, second- and third-place prizes in the ratio 9:7:4, how many dollars is the second-place prize?
42. _____ If $3^{2017} \times 9^{2014} = n^{2015}$, what is the value of n ?
43. _____ Jon found $\frac{2}{3}$ of an apple pie in the refrigerator. If Jon splits the pie equally between himself and two friends, what fraction of the pie will Jon get? Express your answer as a common fraction.
44. _____ In Antonio's office building, there are nine floors, and the number of steps between consecutive floors is constant. Beginning on the first floor, Antonio walks up the stairs to the ninth floor. When Antonio reaches the third floor, what fraction of his walk from the first to the ninth floor will he have completed? Express your answer as a common fraction.
45. _____ What is the value of $243^{\frac{3}{5}}$?

46. _____ What is the value of $\sqrt{676}$?
47. _____ What is the sum of the distinct positive divisors of 1024?
48. _____ What common fraction is equivalent to $\frac{5! + 4!}{5! - 4!}$?
49. _____ What is the absolute difference between the greatest and least integers that are solutions to $|3x - 7| \leq 8$?
50. _____ What is the value of the quotient $\left(\frac{1/2}{3/4}\right) \div \left(\frac{5/6}{7/8}\right)$ expressed as a common fraction?
51. _____ What is the value of $60^2 - 50^2$?
52. _____ If $27^{x-2} = 729$, what is the value of x ?
53. _____ (cm²) In square centimeters, what is the area of a right triangle with a leg and a hypotenuse of lengths 14 cm and 50 cm, respectively?
54. _____ (students) With one student per seat and no seats left empty, all of the 8th-grade students at Marshall Middle School can fill all the seats on 4 buses and 5 vans. The same students also can fill all the seats on 3 buses and 8 vans. If each van holds 16 students, how many students are in the 8th grade at Marshall Middle School?
55. _____ What is the smallest integer that can be written as a sum of two distinct primes in two distinct ways? Note that $2 + 3$ and $3 + 2$ are not considered distinct sums.
56. _____ On a coordinate plane, D is the image of C reflected about the y -axis. C is the image of B reflected about the x -axis. B is the image of A(3, 2) translated right two units and down five units. What is the sum of the coordinates of D?
57. _____ (minutes) A car is traveling at a uniform rate of 60 mi/h. How many minutes after the car passes highway mile marker 180 will it pass highway mile marker 222?
58. _____ For positive integers a , b and c , with $a > b > c$, the sum $a + b + c$ has the same value as the product $a \times b \times c$. What is the value of $a - b - c$?

59. _____ (degrees) Parallel lines m and n are cut by transversal l . If $\angle A$ and $\angle H$ are alternate exterior angles and $\angle A$ has measure 75° , what is the sum of the degree measures of the complements to $\angle A$ and $\angle H$?

60. _____ (miles) The graph shows the distances in miles between the five points on a delivery route. If the delivery person is free to choose where to begin and end the route, how many miles long is the shortest route possible to make all five deliveries?

61. _____ (dollars) A certain website charges each of its advertisers according to the number of monthly visitors to the website. The monthly rate for one of its advertisers is 0.003 cents per visitor. At that rate, if the website received 200,000 visitors during one month, what was that advertiser's monthly charge, in dollars?

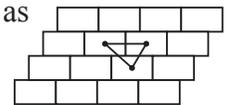

62. _____ (trips) Jennie needs to carry 78 boxes from the cafeteria to the gym. She carries one box on the first trip, two boxes on the second trip, and on each trip after that, Jennie carries one more box than she carried on her previous trip. After how many trips will Jennie first have carried over half of the boxes?

63. _____ One of the 21 dots on a standard die is randomly chosen and colored red. Then the die is rolled. What is the probability that the red dot appears on top? Express your answer as a common fraction.

64. _____ In a regular pentagon, each angle measures $2x$ degrees. What is the value of x ?

65. _____ For what value of k will the line $3y + kx = 140$ contain the point $(-5, -5)$?

66. _____ (cm²) The figure is made from identical rectangles each having area 50 cm². The centers of three adjacent rectangles are joined to form a triangle as shown. What is the area of this triangle, in square centimeters?

67. _____ (m²) In square meters, what is the area of a square with diagonal length $2\sqrt{21}$ meters?

68. _____ What is the smallest positive integer that is divisible by at least four of the numbers in the set $\{5, 6, 7, 8, 9, 10\}$?

69. _____ What is the units digit of 2015^{2015} ?

70. _____ If positive integers a and b have a greatest common factor of 6 and $25 < a < b < 40$, what is the value of $a + b$?
71. _____ When 48 is added to an integer n , the result is the same as when n is multiplied by 4. What is the value of n ?
72. _____ (dollars) If gas is \$3.50 per gallon, the total cost of the gas used to drive 350 miles in a car that can travel 25 miles on a gallon of gas is how many more dollars than the total cost of the gas used to drive the same distance in a car that can travel 35 miles on a gallon of gas?
73. _____ (miles) During a certain week, Joaquin ran 2.5 miles on each of the first 3 days and he ran 3 miles on each of the next 3 days. How many miles must he run on the seventh day to average 3 miles per day for the entire week?
74. _____ (dominoes) In a double-nine domino set, each domino has one number from the set $\{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$ on each half. Every possible combination of numbers appears exactly once, including those that have the same number on each half. How many dominoes are in a double-nine set?
75. _____ What is the least positive integer with exactly 13 positive divisors?
76. _____ (digits) What is the greatest number of digits in the repeating part of any of the decimal representations of $\frac{4}{5}, \frac{5}{6}, \frac{7}{8}, \frac{8}{9}, \frac{9}{10}, \frac{10}{11}, \frac{11}{12}, \frac{12}{13}, \frac{13}{14}$ and $\frac{14}{15}$?
77. _____ (cans) A box of cans has 32 rows of 28 cans each. How many cans are in the box?
78. _____ If $x^2 - 14x = -49$, what is the value of $-3x + 10$?
79. _____ (dollars) At Oops Shippers, an envelope is 60¢ and shipping is 40¢ per ounce of contents. What is the cost, in dollars, to ship an envelope with contents weighing a pound?
80. _____ (calories) The number of calories burned while running increases proportionally with the weight of the runner. Two people are running at the same speed. During their half-hour run, the 120-pound person burns 256 calories. How many calories will the 180-pound person burn during this run?

MATHCOUNTS®

2015 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Team Round problem with less than 10 sheets of scratch paper?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2015 MATHCOUNTS® Chapter Competition. Though these solutions provide creative and concise ways of solving the problems from the competition, there are certainly numerous other solutions that also lead to the correct answer, and may even be more creative or more concise! We encourage you to find numerous solutions and representations for these MATHCOUNTS problems.

*Special thanks to volunteer author **Mady Bauer** for sharing these solutions with us and the rest of the MATHCOUNTS community!*

2015 Chapter Competition

Sprint Round

1. Given: $\frac{a}{b} = \frac{3}{5}, b = 10$

Find: a

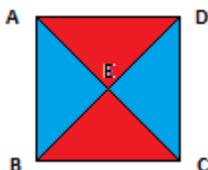

$$5a = 3 \times 10 = 30$$

$$a = 6 \text{ Ans.}$$

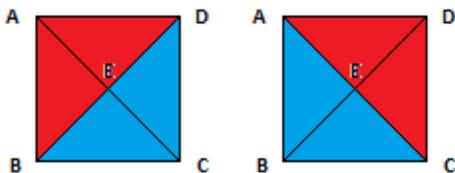

2. Given: Square ABCD has diagonals AC and BD which intersect at E.

Find: the number of triangles in the figure.

There are 4 small triangles.

There are 4 medium triangles each composed of two smaller triangles.

$$4 + 4 = 8 \text{ Ans.}$$

3. Given: Integers 1 to 100 are written.

Find: the digit that is written the fewest number of times.

There are ten 2-digit integers written with leading digits 1 through 9, but of course none are written with a leading 0. Because of this, 1 will be written 21 times, 2 through 9 each will be written 20 times and the digit written on 11 times is 0 Ans.

4. Given: The numbers from 1 to 8 are written in order and one of them is circled. The integers before the circled number have the same sum as the integers after the circled number.

Find: the number that was circled.

Write out the numbers.

1 2 3 4 5 6 7 8

Suppose 7 is chosen.

$$1 + 2 + 3 + 4 + 5 + 6 > 8$$

Suppose 6 is chosen.

$$7 + 8 = 15$$

$$1 + 2 + 3 + 4 + 5 = 15$$

6 is the number chosen. 6 Ans.

5. Given: $\frac{1}{3}$ of Sally's money is spent on the bus. $\frac{1}{2}$ of the remaining money was spent at the movies leaving \$12 remaining.

Find: how much money Sally had

Let x = the amount of money that Sally was given. After spending money for the bus she had $\frac{2}{3}x$ left. Half of that is $\frac{1}{3}x$, which means $\frac{1}{3}x$ remains, and this amount is \$12.

$$\text{So } \frac{1}{3}x = 12 \text{ and } x = 12 \times 3 = 36 \text{ Ans.}$$

6. Given: 6 added to a number results in 3 times the original number.

Find: the original number

Let x = the original number.

$$6 + x = 3x$$

$$2x = 6$$

$$x = 3 \text{ Ans.}$$

7. Given: Yuan gets 60% of the money for each painting that the gallery sells. Three paintings sold for \$200, \$300 and \$500.

Find: the money that Yuan earned.

$$200 + 300 + 500 = 1000$$

$$1000 \times 0.6 = 600 \text{ Ans.}$$

8. Given: x is 15% of 500; y is 200% of x .

Find: $x + y$.

$$x = 0.15 \times 500 = 75$$

$$y = 2 \times 75 = 150$$

$$x + y = 75 + 150 = 225 \text{ Ans.}$$

9. Given: The four congruent triangles displayed in the square in Figure 1 are arranged to create Figure 2.
Find: the probability that a point chosen at random is in the shaded area of Figure 2.

Figure 1

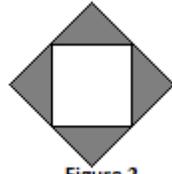

Figure 2

Let x = the length of the side of the square in Figure 1. Then the area of the smallest square is x^2 .

By placing the component triangles around the space originally taken by the square, we have created a new figure that is double the area of the original figure. The area of all of Figure 2 is $2x^2$. The probability of a point being in the shaded area is $\frac{x^2}{2x^2} = \frac{1}{2}$ **Ans.**

10. Given: $\sqrt[3]{b} = 5$

Find: the value of $2b$.

$$(\sqrt[3]{b})^3 = 5^3 = 125$$

$$b = 125$$

$$2b = 125 \times 2 = 250 \text{ **Ans.**}$$

11. Given:

Rent: 35% of income

Car Loan: 15% of income

Utilities: 20% of income

Food: 15% of income

Savings: 10% of income

And Gasoline is \$80.

Find: Martin's monthly income

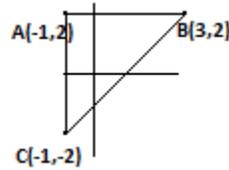

$$35\% + 15\% + 20\% + 15\% + 10\% = 95\%$$

Therefore, everything but the Gasoline takes up 95% of Martin's income. That leaves 5% which is \$80.

100% of Martin's income is

$$20 \times 80 = 1600 \text{ **Ans.**}$$

12. Given: Points $A(-1,2)$ and $B(3,2)$ are graphed on a coordinate plane. Point C is the reflection of point A over the x-axis.
Find: the area of triangle ABC.

Point C is $(-1, -2)$.

$$\text{The } AB = 3 - (-1) = 4$$

$$\text{The } AC = 2 - (-2) = 4$$

The area of triangle ABC is

$$\frac{1}{2} \times 4 \times 4 = 8 \text{ **Ans.**}$$

13. Find: the greatest prime factor of the product $6 \times 14 \times 22$.

$$6 \times 14 \times 22 =$$

$$(3 \times 2) \times (7 \times 2) \times (11 \times 2)$$

11 is the largest prime factor.

11 **Ans.**

14. Given: $\blacktriangle + \blacksquare = 5$; $\blacktriangle - \blacksquare = 3$

Find: $\blacktriangle + \blacktriangle$.

$$2\blacktriangle = 5 + 3 = 8 \text{ **Ans.**}$$

15. Given: The product of the numerator and denominator of a fraction is 60. Adding 1 to the numerator and dividing the denominator by 2 results in a fraction that is equal to 1.

Find: the fraction.

Let n = the numerator

Let d = the denominator

$$n \times d = 60$$

$$\frac{n+1}{\frac{d}{2}} = 1$$

$$n+1 = \frac{d}{2}$$

$$2n+2 = d$$

$$n \times (2n+2) = 60$$

$$2n^2 + 2n - 60 = 0$$

$$n^2 + n - 30 = 0$$

$$(n + 6)(n - 5) = 0$$

We have $n + 6 = 0$ and $n = -6$. But n/d is a positive common fraction so n must be positive. Then $n - 5 = 0$ and $n = 5$; $5d = 60$ and $d = 12$. So $\frac{n}{d} = \frac{5}{12}$ **Ans.**

16. Given: The professor grades a paper every 10 minutes. The professor takes 20 minutes to train an assistant and then they grade 2 papers every 15 minutes.

Find: the number of papers that take the same amount of time for the professor to grade as it does for the professor to train the assistant and have both of them grade together.

Together they grade 2 papers in 15 minutes or 1 paper every 7.5 minutes.

Let n = the number of papers graded. Then

$$10n = 20 + 7.5n$$

$$2.5n = 20$$

$$n = 8$$
 Ans.

17. Given: $b = a^2$; $c = 3b - 2$

Find: the product of all values of a for which $b = c$.

If $b = a^2$ and $c = 3b - 2$ then $c = 3a^2 - 2$

And if $b = c$ then

$$a^2 = 3a^2 - 2$$

$$2a^2 = 2$$

$$a^2 = 1$$

$$a = \pm 1$$

$$1 \times -1 = -1$$
 Ans.

18. Given: A set of 6 distinct positive integers has a mean of 8, a median of 8 and no term larger than 13.

Find: the minimum possible value of any term in the set.

A mean of 8 means that the sum of the 6 values is 48.

A median of 8 means that either the third and fourth elements are 8 or the midpoint between these elements is 8, like 7 and 9, for example. In any event, the sum of the third and fourth elements are 16. Now we have $48 - 16 = 32$ as the sum of the remaining four terms.

We are looking for the term of least value, so let's maximize all other values. We know that the maximum value of any term is 13. With that as the greatest term, the remaining three terms must have a sum of $32 - 13 = 19$.

Since the integers are distinct, and we are using 13, let's also use 12. That leaves us with a sum of $19 - 12 = 7$ for the two terms of least value.

If the sum of the first two terms is 7, they could be 1 and 6. That would give us

$$1, 6, 7, 9, 12, 13$$

$$1 + 6 + 7 + 9 + 12 + 13 = 48$$

The mean is 8, the median is 8 and the largest value is 13.

Can't get smaller than 1. **Ans.**

19. Given: $x \uparrow y = (x + y)^2$

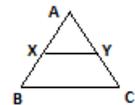

Find: $(1 \uparrow 2) \uparrow 3$

$$1 \uparrow 2 = (1 + 2)^2 = 3^2 = 9$$

$$9 \uparrow 3 = (9 + 3)^2 = 12^2 = 144$$
 Ans.

20. Given: Segment XY is parallel to segment BC. The area of trapezoid BCYX is 10 and the area of triangle AXY is 8.

Find: the ratio of XY to BC.

Since segments XY and BC are parallel, then $\triangle AXY \sim \triangle ABC$ (Angle-Angle). The ratio of the areas of $\triangle AXY$ to $\triangle ABC$ is $8/18 = 4/9$. That means the ratio of the lengths of their sides is $\sqrt{4}/\sqrt{9}$ and $XY/BC = 2/3$ **Ans.**

21. Find: the greatest absolute difference between the mean and median of 5 single-digit positive integers.

To get the smallest median we can create the set $\{1, 1, 1, 9, 9\}$ – the median is 1 and the mean is $\frac{21}{5}$. The difference is $\frac{16}{5}$ **Ans.**

22. Given: $f(f(x)) = x^2 - 1$

Find: $f(f(f(f(3))))$

$$f(f(3)) = 3^2 - 1 = 9 - 1 = 8$$

$$f(f(8)) = 8^2 - 1 = 64 - 1 = 63 \text{ **Ans.**}$$

23. Given: the sum of an arithmetic progression of six positive integers is 78.

Find: the greatest possible difference between consecutive terms.

Let x = the first term.

Let y = the difference between terms.

Then the terms are

$$x, x + y, x + 2y, x + 3y, x + 4y, x + 5y$$

$$x + x + y + x + 2y + x + 3y + x + 4y +$$

$$x + 5y = 6x + 15y = 78$$

$$2x + 5y = 26$$

We are looking for the largest value of y .

Let's start with $x = 1$.

$$2 + 5y = 26$$

$$5y = 24$$

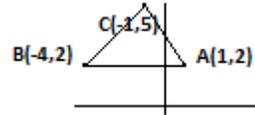

y would not be an integer. For y to be an integer, the value on the right-hand side of the equation must be divisible by 5. Instead of 2 (for $2x$) we need 6 to be the value of $2x$, or $x = 3$.

$$6 + 5y = 26$$

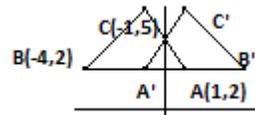

$$y = 4 \text{ **Ans.**}$$

24. Given: Points A, B and C are $(1, 2)$, $(-4, 2)$ and $(-1, 5)$. Reflect triangle ABC across the y -axis.

Find: the area of the intersection of the triangle and its reflection.

Reflecting point (x, y) over the y -axis results in the point $(-x, y)$. The reflection points A' , B' and C' are $(-1, 2)$, $(4, 2)$ and $(1, 5)$, respectively.

The line $A'C'$ intersects line AC at their respective midpoint which is

$$\left(-1 + \frac{1 - (-1)}{2}, 2 + \frac{5 - 2}{2}\right) =$$

$$\left(-1 + 1, 2 + \frac{3}{2}\right) = \left(0, 3\frac{1}{2}\right)$$

Let's call that point D. The height of triangle $A'D$ is:

$$h = 3\frac{1}{2} - 2 = 1\frac{1}{2}$$

The base of the triangle is $1 - (-1) = 2$

The area of the triangle is:

$$\frac{1}{2} \times 1\frac{1}{2} \times 2 = 1.5 \text{ **Ans.**}$$

25. Given: Each face of a standard die has the numbers 1 through 6. On a non-standard die, each face has an expression which is equal to 1 through 6. The expressions are $a + 1, 2a - 5, 3a - 10, b + 8, 2b + 5, 3b + 10$.

Find: $a \times b$.

Clearly, the sum of all 6 expressions is

$$1 + 2 + 3 + 4 + 5 + 6 = 21$$

$$a + 1 + 2a - 5 + 3a - 10 + b + 8 +$$

$$2b + 5 + 3b + 10 = 21$$

$$6a + 6b + 9 = 21$$

$$6a + 6b = 21 - 9 = 12$$

$$a + b = 2$$

Looking at the expressions containing b , it is clear that b must be negative in order to get a positive value in the range of 1 to 6.

a must be positive.

Let's look at $3b + 10$. For this value to be in the range of 1 through 6, $-1 \leq b \leq 3$.

Suppose $b = -1$. Then

$$3b + 10 = 1, 2b + 5 = 3, b + 8 = 7$$

That won't work. Let's try $b = -2$.

$$3b + 10 = 4, 2b + 5 = 1, b + 8 = 6$$

That's good. $4 + 1 + 6 = 11$

$$a + 1 + 2a - 5 + 3a - 10 =$$

$$21 - 11 = 10$$

$$6a - 14 = 10$$

$$6a = 24$$

$$a = 4$$

Let's see if the other three sides will have the right values.

$$a + 1 = 5, 2a - 4 = 4, 3a - 10 = 2$$

That's good. So $a \times b = 4 \times -2 = -8$ **Ans.**

26. Given: $a_1 = 3, a_2 = 5, a_n = a_{n-1} - a_{n-2}$ for $n \geq 3$

Find the 2015th term.

Let's look at the first couple of terms and see if we can detect a pattern:

3, 5, 2, -3, -5, -2, 3, 5, 2, -3 etc.

The pattern repeats every 6 terms.

$$\frac{2015}{6} = 335R5$$

The fifth value of the repeating pattern is -5. **Ans.**

27. Given: A coin is flipped 8 times.

Find: the probability that equal numbers of heads and tails occur

There are

$$\frac{8!}{4!4!} = \frac{8 \times 7 \times 6 \times 5}{4 \times 3 \times 2 \times 1} =$$

$$\frac{7 \times 6 \times 5}{3} = 70$$

ways of getting 4 heads and 4 tails.

Therefore, the probability of flipping for 4 heads and 4 tails is

$$\frac{70}{2^8} = \frac{70}{256} = \frac{35}{128} \text{ **Ans.**}$$

28. Given: $x + |y| = y + |x|$

$$-10 \leq x \leq 10 \text{ and } -10 \leq y \leq 10$$

Find: the number of ordered pairs of integers (x, y) that satisfy the equation.

If x and y are both positive we would just have $x + y = y + x$

The values of x and y that satisfy this are

$$0 \leq x \leq 10 \text{ and } 0 \leq y \leq 10$$

There are 11 values for x and 11 values for y for a total of $11^2 = 121$ pairs.

If x is negative and y is positive no pairs will work, like

$$2 + |-3| = -3 + |2| \text{ No.}$$

The same is true if x is positive and y is negative.

But, if both x and y are negative we will have some pairs that work. These pairs occur where $x = -y$

$$\text{E.g., } -3 + |-3| = -3 + |-3|$$

So we have 10 pairs, $(-1, -1)$ through $(-10, -10)$.

$$121 + 10 = 131 \text{ **Ans.**}$$

29. Given $\frac{1}{98}$ is written a decimal.

Find: the 10th digit to the right of the decimal point.

Well using long division we can get

$$\frac{1}{98} = 0.0102040816$$

For fractions of the form $1/n$ where $10^{(m-1)} < n < 10^m$, it turns out that

$$1/n = \sum_{i=0}^{\infty} \frac{(10^m - n)^i}{10^{(mi+m)}}$$

Well 98 is less than $100 = 10^2$ and greater than $10 = 10^{2-1}$. In our case, $n = 98$ and $m = 2$. And that crazy looking summation

formula basically means this

$$\frac{1}{98} = \frac{2^0}{10^2} + \frac{2^1}{10^4} + \frac{2^2}{10^6} + \frac{2^3}{10^8} + \frac{2^4}{10^{10}} + \dots \text{ or}$$

$$\begin{array}{r} .01 \\ .0002 \\ .000004 \\ .00000008 \\ .0000000016 \\ \vdots \\ + \\ \hline .0102040816 \end{array}$$

Either way, the 10th digit is 6 **Ans.**

30. Given: Each exterior angle of a regular n -sided polygon is 45° larger than each exterior angle of a regular m -sided polygon. Find: the greatest possible value of m .

Each exterior angle of a regular n -sided polygon has a degree measure $360/n$, and each exterior angle of a regular m -sided polygon as a degree measure of $360/m$. We are looking for the greatest integer m such that $360/n - 45 = 360/m$. Now solve for m :

$$(360 - 45n)/n = 360/m$$

$$360n = 360m - 45mn$$

$$8n = 8m - mn$$

$$8n = m(8 - n)$$

$$(8n)/(8 - n) = m.$$

Now let's make a use a table of values to find the greatest integer value of m .

| n | m |
|-----|------|
| 1 | 8/7 |
| 2 | 8/3 |
| 3 | 24/5 |
| 4 | 8 |
| 5 | 40/3 |
| 6 | 24 |
| 7 | 56 |
| 8 | 64/0 |
| 9 | -72 |

← Undefined
 $m < 0$ when $n \geq 9$

The greatest integer value is 56 **Ans.**

Target Round

1. Find: the number of rectangles in the figure.

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

First of all, there are the small rectangles (1, 2, 3, 4, 5, 7, 8, 9, 10, 11) – 10 of them

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

Then there are the rectangles made of two smaller rectangles (1+2, 3+4, 8+9, 10+11, 1+5, 5+8, 4+7, 7+11) – 8 of them

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

Then there are the rectangles made of three smaller rectangles (1+5+8, 4+7+11) – 2 of them.

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

Then there is the rectangle made from everything but the two rectangles made of 3 smaller rectangles (2+3+6+9+10) – one of them.

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

Then there are the two rectangles made from everything but one of the two rectangles made of the 3 smaller rectangles. $(1+2+3+5+6+8+9+10)$ and $(2+3+4+6+7+9+10+11)$.

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

And, finally, there is the entire rectangle.

| | | | | |
|---|---|---|----|----|
| 1 | 2 | | 3 | 4 |
| 5 | | 6 | | 7 |
| 8 | 9 | | 10 | 11 |

$10 + 8 + 2 + 1 + 2 + 1 = 24$ **Ans.**

2. Given: A batch of fudge contains 40,000 calories and fills a 9 inch x13 inch pan to a depth of 1 inch.

Find: the number of calories in each cubic inch of fudge.

The number of cubic inches of fudge is:

$$9 \times 13 \times 1 = 117$$

$$\frac{40000}{117} \approx 341.880341 \dots \approx 342$$
 Ans.

3. Given: The first three terms of an arithmetic sequence are $k, 2k + 3, 4k + 1$.

Find: the fourth term.

The adjacent terms of an arithmetic sequence differ by the same value.

Therefore,

$$2k + 3 - k = 4k + 1 - (2k + 3)$$

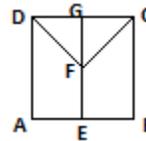

$$k + 3 = 4k + 1 - 2k - 3 = 2k - 2$$

$$k = 5$$

The first three terms are 5, 13, 21. The difference between terms is 8, so the fourth term is $21 + 8 = 29$. **Ans.**

4. Given: Square ABCD has a side of 6. The three interior segments divide the square into two congruent trapezoids and an isosceles triangle which are all of equal area.

Find: the length of EF.

Let $EF = x$.

The area of the square is $6 \times 6 = 36$ and it is divided into three parts of equal area therefore the area of each of these is

$$\frac{36}{3} = 12$$

The area of trapezoid AEF or EFCB is:

$$\frac{1}{2}(6 + x) \times 3 = 12$$

$$(6 + x) \times 3 = 24$$

$$6 + x = 8$$

$$x = 8 - 6 = 2$$
 Ans.

5. Find: the least positive integer that has only 1s and 0s and is a multiple of 75. Multiples of 75 end in 00, 25, 50 and 75. To find a value with only 1s and 0s we must consider only multiples of 75 that are divisible by 4. These multiples are: 300, 600, 900, 1200, etc. Given that 1200 doesn't match we need to immediately switch to the first multiple of 75 that is 5 integers. (By the way, a multiple of 75 is also a multiple of 3 so the digits must have at least 3 ones.) 11100 is a multiple of 75 and is the smallest

positive integer that satisfies our requirement. 11100 **Ans.**

6. Given: All points equidistant from (2, 2) and (9, 3) lie on the line $ax + by = c$.

Find: $a + b + c$.

One point on the line $ax + by = c$ will be the midpoint of a line drawn through the (2, 2) and (9, 3). Let (a, b) the midpoint of that line. Then:

$$a - 2 = 9 - a$$

$$2a = 11$$

$$a = \frac{11}{2}$$

$$b - 2 = 3 - b$$

$$2b = 5$$

$$b = \frac{5}{2}$$

So the point is $(\frac{11}{2}, \frac{5}{2})$.

The line $ax + by = c$ will be perpendicular to the line between points (2, 2) and (9, 3).

The slope between the two given points is:

$$m = \frac{3 - 2}{9 - 2} = \frac{1}{7}$$

Therefore the slope of the perpendicular line will be the negative reciprocal, -7. With the slope and one point we can now find the y intercept and write the equation of the line:

$$\frac{5}{2} = -7 \left(\frac{11}{2} \right) + y_{int}$$

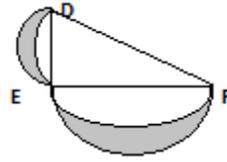

$$y_{int} = \frac{5}{2} \times \frac{2}{11} \times \left(-\frac{1}{7} \right) = 41$$

$$y = -7x + 41 \text{ or } 7x + y = 41$$

$$a = 7, b = 1, c = 41$$

$$a + b + c = 7 + 1 + 41 = 49 \text{ **Ans.**}$$

7. Given: Right triangle DEF has sides of integer length and a perimeter of 40. Semicircles with diameters DE and EF are down. Arc DEF is a semicircle. Find: the total area of the shaded region.

First let's determine the sides of triangle DEF. Pythagorean triples are 3, 4, 5 (a perimeter of 12), 6, 8, 10 (a perimeter of 24), 5, 12, 13 (a perimeter of 30), 8, 15, 17 (a perimeter of 40!). And there we are.

DE = 8, EF = 15 and DF = 17

The area of the semicircle with diameter DE

$$\text{is } \frac{1}{2} \pi \left(\frac{8}{2} \right)^2 = 8\pi$$

The area of the semicircle with diameter EF

$$\text{is } \frac{1}{2} \pi \left(\frac{15}{2} \right)^2 = \frac{225}{8} \pi$$

The area of the semicircle with diameter DF

$$\text{is } \frac{1}{2} \pi \left(\frac{17}{2} \right)^2 = \frac{289}{8} \pi$$

The area of triangle DEF is

$$\frac{1}{2} \times 15 \times 8 = 60$$

The area of the shaded portion will be equal to the sum of the area of semicircle with diameter DE and the area of semicircle with diameter of EF and the area of triangle DEF minus the area of semicircle with diameter of DF.

$$8\pi + \frac{225}{8} \pi + 60 - \frac{289}{8} \pi = 60 \text{ **Ans.**}$$

8. Given: $f(x) + \frac{1}{x} \cdot f\left(-\frac{1}{x}\right) = 3$

Find: $f(2)$

Substituting $x = 2$ into the expression:

$$f(2) + \frac{1}{2} \cdot f\left(-\frac{1}{2}\right) = 3$$

$$f(2) = 3 - \frac{1}{2} f\left(-\frac{1}{2}\right)$$

Substituting $x = -\frac{1}{2}$ into the expression:

$$f\left(-\frac{1}{2}\right) + \frac{1}{-\frac{1}{2}} f\left(-\frac{1}{-\frac{1}{2}}\right) = 3$$

$$f\left(-\frac{1}{2}\right) - 2f(2) = 3$$

$$f\left(-\frac{1}{2}\right) = 3 + 2f(2)$$

Now, substitute the second equation into the first:

$$f(2) = 3 - \frac{1}{2}f\left(-\frac{1}{2}\right) = 3 - \frac{1}{2}(3 + 2f(2))$$

$$2f(2) = 6 - 3 - 2f(2)$$

$$4f(2) = 3$$

$$f(2) = \frac{3}{4} \text{ **Ans.**}$$

Team Round

1. Given: Devin cleaned his room on Jan. 1 and went to the gym. He goes to the gym every other day and cleans his room every Thursday.

Find: how many days he cleans his room and goes to the gym as well.

Jan 1 was a Thursday. Therefore, he goes to the gym on Thursday, Saturday, Monday, Wednesday, Friday, Sunday, Tuesday, Thursday – i.e., every two weeks he'll be cleaning his room and going to the gym. So, how many Thursdays do we have in 2015?

There are 365 days in 2015.

$$\frac{365}{7} = 52R1$$

Therefore we actually have 53 Thursdays in the year. Starting with the first Thursday, there are actually 27 Thursdays where Devin will clean his room and go to the gym.

27 **Ans.**

2. Given: The sum of the areas of two equilateral triangles is equal to twice the area of a third equilateral triangle. The side length of the first triangle is 3 and the side length of the second triangle is 5.

Find: the side length of the third triangle.

The formula for the area of an equilateral

triangle is

$$A = \frac{\sqrt{3}}{4}s^2 \text{ where } s \text{ is the side of the triangle.}$$

The area of the first triangle is

$$\frac{\sqrt{3}}{4}(3)^2 = \frac{9}{4}\sqrt{3}$$

The area of the second triangle is:

$$\frac{\sqrt{3}}{4}(5)^2 = \frac{25}{4}\sqrt{3}$$

The sum of the area of both triangles is:

$$\frac{9}{4}\sqrt{3} + \frac{25}{4}\sqrt{3} = \frac{34}{4}\sqrt{3} = \frac{17}{2}\sqrt{3}$$

This is twice the area of the third triangle, so the area of the third triangle is:

$$\frac{17}{4}\sqrt{3}$$

If s is the side of the third triangle:

$$\frac{\sqrt{3}}{4}s^2 = \frac{17}{4}\sqrt{3}$$

$$s^2 = 17$$

$$s = \sqrt{17} \text{ **Ans.**}$$

3. Given: The cheetah's speed is 75 mph. The sloth's speed is 13 feet per minute.

Find: how many times faster the cheetah's speed is.

75 mph is

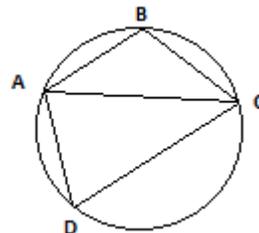

$$\frac{75 \times 5280}{60} = \frac{5 \times 5280}{4} = 5 \times 1320 =$$

6600 feet per minute.

$$\frac{6600}{13} \approx 507.692307 \dots \approx 508 \text{ times **Ans.**}$$

4. Given: $AB \parallel CD$ and the measure of $m\angle ADC = 50^\circ$. $m\angle BAC = m\angle BCA$

Find: $m\angle BAD$

Let $x =$ the measure of $\angle BAC$.

$m\angle BCA = x$ and $m\angle ABC = 180 - 2x$
 Since $AB \parallel CD$, $m\angle ACD = m\angle BAC = x$
 Thus, $m\angle BCD = m\angle BCA + m\angle ACD = 2x$
 $m\angle CAD = 180 - m\angle ADC - m\angle ACD = 180 - 50 - x = 130 - x$
 $m\angle BAD = m\angle BAC + m\angle CAD = 130$ **Ans.**

5. Given: $\frac{1}{x} + \frac{1}{y} = 2$

$$\frac{1}{xy} = 4$$

Find: $\frac{x+y}{2}$

$$\frac{1}{4} = xy$$

$$\frac{1}{x} + \frac{1}{y} = \frac{y}{xy} + \frac{x}{xy} = \frac{x+y}{xy} = 2$$

$$x + y = 2xy$$

$$\frac{x+y}{2} = xy = \frac{1}{4}$$
 Ans.

6. Find: the greatest possible sum of the digits of a six-digit number that is a multiple of 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11.

Find the least common multiple of 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11

$$2 \times 3 \times 2 \times 5 \times 7 \times 2 \times 3 \times 11 = 27720$$

The largest 6-digit multiple of 27720 is 997920 (27720×36). (Note that any multiple of 27720 will end in 0.) 99792 is not bad. The sum of the digits is 34.

The smallest 6-digit multiple of 27720 is 110880 (27720×4). The sum of the digits is 18. Probably better to look at more of the larger multiples.

$27720 \times 35 = 970200$ - way too many zeroes! Note that multiplying 27720 by any multiple of 5 will result in at least two of the digits being 0, so let's remove 5, 10, 15, 20, 25, 30 and 35.

Multiplying 27720 by 32 or 34 gives 877040 and 942480. Sums are 26 and 27, respectively.

Multiplying 27720 by 26 or 28 gives 720720

and 776160. Sums are 18 and 27, respectively.

Multiplying 27720 by 22 and 24 gives 609840 and 665280. Sums are 27 and 27, respectively.

Multiplying 22720 by 16 and 18 gives 363520 and 498960. Sums are 19 and 36, respectively. Aha! 498960 beats 977920. Continuing on.

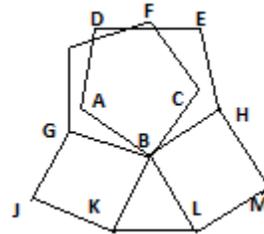

Multiplying 22720 by 12 and 14 gives 332640 and 318080. Sums are 18 and 20, respectively.

Multiplying 22720 by 6 and 8 gives 136320 and 181760. Sums are 15 and 23, respectively.

36 Ans.

7. Given: A side of each square coincides with a side of the equilateral triangle. One side of each regular pentagon coincides with a side of one of the squares.

Find: the degree measure of $\angle ABC$

Triangle KBL is an equilateral triangle. This makes the measure of $\angle KBL = 60^\circ$.

$\angle GBK$ and $\angle LBH$ and are both angles within squares. Therefore, each is 90° .

The sum of all three angles is 240° . This makes the measure of $\angle GBH = 120^\circ$.

$\angle GBC$ is an angle of the pentagon FCBGD; its measure is 108° . $\angle ABH$ is an angle of pentagon ABHED; its measure is 108° .

$$m\angle GBC = 108 = m\angle GBA + m\angle ABC$$

$$m\angle ABH = 108 = m\angle ABC + m\angle CBH$$

$$m\angle GBH = 120 = m\angle GBA + m\angle ABC + m\angle CBH$$

$$120 = 108 + m\angle CBH$$

$$12 = m\angle CBH$$

$$120 = m\angle GBA + 108$$

$$12 = m\angle GBA$$

$$120 = 12 + m\angle ABC + 12$$

$$m\angle ABC = 120 - 24 = 96 \text{ Ans.}$$

8. Given: A stairstep number is a number whose digits are strictly increasing in value from left to right.

Find: How many positive integers with two or more digits are stairstep numbers.

There are several things to note:

- 0 cannot be part of a stairstep number.

We don't start numbers with a leading zero (even if we did, it wouldn't matter) and inserting a zero anywhere else in the number violates the concept of a stairstep number.

- The largest stairstep number is 9 digits long because if you have 10 digits, one of them will have to be equal to or less than an adjacent number.

Let's start with 9 digit numbers.

Obviously there is only 1: 123456789.

Now let's look at 8 digit numbers. They are: 12345678, 12345679, 12345689, 12345789, 12346789, 12356789, 12456789, 13456789, 23456789. Note that each number has a single digit removed from 123456789. And this is the way to solve the problem. We are just looking for ways of picking a number of digits to remove from 123456789.

For a 7 digit number remove 2 of the digits.

$$\frac{9!}{7!2!} = \frac{9 \times 8}{2} = 36$$

For a 6 digit number, remove 3 of the digits.

$$\frac{9!}{6!3!} = \frac{9 \times 8 \times 7}{3 \times 2 \times 1} = 3 \times 4 \times 7 = 84$$

For a 5 digit number, remove 4 of the digits.

$$\frac{9!}{5!4!} = \frac{9 \times 8 \times 7 \times 6}{4 \times 3 \times 2 \times 1} = 3 \times 7 \times 6 = 126$$

For a 4 digit number, remove 5 of the digits.

$$\frac{9!}{4!5!} = \frac{9!}{5!4!} = 126$$

For a 3 digit number, remove 6 of the digits.

$$\frac{9!}{3!6!} = \frac{9!}{6!3!} = 84$$

And for a 2 digit number, remove 7 of the digits.

$$\frac{9!}{2!7!} = \frac{9!}{7!2!} = 36$$

Therefore, the total number of stairstep numbers is:

$$1 + 9 + 36 + 84 + 126 + 126 + 84 + 36 = 502 \text{ Ans.}$$

9. Given: We move either on the x or y axis (but not both at the same time). The first step moves 1 unit, the second 2 units, etc. Find: the number of paths from (0, 0) to (14, 14).

How many ways can we add several numbers that sum up to 14?

We can't go more than 4 digits to get to 14. Why? $1 + 2 + 3 + 4 = 10$ and $1 + 2 + 3 + 4 + 5 = 15$ – so if we just did consecutive moves on one axis, 5 moves would be too far.

Let's look at 4 moves.

$$1 + 2 + 3 + 8$$

$$1 + 2 + 4 + 7$$

$$1 + 2 + 5 + 6$$

$$1 + 3 + 4 + 7$$

$$1 + 3 + 5 + 6$$

$$2 + 3 + 4 + 5$$

And that's it for 4 moves.

Now 3 moves.

$$1 + 2 + 11$$

$$1 + 3 + 10$$

$$1 + 4 + 9$$

$$1 + 5 + 8$$

$$1 + 6 + 7$$

$$2 + 3 + 9$$

$$2 + 4 + 8$$

$$2 + 5 + 7$$

$$3 + 4 + 7$$

Whichever set we pick for the x -axis, we have to pick another set that uses integers other than the first set we've picked and the union of both sets of integers give us a set of consecutive integers starting with 1.

By inspection:

One combination can be $1 + 2 + 5 + 6$ and

$$3 + 4 + 7$$

We can switch the 1 and 2 from the set of 4 integers with the 3 from the set of 3 integers. The second combination is

$$3 + 5 + 6 \text{ and } 1 + 2 + 4 + 7$$

Switch 6 with 2 + 4. The third combination:

$$2 + 3 + 4 + 5 \text{ and } 1 + 6 + 7$$

Switch 3 + 4 with 7. The fourth combination:

$$2 + 5 + 7 \text{ and } 1 + 3 + 4 + 6.$$

8 **Ans.**

$$PO = OQ = 12$$

The length of SP or SQ is $12 + x$.

$$(24 - x)^2 + 12^2 = (12 + x)^2$$

$$24^2 - 48x + x^2 + 12^2 =$$

$$12^2 + 24x + x^2$$

$$24^2 - 48x = 24x$$

$$24 - 2x = x$$

$$24 = 3x$$

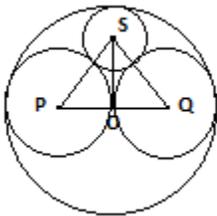

$$x = 8$$

The diameter is twice that, or 16. **Ans.**

10. Given: Circles P and Q are tangent to circle O and tangent to each other at point O. Circle S is tangent to circles O, P and Q. $PQ = 24$ cm.

Find: the diameter of circle S.

Create the triangle SPQ by connecting points S, P and Q. Draw a perpendicular from S to O, the height of the triangle.

Since $PQ = 24$, 24 is the radius of circle O.

The radius of circles P and Q are each 12.

Let x = the radius of circle S.

Then $OS = 24 - x$.

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ weeks Jared needs \$240 to buy a new bicycle. He has saved \$60 so far and saves \$9 per week. In how many weeks will Jared have saved enough to buy the bicycle?

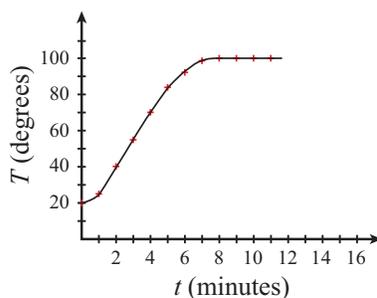

2. _____ Given that $2 = \frac{a}{20} = \frac{60}{b}$, what is the value of $a + b$?

3. _____ Given the function $f(x) = 2x^2 - 3x + 7$ with domain $\{-2, -1, 3, 4\}$, what is the largest integer in the range of f ?

4. _____ The first two terms of a sequence are 10 and 20. If each term after the second term is the average of all of the preceding terms, what is the 2015th term?

Water Temperature

5. _____ degrees

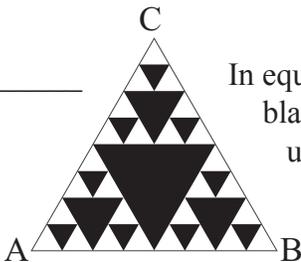

This graph shows the water temperature T degrees at time t minutes for a pot of water placed on a stove and heated to 100 degrees. On average, how many degrees did the temperature increase each minute during the first 8 minutes?

6. _____ In the table shown, $y = \frac{3x-1}{2}$. What is the value of t ?

| x | y |
|-----|---------|
| 1 | 1 |
| s | 4 |
| t | $t + 4$ |

7. _____ downloads A streaming video service offers its customers two plans. The first plan has a \$24 registration fee, a fixed monthly rate of \$5 and a charge of \$0.75 for each video download. The second plan has a \$15 registration fee, a fixed monthly rate of \$3 and a charge of \$1.50 for each video download. For how many downloads would the two plans cost the same for a year of service?

8. _____ feet The length of a rectangle is three times its width. A new rectangle is created by decreasing the length of the original rectangle by 9 feet and increasing its width by 4 feet. The area of the new rectangle is the same as the area of the original rectangle. What is the perimeter of the new rectangle?

9. _____  In equilateral triangle ABC, shown here, each downward pointing black triangle has its vertices at the midpoints of the sides of a larger upward pointing white triangle. What fraction of the area of $\triangle ABC$ is white? Express your answer as a common fraction.

10. _____ units What is the greatest possible perimeter of an isosceles triangle with sides of length $5x + 20$, $3x + 76$ and $x + 196$?

11. _____ Consider an arithmetic sequence with $a_3 = 165$ and $a_{12} = 615$. For what value of n is $a_n = 2015$?

12. _____ If $\sqrt{x+7} = 2 + \sqrt{x}$, what is the value of x ? Express your answer as a common fraction.

13. _____ The line perpendicular to $2x - 2y = 2$, and with the same y -intercept, is graphed on the coordinate plane. What is the sum of its x - and y -intercepts?

14. _____ What is the units digit of the sum of the squares of the integers from 1 to 2015, inclusive?

15. _____ ways The doctor gave Amber ten vitamins, with instructions to take one or two each day until she runs out of vitamins. For example, Amber could take a vitamin a day for ten days, or she could take two the first day and one a day for the next eight days. A third way is to take one vitamin a day for eight days and two on the ninth day. Including the three examples given, in how many different ways can Amber take the ten vitamins?

16. _____ units What is the radius of a circle inscribed in a triangle with sides of length 5, 12 and 13 units?

17. _____ gumballs A bag initially had blue, red and purple gumballs in the ratio of 2:3:4. Five red gumballs are added to the bag. The probability of randomly drawing a red gumball is now 40%. How many gumballs are now in the bag?

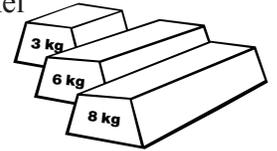

18. _____ The quadratic equation $x^2 + px + 2p = 0$ has solutions $x = a$ and $x = b$. If the quadratic equation $x^2 + cx + d = 0$ has solutions $x = a + 2$ and $x = b + 2$, what is the value of d ?

19. _____ cm² A rectangle of perimeter 22 cm is inscribed in a circle of area 16π cm². What is the area of the rectangle? Express your answer as a decimal to the nearest tenth.

20. _____ The units and tens digits of one two-digit integer are the tens and units digits of another two-digit integer, respectively. If the product of the two integers is 4930, what is their sum?

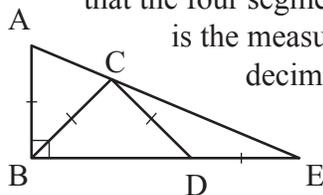

21. _____ Octavius has eight identical blue socks, six identical red socks, four identical black socks and two identical orange socks in his drawer. If he randomly selects two socks from his drawer, what is the probability that they will be the same color? Express your answer as a common fraction.

22. _____ small bars Iniki has large, medium and small metal bars. The large bars each weigh 8 kg. The medium bars each weigh 6 kg. The small bars each weigh 3 kg. Iron, nickel and lead are present in the ratio 4:1:3 in each large bar, 2:1:3 in each medium bar and 1:1:1 in each small bar. If Iniki wants to melt together a combination of bars to make an alloy that contains 40 kg of iron, 20 kg of nickel and 40 kg of lead, how many small bars will she have to use?

23. _____ If $x + \frac{1}{x} = 3$, what is the value of $x^4 + \frac{1}{x^4}$?

24. _____ degrees Points C and D are chosen on the sides of right triangle ABE, as shown, such that the four segments AB, BC, CD and DE each have length 1 inch. What is the measure of angle BAE, in degrees? Express your answer as a decimal to the nearest tenth.

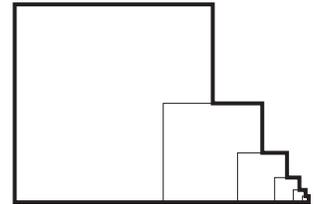

25. _____ people A restaurant sells three sizes of drinks: small for \$1.20, medium for \$1.30 and large for \$1.80. Each person at a table of ten ordered one drink, for a total cost of \$14.90, before sales tax. How many people ordered a large drink?

26. _____
arrange-
ments

Each of the 25 cells in a five-by-five grid of squares is filled with a 0, 1 or 2 in such a way that the numbers written in neighboring cells differ from the number in that cell by 1. Two cells are considered neighbors if they share a side. How many different arrangements are possible?

27. _____
units²

Starting with a square of side length 1, a square of side length $\frac{1}{2}$ is drawn so that it is bisected by a side of the original square, as shown. This process is repeated with a square of side length $\frac{1}{4}$ bisected by the square of side length $\frac{1}{2}$, and so on without end. What would be the area of such a figure, when generated as described? Express your answer as a common fraction.

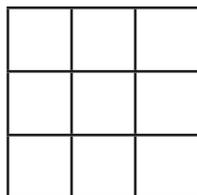

28. _____

In regular pentagon ABCDE, point M is the midpoint of side AE, and segments AC and BM intersect at point Z. If $ZA = 3$, what is the value of AB? Express your answer in simplest radical form.

29. _____

Fifty tickets numbered with consecutive integers are in a jar. Two are drawn at random and without replacement. What is the probability that the absolute difference between the two numbers is 10 or less? Express your answer as a common fraction.

30. _____
ways

How many ways are there to arrange the digits 1 through 9 in this 3×3 grid, such that the numbers are increasing from left to right in each row and increasing from top to bottom in each column?

MATHCOUNTS®

■ State Competition ■
Target Round
Problems 1 & 2

Name _____

School _____

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____ years old Julia's age is a two-digit multiple of 5, and when Julia's age is divided by 2, 3, 4, 6 or 8, the remainder is always 1. If Julia is five times as old as Bart, how old is Bart?

2. _____ If p is the maximum number of points of intersection possible of n distinct lines, and the ratio $p:n = 6:1$, what is the value of n ?

7. _____ years old

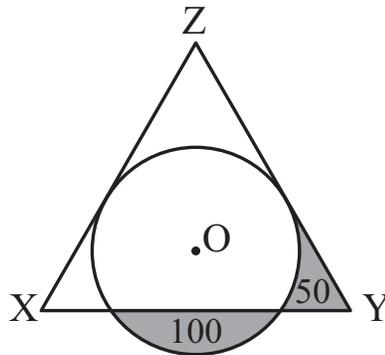

When trying to recall some facts about the ages of his three aunts, Josh made the following claims:

- Alice is fifteen years younger than twice Catherine's age.
- Beatrice is twelve years older than half of Alice's age.
- Catherine is eight years younger than Beatrice.
- The three women's ages add to exactly one-hundred years.

However, Josh's memory is not perfect, and in fact only three of these four claims are true. If each aunt's age is an integer number of years, how old is Beatrice?

8. _____

Circle O is tangent to two sides of equilateral triangle XYZ. If the two shaded regions have areas 50 cm^2 and 100 cm^2 as indicated, what is the ratio of the area of triangle XYZ to the area of circle O? Express your answer as a decimal to the nearest hundredth.

Team Round
Problems 1–10

School _____
Chapter _____
Team _____
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ When the integers 1 through 7 are written in base two, what fraction of the digits are 1s? Express your answer as a common fraction.

2. _____ sets Using the figure of 15 circles shown, how many sets of three distinct circles A, B and C are there such that circle A encloses circle B, and circle B encloses circle C?

3. _____ cm^2 Equilateral triangle ABC with side-length 12 cm is inscribed in a circle. What is the area of the largest equilateral triangle that can be drawn with two vertices on segment AB and the third vertex on minor arc AB of the circle? Express your answer in simplest radical form.

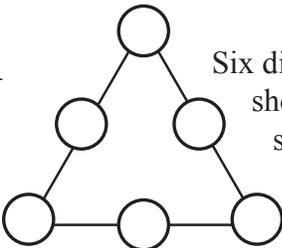

4. _____ minutes Sue and Kara run along the perimeter of a 120-yard by 40-yard rectangular field. In the time it takes Sue to run 120 yards along one side at a rate of 10 minutes per mile, Kara runs the lengths of the other three sides. At Kara's current rate, how many minutes would it take her to run a mile?

5. _____ An arithmetic sequence has first term a and common difference d . If the sum of the first ten terms is half the sum of the next ten terms, what is the ratio $\frac{a}{d}$? Express your answer as a common fraction.

6. _____ students In one math class, all of the students wrote the amount of change in their pockets on the board. Then they computed some properties of these numbers: the median was 50¢, the mean was 40¢ and there was a unique mode of 40¢. What is the fewest number of students that can be in this class?

7. _____ units Four consecutive sides of an equiangular hexagon have lengths of 1, 9, 16 and 4 units, in that order. What is the absolute difference in the lengths of the two remaining sides?

8. _____ convex sequences A *convex sequence* is a sequence of integers where each term (other than the first and last) is no greater than the arithmetic mean of the terms immediately before and after it. For example, the sequence 4, 1, 2, 3 is convex because $1 \leq \frac{4+2}{2}$ and $2 \leq \frac{1+3}{2}$. How many convex sequences use each number in the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ exactly once?

9. _____  Six different prime numbers are placed in the six different circles shown. The three circles on each side of the triangle have the same sum. What is the least possible value of the side sum?

10. _____ Two integers have the property that when their sum is added to the arithmetic mean of their squares, the result is 64. What is the greatest possible value of the product of these two integers?

1. _____ (percent) The number $\frac{4}{5}$ is what percent of $\frac{5}{6}$?

2. _____ If $a > b > 1$ and $a^m b^n = (a^{-2} b^5)(a^6 b^{-2})$, what is the value of the product mn ?

3. _____ The average of a , b and c is 60, and the average of a and b is 90. What is the value of c ?

4. _____ (cm) Two equilateral triangles of side length 6 cm share a side as shown. In centimeters, what is the radius of the smallest circle that encloses both triangles? Express your answer in simplest radical form.

5. _____ (degrees) In the seven-pointed star shown here, what is the mean degree measure of the seven vertex angles? Express your answer as a common fraction.

6. _____ (\$) Mary and Fred purchased sandwiches for a luncheon. Mary spent \$29.95 on 3 medium sandwiches and 2 large sandwiches. Fred spent \$28.45 on 4 medium sandwiches and 1 large sandwich. What would it cost to buy 1 medium sandwich and 1 large sandwich?

7. _____ (ft/s) A ball thrown upward from a height of 4 feet with an initial velocity of v feet per second will be $vt - 16t^2 + 4$ feet above the ground after t seconds. What is the minimum value of v for which the ball reaches a height of at least 20 feet?

8. _____ If the sum of the first 42 positive odd numbers is reduced by 1, what is the sum of the prime factors of the result?

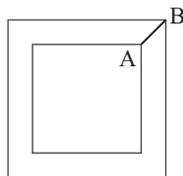

9. _____ (days) A 24-hour clock that runs fast gains 90 seconds every hour. If it is set correctly at 9:00 a.m., in how many days will it next show the correct time?

10. _____ What is the greatest whole number that is a factor of both 2012 and 2013?

11. _____ (inches) The area of a rectangular picture is 96 in^2 , and its width is two-thirds of its height. What is the sum of its height and width, in inches?

12. _____ (units²) What is the smallest possible area, in square units, of a right triangle with two sides of lengths 21 units and 29 units?

13. _____ If $3^x - 1 = 5$, what is the value of $9^x - 1$?
14. _____ (integers) How many positive four-digit integers consist of four digits that are consecutive integers in increasing or decreasing order?
15. _____ What is the sum of the distinct prime factors of 180?
16. _____ (percent) A price increase of 5% followed by a price increase of 6% is equivalent to a single price increase of what percent? Express your answer as a decimal to the nearest tenth.
17. _____ The mean of a set of n numbers is 27, and the mean of another set of $2n$ numbers is 30. What is the mean of a third set of $3n$ numbers if the mean of all $6n$ numbers is 32?
18. _____ What is the sum of the two real numbers x such that $3x^2 - 4x + 5 = \pi^2$? Express your answer as a common fraction.
19. _____ (degrees) If an acute triangle has angles with distinct integer degree measures, what is the least possible degree measure of the smallest angle?
20. _____ What is the product of all numbers x such that $x^3 + 2x^2 - 3x - 6 = 0$ or $6x^3 - 3x^2 - 2x - 1 = 0$?
21. _____ What is the value of $x + x^2 + x^4 + x^8$ when $x = 2$?
22. _____ (inches)

A 6" by 6" photo is surrounded by a 1" wide frame. In inches, what is the length of segment AB, which joins a corner of the photo to a corner of the frame? Express your answer in simplest radical form.

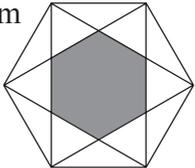

23. _____ What is the mean of the 17 numbers represented in this stem-and-leaf plot, where $3|9 = 39$?

| | |
|---|-----------|
| 3 | 9 9 |
| 4 | 1 3 5 6 |
| 5 | 2 3 5 7 8 |
| 6 | 4 5 7 9 |
| 7 | 1 1 |

24. _____ (participants) A summer camp had 78 participants who played at least one of soccer, basketball and volleyball. Of these participants, 35 played soccer, 30 played basketball, 27 played volleyball, 7 played both basketball and volleyball, 5 played both volleyball and soccer, 6 played both soccer and basketball. How many participants played all three sports?
25. _____ The product of two nonnegative integers is 10,000. If neither number is a multiple of ten, what is the sum of those two integers?
26. _____ (laps) When Maria has run one-fourth of her third lap in a race, she will have completed one-fourth of the entire race. How many laps are in the race?
27. _____ If $x^2 + y^2 = 12$ and $x^2 - y^2 = 5$, for $x > 0$ and $y > 0$, what is the value of the product xy ? Express your answer as a common fraction in simplest radical form.
28. _____ (units²) In square units, what is the area of the region bounded by the graphs of $y = |x|$ and $y = \sqrt{16 - x^2}$? Express your answer in terms of π .
29. _____ If the integers 1, 2, 3 and 4 are each used exactly once to replace the variables a , b , c and d , what is the greatest possible value of $(a + b)^{c + d}$?
30. _____ (people) How many people must be in a group to guarantee that at least three people in the group were born in the same month?
31. _____ (inches) The diagonals of a rhombus have lengths 15 inches and 36 inches. What is the perimeter of the rhombus, in inches?
32. _____ (cards) In the game of *Swick*, each card contains a letter from A to J, inclusive, followed by an integer from 0 to 9, inclusive. Each possible letter-number combination appears on exactly one card. How many cards are in a *Swick* deck?
33. _____ (units²) A rectangle has an area of 10 units² and a diagonal of length 11 units. What is the sum of the squares of the rectangle's length and width?
34. _____ What is the absolute difference between 3.45×10^6 and 1.35×10^4 ? Express your answer to the nearest whole number.

35. _____ What is the sum of the odd positive divisors of 10,000?
36. _____ (percent) If 20% of x is equal to 30% of y , what percent of y is x ?
37. _____ The terms of an increasing arithmetic sequence have a common difference of 3. If the sum of four consecutive terms is 72, what is the sum of the next four consecutive terms?
38. _____ If $f(x) = x + 2$ and $g(x) = 3x - 2$, what is the value of $g(f(5))$?
39. _____ (seconds) The height y , in feet, of a soccer ball x seconds after it is kicked is given by the equation $y = 40x - 16x^2$. How many seconds after the ball is kicked will it first hit the ground? Express your answer as a decimal to the nearest tenth.
40. _____ (units) What is the shortest distance from the line $y = x + 1$ to the origin? Express your answer as a common fraction in simplest radical form.
41. _____ If $x:y = 2:3$ and $y:z = 4:5$, what is the value of $\frac{x}{z}$? Express your answer as a common fraction.
42. _____ Two real numbers are randomly chosen strictly between 0 and 1. What is the probability that their sum exceeds their product? Express your answer as a decimal to the nearest tenth.
43. _____ What is the value of $(5^{2015} + 5^{-2015})^2 - (5^{2015} - 5^{-2015})^2$?
44. _____ If a number written in base 2 consists entirely of a sequence of 2015 1s, what is the units digit of the number in base 10?
45. _____ If a 45° arc on circle O has the same length as a 120° arc on circle P, what is the ratio of the area of circle O to the area of circle P? Express your answer as a common fraction.
46. _____ What common fraction is equivalent to $\overline{0.45}$?

47. _____ (percent) Sandra bought a bag of jelly beans. She sorted the jelly beans and found $\frac{3}{10}$ were yellow, $\frac{2}{5}$ were green and $\frac{1}{10}$ were red. The remaining jelly beans were purple. What percent of the jelly beans were purple?
48. _____ When rolling five dice, what is the probability that they will all show even numbers or all show odd numbers? Express your answer as a common fraction.
49. _____ If x is an integer such that $(x + 3)(x + 4) = 42$, what is the least possible value of $(x + 4)(x + 5)$?
50. _____ If $\frac{(4!)!}{4!} = a!$, what is the value of a ?
51. _____ The variables a, b, c, d and e represent five different positive integers. The median, mean and mode of $\{a, a, b, c, d, e\}$ (which includes a twice) are the same. What integer is the smallest possible sum of the six numbers?
52. _____ Max rolls a standard die twice. What is the probability that the first number he rolls is no larger than the second number? Express your answer as a common fraction.
53. _____ If n is a positive integer greater than 2 and $\sqrt[n]{n} = \sqrt{2}$, what is the value of n ?
54. _____ If the decimal representation of the common fraction $\frac{a}{b}$ begins with 0.13 followed by at least one more nonzero digit, what is the minimum possible value of b ?
55. _____ (integers) How many positive integers are a multiple of 1000 and a factor of 1,000,000?
56. _____ What is the sum of the positive divisors of 256?
57. _____ If $a > b > 0$, what is the simplest form of the expression $\frac{a - \frac{b^2}{a}}{b - \frac{a^2}{b}}$? Express your answer as a common fraction in terms of a and b .

58. _____ What is the only integer between -100 and 100 that has more than 12 positive divisors?
59. _____ What is the smallest prime number that is not a divisor of $14!$?
60. _____ Each term of the sequence $3, 10, 17, 24, \dots$, is seven more than the term that precedes it. What is the value of the term of the sequence that is closest to 2015?
61. _____ What is the value of x if $\frac{2}{x-14} = \frac{3}{4x}$? Express your answer as a decimal to the nearest tenth.
62. _____ For what value of x does $8^{(9^{10})} = 2^{(3^x)}$?
63. _____ For positive integers a and b , $a + b = 20$. What is the greatest possible value of $a^2 + b^2$?
64. _____ (cm²) In a regular hexagon of area 120 cm^2 , six diagonals are drawn to form a smaller, shaded hexagon as shown. What is the area of the smaller hexagon, in square centimeters?
- 
65. _____ (cm) The area of a sector of a circle is $12\pi \text{ cm}^2$. The measure of the central angle of the sector is 120° . In centimeters, what is the radius of the circle?
66. _____ (percent) Park Middle School has 80 girls and 74 boys in the 7th grade. It has 96 girls and 70 boys in the 8th grade. What percent of the 7th- and 8th-grade students at Park Middle School are girls?
67. _____ (positive integers) How many positive integers are a factor of $2^8 - 1$?
68. _____ What is the least positive integer with exactly 16 positive factors?
69. _____ (amounts) How many amounts from 1¢ to 99¢ , inclusive, can be created using only dimes and quarters?

70. _____ Ryan squared a positive number, then added $\frac{1}{9}$ of the result, then increased its value by 10, and finally decreased the result by 20%. All of these steps gave a result of 208. What was Ryan's original number?

71. _____ (percent) If the length of each edge of a cube is increased by 20%, by what percent does the volume increase? Express your answer to the nearest whole number.

72. _____ (percent) A band sells the rights to one of its songs for a certain amount of money. After the band receives 60% of the money, the manager gets 25% of what remains. The record company then receives 20% of what remains after the band and its manager have been paid. The rest goes to the shareholders. What percent of the original amount will the shareholders receive?

73. _____ What is the value of $(4 + 6 + 8 + 10 + 12)^3$?

74. _____ For what integer x does $2^x = 4^x$?

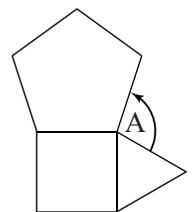

75. _____ (students) The ratio of the number of 6th, 7th and 8th grade students at King Middle School is 9:5:7, respectively. If there are a total of 630 students at King, how many of the students are in the 8th grade?

76. _____ What is the value of $155^2 - 145^2 + 135^2 - 125^2$?

77. _____ If $f(x) = 2x^2 + 8$, what is the positive value of x for which $f(x) = 136$?

78. _____ For what integer n is the value of 2^n closest to 1,000,000?

79. _____ (degrees) Three regular polygons have common sides and vertices, as shown. What is the degree measure of angle A?

80. _____ (IDs) At Matrix Middle School student IDs start with a 7 or 8 to indicate the grade level, followed by an F or M for gender, followed by a 1 or 0 to indicate whether the student is a bus rider or not, followed by a three-digit number that does not contain the digits 0, 1, 7 or 8. How many distinct student IDs are possible?

MATHCOUNTS®

2015 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Team Round problem with less than 10 sheets of scratch paper?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2015 MATHCOUNTS® State Competition. Though these solutions provide creative and concise ways of solving the problems from the competition, there are certainly numerous other solutions that also lead to the correct answer, and may even be more creative or more concise! We encourage you to find numerous solutions and representations for these MATHCOUNTS problems.

*Special thanks to volunteer author **Mady Bauer** for sharing these solutions with us and the rest of the MATHCOUNTS community!*

2015 State Competition

Sprint Round

1. Given: A bike costs \$240. Jared has \$60 and saves \$9 per week.

Find: The number of weeks it will take Jared to save the rest of the money for the bike.

Subtracting $240 - 60 = 180$, gives us the amount he needs to save. At \$9 per week, the number of weeks it will take is

$$\frac{180}{9} = 20 \text{ Ans.}$$

2. Given: $2 = \frac{a}{20} = \frac{60}{b}$

Find: $a + b$

$$2 = \frac{a}{20}$$

$$a = 40$$

$$2 = \frac{60}{b}$$

$$2b = 60$$

$$b = 30$$

So $a + b = 40 + 30 = 70$ Ans.

3. Given: $f(x) = 2x^2 - 3x + 7$ with domain $\{-2, -1, 3, 4\}$

Find: The largest integer in the range of f .

Substitute each of the domain values into the function to determine the range values.

$$f(-2) = 2(-2)^2 - 3(-2) + 7 = 8 - (-6) + 7 = 21$$

$$f(-1) = 2(-1)^2 - 3(-1) + 7 = 2 - (-3) + 7 = 12$$

$$f(3) = 2(3)^2 - 3(3) + 7 = 18 - 9 + 7 = 16$$

$$f(4) = 2(4)^2 - 3(4) + 7 = 32 - 12 + 7 = 27$$

The largest value is 27. Ans.

4. Given: First two terms are 10 and 20. The rest of the terms are the average of the preceding terms.

Find: The 2015th term

Let's see if we can generalize.

$$3^{\text{rd}} \text{ term: } \frac{10+20}{2} = \frac{30}{2} = 15$$

$$4^{\text{th}} \text{ term: } \frac{10+20+15}{3} = \frac{45}{3} = 15$$

$$5^{\text{th}} \text{ term: } \frac{10+20+15+15}{4} = \frac{60}{4} = 15$$

We can now generalize. The average of the first two terms was 15. And after that, we continue to add 15 because the average is always 15. Therefore, the value of the 2015th term also will be 15. Ans.

5. Given: a graph showing the water temperature T at time t for a pot of water heated to 100° .

Find: The average of how many degrees the temperature increased each minute during the first 8 minutes.

At time $t = 0$, the temperature is $T = 20$.

At time $t = 8$, the temperature is $T = 100$. So the average increase in temperature per

minute was $\frac{100-20}{8} = \frac{80}{8} = 10$ Ans.

6. Given the following table:

| x | y |
|-----|---------|
| 1 | 1 |
| s | 4 |
| t | $t + 4$ |

$$\text{and } y = \frac{3x-1}{2}$$

Find: t

Using the last line of the table:

$$t + 4 = \frac{3t - 1}{2}$$

$$2t + 8 = 3t - 1$$

$$t = 9 \text{ Ans.}$$

7. Given: First plan has a \$24 registration fee, a monthly rate of \$5 and a charge of \$0.75 for each download.

Second plan has a \$15 registration fee, a fixed monthly rate of \$3 and a charge of \$1.50 for each download.

Find: The number of downloads for which the two plans cost the same for a year.

Let x be the number of downloads for which the two plans cost the same.

We have

$$24 + (12 \times 5) + 0.75x =$$

$$15 + (12 \times 3) + 1.50x$$

$$84 + 0.75x = 51 + 1.50x$$

$$0.75x = 33$$

$$x = 44 \text{ **Ans.**}$$

8. Given: Length of a rectangle is 3 times the width. A second rectangle decreases the length by 9 and increases the width by 4. Both rectangles have the same area. Find: The perimeter of the second rectangle.

Let l = length of the first rectangle.

Let w = width of the first rectangle.

Then $l = 3w$

The length of the second rectangle is

$3w - 9$, and its width is $w + 4$

Now, since both areas are the same we have:

$$(3w)(w) = (3w - 9)(w + 4)$$

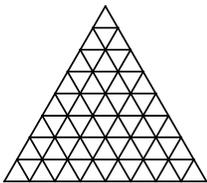

$$3w^2 = 3w^2 - 9w + 12w - 36$$

$$3w = 36$$

$$w = 12$$

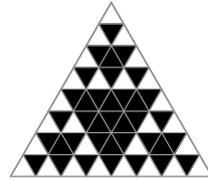

The second rectangle has length $3w - 9 = 36 - 9 = 27$ and width $w + 4 = 12 + 4 = 16$. Its perimeter, then, is $2(27 + 16) = 2(43) = 86$ **Ans.**

9. Given: Equilateral triangle ABC has downward pointing black triangles whose vertices are at the midpoints of the sides of a larger upward pointing white triangle. Find: The fraction of the area of triangle ABC that is white. First, break up the triangle into 64 smaller congruent equilateral triangles as shown.

If we place this figure of equilateral

triangles over triangle ABC, as shown below, we can count the white triangles to determine what fraction of triangle ABC they represent.

Now since there are 27 white triangles, the fraction of triangle ABC that they represent is $\frac{27}{64}$. **Ans.**

10. Given: an isosceles triangle with sides $5x + 20$, $3x + 76$, $x + 196$
Find: The greatest possible perimeter.
Since the triangle is isosceles, two sides must be equal in length. If $5x + 20 = 3x + 76$, then $2x = 56$ and $x = 28$. If $3x + 76 = x + 196$, then $2x = 120$ and $x = 60$. Finally, if $5x + 20 = x + 196$, then $4x = 176$ and $x = 44$. The greatest value for x is 60, so the greatest possible perimeter occurs with side lengths $5x + 20 = 5(60) + 20 = 320$, $3x + 76 = 3(60) + 76 = 256$ and $x + 196 = 60 + 196 = 256$. That perimeter is $320 + 256 + 256 = 832$ **Ans.**

11. Given: An arithmetic sequence with $a_3 = 165$ and $a_{12} = 615$
Find: n if $a_n = 2015$
There is a common difference between terms in an arithmetic sequence. The difference between a_3 and a_{12} is $615 - 165 = 450$. The common difference between each of the nine pairs of terms from a_3 to a_{12} is $450 \div 9 = 50$. Since $2015 - 615 = 1400$ and $\frac{1400}{50} = 28$, to get from $a_{12} = 615$ to $a_n = 2015$ this common difference is applied 28 times. So $n = 12 + 28 = 40$ **Ans.**

12. Given: $\sqrt{x+7} = 2 + \sqrt{x}$

Find: The value of x .

$$x + 7 = (2 + \sqrt{x})^2 = 4 + 4\sqrt{x} + x$$

$$7 = 4 + 4\sqrt{x}$$

$$3 = 4\sqrt{x}$$

$$9 = 16x$$

$$x = \frac{9}{16} \text{ Ans.}$$

13. Given: The line perpendicular to $2x - 2y = 2$ with the same y -intercept is graphed.

Find: The sum of its x - and y -intercept

Rewriting $2x - 2y = 2$ in the form $y = mx + b$, we get $y = x - 1$ and see that the slope is $m = 1$ and the y -intercept is $b = -1$.

The line perpendicular to $y = x - 1$ has a slope of $-\frac{1}{m} = -1$. The y -intercept is the same so the equation of the perpendicular line is $y = -x - 1$. The x -intercept, which is found when $y = 0$, is $x = -1$. The sum of the x - and y -intercepts of the perpendicular line is: $-1 + (-1) = -2$ Ans.

14. Find: The units digit of the sum of the squares of the integers from 1 to 2015.

Let's look at the squares of the first 10 numbers to see if we can generalize.

1, 4, 9, 16, 25, 36, 49, 64, 81, 100

And the next 10 numbers, we have

121, 144, 169, 196, 225, 256, 289, 324, 361, 400.

The one's digit repeats in every set of 10 squares.

The sum of the one's digits in each set of 10 squares is:

$$1 + 4 + 9 + 6 + 5 + 6 + 9 + 4 + 1 + 0 = 45$$

Now, let's look at the sums of the squares of integers from 1 to n where $1 < n < 10$.

1, 5, 14, 30, 55, 91, 140, 204, 285, 385

The fifth term is 55. If we add the next 10 squares to get to the 15th term, we add 45 (actually we only care about the 5) and the

15th term will end in 0 (i.e., 5 + 5). Similarly, the 25th term will end in 5. And so on. The one's digit of the terms that end in 5 will cycle back and forth from 5 to 0 to 5 etc. Therefore, the one's digit of the 2015th term is 0 (the 2005th term would have a one's digit of 5). 0 Ans.

15. Given: Amber takes one or two vitamins a day. She has a total of 10 vitamins.

Find: How many different ways Amber can take the vitamins.

Start with 2 a day.

$$2 + 2 + 2 + 2 + 2 - 1 \text{ way}$$

Now let her take 2 vitamins a day for 4 days and 1 vitamin a day for 2 days, i.e.,

$$2 + 2 + 2 + 2 + 1 + 1$$

There are $\frac{6!}{4!2!} = \frac{6 \times 5}{2} = 15$ ways to do this.

Now take 2 vitamins a day for 3 days and 1 vitamin a day for 4 days, i.e.,

$$2 + 2 + 2 + 1 + 1 + 1 + 1$$

$$\frac{7!}{4!3!} = \frac{7 \times 6 \times 5}{3 \times 2 \times 1} = 35 \text{ ways}$$

Now take 2 vitamins a day for 2 days and 1 vitamin a day for 6 days, i.e.,

$$2 + 2 + 1 + 1 + 1 + 1 + 1 + 1$$

$$\frac{8!}{6!2!} = \frac{8 \times 7}{2 \times 1} = 28 \text{ ways.}$$

Now take 2 vitamins a day for 1 day and 1 vitamin a day for 8 days, i.e.,

$$2 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$$

$$\frac{9!}{8!1!} = 9 \text{ ways}$$

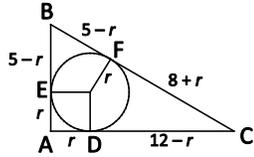

Finally, there is 1 way to take one vitamin a day for 10 days. The total number of ways to take the 10 vitamins as prescribed is

$$1 + 9 + 28 + 35 + 15 + 1 = 89 \text{ Ans.}$$

16. Given: a circle inscribed in a triangle with sides of length 5, 12 and 13.

Find: The radius of the circle.

The triangle is a 5-12-13 right triangle.

Draw a radius perpendicular to each side of the triangle. The point of intersection between each of these radii and the triangle also is the point of tangency between the circle and that side of the triangle.

Let r be the radius of the circle.

Side AB of length 5 is divided into two segments $AE = r$ and $EB = 5 - r$.

Side AC of length 12 is divided into two segments of $AD = r$ and $DC = 12 - r$.

Two segments tangent to a circle that intersect at a point outside the circle are equal in length, so $EB = BF$.

Hypotenuse BC of length 13 is divided into two segments of lengths $BF = 5 - r$ and $FC = 13 - (5 - r) = 8 + r$.

Segments DC and FC are both tangent to the circle and intersect at C , so $DC = FC$ and $12 - r = 8 + r$

$$2r = 4$$

$$r = 2 \text{ Ans.}$$

17. Given: A bag has blue, red and purple gumballs in the ratio of 2:3:4. 5 red balls are added to the bag making the probability of drawing a red gumball 40%.

Find: The number of gumballs now in the bag.

Let x = the original number of gumballs in the bag.

The number of blue gumballs is $\frac{2}{9}x$.

The number of red gumballs is $\frac{3}{9}x$.

The number of purple gumballs is $\frac{4}{9}x$.

Now, add the 5 red gumballs.

$$\frac{\frac{3}{9}x + 5}{x + 5} = 40\% = \frac{4}{10} = \frac{2}{5}$$

$$\frac{15}{9}x + 25 = 2x + 10 = \frac{18}{9}x + 10$$

$$\frac{3}{9}x = 25 - 10 = 15$$

$$\frac{1}{3}x = 15$$

$x = 45$; This is the original number of gumballs. The number of gumballs now in the bag is $x + 5 = 45 + 5 = 50$. Ans.

18. Given: $x^2 + px + 2p = 0$ with solutions: $x = a$ and $x = b$

$bx^2 + cx + d = 0$ with solutions: $x = a + 2$ and $x = b + 2$

Find: d

For the first quadratic equation we have

$$(x - a)(x - b) = 0$$

$$x^2 - x(a + b) + ab$$

Therefore, $p = -(a + b)$

$$2p = ab$$

$$-2(a + b) = ab$$

$$2(a + b) + ab = 0$$

For the second equation we have

$$(x - (a + 2))(x - (b + 2)) = 0$$

$$x^2 - x(a + b + 4) + 2(a + b) + ab + 4 = 0$$

So $c = -(a + b + 4)$ and $d = 2(a + b) + ab + 4$.

From the previous equation, we know that $2(a + b) + ab = 0$, so $d = 4$. Ans.

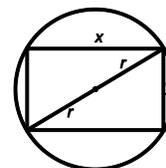

19. Given: The perimeter of a rectangle is 22. The rectangle is inscribed in a circle of with area 16π .

Find: The area of the rectangle.

Let x = the length of the rectangle.

Let y = the width of the rectangle.

Let r = the radius.

We are asked to find the area of the rectangle, $A = xy$.

The circle has area 16π so

$$\pi r^2 = 16\pi$$

$$r^2 = 16$$

$$r = 4$$

By the Pythagorean Theorem

$$x^2 + y^2 = 8^2$$

$$x^2 + y^2 = 64$$

Since the perimeter of the rectangle is 22,

$$2(x + y) = 22$$

$$x + y = 11$$

Squaring both sides, we get

$$(x + y)^2 = 11^2$$

$$x^2 + 2xy + y^2 = 121$$

Substituting 64 for $x^2 + y^2$ gives us

$$64 + 2xy = 121$$

$$2xy = 57$$

$$xy = 28.5 \text{ Ans.}$$

20. Given: The units and tens digits of a two-digit number are the tens and units digit of another two-digit number. The product of the two integers is 4930.

Find: The sum of the two integers.

$$4930 = 493 \times 2 \times 5 = 17 \times 29 \times 2 \times 5$$

By inspection, the two numbers must be

$$85 = 17 \times 5 \text{ and } 58 = 29 \times 2. \text{ And } 85 + 58 =$$

$$143 \text{ Ans.}$$

21. Given: 8 blue socks, 6 red socks, 4 black socks and 2 orange socks.

Find: The probability of selecting 2 socks of the same color.

There are a total of $8 + 6 + 4 + 2 = 20$ socks.

The probability of selecting two orange socks:

$$\frac{2}{20} \times \frac{1}{19} = \frac{2}{380} = \frac{1}{190}$$

The probability of selecting two black socks:

$$\frac{4}{20} \times \frac{3}{19} = \frac{12}{380} = \frac{6}{190}$$

The probability of selecting two red socks:

$$\frac{6}{20} \times \frac{5}{19} = \frac{30}{380} = \frac{15}{190}$$

The probability of selecting two blue socks:

$$\frac{8}{20} \times \frac{7}{19} = \frac{56}{380} = \frac{28}{190}$$

The total probability of selecting two socks of the same color is:

$$\frac{1}{190} + \frac{6}{190} + \frac{15}{190} + \frac{28}{190} = \frac{50}{190} = \frac{5}{19} \text{ Ans.}$$

22. Given: Large bars weigh 8 g. Medium bars weigh 6 kg. Small bars weigh 3 kg. Iron, nickel and lead are present in the ratio 4:1:3 in each large bar, 2:1:3 in each medium bar and 1:1:1 in each small bar. A combination of bars is used to make an alloy containing 40 kg of iron, 20 kg of nickel and 40 kg of lead.

Find: The number of small bars needed.

Each large bar contains 4 kg of iron, 1 kg of nickel and 3 kg of lead.

Each medium bar contains 2 kg of iron, 1 kg of nickel and 3 kg of lead.

Each small bar contains 1 kg of iron, 1 kg of nickel and 1 kg of lead.

Let x = the number of large bars used.

Let y = the number of medium bars used.

Let z = the number of small bars used.

$$8x + 6y + 3z = 40 + 20 + 40$$

$$8x + 6y + 3z = 100$$

From the given ratios, we can write the following equations for the iron, nickel and lead content of the final alloy:

$$4x + 2y + z = 40$$

$$x + y + z = 20$$

$$3x + 3y + z = 40$$

Subtracting the equations $4x + 2y + z = 40$ and $4x + 2y + z = 40$ yields

$$x - y = 0$$

$$x = y$$

Substituting into the equation $x + y + z = 20$ gives us

$$2x + z = 20$$

$$z = 20 - 2x$$

With y and z in terms of x we can substitute into the original equation to get

$$8x + 6x + 3(20 - 2x) = 100$$

$$14x + 60 - 6x = 100$$

$$8x = 40$$

$$x = 5$$

The number of small bars needed is

$$20 - 2(5) = 20 - 10 = 10 \text{ Ans.}$$

23. Given: $x + \frac{1}{x} = 3$

Find: $x^4 + \frac{1}{x^4}$

$$\left(x + \frac{1}{x}\right)^2 = 3^2$$

$$x^2 + 2 + \frac{1}{x^2} = 9$$

$$x^2 + \frac{1}{x^2} = 7$$

$$\left(x^2 + \frac{1}{x^2}\right)^2 = 7^2$$

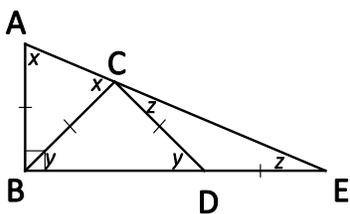

$$x^4 + 2 + \frac{1}{x^4} = 49$$

$$x^4 + \frac{1}{x^4} = 47 \text{ Ans.}$$

24. Given: Points C and D are on lines AE and BE, respectively.

$$AB = BC = CD = DE = 1$$

Find: The measure of $\angle BAE$

For $\triangle ABC$ let $x = m\angle BAC = m\angle BCA$.

For $\triangle BCD$ let $y = m\angle CBD = m\angle CDB$.

For $\triangle CDE$ let $z = m\angle DCE = m\angle DEC$. Then

$$m\angle ABC = 180 - 2x = 90 - y$$

$$y = 2x - 90$$

$$m\angle BCD = 180 - 2y = 180 - (x + z)$$

$$2y = x + z$$

$$m\angle CDE = 180 - 2z = 180 - y$$

$$2z = y$$

For $\triangle ABE$ $m\angle BAE = x$ and $m\angle AEB = z$ so

$$x = 90 - z$$

$$x + z = 90$$

Substituting $2y = x + z$, we get

$$2y = 90$$

$$y = 45$$

Now, substituting into $y = 2x - 90$, we get

$$2x - 90 = 45$$

$$2x = 135$$

$$x = 67.5 \text{ Ans.}$$

25. Given: Small drinks cost \$1.20, mediums cost \$1.30 and larges cost \$1.80. Ten people each order one drink costing \$14.90.

Find: The number of large drinks ordered.

Let x = the number of small drinks.

Let y = the number of medium drinks.

Let z = the number of large drinks.

From the information provided, we have

$$1.2x + 1.3y + 1.8z = 14.9$$

$$x + y + z = 10$$

Unfortunately, we have more unknowns than we have equations, so we aren't able to use any of the standard techniques we typically employ to solve a system of equations. Let's try another approach.

The maximum number of large drinks that could be ordered is 8 since $1.8 \times 8 = 14.4$. That would leave \$0.50 which isn't enough for another drink of any size.

With seven large drinks, we have $1.8 \times 7 = 12.6$. That leaves $14.90 - 12.60 = \$2.30$.

But we can't divide that to buy an integral number of small and/or medium drinks.

With six large drinks, we have $1.8 \times 6 = 10.8$. That leaves $14.90 - 10.80 = \$4.10$.

And that still can't be divided to purchase an integral number of small and/or medium drinks.

With five large drinks, we have $1.8 \times 5 = 9$.

That leaves $14.90 - 9.00 = \$5.40$. Again, that can't be divided to purchase an integral

number of small and/or medium drinks.
 With four large drinks, we have $1.8 \times 4 = 7.2$. That leaves $14.90 - 7.20 = \$7.70$. If one small drink is ordered, that costs 1.20. That leaves $7.70 - 1.20 = \$6.50$ which is enough to buy $6.5 \div 1.3 = 5$ medium drinks. Thus, the number of large drinks ordered was 4 **Ans.**

26. Given: 25 cells in a 5x5 grid. Each cell has a 0, 1 or 2, so that the values differ by 1.

Find: number of grids.

Let's take a look at the possibilities for the first row.

Let's suppose that the first row starts with 0. We can then have

0 1 0 1 0

0 1 0 1 2

0 1 2 1 0

0 1 2 1 2

Call this Group A.

Now suppose that the first row starts with 1. We can then have

1 0 1 0 1

1 0 1 2 1

1 2 1 0 1

1 2 1 2 1

Call this Group B.

Now suppose that the first row starts with 2. We can then have

2 1 0 1 0

2 1 0 1 2

2 1 2 1 0

2 1 2 1 2

Call this Group C.

Now take one of the items from Group A.

Say, 01010.

What would the second row be?

10101 or

10121 or

12101 or

12121

That's Group B. Any of the items in Group A chosen as the first row will require an item from Group B as the second row.

Now take an item from Group B.

Say, 10101.

What would the second row be?

01010 or

01012 or

01210 or

01212 or

21212 or

21210 or

21010 or

21012

That's Group A and Group C. Any of the items in Group B chosen as the first row will require an item from Group A or Group C as the second row.

Now take an item from Group C.

Say, 21212.

What would the second row be?

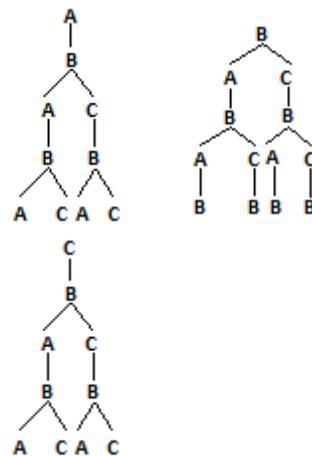

12121

12101

10121

10101

That's Group A. Any of the items in Group C chosen as the first row will require an item from Group B as the second row. That gives us the following "state" transitions.

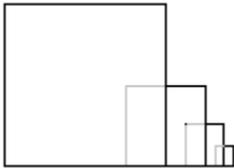

With the first image (Group A is at the top), there are 4 possibilities for the first row, 4

possibilities for the second row (Group B), 8 possibilities for the third row (Group A and C), 4 possibilities for the fourth row (Group B) and 8 possibilities for the fifth row (Group A and C). That's a total of $4 \times 4 \times 8 \times 4 \times 8 = 2^{12} = 4096$ combinations.

With the second image (Group B is at the top), there are 4 possibilities for the first row, 8 possibilities for the second row, 4 possibilities for the third row, 8 possibilities for the fourth row and 4 possibilities for the fifth row. That's another 4096 combinations.

Finally, with the third image, it's similar to the first image for another 4096 possibilities. So $4096 \times 3 = 12,288$ **Ans.**

27. Given: a square with a side of length 1, another with a side of length $\frac{1}{2}$ bisecting the first square, another with a side of length $\frac{1}{4}$ bisecting the second square, and so on. Find: The area of the figure.

As can be seen from the diagram, half the area of the second square is added to the entire figure, as is half the area of the third square etc.

Half the area of the second square is

$$\frac{1}{2} \times \left(\frac{1}{2} \times \frac{1}{2}\right) = \frac{1}{8}$$

Half the area of the third square is

$$\frac{1}{2} \times \left(\frac{1}{4} \times \frac{1}{4}\right) = \frac{1}{32}$$

Half the area of the fourth square is

$$\frac{1}{2} \times \left(\frac{1}{8} \times \frac{1}{8}\right) = \frac{1}{128}$$

The area of the entire figure is the sum of the areas of the original square and the remaining half squares. So the sum, let's call it S, is $S = 1 + \frac{1}{8} + \frac{1}{32} + \frac{1}{128} + \dots$

It follows, then, that $\frac{S}{4} = \frac{1}{4} + \frac{1}{128} + \frac{1}{512} + \dots$

Subtracting, these two sums, we get

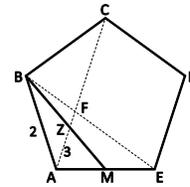

$$S - \frac{S}{4} = 1 + \frac{1}{8} - \frac{1}{4}$$

$$\frac{3}{4}S = \frac{7}{8}$$

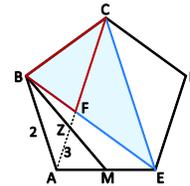

$$S = \frac{7}{8} \times \frac{4}{3}$$

$$S = \frac{7}{6} \text{ **Ans.**}$$

28. Given: Regular pentagon ABCDE with point M as the midpoint of side AE. AC and BM intersect at Z. ZA = 3. Find: AB

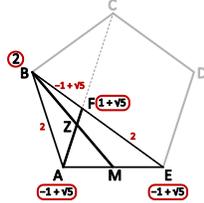

First, consider pentagon ABCDE with diagonal BE, as shown. Let F be the intersection of diagonals AC and BE, each of length d . For now, let's assume the pentagon has sides of length 2, and we'll scale this once we determine the actual measurements and ratios. Since $AC \parallel DE$ and $BE \parallel CD$, it follows that CDEF is a rhombus with $CF = DE = EF = DC = 2$. Additionally, $AF = BF = d - 2$. Notice, too, that $AF = AZ + FZ$, so $AZ = AF - FZ$. We will need this later. If we now draw diagonal CE, as shown, we create isosceles triangle BCE, which is similar to triangle BFC.

We can write the following proportion: $d/2 = 2/(d - 2)$. Cross-multiplying, we get

$d(d - 2) = 4$ and $d^2 - 2d - 4 = 0$. Using the quadratic formula, we see that the solution to this equation is $d = 1 + \sqrt{5}$, so $d - 2 = -1 + \sqrt{5}$. Now, let's apply principles of mass point geometry to triangle BAE with median BM and cevian AF, as shown.

So far, we have $AB = FE = 2$ and $BF = -1 + \sqrt{5}$. To balance side BE on F, let's assign a mass of 2 at B and a mass of $-1 + \sqrt{5}$ at E. Doing so balances side BE because on one side of F, we have a mass \times distance $= 2 \times (-1 + \sqrt{5})$ and on the other side of F, mass \times distance $= (-1 + \sqrt{5}) \times 2$. This also gives us a mass of $2 + (-1 + \sqrt{5}) = 1 + \sqrt{5}$ at F. Since we've already assigned a mass of $-1 + \sqrt{5}$ to E and M is the midpoint of side AE, we also need to assign a mass of $-1 + \sqrt{5}$ to A. Given the masses at A and F, if cevian AF is balanced on Z, we must have the following ratio

$$AZ/FZ = (1 + \sqrt{5})/(-1 + \sqrt{5}).$$

Cross-multiplying yields

$$FZ(1 + \sqrt{5}) = AZ(-1 + \sqrt{5})$$

$$FZ = AZ \left(\frac{-1 + \sqrt{5}}{1 + \sqrt{5}} \right) \left(\frac{1 - \sqrt{5}}{1 - \sqrt{5}} \right)$$

$$FZ = AZ \left(\frac{-6 + 2\sqrt{5}}{-4} \right)$$

$$FZ = AZ \left(\frac{3 - \sqrt{5}}{2} \right)$$

Recall, we previously determined that $AZ = AF - FZ$ and $AF = -1 + \sqrt{5}$. Putting this all together gives us

$$AZ = -1 + \sqrt{5} - AZ \left(\frac{3 - \sqrt{5}}{2} \right)$$

$$AZ + AZ \left(\frac{3 - \sqrt{5}}{2} \right) = -1 + \sqrt{5}$$

$$2AZ + AZ(3 - \sqrt{5}) = -2 + 2\sqrt{5}$$

$$AZ(2 + 3 - \sqrt{5}) = -2 + 2\sqrt{5}$$

$$AZ(5 - \sqrt{5}) = -2 + 2\sqrt{5}$$

$$AZ = \frac{-2 + 2\sqrt{5}}{5 - \sqrt{5}} \cdot \frac{5 + \sqrt{5}}{5 + \sqrt{5}}$$

$$AZ = \frac{2\sqrt{5}}{5}$$

So, the ratio $AZ/AB = (2\sqrt{5}/5)/2 = \sqrt{5}/5$.

Since we are told that $AZ = 3$, we have the following proportion $3/AB = \sqrt{5}/5$.

Cross-multiplying gives us $\sqrt{5} \times AB = 15$, so $AB = 15/\sqrt{5}$. Rationalizing the denominator, we see that $AB = (15/\sqrt{5})(\sqrt{5}/\sqrt{5}) = 15\sqrt{5}/5 = 3\sqrt{5}$ **Ans.**

29. Given: 50 tickets numbered with consecutive integers. Two are drawn. Find: The probability that the absolute difference between the two numbers is 10 or less.
- Suppose one of the tickets chosen contains the number 1. Then a ticket numbered 2 through 11 yields a difference of 10 or less. That's 10 ways to get a difference of 10 or less if one of the tickets is numbered 1. For each of the tickets numbered 1 through 40, if one of these 40 tickets is chosen, then there are 10 ways to select a second numbered ticket such that the numbers differ by 10 or less. That's $40 \times 10 = 400$ possible ways to select two number tickets in this manner.
- Then if the tickets numbered 41 through 50 are chosen, there are 9, 8, 7, 6, 5, 4, 3, 2, 1 and 0 ways, respectively to select a second numbered ticket such that the numbers differ by 10 or less. That's another $9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 45$ possible ways to select two numbered tickets in the manner described. That's a total of $400 + 45 = 445$

possibilities out of the ${}_{50}C_2 = \frac{50!}{(48!)(2!)} = 1225$
 possible ways to select two of the
 numbered tickets.

That's a probability of $\frac{445}{1225} = \frac{89}{245}$ **Ans.**

These are the total possibilities for either the
 first column or row. You can't have 8 as the
 last value in the first row or column. And 1 5
 6 leaves too many values that are smaller and
 we'll violate the increase requirement.

$21 \times 2 = 42$ **Ans.**

30. Find: The number of ways to arrange the
 digits 1 through 9 in a 3×3 grid such that the
 numbers are increasing from left to right in
 each row and increasing from top to bottom
 in each column.

Some things we know:

- The first item in the first row must be 1 and
 the last item in the third row must be 9.

- Whatever works horizontally will work
 vertically. I.e.,

1 2 3 1 4 7
 4 5 6 2 5 8
 7 8 9 3 6 9

Let's start with 1 2 ___ for the first row.

1 2 3 1 2 3 1 2 3 1 2 3 1 2 3
 4 5 6 4 5 7 4 5 8 4 6 7 4 6 8
 7 8 9 6 8 9 6 7 9 5 8 9 5 7 9

That's 5.

1 2 4 1 2 4 1 2 4 1 2 4 1 2 4
 3 5 6 3 5 7 3 5 8 3 6 7 3 6 8
 7 8 9 6 8 9 6 7 9 5 8 9 5 7 9

That's 5.

1 2 5 1 2 5 1 2 5 1 2 5 1 2 5
 3 4 6 3 4 7 3 4 8 3 6 7 3 6 8
 7 8 9 6 8 9 6 7 9 4 8 9 4 7 9

That's 5.

1 2 6 1 2 6 1 2 6 1 2 6
 3 4 7 3 4 8 3 5 7 3 5 8
 5 8 9 5 7 9 4 8 9 4 7 9

That's 4.

1 2 7 1 2 7
 3 4 8 3 5 8

5 6 9 4 6 9 That's 2.

That's a total of 21.

Note that in each set of 9, the first column
 covers the following combinations:

1 3 4, 1 3 5, 1 3 6, 1 3 7, 1 4 5, 1 4 6, 1 4 7

Target Round

1. Given: Julia's age is a 2 digit number. The remainder is 1 when her age is divided by 2, 3, 4, 6 or 8. Julia is 5 times Bart's age.
Find: Bart's age
Let x be Julia's age. Then, when $x - 1$ is divided by 2, 3, 4, 6 or 8, the remainder is 0. What we are looking for is the Least Common Multiple which is: $2 \times 3 \times 2 \times 2 = 24$. Therefore, $x = 24 + 1 = 25$. Julia's age is 5 times Bart's age so Bart must be $\frac{25}{5} = 5$ **Ans.**

2. Given: p be the maximum number of points of intersection of n distinct lines. $p:n = 6:1$
Find: n
If we begin drawing lines, we see that each new line can add, at most, a number of points of intersection equal to the number of lines drawn.

| No. Lines | Max Pts. |
|-----------|----------|
| 1 | 0 |
| 2 | 1 |
| 3 | 3 |
| 4 | 6 |
| 5 | 10 |

The maximum number of points of intersection for n lines follows this pattern which is given by the formula:

$$\frac{n(n-1)}{2}$$

We are looking for the number of lines n for which this ratio is 6:1, so we have

$$\frac{\frac{n(n-1)}{2}}{n} = \frac{6}{1}$$

$$6n = \frac{n(n-1)}{2}$$

$$12n = n^2 - n$$

$$n^2 = 12n + n = 13n$$

$$n = 13 \text{ **Ans.**}$$

3. Given: p is the greatest prime whose digits are distinct prime numbers
Find: The units digit of p^2
The only one-digit prime numbers are 2, 3, 5, and 7. We are looking for a large prime number with digits that consist of at least two and at most four of these. We know the last digit cannot be 2 or 5 because any number that is two or more digits and ends in 2 or 5 will not be prime. This means our last digit must be 3 or 7. The squares of both 3 and 7 have a units digit of 9 **Ans.**

4. Given: $\frac{a}{4-a} = \frac{b}{5-b} = \frac{c}{7-c} = 3$

Find: $a + b + c$

$$\begin{array}{lll} a = 3(4-a) & b = 3(5-b) & c = 3(7-c) \\ a = 12 - 3a & b = 15 - 3b & c = 21 - 3c \\ 4a = 12 & 4b = 15 & 4c = 21 \\ a = 3 & b = \frac{15}{4} & c = \frac{21}{4} \end{array}$$

$$\begin{aligned} a + b + c &= 3 + \frac{15}{4} + \frac{21}{4} \\ &= 3 + \frac{36}{4} \\ &= 3 + 9 = 12 \text{ **Ans.**} \end{aligned}$$

5. Given: The 1-month anniversary of a building was in February, 2000. The 12-month anniversary was in January, 2001. During the year n , the building will celebrate its n month anniversary.

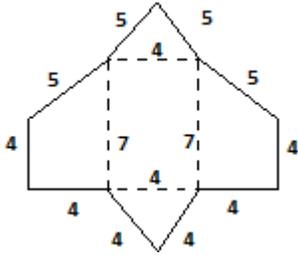

Find: n

$$\begin{aligned} (n-2000) \times 12 &= n \\ 12n - 24,000 &= n \\ 11n &= 24,000 \\ n &\approx \frac{24000}{11} \approx 2181.18 \end{aligned}$$

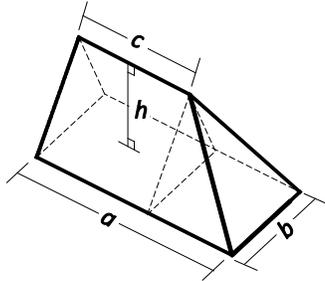

In 2181, the building will be 181 years old. January, 2181 is $181 \times 12 = 2172$ months from January, 2000. Nine months later is the 2181th month. 2181 **Ans.**

6. Given: The shape can be folded and taped to form a 3-dimensional polyhedron.

Find: The volume of the polyhedron.

When you make the folds you end up with a wedge, which is polyhedron defined by two triangle and three trapezoidal faces.

We can break this shape into a triangular prism and rectangular pyramid.

The formula for the volume of a wedge is:

$$V = \frac{1}{2} bhc$$

$$a = 7$$

$$b = 4$$

$$c = 4$$

The height of the polyhedron, h , also is the height of the equilateral triangle at the left end of the polyhedron.

$$h = 4 \times \frac{\sqrt{3}}{2} = 2\sqrt{3}$$

$$V = \frac{1}{2} (4)(2\sqrt{3})(4) = 16\sqrt{3}$$

Now we need to find the volume of the pyramid at the end. The formula for volume of a pyramid is:

$$V = \frac{1}{3} Bh$$

$$B = b(a - c) = 4 \times 3 = 12$$

$$V = \frac{1}{3} \times 12 \times 2\sqrt{3} = 8\sqrt{3}$$

Therefore the volume of the entire figure is the sum of the volume of the triangular prism and the pyramid.

$$V = 16\sqrt{3} + 8\sqrt{3} = 24\sqrt{3} \text{ Ans.}$$

7. Given: 1-Alice is 15 years younger than twice Catherine's age.

2- Beatrice is 12 years older than half of Alice's age.

3- Catherine is 8 years younger than Beatrice.

4- The sum of the three ages is 100.

But only 3 of the 4 items are true.

Find: Beatrice's age which is an integer.

Let a be Alice's age.

Let b be Beatrice's age.

Let c be Catherine's age.

The four statements can then be written algebraically as follows:

$$a = 2c - 15$$

$$b = \frac{1}{2}a + 12$$

$$c = b - 8$$

$$a + b + c = 100$$

Let's assume 1, 2 and 4 are true and try to solve the system of equations.

$$2c = a + 15$$

$$c = \frac{a+15}{2}$$

$$a + \frac{1}{2}a + 12 + \frac{a+15}{2} = 100$$

$$2a + a + 24 + a + 15 = 200$$

$$4a + 39 = 200$$

Alice's age isn't going to be an integer so it's not items 1, 2 and 4. Let's try items 1, 3, and 4.

$$a = 2c - 15$$

$$c = b - 8$$

$$a + b + c = 100$$

$$a = 2c - 15 = 2(b - 8) - 15$$

$$a = 2b - 31$$

$$2b - 31 + b + b - 8 = 100$$

$$4b - 39 = 100$$

Again, we're not going to get an integer value. Let's try items 2, 3 and 4.

$$b = \frac{1}{2}a + 12$$

$$c = b - 8$$

$$a + b + c = 100$$

$$2b = a + 24$$

$$a = 2b - 24$$

$$2b - 24 + b + b - 8 = 100$$

$$4b - 32 = 100$$

$$b = \frac{132}{4} = 33$$

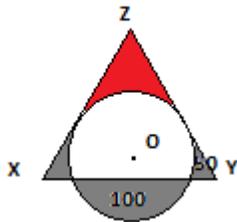

$$c = b - 8 = 33 - 8 = 25$$

$$a = 2b - 24 = 66 - 24 = 42$$

All three ages are integers. $b = 33$ **Ans.**

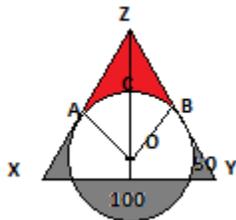

8. Given: Circle O is tangent to 2 sides of equilateral triangle XYZ. The area of the two shaded regions are 50 and 100 cm as indicated.

Find: The ratio of the area of triangle XYZ to the area of circle O.

The grey shaded area at vertex X is also 50 just as the grey shaded area by vertex Y is (because it's an equilateral triangle).

Draw two lines from the center of the circle that are perpendicular to the tangents XZ and YZ at points A and B.

Let r = the radius of circle O. The area of circle O is πr^2 . But this is also the area of ACBYX. (The two grey colored areas of size 50 take the place of the portion of the circle outside of the triangle.)

Quadrilateral AZBO has 360° . The measure of $\angle Z$ is 60° . The measures of both $\angle ZAO$ and $\angle ZBO$ are 90° . Therefore, the measure of $\angle AOB$ is 120° .

Triangles AZO and BZO are similar. The

measure of $\angle BZO$ is 30° and the measure of $\angle ZOB$ is 60° . Segment OB, of length r , is opposite the 30° angle so $ZB = r\sqrt{3}$. The same is true for AB. The area of quadrilateral AOBZ is $2 \times \frac{1}{2} \times r \times r\sqrt{3} = r^2\sqrt{3}$. If we subtract the sector of the circle created by $\angle AOB$ we will have found the size of the red-filled area. The sector is just $\frac{1}{3}$ of the area of circle O, or $\frac{1}{3}\pi r^2$. Thus, the red-filled area is $r^2\sqrt{3} - \frac{1}{3}\pi r^2$. The area of triangle XYZ is the red-filled area plus the area of ACBYX.

$$\pi r^2 + r^2\sqrt{3} - \frac{1}{3}\pi r^2 = \frac{2}{3}\pi r^2 + r^2\sqrt{3}$$

The ratio of triangle XYZ to circle O is:

$$\frac{\frac{2}{3}\pi r^2 + r^2\sqrt{3}}{\pi r^2} = \frac{\frac{2}{3}\pi + \sqrt{3}}{\pi} =$$

$$\frac{2}{3} + \frac{\sqrt{3}}{\pi} = 0.666666 + 0.55129 \approx$$

$$1.217995 \approx 1.22$$
 Ans.

Team Round

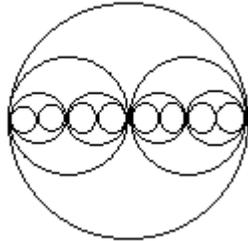

1. Given: The integers 1 through 7 are written in base two.

Find: The fraction of the digits that are 1.

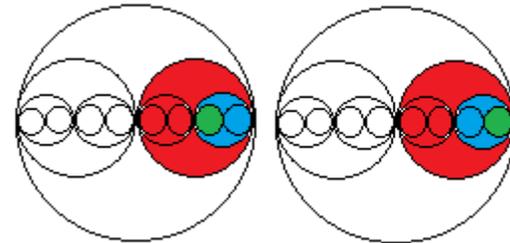

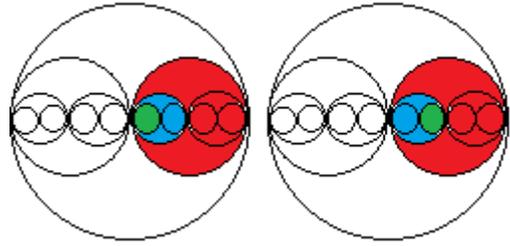

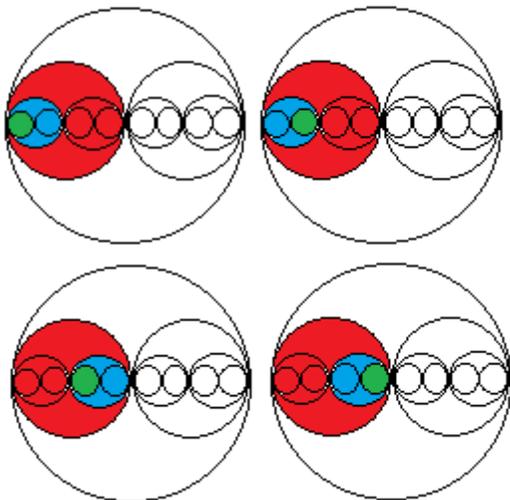

The integers 1 through 7 written in base 2 are 1, 10, 11, 100, 101, 110 and 111, respectively. That's a total of 17 digits with 12 of them being 1s. $\frac{12}{17}$ **Ans.**

2. Given: The diagram

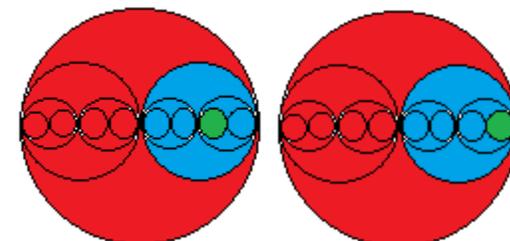

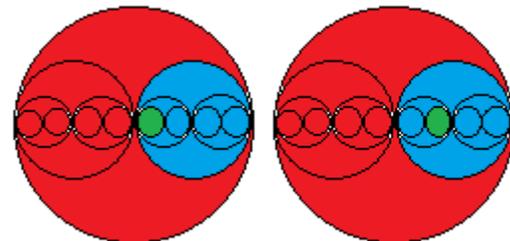

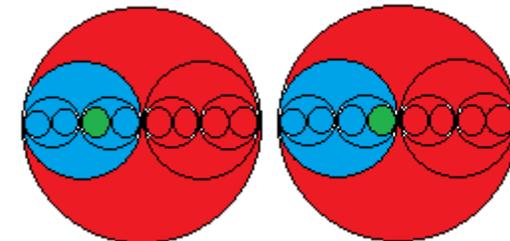

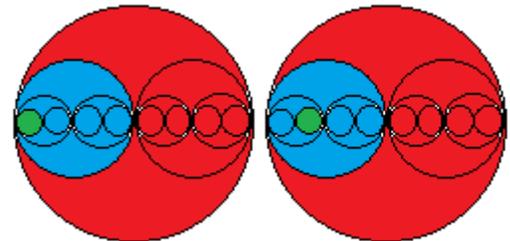

Find: How many sets of 3 distinct circles, A, B and C are there such that circle A encloses circle B and circle B encloses circle C?

There are 4 sizes of circles – let's call them sizes a, b, c and d where the area of a > the area of b > the area of c > the area of d. There are 8 instances of circles of area b enclosing circles of area c which encloses circles of area d.

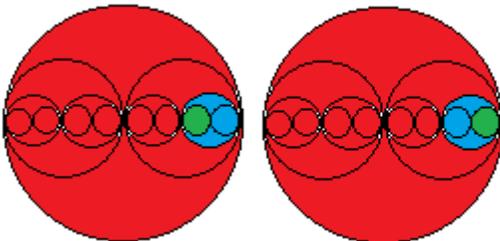

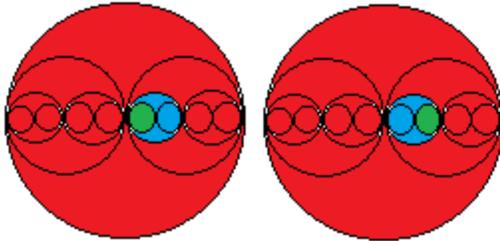

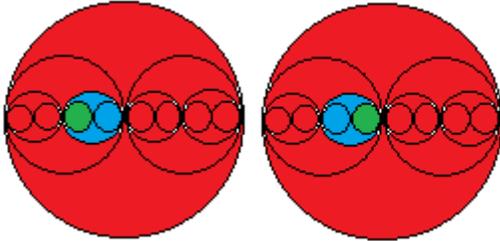

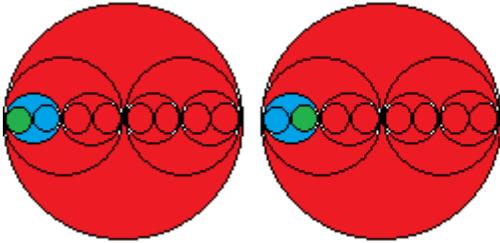

There are also 8 instances of circles of area a > circles of area b > circles of area d.

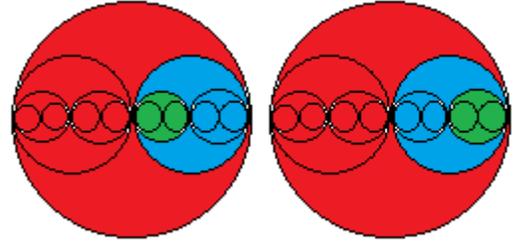

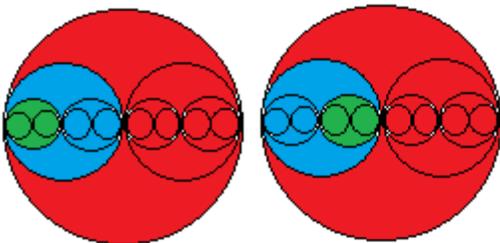

There are also 8 instances of circles of area

a > circles of area c > circles of area d.

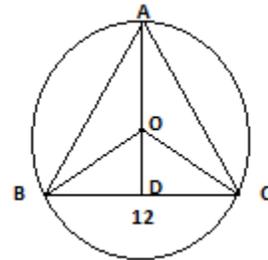

Finally, there are 4 instances of circles of area a > circles of area b > circles of area d.

To sum up: $8 + 8 + 8 + 4 = 28$ **Ans.**

3. Given: Equilateral triangle ABC is inscribed in a circle. The sides have lengths of 12. Find: the area of the largest equilateral triangle that can be drawn with two vertices on segment AB and the third vertex on minor arc AB.

First, let's find the radius of circle O.

Draw radii from the center of the circle to points A, B, and C. Extend the radius AO to point D on BC. AD is the height of triangle ABC. $BD = DC = 6$

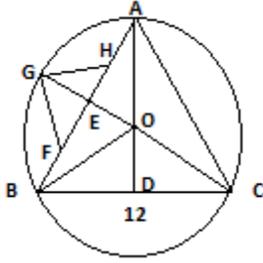

$$AD = 6\sqrt{3}$$

$$BO = r$$

$$\text{Let } x = OD.$$

Triangle BOD is 30-60-90. We know $BD=6$ so using the known ratios of 30-60-90 triangles we figure out that $BO = 4\sqrt{3}$ and $OD = 2\sqrt{3}$

The area of the largest triangle that can be drawn with two vertices on segment AB and the third vertex on arc AB that is an equilateral triangle has a height of $2\sqrt{3}$,

We know the height will be this because $GO = BO$, both the radius of the circle, and $EO = OD$. Draw triangle FGH . GE is the height.

Let y be the length of one of the sides. We know that $\angle F$ is 60° . That makes

$$GE = \frac{\sqrt{3}}{2}y = 2\sqrt{3}$$

$$y = \frac{2 \times 2\sqrt{3}}{\sqrt{3}} = 4$$

The area of the triangle is

$$\frac{1}{2} \times 4 \times 2\sqrt{3} = 4\sqrt{3}$$

$4\sqrt{3}$ **Ans.**

4. Given: A 120-yard by 40-yard rectangular field. In the time it takes Sue to run 120 yards of the perimeter at a rate of 10 minutes/mile, Kara runs the lengths of the other three sides.

Find: How many minutes it takes Kara to run a mile.

Sue runs 120 yards. In the same time Kara runs $40 + 120 + 40 = 200$ yards.

$$\frac{200}{120} = \frac{20}{12} = \frac{5}{3}$$

Sue runs at $\frac{5}{3}$ the rate that Kara does.

So, if Sue takes 10 minutes to run a mile,

Kara will take $\frac{3}{5} \times 10 = 6$ minutes to run a mile.

6 Ans.

5. Given: An arithmetic sequence has the first term a and common difference d . The sum of the first ten terms is half the sum of the

next 10 terms.

Find: the ratio $\frac{a}{d}$

The sum of the first 10 terms is:

$$a + (a + d) + (a + 2d) + (a + 3d) + (a + 4d) + (a + 5d) + (a + 6d) + (a + 7d) + (a + 8d) + (a + 9d) = 10a + 45d$$

The sum of the second 10 terms is:

$$(a + 10d) + (a + 11d) + (a + 12d) + (a + 13d) + (a + 14d) + (a + 15d) + (a + 16d) + (a + 17d) + (a + 18d) + (a + 19d) = 10a + 145d$$

$$10a + 45d = \frac{1}{2}(10a + 145d)$$

$$20a + 90d = 10a + 145d$$

$$10a = 55d$$

$$\frac{a}{d} = \frac{55}{10} = \frac{11}{2} \text{ **Ans.**}$$

6. Given: The median of all the change is 50¢. The mean of the change is 40¢. The mode is 40¢.

Find: the fewest number of students.

The median is 50¢. Let's assume we have an odd number of students so that 50¢ is the exact amount in the possession of the middle student. The mode is 40¢ meaning that we have to have at least 2 students with that amount.

40 40 50 – For 50 to be the median, we need to more values larger than 50 and they can't be the same value (if the mode is caused by 2 values that are the same).

40 40 50 51 52

40 40 50 51 52

What's the mean?

$$\frac{40 + 40 + 50 + 51 + 52}{5} = \frac{233}{5} = 46.6$$

We need more values, especially smaller ones to get the average down. Let's add 1 and 53

$$\frac{1 + 40 + 40 + 50 + 51 + 52 + 53}{7} =$$

$$\frac{287}{7} = 41$$

Better, but still not good enough. Add 2 and 54.

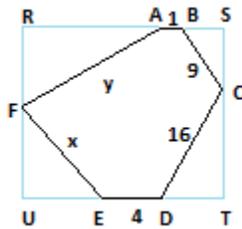

$$\frac{1 + 2 + 40 + 40 + 50 + 51 + 52 + 53 + 54}{9} = \frac{343}{9} < 40$$

With 9 people we need a total of 360 cents to get the average of 40 and we can do that by changing the 2 to 19, or the 54 to 71 or a number of other values. So 9 people will work. How about 8. In that case we'd need to replace 50 by 49 and 51 and get rid of the 2.

$$\frac{1 + 40 + 40 + 49 + 51 + 52 + 53 + 54}{8} = \frac{340}{8} = 42.5 \text{ And that's too much.}$$

9 Ans.

7. Given: 4 consecutive sides of an equiangular hexagon have lengths of 1, 9, 16 and 4. Find: the absolute difference in the lengths of the two remaining sides. Let's "try" and draw this hexagon.

Hexagon ABCDEF has sides 1, 9, 16, 4, x, and y. We're looking for the difference between x and y. In blue, we've also drawn right triangles at each of the points of the hexagon to form rectangle RSTU.

The angles of an equiangular hexagon are each 120° . The measure of $\angle FAR$, $\angle FEU$, $\angle CDT$ and $\angle CBS$ are each 60° . The measure of $\angle RFA$, $\angle EFU$, $\angle DCT$ and $\angle SCB$ are each 30° . So we have 4 30° , 60° , 90° triangles.

From this we can determine the lengths of the different segments that make up the rectangle.

$$BS = \frac{9}{2}, SC = \frac{9}{2}\sqrt{3}$$

$$CD = 8\sqrt{3}, DT = 8$$

$$UE = \frac{x}{2}, FU = \frac{x}{2}\sqrt{3}$$

$$FR = \frac{y}{2}\sqrt{3}, RA = \frac{y}{2}$$

$$RS = UT$$

$$RS = RA + AB + BS = \frac{y}{2} + 1 + \frac{9}{2}$$

$$UT = UE + ED + DT = \frac{x}{2} + 4 + 8$$

$$\frac{y}{2} + 1 + \frac{9}{2} = \frac{x}{2} + 4 + 8$$

$$y + 2 + 9 = x + 8 + 16$$

$$y + 11 = x + 24$$

$$y - x = 24 - 11 = 13$$

And that's the absolute difference of the lengths of the other two sides. **13 Ans.**

8. Given: A convex sequence is a sequence of integers where each term (but first or last) is no greater than the arithmetic mean of the terms immediately before and after it. Find: How many convex sequences use each number in the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ exactly once?

The major thing to note that is that 8 must always be in the first or last position. 7 has to be next to the 8 (which would be second or 7th position or last).

First: the 2 easy sets are:

$$1 - 1, 2, 3, 4, 5, 6, 7, 8$$

and

$$2 - 8, 7, 6, 5, 4, 3, 2, 1$$

Next we can take 1-6 and surround it by 7 and 8.

$$3 - 7, 1, 2, 3, 4, 5, 6, 7, 8$$

and

$$4 - 8, 1, 2, 3, 4, 5, 6, 7$$

Similarly, we can surround 6-1 with 8 and 7.

$$5 - 7, 6, 5, 4, 3, 2, 1, 8$$

and

$$6 - 8, 6, 5, 4, 3, 2, 1, 7$$

Finally, choosing every other one with half the values decreasing and the others decreasing also gives us a convex sequence.

7—7, 5, 3, 1, 2, 4, 6, 8

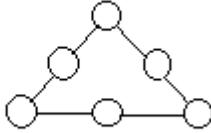

and

8—8, 6, 4, 2, 1, 3, 5, 7

8 **Ans.**

9. Given: 6 different prime numbers are placed in the circles. The three circles on each side of the triangle have the same sum.

Find: the least possible value of the side sum.

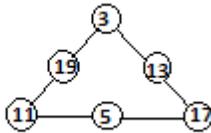

Let's list the primes under 100.

2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97

First of all, 2 can't be one of the numbers.

This is because 2 odds plus an even number is an even number but 3 odd numbers sum to an odd number.

So we can start with 3. 3, 5, and 7 differ by 2. But 11, 13, 17 don't differ by 2. 11 and 13 do but 13 and 17 don't. But 3 and 5 do, 11 and 13 do and 17 and 19 do. We can put these together.

$$3 + 13 + 11 = 11 + 5 + 17 = 3 + 13 + 17 =$$

33 **Ans.**

10. Given: The sum of two numbers added to the mean of their squares is 64.

Find: the greatest possible value of the

product of the two integers.

Let x and y be the numbers.

$$x + y + \frac{x^2 + y^2}{2} = 64$$

Let's write the squares ≤ 64 and try some substitution.

1 4 9 16 25 36 49 64

$$\frac{36 + 49}{2} + 6 + 7 = \frac{85}{2} + 13 = 42.5 + 13 = 55.5$$

Too low.

$$\frac{49 + 64}{2} + 7 + 8 = \frac{113}{2} + 15 = 66.5 + 13 = 79.5$$

Too high.

$$\frac{64 + 36}{2} + 6 + 8 = \frac{100}{2} + 14 =$$

$$50 + 14 = 64$$

$$x = 8; y = 6$$

This is one possible solution.

But notice the wording of the problem: find the "greatest" ... It won't work with positive integers which is what we are normally drawn to. Let's try negative integers (because they didn't say we couldn't). And sure enough, try -8, -10.

$$\frac{64 + 100}{2} - 8 - 10 = \frac{164}{2} - 18 =$$

$$82 - 18 = 64$$

$$x = -8; y = -10$$

$$-8 \times -10 = 80 \text{ **Ans.**}$$

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

State _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What is the slope of the line that passes through the points (6, 9) and (-1, -5)?

2. _____ When $\frac{a^2b^3}{(ab^2)^2} \cdot \frac{(a^2b)^4}{a^3b}$ is written in the form $a^r b^s$, what is the value of $r + s$?

3. _____ What integer value of n makes the equation $1 + 3^n + 3^{2n} = 757$ true?

4. _____ What is the units digit of 3^{2015} ?

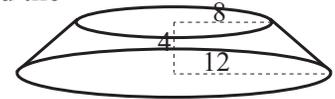

5. _____ cm Two similar right triangles have areas of 30 cm^2 and 270 cm^2 . The length of the hypotenuse of the smaller triangle is 13 cm. What is the length of the hypotenuse of the larger triangle?

6. _____ ft^2 The lengths of two sides of an isosceles triangle are 41 feet and 18 feet. What is the area of the triangle?

7. _____ mi/h For the first 30 miles of Rafael's trip, he traveled at an average speed of 45 mi/h. For the remaining 20 miles of that trip, he traveled at an average speed of 30 mi/h. What was Rafael's average speed for the entire trip? Express your answer as a decimal to the nearest tenth.

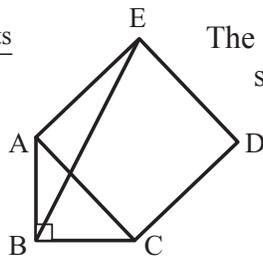

8. _____ If $a \# b = \frac{a-1}{b}$, what is the least positive integer a for which $(a \# 3) \# 3$ also is a positive integer?

9. _____ inches A frustum is created by slicing a cone parallel to its base. The two circular bases of the frustum have radii of 8 inches and 12 inches, and the height of the frustum is 4 inches, as shown. What was the height of the original cone?

10. _____ The median of an arithmetic sequence of eight integers is 44. If the first term is 30, what is the value of the eighth term?

11. _____ units The hypotenuse of isosceles right triangle ABC is a side of square ACDE as shown. If $AB = 4$ units, what is the length of segment BE? Express your answer in simplest radical form.

12. _____ A triangle with one vertex at $(1, 0)$ is graphed in the first quadrant so that one side of the triangle is on the x -axis and another side is on the y -axis. If the area of the triangle is 3 units^2 , what is the slope of the third side?

13. _____ units² What is the area of the region between the inscribed and circumscribed circles of an equilateral triangle with side length 12 units? Express your answer in terms of π .

14. _____ Jane's drawer contains 6 white socks, 4 black socks and 2 red socks. Jane reaches into the drawer, without looking, and randomly selects two socks. What is the probability that the two socks she selects are the same color? Express your answer as a common fraction.

15. _____ A regular octagon has a perimeter of 96 m. Its area, in square meters, can be expressed in simplest radical form as $a + b\sqrt{c}$. What is the value of $a + b + c$?

16. _____ For what 3-digit positive integer do all of the following conditions hold?

- The hundreds digit is one less than three times the units digit.
- The tens digit is twice the units digit.
- The absolute difference between the integer itself and the number obtained by reversing its digits is 495.

17. _____ base 3 If $(11011000_2)^2 = x^3$, what is the value of x expressed in the base 3?

18. _____ If a and b are positive integers such that $\left(1 + \frac{1}{a}\right)\left(1 + \frac{1}{b}\right) = \frac{3}{2}$, and $a < b$, what is the sum of all possible values of a ?

19. _____ cm^3 Tetrahedron ABCD has side lengths $AB = AC = 15$ cm, $BC = 18$ cm, $AD = 8$ cm, and $BD = CD = 17$ cm. What is the volume of tetrahedron ABCD?

20. _____ For a particular sequence, the first term, a_1 , is 1, and for every term thereafter, the value of the n th term is given by $a_n = a_{n-1} + 2n$. What is the value of a_{100} ?

21. _____ If $f(x) = \begin{cases} -x, & x < 0 \\ -x^2, & x \geq 0 \end{cases}$ and $f(f(f(x))) = 4$, what is the value of x ?

22. _____ If six people randomly sit down at a table with six chairs, and they do not notice that there are name tags marking assigned seats, what is the probability that exactly three of them will sit in the seat he or she was assigned? Express your answer as a common fraction.

23. _____ $\frac{\text{permu-}}{\text{tations}}$ A sequence is *unimodal* if $a_1 < a_2 < \dots < a_{k-1} < a_k > a_{k+1} > \dots > a_{n-1} > a_n$ for some value of k such that $1 < k < n$. How many permutations of the numbers 1, 2, 3, 4, 5, 6, 7, 8 form a unimodal sequence?

24. _____ $\frac{\text{ordered}}{\text{pairs}}$ How many ordered pairs of real numbers (x, y) satisfy exactly two of these three equations?

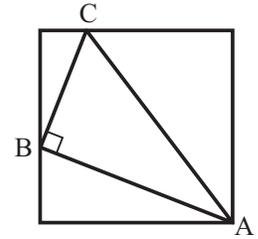

$$(x - 3)^2 + (y - 4)^2 = 25$$

$$(x + 4)^2 + (y - 3)^2 = 25$$

$$y = -6x$$

25. _____ cm²

Right triangle ABC has side lengths $AB = 4$ cm, $BC = 3$ cm and $AC = 5$ cm. A also is a vertex of a square, and B and C lie on two sides of the square as shown. What is the area of the square? Express your answer as a common fraction.

26. _____ permutations

How many distinct four-letter permutations are possible using four of the ten letters in MATHCOUNTS?

27. _____ units

An equilateral triangle shares a side with a square, and a circle is inscribed between them, as shown. If the radius of the circle is $9 - 3\sqrt{3}$, what is the side length of the square?

28. _____

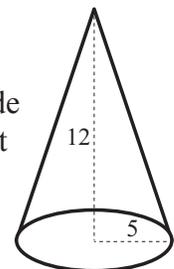

What is the minimum value of $8x^3 + 36x + \frac{54}{x} + \frac{27}{x^3}$ for positive real numbers x ? Express your answer in simplest radical form.

29. _____

One box contains 4 green balls and 3 red balls. Another box contains 4 red balls and 3 purple balls. A box will be selected at random, then two balls will be randomly selected from that box without replacement. If the first ball is red, what is the probability that the second ball also will be red? Express your answer as a common fraction.

30. _____

A solid right circular cone has radius 5 cm and height 12 cm as shown. What is the probability that a randomly chosen point inside this cone is a distance of at least 1 cm away from the closest point on the surface of the cone? Express your answer as a decimal to the nearest thousandth.

1. _____ If $2015^2 - x^2 = 5(x + 2015)$ and $x < 0$, what is the value of x ?

2. _____ The radius of a cylindrical can is 5 inches and its height is 2 inches. The increase in volume when x inches are added to the radius of the can is the same as the increase in volume when x inches are added to its height. What is the value of x , if $x > 0$? Express your answer as a common fraction.

3. _____ integers How many positive integers have the same number of digits when written in base 5 and in base 8?

4. _____ units² One corner of a square of side length 12 units is folded down to meet the midpoint of a side as shown. What is the area of the shaded trapezoid?

5. _____ The consecutive integers from 1 to n inclusive were written on a chalkboard. One of the integers was erased, and the mean of the remaining integers was $35\frac{7}{17}$. What integer was erased?

6. _____ minutes As Kyle walked along a street at a constant speed, he noticed that every 12 minutes, a bus passed him traveling in the same direction as Kyle, and every 4 minutes, a bus passed him traveling in the opposite direction as Kyle. If all of the buses travel at a constant speed and leave the terminals at each end of the street at equally spaced intervals, how many minutes long is that interval?

7. _____ An unfair coin is weighted so that it lands on heads with a probability of p , where $p \neq 0$. The probability of getting three heads and one tail, in any order, in four tosses of this coin is the same as the probability of getting four heads. What is the value of p ? Express your answer as a common fraction.

8. _____ ordered
pairs If x and y must be positive integers no greater than 100, how many ordered pairs (x, y) exist such that the least common multiple of x and y is ten times the greatest common factor of x and y ?

1. _____ What is the least positive integer n such that $2^n + 1$ and $2^n - 1$ both are composite?
2. _____ A sequence is defined by $a_1 = a_2 = 1$ and $a_{n+2} = a_{n+1} + 2a_n$, for $n > 0$. What is the least value of k for which $a_k > 1000$?
3. _____ regions Seven lines are drawn in the plane. There are two pairs of parallel lines, but not all four of these lines are parallel. The other three lines, which are not parallel to any of the first four lines, intersect at a single point, and there are no other points at which more than two lines intersect. Into how many regions do these seven lines divide the plane?
4. _____ Alec and Beau race to compute $1 + 2 + 3 + \dots + n$. Alec skips two numbers and gets a sum of 92. Beau double-counts two numbers and gets a sum of 145. What is the value of n ?
5. _____ A dartboard is shaped like a regular hexagon. The six vertices are marked in blue, and the midpoints of the six edges are marked in red. When a dart is thrown and lands on the dartboard, the closest of the twelve colored points is located. The throw is said to be *bluish* if the closest point is blue. If the closest point is red, it is said to be *reddish*. If a dart is thrown and hits a random point in the dartboard, what is the probability that the throw is bluish? Express your answer as a common fraction.

6. _____ The solutions of $x^3 - 3x^2 + kx + 15 = 0$ form an arithmetic sequence. What is the value of k ?

7. arrange-ments The numbers 1, 2, 3, ..., 15 must be arranged in the circles of the figure shown, with one number per circle and each number used exactly once, in such a way that each arrow points from a smaller number to a larger number. How many such arrangements are possible?

8. _____ There is just one positive number x such that $3x + 5$, $4x + 4$ and $5x$ are the side lengths of a right triangle. What is this value of x ? Express your answer as a common fraction.

9. sequences How many sequences of integers a, b, c, d, e exist such that $a \geq b \geq c \geq d \geq e$ and $a^2 \leq b^2 \leq c^2 \leq d^2 \leq e^2 \leq 5$?

10. _____ In the city of Trichotomy, every day the weather is exactly one of the following: sunny, cloudy or rainy. Each day has a 50% chance of having the same weather as the day before and a 25% chance of having each of the other two types of weather. If it does not rain on Friday, what is the probability that there will be no rain during the weekend (Saturday and Sunday)? Express your answer as a common fraction.

Vol. 35 Issue 2

Kevin Liu Wins National Champion Title at 2015 Raytheon MATHCOUNTS National Competition

In 2014, after a remarkable year in the MATHCOUNTS Competition Series, Kevin Liu made it to final matchup of the Countdown Round. Trailing by just one point, he was so close to winning. But when his opponent buzzed in, Kevin groaned in frustration, knowing at that moment the title of National Champion had slipped beyond his grasp.

Eighth grader Kevin Liu at the moment he learned he was the 2015 National Champion at the 2015 Raytheon MATHCOUNTS National Competition in Boston, Mass.

One year and many more MATHCOUNTS accolades later, Kevin found himself at the [2015 Raytheon MATHCOUNTS National Competition](#) in a position almost identical to where he was last year...with one key difference: this time it was Kevin who was up 3-2 in the final matchup of the Countdown Round. This time, it was Kevin who was just one correct answer away from being the National Champion.

After multiple nail-biting questions, the eighth question of the matchup flashed on the screen.

How many arithmetic progressions of six increasing terms include the terms 15 and 20?

Kevin's opponent buzzed in immediately. Last year, this would have been the moment that Kevin had dreaded. But this year was different. His opponent answered the question incorrectly; Kevin calmly kept working as the audience pulsed with silent excitement. He buzzed in

and, without any doubt in his voice, gave the correct answer (15 progressions), needing just 17.9 seconds total to complete the problem and answer.

As the winner of the 2015 Raytheon MATHCOUNTS National Competition Kevin Liu received the \$20,000 Donald G. Weinert Scholarship and a trip to U.S. Space Camp. An eighth-grade student at Carmel Middle School in Carmel, Ind., Liu is the third Mathlete® from Indiana to be crowned a National Champion.

Liu was one of 224 students who participated in the 2015 Raytheon MATHCOUNTS National Competition on Friday May, 8 at the Sheraton Boston Hotel in Boston, Mass. National competitors came from all 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands and from schools worldwide affiliated with the U.S. Department of Defense and State Department.

The National Competition is one of the most rigorous math competitions in the country. Middle school mathematicians must complete a series of written exams in the morning, requiring them to work as individuals and as part of their four-person state team. The 12 students with the highest scores on the Written Competition earn the right to compete in the Countdown Round, an intense bee-style contest with fast-paced one-on-one matchups. Students must answer a series of difficult questions, each in no more than 45 seconds.

Rankings for the Countdown Round are determined by the students' scores on the written rounds. The four students with the highest written scores, who received a bye in the first round of this year's Countdown Round, were Andy Xu, an eighth grader from Simpsonville, S.C.; Daniel Zhu, an eighth grader from Potomac, Md.; Alex Gu, an eighth grader from Carmel, Ind.; and Freddie Zhao, an eighth grader from Troy, Mich.

The Countdown Round Runner-Up was Xu, who was also the Written Competition Champion. The two semifinalists were Zhao and Frank Han, an eighth-grade student from Eden Prairie, Minn.

Indiana had a particularly strong showing at this year's National Competition. In addition to Liu's accomplishments, all of the students on the Indiana team finished in the top 14, with three Mathletes qualifying for the Countdown Round. Indiana also won first place in the team competition. Team members Gu, Joey Heerens, Nathan Hu and Liu each won a \$2,000 college scholarship and a trip to U.S. Space Camp. The Maryland team won second place and the Massachusetts team won third place.

After winning the title of 2015 National Champion, Liu went on a media tour that included an appearance on [Live! with Kelly and Michael](#), where he competed against hosts Kelly Ripa and Michael Strahan in an on-air math competition. Liu also was interviewed for [TIME for Kids](#), and he and his coach, Trent Tormoehlen, also both took part in a video segment for [USA Today](#).

Liu thinks through a problem during a matchup in the Countdown Round.

The 2015 National Competition took place in Boston for the first time in MATHCOUNTS history, making this year's event unique and especially meaningful for MATHCOUNTS and for our students, coaches and alumni. The Greater Boston Area is the headquarters of Raytheon, the

During his media tour and appearance on Live! with Kelly and Michael, Liu receives a trophy from Kelly Ripa and Michael Strahan

Title Sponsor of the National Competition, as well as some of the nation's leading academic institutions for science, technology, engineering and mathematics. Mathletes had the opportunity to attend an exclusive event at the Museum of Science, as well as tour the Massachusetts Institute of Technology Museum during their time in Boston. The 2015 National Competition was featured on [WBZ 4](#), [CBS Boston](#); [90.9 WBUR](#), [Boston's NPR News Station](#); and on the cover of the [Boston Globe](#).

MATHCOUNTS congratulates all 224 of the Mathletes who competed in the 2015 Raytheon MATHCOUNTS National Competition. Earning the right to compete at the national level is an incredible achievement, and each and every national competitor should feel proud. [National Competition results](#) are available on the MATHCOUNTS website.

2015 NATIONAL COMPETITION WINNERS

NATIONAL CHAMPION:

Kevin Liu, IN

- \$20,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

COUNTDOWN ROUND

RUNNER-UP: Andy Xu, SC

- \$7,500 Scholarship

COUNTDOWN ROUND

SEMIFINALISTS:

Freddie Zhao, MI

Frank Han, MN

- \$3,000 Scholarship each

WRITTEN COMPETITION

CHAMPION: Andy Xu, SC

- \$2,500 Scholarship

1ST PLACE TEAM: Indiana

Alex Gu, Joey Heerens,
Nathan Hu and Kevin Liu

- \$2,000 Scholarship each
- Trip to U.S. Space Camp

Ben Qi, NJ

COUNTDOWN ROUND

PARTICIPANTS:

Jeffrey Chang, MA

Nathan Hu, IN

Nathan Ramesh, MA

Walker Kroubalkian, AZ

2ND PLACE TEAM: Maryland

3RD PLACE TEAM: Massachusetts

MATHCOUNTS Alumni Studying at MIT and Harvard Attend National Competition

Bringing the 2015 Raytheon MATHCOUNTS National Competition to Boston for the first time was especially exciting because so many successful alumni go on to study and work at the Massachusetts Institute of Technology, Harvard University and other Boston area organizations.

On Friday, May 8, nearly 100 alumni attended the Countdown Round and an exclusive alumni event at the Sheraton Boston Hotel. In addition to meeting and engaging with other MATHCOUNTS alumni, attendees presented state banners to the middle school Mathletes and coaches who were participating in the National Competition.

Among the alumni guests this year were past National Champions Albert Ni, Adam Hesterberg, Kevin Chen and Mark Sellke, all of whom were recognized during the Countdown Round.

We'd like to say
thank you
to all of the
awesome alumni
who attended!

From top: Alumni get ready to present state banners to the 224 state teams. Po-Shen Loh of Expii, Inc. (far right) and other alumni sign the alumni event banner. MATHCOUNTS Executive Director Lou DiGioia welcomes past National Champions Albert Ni (2002), Mark Sellke (2010), Kevin Chen (2007) and Adam Hesterberg (2003) as special guests to the 2015 Countdown Round.

Celebrating Spirit at the National Competition

Each year the Spirit Award is presented to the team that best exemplifies sportsmanship and camaraderie. So many Mathletes and coaches at the National Competition demonstrate these qualities, and this year's participants were no exception. The Department of Defense Team was the winner of the 2015 Spirit Award.

From Top Left: A Mathlete from Georgia uses a MATHCOUNTS hat to collect pins from all of the state teams represented at the National Competition. The Department of Defense Team poses with the Spirit Stick at the Awards Banquet & Ceremony. Team members Annette Belleman, Josh Lovejoy, Lily Butler, Tyler Barber and coach Kara Stolee-Kiefer get ready for the Written Competition.

Overseas teams often face unique challenges preparing for the National Competition—having teammates living in different countries and time zones makes team practices challenging! Department of Defense team members Tyler Barber, Annette Belleman, Lily Butler and Josh Lovejoy did not meet in person until arriving in Boston, but their group quickly stood out as one of the most positive, collaborative and supportive teams at the entire event.

From creating an original song for their state team cheer, to encouraging other Mathletes throughout the weekend, these students and their coach, Kara Stolee-Kiefer, helped make this National Competition truly special.

Program Highlights in The National Math Club

A record number of clubs participated in The National Math Club this year. Dedicated club leaders receive free materials, activity ideas and prizes from MATHCOUNTS so that they can make math more fun and accessible for students of all abilities and interests.

The most active clubs in the program can receive recognition by attaining Silver and Gold Level Status. Over 300 clubs achieved Silver Level this year by having a minimum number of students attend multiple club meetings throughout the year.

In order to achieve Gold Level Status, clubs were required to complete a challenging, multi-step, collaborative project. This year 150 clubs successfully completed the Gold Level Project.

Each year one lucky Gold Level club wins the Grand Prize: a \$500 gift card and an all-expenses-paid trip for four club members and the club leader to attend the National Competition. The club from East Middle School in Plymouth, Mich. won the Grand Prize Drawing this year! The complete list of [Silver and Gold Level drawing winners](#) is posted on the MATHCOUNTS website.

Clockwise from top left: The club at NOVA Bright Mind in Centerville, Va. created the game "Piece of Pi" as part of the Gold Level Project. The club at St. Catharine's in Columbus, Ohio created the game "Pemos Land" as part of the Gold Level Project. DePonte and Pam Erickson, Vice President of Corporate Affairs at Raytheon (far right) present the Gold Level banner to sixth graders Vamsi Gollapalli, Hannah Shu, Srikruti Vinnakota, Justus Heers and club leader Melanie Formosa of the Grand Prize winning club from East Middle School.

“The Decision by PBSQ” by Team PBSQ from Georgia Voted Best Video at 2015 Math Video Challenge Finals

Team PBSQ from the Ron Clark Academy in Atlanta, Ga. took top prize at the 2015 Math Video Challenge Finals for their original video, “[The Decision by PBSQ](#).” Team members Peter Warrick Jr., Brandon Benn, Shawl Pryor and Quivion Wynn, all eighth graders, each received a \$1,000 college scholarship. PBSQ—an acronym of the students’ first names—is the second team from the Ron Clark Academy to win the Math Video Challenge. The students’ team advisor was math teacher Dr. Camille Jones.

“The Decision” was one of over 400 videos submitted to the Math Video Challenge contest this year. After a round of general public voting and two rounds of review by an expert judges’ panel, four videos were selected to advance to the finals, which took place on Saturday, May 9 at the Sheraton Boston Hotel in Boston, Mass. The sixteen students who created the four finalist videos presented their work to the 224 students competing at the National Competition. The Mathletes voted to determine the winning video.

“The Decision” tells the story of four scouts from PBSQ University who seek to recruit three of the nation’s top young basketball players. After watching the athletes work together seamlessly on the court, the scouts use algebra to determine the total number of points the players scored individually and as a unit. Will the scouts succeed in getting all three basketball stars to choose PBSQ University? The video solves question #51 from the 2014-2015 MATHCOUNTS School Handbook:

In a basketball game, Alex and Brock scored 23 points in all; Alex and Cash scored 21 points in all; and Brock and Cash scored 20 points in all. How many points did the three boys score altogether? (Answer: 32 points)

All four of the 2015 finalist videos were outstanding. This year’s finalist moviemakers tackled challenging math problems, created imaginative real-world applications and let their personalities shine through in their productions. Over 1,000 student-made videos can be viewed in the [Math Video Challenge archive](#).

Above: Lou DiGioia welcomes PBSQ teammates Peter Warrick Jr., Brandon Benn, Shawl Pryor and Quivion Wynn to the stage at the 2015 Math Video Challenge Finals. At right: In “The Decision,” four scouts must use algebra to better understand the performances of three basketball stars they hope to recruit to PBSQ University.

$$\begin{array}{l}
 A + B = 23 \quad \text{Alex scored 12 pts} \quad A = \text{Alex} \\
 A + C = 21 \quad \text{Brock scored 11 pts} \quad B = \text{Brock} \\
 C + B = 20 \quad \text{Cash scored 9 pts} \quad C = \text{Cash}
 \end{array}$$

$$\begin{array}{l}
 \text{Alex Pts} + \text{Brock Pts} + \text{Cash Pts} = \text{Total Pts} \\
 12 + 11 + 9 = 32 \\
 \text{Total Scored 32 pts}
 \end{array}$$

2015 MATH VIDEO CHALLENGE FINALISTS

“ALGEBRA BASKETBALL” BY SARANAC LAKE, NEW YORK
James Catania, Bruno Freeman, Noah Pittman, Simon Thill and Team Advisor Tyler Chase

“HONEY, I MADE ALL THE SHOTS!” BY G.I.T. INTERNATIONAL, STOCKHOLM, SWEDEN
Gabby Castle, Jacques Cazayoux, Ryan Clapper, Max Shenk and Team Advisor Denrol Carayol

“MULTIPLE STEPS” BY MACK DOJO, CALIFORNIA
Caitlin Hamilton, Kento Logan, Mai Nguy, Ameen Safi and Team Advisor Belynda Ray

Shyam Narayanan Wins 2015 MATHCOUNTS Alumni Scholarship

Above: MATHCOUNTS Alumni Scholarship winner Shyam Narayanan, currently a senior in high school. Right: As an 7th grader Narayanan was the Countdown Round Runner-Up and Written Competition Runner-Up at the 2010 Raytheon MATHCOUNTS National Competition.

The [MATHCOUNTS Alumni Scholarship](#) was created last year as a way to recognize and support MATHCOUNTS students beyond their time in middle school. This \$3,000 scholarship award is presented to an alumnus/a whose participation in MATHCOUNTS was influential and had a positive impact on his or her academic and professional endeavors.

Over 250 exceptional students from across the country applied for the scholarship this year. The winner of the 2015 MATHCOUNTS Alumni Scholarship was Shyam Narayanan, a high school senior from Overland Park, Kan. An exceptional mathematician, Narayanan was a three-time MATHCOUNTS national competitor whose awards included Written Competition Champion, Countdown Round Semifinalist, and Countdown Round Runner-Up.

As a high school student, Narayanan searched for new ways to combine his love of math and his desire to give back to his community, which led him to found a Mu Alpha Theta math club, serve as a volunteer MATHCOUNTS coach and tutor students of all ages. Already having won national recognition for his research in biophysics, Narayanan aspires to make a difference in the world through scientific research.

THANK YOU!

MATHCOUNTS would not be able to make a difference in the lives of hundreds of thousands of students each year without the support of our individual and corporate donors.

Together we can help all students reach their full potential in mathematics.

■ School Competition ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ °C

What is the temperature according to this thermometer that measures temperature in degrees Celsius?

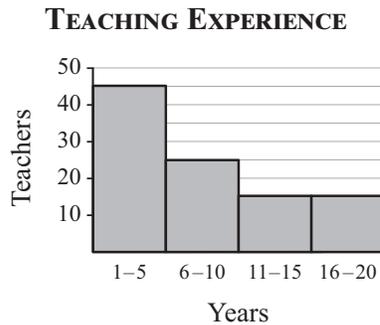

2. \$ _____

Cory has a summer job at the local grocery store. How much will Cory get paid to work 20 hours each week for 8 weeks if he earns \$10 an hour?

3. _____

What is the value of 21 divided by $\frac{7}{8}$?

4. _____ percent

The graph shows the results when 100 teachers reported the number of years they have been teaching. What percent of these teachers have been teaching more than 5 years but no more than 15 years?

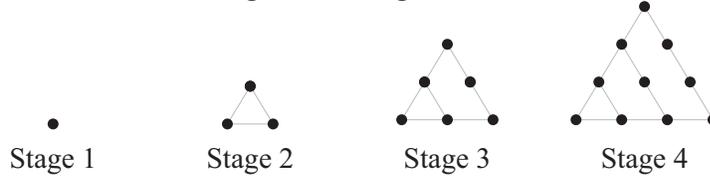

5. _____

Let $a \odot b = 2a - 3b$. What is the value of $(1 \odot 2) \odot 7$?

6. _____

If $\frac{8}{14} = \frac{4}{d}$, what is the value of d ?

7. _____ dots The figure shows the first four stages of a dot pattern. If the pattern continues, how many dots will be in the figure for Stage 7?

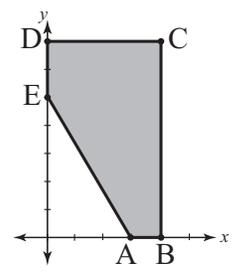

8. \$ According to this order form for Tessa’s art supplies, the total cost for the 20 items she ordered was \$150.00. Some of the details of Tessa’s order are missing from the order form, but based on the information given, what was the unit price for each sketch pad Tessa ordered?

| ORDER FORM | | | |
|-------------------|----------------------|-------------------------|-------------------------|
| ITEM | QUANTITY | UNIT PRICE | TOTAL COST |
| Paint Brush | <input type="text"/> | \$ 8.00 | \$ 48.00 |
| Acrylic Paint | 10 | \$ <input type="text"/> | \$ 75.00 |
| Sketch Pad | 4 | \$ <input type="text"/> | \$ <input type="text"/> |
| | 20 | | \$150.00 |

9. _____ feet A length of 240 feet of fencing is to be supported by a total of 13 evenly spaced fence posts, including one at each end, as shown. How far apart must the fence posts be spaced?

10. _____ units² This coordinate grid shows pentagon ABCDE with vertices A(3, 0), B(4, 0), C(4, 7), D(0, 7) and E(0, 5). What is its area? Express your answer as a decimal to the nearest tenth.

11. _____ cookies Maria baked a batch of cookies. She ate three cookies and then $\frac{4}{5}$ of the cookies were left. How many cookies did Maria bake?

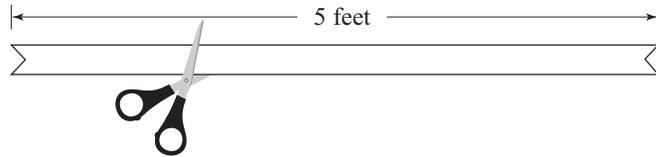

12. _____ If $\heartsuit + \heartsuit = \spadesuit + \spadesuit$ and $\spadesuit = 16 - (\heartsuit + \heartsuit)$, what is the value of $\heartsuit + \spadesuit$?

13. _____ pounds

The weights of four students on a wrestling team are 100 pounds, 108 pounds, 113 pounds, and 119 pounds. What is the mean weight of the four students?

14. _____ inches

A 5-foot ribbon is cut into two pieces with lengths in the ratio 1:4. How many inches long is the shortest piece?

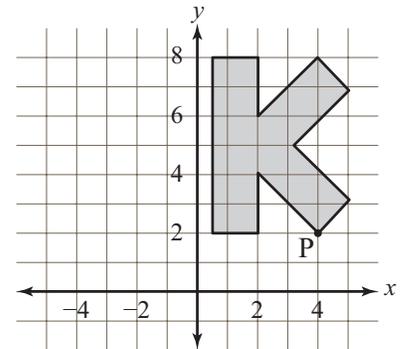

15. _____ gallons

While jogging, Cher's heart pumped 450 gallons of blood in 1 hour, 15 minutes. On average, how many gallons of blood did her heart pump each minute?

16. (_____ , _____)

What are the coordinates of the image of P, when this figure is reflected across the y -axis? Express your answer as an ordered pair.

17. _____ boxes

The glee club had a fund-raiser selling cookies to raise money for a spring concert. The club kept half of the money collected from selling cookies for \$5 per box. How many boxes of cookies were sold if the glee club kept \$1250?

18. _____ cm

The length of a rectangle is twice its width. The rectangle has an area of 128 cm^2 . What is its perimeter?

19. _____ integers How many two-digit positive integers less than 25 have the property that they are divisible by each of their digits?

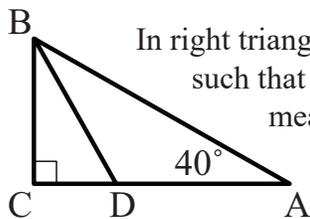

20. _____ The three-digit integer $5A4$ is a multiple of six. What is the sum of all the possible values for the digit represented by A ?

21. _____ coins The total cost of Keegan's lunch was \$4.56. He paid with a 5-dollar bill and received exact change. What is the fewest number of coins Keegan could have received?

22. _____ The line passing through $(-3, 2)$ and $(7, -1)$ intersects the x -axis at the point $(a, 0)$. What is the value of a ? Express your answer as a common fraction.

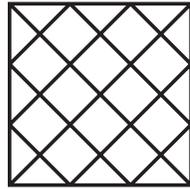

23. \$ _____ The prize money in a science fair is divided among the top three winners so that the amount awarded for first place is four times the amount for third place, and the amount for second place is three times the amount for third place. If the total amount of prize money is \$2400, what is the amount awarded for second place?

24. _____ degrees In right triangle ABC , shown here, $m\angle A = 40^\circ$, and D is on side AC such that segment BD bisects $\angle CBA$. What is the degree measure of $\angle BDC$?

25. _____ Addie's one-quart fruit salad is $\frac{1}{4}$ strawberries and $\frac{3}{4}$ blueberries. Ashlyn's one-quart fruit salad is $\frac{1}{2}$ strawberries and $\frac{1}{2}$ blueberries. When Addie and Ashlyn combine their fruit salads, what portion of the mixture is strawberries? Express your answer as a common fraction.

26. _____ triangles

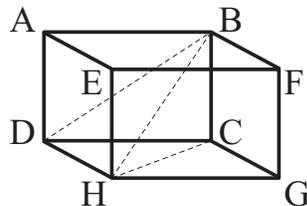

How many triangles are in the figure shown here?

27. _____ J.R.R. Tolkien, author of *The Hobbit*, stated in 1970 that on one of his birthdays the age he turned was the square root of the year. In what year was he born?

28. _____ hours Twins Cara and Dara drove from their house to the beach in exactly 5 hours, not including rest stops. First, Cara drove at an average speed of 40 mi/h and stopped at a rest area located halfway between their house and the beach. Then Dara drove from that location to the beach at an average speed of 60 mi/h. For how many hours did Dara drive?

29. _____ units³

For the rectangular solid shown, $AB = 12$ units, $BC = 8$ units and $AE = 6$ units. What is the volume of the tetrahedron $DHBC$?

30. _____ Bobby attends an event along with two friends. At the event, there is a drawing for three door prizes. Each person in attendance has an equal chance of winning a prize and no one can win more than one prize. If there are 20 people at the event, including Bobby and his two friends, what is the probability that Bobby and both of his friends each will win a prize? Express your answer as a common fraction.

■ **School Competition** ■
Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____ grams A particular coin that is composed only of silver and copper has a mass of 5 grams. If copper accounts for $\frac{9}{10}$ of the coin's mass, what is the mass of the silver in the coin? Express your answer as a decimal to the nearest tenth.

2. _____ ordered pairs How many ordered pairs of integers (a, b) satisfy $a \times b = 60$?

3. \$ _____ The final bill for the Freeman's dinner, including a 20% tip, was \$72. What was the total cost of the Freeman's dinner before the tip was added?

4. _____ marbles Tucker has a jar containing 4 green and 5 blue marbles. What is the minimum number of marbles Tucker needs to remove from the jar, without replacement, to guarantee that he has at least four marbles of the same color among those removed?

5. _____ in² A rectangular piece of paper measures 8 inches by 4 inches. The paper is folded along a crease from the upper left corner to a point located 3 inches from the lower left corner along the bottom edge, creating a right triangle as shown. What is the area of the shaded region?

6. _____ The product of three consecutive prime numbers is 105. What is their sum?
7. _____ hits Everett's batting average is 0.300 after getting 120 hits in 400 times at bat. How many hits must he get in his next 100 times at bat to raise his average to 0.400?
8. _____ The lines given by the equations $y = x + 1$ and $y = ax + b$ are perpendicular and intersect at the point $(2, 3)$. What is the value of $a + b$?
9. _____ ft^3 The Farmington family has two different silos on their farm. The first silo is a circular cylinder of height 20 ft with parallel bases of diameter 14 ft. The second silo is a cylinder of height 22 ft topped by a cone of height 10 ft, both with bases of diameter 12 ft. What is the absolute difference between the volumes of the two silos? Express your answer in terms of π .
10. _____ Regular octagon ABCDEFGH with side length 2 units is placed on a coordinate plane such that side AB lies on the positive y -axis and side CD lies on the positive x -axis. What is the absolute difference between the x - and y -coordinates of F? Express your answer in simplest radical form.

GENERAL INSTRUCTIONS

This section contains instructions, rules and procedures for administering the MATHCOUNTS School Competition. It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better mathematics skills in all participants. Therefore, the coach is encouraged to postpone the selection of those students who will be competing at the Chapter Competition until just prior to the event in February. **Selection of the students need not be based on the results of a school competition.** For this reason, schools may deviate from these rules in administering the School Competition. However, experience with the official rules may aid the students who compete at the chapter, state and national levels.

Individual scores are kept for each participating student, and a team score is calculated for each team. Before beginning the competition, divide participants into teams of four students and designate a captain for each team.

At the end of each round of the competition, collect all competition booklets, problems and scratch paper.

1. Use of notes or other reference materials (including dictionaries) is not permitted.
2. **The Target and Team Rounds assume the use of a calculator.** Calculator use is permitted in these rounds only. Any calculator that does not contain a QWERTY (i.e., typewriter-like) keypad is permitted. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. ***Smart phones, laptops, tablets and any other “smart” devices are not considered calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.***
3. Talking and signals are permitted only during the Team Round.
4. Before the competition, coaches should review with students the rules for acceptable forms of answers, found in the SCORING section of this booklet (or see page 53 of the *MATHCOUNTS School Handbook*).

SPRINT ROUND INSTRUCTIONS

1. Distribute scratch paper.
2. Distribute Sprint Round booklet.
3. Instruct each student to print his/her name on the front of the booklet, in the allotted space.
4. Instruct each student to write the digits 0 through 9 on the booklet, in the spaces provided. ***This may be used during scoring to clarify written answers that are not legible.***
5. Read aloud instructions printed on the front of the booklet while students read instructions silently.
6. Instruct students to begin. Start timing.
7. After 37 minutes, give a three-minute warning. After 40 minutes, say, **“Stop, pencils down”** and instruct students to close competition booklets.

TARGET ROUND INSTRUCTIONS

1. Distribute scratch paper.
2. Distribute the first (next) pair of Target Round problems, and instruct each student to print his/her name in the allotted space.
3. Read aloud the instructions printed on the cover of the first pair of problems.
4. Instruct students to begin. Start timing.
5. Give a ten-second warning at 5 minutes 50 seconds, and, after 6 minutes, say, **“Stop, pencils down.”**
6. Collect all papers.
7. For each of the next three pairs of problems, repeat step 2, then steps 4 through 6.

TEAM ROUND INSTRUCTIONS

1. Arrange all teams (of four students) in a room with at least five feet of unoccupied space between teams.
2. Distribute scratch paper.
3. Distribute Team Round booklet to each person, and instruct team captain to print team name and team members' names on his/her booklet. This becomes the team's official answer booklet.
4. Read aloud the instructions printed on the cover of the booklet while students read the instructions silently.
5. Instruct students to begin. Start timing.
6. After 17 minutes, give a three-minute warning. After 20 minutes, say, "**Stop, pencils down**" and instruct students to close competition booklets.

COUNTDOWN ROUND INSTRUCTIONS

The Countdown Round is a mandatory component at the National Competition, and it is used to determine the final rank of the top competitors. At the chapter and state levels, the use of the Countdown Round, officially or unofficially, is at the discretion of the state coordinator. When used officially, the Countdown Round will adhere to the rules presented below. The instructions may be modified as necessary at the school level. **This round is available only in PowerPoint® format for the School Competition. The PowerPoint file can be downloaded by logging in at www.mathcounts.org/competitioncoaches.**

1. Based on scores in the Sprint and Target Rounds, rank all competitors and select the top 25%, up to ten students, to compete in the Countdown Round.
2. Seat the two lowest-ranked students so they are in clear view of the moderator. Each competitor should be given scratch paper and sharpened pencils before the round begins. Invite the competitors to introduce themselves and test their buzzers.
3. Read the following statement to all students who will be competing in the round:

I will read each problem aloud as it is presented to you. You may use the scratch paper and pencil in front of you to calculate your answer to the problem. You are not allowed to use calculators during this round.

You will have a maximum of 45 seconds to solve the problem after it is presented. You will be given a ten-second warning before time expires. As soon as you have solved the problem, press your buzzer. [Schools may have alternate methods of determining order of finish and should adjust directions to students accordingly.] I will call on the first person who signals. Do not announce your answer until I call on you. Each time you wish to answer, you must signal, though you may not answer more than once for any question. If you do not signal before you answer, your answer will be disqualified. If you answer after signaling but before I call on you, your answer will be accepted, but I ask that you please wait until you hear your name so that there is no confusion.

Once I call on you, you will have three seconds to begin your answer. Your opponent may continue working while you are responding.

If you answer correctly, you will score one point in the round. If you answer incorrectly, your opponent will have the remainder of the allotted 45 seconds to press his/her buzzer for an opportunity to answer the problem and score a point in the round.

Whoever answers *the most of the three problems correctly*—*not necessarily two out of the three*—will progress to the next round to compete for the next place. If you are tied after three questions, I will declare a *sudden victory* situation. I will describe the rules for this process should this situation arise.

[Note that the above procedure does not necessarily require a student to answer two out of the three problems correctly. For instance, a student answering only one problem of three will progress to the next round if his/her opponent has not correctly answered any questions in the round.]

It is very important that rules be followed exactly. If you answer without signaling your buzzer, your answer will be disqualified.

4. Conduct the round as described above. After the winner of each round is identified, dismiss his/her opponent, and ask the next written competition place-holder to be seated to participate in the next round. Invite the new competitor to introduce himself or herself and test his/her buzzer.
5. If a sudden victory situation occurs, read the following statement to the students:

Since you are tied at the end of three problems, I must declare a sudden victory situation. I will now continue to read problems to both of you. Rules for answering problems remain the same as before. The first one of you to answer a problem correctly will advance to the next round.

6. Repeat procedure until the champion is identified. *However, just before the 4th-ranked student competes in his/her first round, announce that for the final four rounds, the first student to answer three problems correctly will advance to the next round.*

*Rules for the Countdown Round change for the National Competition.

SCORING

1. Acceptable forms for answers are as follows:
 - a. All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions, and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N \frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$.
 - b. Ratios should be expressed as common fractions, unless otherwise specified.
 - c. Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form.
 - d. Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form of $(\$)a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they both may be omitted. Answers in the form $(\$)a.bc$ should be rounded to the nearest cent, unless otherwise specified.
 - e. Do not make approximations for numbers (e.g. π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

- f. Do not perform any intermediate rounding (other than the “rounding” the calculator does) when calculating solutions. All rounding should be done at the end of the computation process.
 - g. Answers expressed in scientific notation should be in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$ and n is an integer.
 - h. An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form. Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0
 - i. Units of measurement are not required in answers, but must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.
 - j. The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.
2. Specific instructions stated in a given problem should take precedence over any general rule or procedure.
 3. Scores are kept for individuals and teams. The **individual score** is the number of Sprint Round questions answered correctly plus two times the number of Target Round questions answered correctly. ***The maximum possible individual score is 46.*** The **team score** is calculated by dividing the sum of the team members’ individual scores by four, and then adding two times the number of Team Round questions answered correctly. ***The maximum possible team score is 66.***

Because the School Competition is not the only mechanism available to determine which students should advance to the Chapter Competition, ties on the School Competition needn’t be broken. At the Chapter, State and National Competitions, however, ties among individuals or teams will be broken by comparing the scores of specific rounds.

Sprint Round Answers

- | | | |
|-----------------------------|----------------|---------------------------|
| 1. 5 °C | 11. 15 cookies | 21. 7 coins |
| 2. \$1600 or 1600.00 | 12. 10 | 22. $\frac{11}{3}$ |
| 3. 24 | 13. 110 pounds | 23. \$900 or 900.00 |
| 4. 40 percent | 14. 12 inches | 24. 65 degrees |
| 5. -29 | 15. 6 gallons | 25. $\frac{3}{8}$ |
| 6. 7 | 16. (-4, 2) | 26. 36 triangles |
| 7. 28 dots | 17. 500 boxes | 27. 1892 |

■ School Competition ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ °C

What is the temperature according to this thermometer that measures temperature in degrees Celsius?

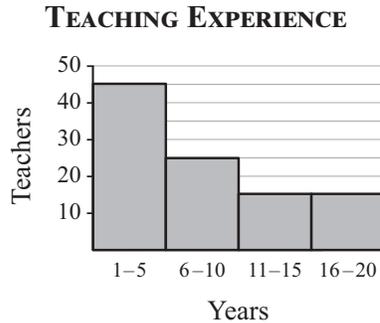

2. \$ _____

Cory has a summer job at the local grocery store. How much will Cory get paid to work 20 hours each week for 8 weeks if he earns \$10 an hour?

3. _____

What is the value of 21 divided by $\frac{7}{8}$?

4. _____ percent

The graph shows the results when 100 teachers reported the number of years they have been teaching. What percent of these teachers have been teaching more than 5 years but no more than 15 years?

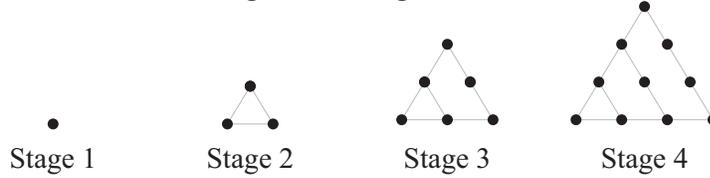

5. _____

Let $a \odot b = 2a - 3b$. What is the value of $(1 \odot 2) \odot 7$?

6. _____

If $\frac{8}{14} = \frac{4}{d}$, what is the value of d ?

7. _____ dots The figure shows the first four stages of a dot pattern. If the pattern continues, how many dots will be in the figure for Stage 7?

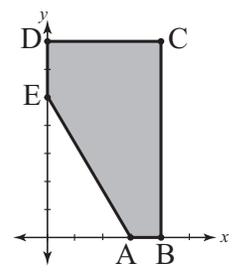

8. \$ According to this order form for Tessa’s art supplies, the total cost for the 20 items she ordered was \$150.00. Some of the details of Tessa’s order are missing from the order form, but based on the information given, what was the unit price for each sketch pad Tessa ordered?

| ORDER FORM | | | |
|-------------------|----------------------|-------------------------|-------------------------|
| ITEM | QUANTITY | UNIT PRICE | TOTAL COST |
| Paint Brush | <input type="text"/> | \$ 8.00 | \$ 48.00 |
| Acrylic Paint | 10 | \$ <input type="text"/> | \$ 75.00 |
| Sketch Pad | 4 | \$ <input type="text"/> | \$ <input type="text"/> |
| | 20 | | \$150.00 |

9. _____ feet A length of 240 feet of fencing is to be supported by a total of 13 evenly spaced fence posts, including one at each end, as shown. How far apart must the fence posts be spaced?

10. _____ units² This coordinate grid shows pentagon ABCDE with vertices A(3, 0), B(4, 0), C(4, 7), D(0, 7) and E(0, 5). What is its area? Express your answer as a decimal to the nearest tenth.

11. _____ cookies Maria baked a batch of cookies. She ate three cookies and then $\frac{4}{5}$ of the cookies were left. How many cookies did Maria bake?

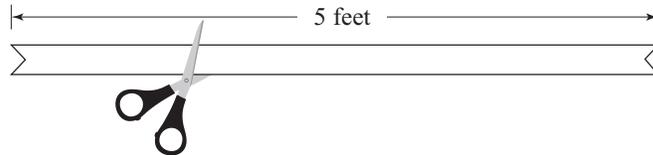

12. _____ If $\heartsuit + \heartsuit = \spadesuit + \spadesuit$ and $\spadesuit = 16 - (\heartsuit + \heartsuit)$, what is the value of $\heartsuit + \spadesuit$?

13. _____ pounds

The weights of four students on a wrestling team are 100 pounds, 108 pounds, 113 pounds, and 119 pounds. What is the mean weight of the four students?

14. _____ inches

A 5-foot ribbon is cut into two pieces with lengths in the ratio 1:4. How many inches long is the shortest piece?

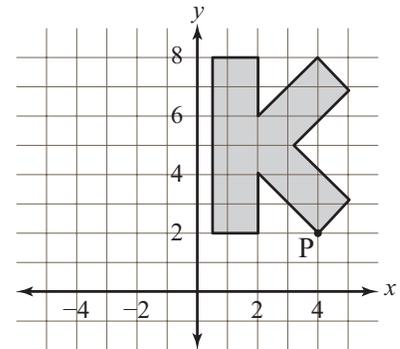

15. _____ gallons

While jogging, Cher's heart pumped 450 gallons of blood in 1 hour, 15 minutes. On average, how many gallons of blood did her heart pump each minute?

16. (_____ , _____)

What are the coordinates of the image of P, when this figure is reflected across the y -axis? Express your answer as an ordered pair.

17. _____ boxes

The glee club had a fund-raiser selling cookies to raise money for a spring concert. The club kept half of the money collected from selling cookies for \$5 per box. How many boxes of cookies were sold if the glee club kept \$1250?

18. _____ cm

The length of a rectangle is twice its width. The rectangle has an area of 128 cm^2 . What is its perimeter?

19. _____ integers How many two-digit positive integers less than 25 have the property that they are divisible by each of their digits?

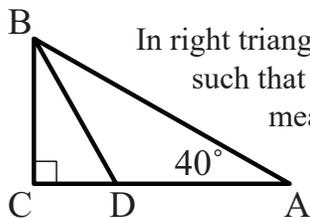

20. _____ The three-digit integer $5A4$ is a multiple of six. What is the sum of all the possible values for the digit represented by A ?

21. _____ coins The total cost of Keegan's lunch was \$4.56. He paid with a 5-dollar bill and received exact change. What is the fewest number of coins Keegan could have received?

22. _____ The line passing through $(-3, 2)$ and $(7, -1)$ intersects the x -axis at the point $(a, 0)$. What is the value of a ? Express your answer as a common fraction.

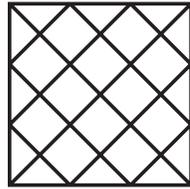

23. \$ _____ The prize money in a science fair is divided among the top three winners so that the amount awarded for first place is four times the amount for third place, and the amount for second place is three times the amount for third place. If the total amount of prize money is \$2400, what is the amount awarded for second place?

24. _____ degrees In right triangle ABC , shown here, $m\angle A = 40^\circ$, and D is on side AC such that segment BD bisects $\angle CBA$. What is the degree measure of $\angle BDC$?

25. _____ Addie's one-quart fruit salad is $\frac{1}{4}$ strawberries and $\frac{3}{4}$ blueberries. Ashlyn's one-quart fruit salad is $\frac{1}{2}$ strawberries and $\frac{1}{2}$ blueberries. When Addie and Ashlyn combine their fruit salads, what portion of the mixture is strawberries? Express your answer as a common fraction.

26. _____ triangles

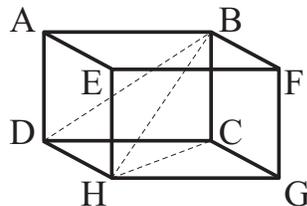

How many triangles are in the figure shown here?

27. _____ J.R.R. Tolkien, author of *The Hobbit*, stated in 1970 that on one of his birthdays the age he turned was the square root of the year. In what year was he born?

28. _____ hours Twins Cara and Dara drove from their house to the beach in exactly 5 hours, not including rest stops. First, Cara drove at an average speed of 40 mi/h and stopped at a rest area located halfway between their house and the beach. Then Dara drove from that location to the beach at an average speed of 60 mi/h. For how many hours did Dara drive?

29. _____ units³

For the rectangular solid shown, $AB = 12$ units, $BC = 8$ units and $AE = 6$ units. What is the volume of the tetrahedron $DHBC$?

30. _____ Bobby attends an event along with two friends. At the event, there is a drawing for three door prizes. Each person in attendance has an equal chance of winning a prize and no one can win more than one prize. If there are 20 people at the event, including Bobby and his two friends, what is the probability that Bobby and both of his friends each will win a prize? Express your answer as a common fraction.

1. _____ grams A particular coin that is composed only of silver and copper has a mass of 5 grams. If copper accounts for $\frac{9}{10}$ of the coin's mass, what is the mass of the silver in the coin? Express your answer as a decimal to the nearest tenth.

2. _____ ordered pairs How many ordered pairs of integers (a, b) satisfy $a \times b = 60$?

3. \$ _____ The final bill for the Freeman's dinner, including a 20% tip, was \$72. What was the total cost of the Freeman's dinner before the tip was added?

4. _____ marbles Tucker has a jar containing 4 green and 5 blue marbles. What is the minimum number of marbles Tucker needs to remove from the jar, without replacement, to guarantee that he has at least four marbles of the same color among those removed?

5. _____ in² A rectangular piece of paper measures 8 inches by 4 inches. The paper is folded along a crease from the upper left corner to a point located 3 inches from the lower left corner along the bottom edge, creating a right triangle as shown. What is the area of the shaded region?

6. _____ The product of three consecutive prime numbers is 105. What is their sum?
7. _____ hits Everett's batting average is 0.300 after getting 120 hits in 400 times at bat. How many hits must he get in his next 100 times at bat to raise his average to 0.400?
8. _____ The lines given by the equations $y = x + 1$ and $y = ax + b$ are perpendicular and intersect at the point $(2, 3)$. What is the value of $a + b$?
9. _____ ft^3 The Farmington family has two different silos on their farm. The first silo is a circular cylinder of height 20 ft with parallel bases of diameter 14 ft. The second silo is a cylinder of height 22 ft topped by a cone of height 10 ft, both with bases of diameter 12 ft. What is the absolute difference between the volumes of the two silos? Express your answer in terms of π .
10. _____ Regular octagon ABCDEFGH with side length 2 units is placed on a coordinate plane such that side AB lies on the positive y -axis and side CD lies on the positive x -axis. What is the absolute difference between the x - and y -coordinates of F? Express your answer in simplest radical form.

Problems 1–30

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ Sheryl is counting backwards by 4. If the first number she says is 155, and the second number she says is 151, what is the 9th number Sheryl says?

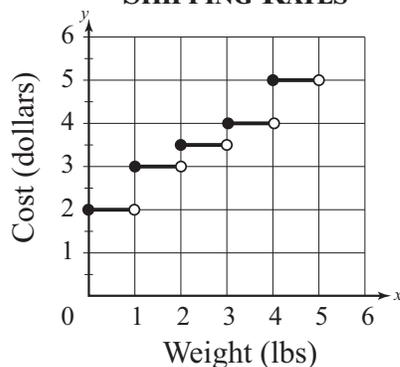

2. _____ What is the difference between the maximum and minimum values of this function graphed on the coordinate plane?

3. _____ If $\frac{1}{b} = \frac{b}{a}$ and $b = -1$, what is the value of a ?

4. _____ What is the sum of all two-digit multiples of 3 that have units digit 1?

5. _____ What is the sum of the first eight terms in the sequence beginning $-4, 5, \dots$, where each subsequent term is the sum of the previous two terms?

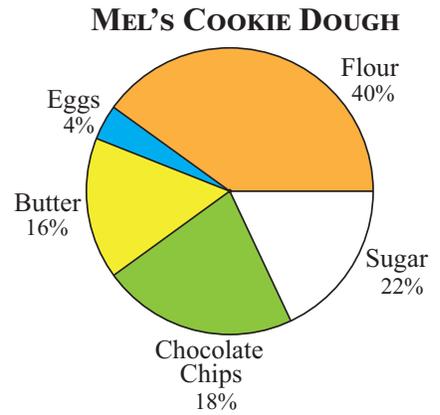

SHIPPING RATES

6. \$ _____ According to the graph, what is the total amount Blythe will be charged to ship three packages weighing 1.8 pounds, 2 pounds and 4.4 pounds?

7. _____ degrees

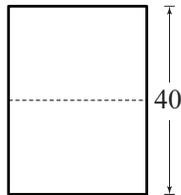

The graph shows the cookie dough ingredients for Mel's secret cookie recipe. What is the degree measure of the portion of the graph that indicates the percent of the cookie dough that is flour?

8. \$ _____

If 3 zoguts and 4 gimuns together cost \$18, and 2 zoguts and 3 gimuns together cost \$13, what is the combined cost of 1 zogut and 1 gimun?

9. _____ inches

A rectangular piece of paper measures 40 inches on its long side. It is folded in half along the dotted line. The ratio of the long side of the original sheet to the short side of the original sheet is the same as the ratio of the long side of the folded sheet to the short side of the folded sheet. What is the length of the short side of the original sheet? Express your answer in simplest radical form.

10. _____

What is the greatest multiple of 3 that can be formed using one or more of the digits 2, 4, 5 and 8, assuming no digit is used more than once?

11. _____

If $\frac{a^6b}{a^3b^5} = \frac{a^m}{b^n}$ for positive integers m and n , what is the value of $m + n$?

12. _____

For what positive integer x , does 8% of $x\%$ of 200 have a value of 4?

13. _____

The table shows the number of students enrolled for each grade at East-West High School. Every 9th- and 10th-grade student at East-West is automatically entered into a drawing to win a new tablet computer. One winning student will be chosen randomly. What is the probability that a 10th-grader at East-West will win the drawing? Express your answer as a common fraction.

| Grade | Enrollment |
|-------|------------|
| 9 | 192 |
| 10 | 136 |
| 11 | 129 |
| 12 | 93 |

14. _____

If $2^2 \cdot 4^4 = 2^k$, what is the value of k ?

15. _____ units²

In the xy -plane, a circle has center $P(5, 10)$ and intersects the x -axis at a single point $Q(5, 0)$. What is the area of circle P ? Express your answer in terms of π .

16. _____

When 3 is subtracted from $2x$ and the difference is divided by 5, the result is 7. What is the value of x ?

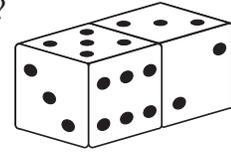

17. _____ percent

In a basketball game, Melina's ratio of 2-point shot attempts to 3-point shot attempts was 4:1. What percent of Melina's attempted shots were 3-point shots?

18. _____

What is the sum of the distinct prime factors of 2016?

19. _____ The opposite faces of a standard six-sided die add up to seven. Two identical standard six-sided dice are placed side by side as shown. What is the sum of the numbers of dots on the two faces that touch each other?

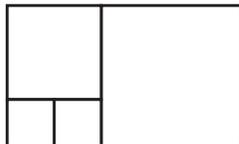

20. _____ sets How many sets of two or three distinct positive integers have a sum of 8?

21. _____ If a , b and c are integers such that $\frac{a+b}{2} = 3$, $\frac{b+c}{2} = 4$ and $\frac{a+c}{2} = 5$, what is the value of $a + b + c$?

22. _____ The mean of a set of five numbers is $3k$. When a sixth number is added to the set, the mean increases by k . What is the ratio of the sixth number to the sum of the first five numbers? Express your answer as a common fraction.

23. _____ inches

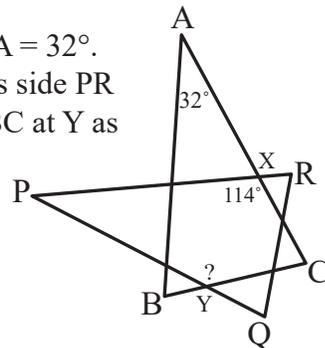

The large rectangle shown here is composed of four squares. If the area of the large rectangle is 240 in^2 , what is its perimeter?

24. _____ What is the least positive integer n such that $n!$ is divisible by 1000?

25. _____ degrees

In isosceles triangle ABC , shown here, $AB = AC$ and $m\angle A = 32^\circ$. Triangles ABC and PQR are congruent. Side AC intersects side PR at X so that $m\angle PXC = 114^\circ$, and side PQ intersects side BC at Y as shown. What is the degree measure of $\angle PYC$?

26. _____

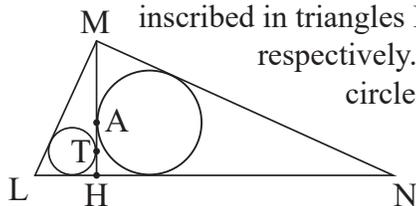

| A | B | C | D | E |
|---|---|----|----|----|
| 1 | 2 | 3 | | |
| | | 6 | 5 | 4 |
| 7 | 8 | 9 | | |
| | | 12 | 11 | 10 |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |

The integers 1 through 66 are arranged in five columns A to E as shown, where column C contains the multiples of 3. What is the sum of the numbers in column D?

27. _____ minutes

On Monday, a worker began painting a fence at 8:00 a.m. At 10:00 a.m., two more workers showed up and helped the first worker paint. The three workers finished the job at 11:30 a.m. On Tuesday, the first worker began painting an identical fence at 8:00 a.m. The other two workers showed up earlier this time, and the job was finished at 10:54 a.m. All three workers paint at the same constant rate. How many minutes did the first worker paint alone on Tuesday?

28. _____

Triangle LMN , shown here, has altitude MH drawn to side LN . Circles are inscribed in triangles MNH and MLH , tangent to altitude MH at A and T , respectively. If $MA:AT:TH = 4:2:1$, what is the ratio of the smaller circle's area to the larger circle's area? Express your answer as a common fraction.

29. _____ mi/h

A bug crawls a distance of n miles at a speed of $n + 1$ miles per hour one day and then crawls $2n + 1$ miles at a speed of $n^2 + n$ miles per hour the next day. If the total time for the trip was 6 hours, what was the bug's average speed? Express your answer as a common fraction.

30. _____

What is the greatest 5-digit palindrome n such that $7n$ is a 6-digit palindrome?

Forms of Answers

The following list explains acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N \frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}$, $1 \frac{1}{2}$
Problem: What is the sum of the lengths of the radius and the circumference of a circle with diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$
Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1 \frac{2}{3}$ *Unacceptable:* $1 \frac{8}{12}$, $\frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}$, $\frac{3}{\pi}$, $\frac{4-\pi}{6}$ *Unacceptable:* $3 \frac{1}{2}$, $\frac{1}{3}$, 3.5, 2:1

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is the value of $\sqrt{15} \times \sqrt{5}$? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c both are zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent unless otherwise specified. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not perform any intermediate rounding (other than the “rounding” a calculator does) when calculating solutions. All rounding should be done at the end of the computation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3
Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole number answers should be expressed in their whole number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

1. _____ percent A package of 8 frankfurters costs \$5.00 and a package of 12 hot dog buns costs \$3.00. If Jeffrey makes a hot dog sandwich using only a frankfurter and a bun, what percent of the cost of his hot dog sandwich comes from the bun? Express your answer to the nearest whole number.

2. _____

Triangles ABC, ACD, ADE and AEF are isosceles right triangles as shown. What is the value of $\frac{AB}{AF}$? Express your answer as a common fraction.

3. _____

What 6-digit number has the following properties?

- None of the digits repeat.
- The hundred-thousands digit is neither prime nor composite.
- The sum of the digits is 21.
- The ones digit is a prime number.
- The ones digit is the sum of the tens and hundreds digits.
- The thousands digit is the sum of the hundreds and ten-thousands digits.

4. _____ feet

A bicycle tire has a diameter of 22 inches and a motorcycle tire has a diameter of 25 inches. After each tire has made 1000 revolutions, how many more feet has the motorcycle traveled than the bicycle? Express your answer in terms of π .

5. _____

What is the sum of the positive integers from 1 through 500 that are divisible by 2, 3, 4, 5 and 6?

6. _____ The mean, median, unique mode and range of a list of ten integers are all 10. What is the greatest possible integer in the list?

7. _____ ml A 200 milliliter solution is 7% detergent. How many milliliters of 100% detergent need to be added so the solution will be 14% detergent? Express your answer as a decimal to the nearest tenth.

8. _____ numbers How many 3-digit numbers are there such that each of the digits is prime, and the sum of the digits is prime?

9. _____ paths

```
      A
     L L
    G G G
   E E E E
  B B B B B
 R R R R R R
A A A A A A A
```

Starting with the A on top and only moving one letter at a time down to the left or down to the right, how many different paths from top to bottom spell ALGEBRA?

10. _____ tokens Kevin and Devin each have a positive integer number of tokens, and the number of tokens Devin has is a square number less than 100. Devin says to Kevin, "If you give me all of your tokens, my total number of tokens will still be a square number." Kevin says, "Yes, if, on the other hand, you give me the same number of tokens that I already have, your total number of tokens will also be a square number." How many tokens does Kevin have?

1. _____ What is the least value of x^2 if $-20 \leq x \leq 16$?
2. _____ Two numbers have a sum of 1000 and a difference of 2. Exactly one of these numbers is prime. What is the composite number?
3. _____ (inches) A man who is exactly 6 feet tall has index fingers that are 3.6 inches long. If a 14-foot-tall statue of this man is built to scale, how many inches long should the statue's index fingers be? Express your answer as a decimal to the nearest tenth.
4. _____ (units) Equilateral triangle $\triangle ABC$ has side length 5 units. Segment DE is drawn perpendicular to \overline{AC} so that $EC = 2$ units. In units, what is the perimeter of quadrilateral $ABDE$? Express your answer in simplest radical form.
 
5. _____ The reciprocal of $x + 2$ equals $x - 2$ for what positive number x ? Express your answer in simplest radical form.
6. _____ Kathy's times in minutes and seconds for three 1-mile runs are 10:13, 9:51 and 9:38. Her average time is t seconds less than 10 minutes. What is the value of t ?
7. _____ (years old) Anita is three times Li's age but only one-third Owen's age. The sum of all three of their ages is 78 years. How old is Li?
8. _____ (rolls) Sydra repeatedly rolls two standard six-sided dice and records each resulting sum. What is the maximum number of rolls without repeating a sum?
9. _____ A regular octahedron is a polyhedron with eight congruent triangular faces. What is the sum of the number of edges and the number of vertices of a regular octahedron?
10. _____ (zeros) When the value of the expression $(0.1) \cdot (0.01) \cdot (0.001) \cdot (0.0001)$ is written in decimal form, how many zeros are between the decimal point and the digit 1?
11. _____ When two standard, six-sided dice are rolled, what is the probability that the two resulting numbers will be consecutive? Express your answer as a common fraction.
12. _____ What is the integer value of the expression $\sqrt{20} \cdot \sqrt{30} \cdot \sqrt{40} \cdot \sqrt{60}$?
13. _____ What is the least integer n for which $3^n > 2016$?
14. _____ (cm) If a triangle with integer side lengths has two sides measuring 18 cm and 25 cm, what is the shortest possible perimeter, in centimeters?
15. _____ What common fraction is equivalent to $1 + \frac{2}{3 + \frac{4}{5 + 6}}$?
16. _____ (times) Byron writes down all of the positive integers from 119 to 158. How many times does he write the digit 2?

17. _____ The figure shows three circles whose diameters are collinear. The two shaded circles are tangent to the largest circle and are also tangent to each other. The diameter of the larger shaded circle is twice that of the smaller shaded circle. What is the ratio of the combined area of the shaded circles to the area of the largest circle? Express your answer as a common fraction.

18. _____ If the mean of the numbers $3x + 10$, $7x + 10$ and $11x + 10$ is 73, what is the value of x ?
19. _____ (ways) In how many different ways can six identical balls be distributed into three jars labeled A, B and C, respectively, so that each jar contains at least one ball?
20. _____ (values) Three distinct positive integers less than 100 are added together. How many possible values are there for the sum?
21. _____ If $3x + 1 = 10$, what is the value of $6x + 1$?
22. _____ A committee is to be formed by randomly selecting three students from a group of two girls and three boys. What is the probability that at least one girl will be on the committee? Express your answer as a common fraction.
23. _____ (mm) A right triangle is inscribed in a circle. One angle of the triangle measures 30° and the length of the side opposite that angle is 14 mm. In millimeters, what is the circle's diameter?
24. _____ (mega bytes) On one computer, formatting any file takes 5 seconds and downloading a file takes $0.3m$ seconds, where m is the file size, in megabytes. On a different computer, formatting any file takes 3 seconds and downloading a file takes $0.5m$ seconds. For what file size, in megabytes, is the total time for formatting and then downloading a file the same for both computers?
25. _____ Each of the digits 1 through 8 is used exactly once to write two 4-digit integers. What is the greatest possible difference between the two integers?
26. _____ (meters) Zoey is training for a swim meet. During the first week of her training she swims 300 meters each day. Each week she increases the length of her daily swim by 100% of the previous week's daily length. How many meters will she swim each day during the fifth week of her training?
27. _____ The dartboard shown consists of three regions. The innermost circle has radius 1 inch, the middle circle has radius 4 inches and the outermost circle has radius 8 inches. What is the probability that a dart landing on the board is within the shaded region? Express your answer as common fraction.
28. _____ What is the 24th term in the arithmetic sequence 4, 9, 14, 19, 24, ...?

29. _____ (ways) How many ways are there to make 14 cents using any combination of pennies, nickels and dimes?

30. _____ If $\frac{(2n)!}{n!} = 120$, what is the value of n ?

31. _____ (integers) How many integers between 1 and 500 are divisible by 3?

32. _____ Twenty-four balls numbered from 1 through 24 are colored alternately red, green, blue and yellow, in that order, then placed in a box. If a ball is randomly drawn from the box, what is the probability that it is blue and has a prime number? Express your answer as a common fraction.

33. _____ (inches) A rectangular prism has length 20 inches and width 5 inches. If the surface area of the prism is 1100 in^2 , what is the height of the prism, in inches?

34. _____ When the digits of 4192 are rearranged to form a different 4-digit positive integer, what is the least possible absolute difference between the new integer and 4192?

35. _____ If $x > 1$ and $(x^6)^3 \cdot (x^k)^3 \cdot (x^{24})^3 = x^{300}$, what is the value of k ?

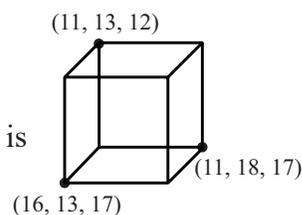

36. _____ (ft^3) How many cubic feet are in the volume of a rectangular box with dimensions 9 inches by 2 feet by 2 yards?

37. _____ (sums) Two fair six-sided dice each have faces numbered 1, 1, 2, 3, 5 and 8. If both dice are rolled, how many distinct sums are possible?

38. _____ (dollars) During a ten-day period, Omar spends an average of \$18 per day. If he spends at least \$10 each day, what is the greatest number of dollars that he could spend on any one day?

39. _____ What is the sum of the distinct prime factors of 9999?

40. _____ (units^3) The coordinates of three vertices of a cube are shown. What is the volume of the cube, in cubic units?

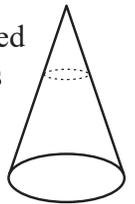

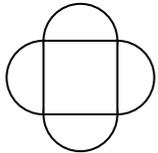

41. _____ What is the value of $\frac{1}{2} + \frac{3}{4} + \frac{5}{6} + \frac{7}{8}$? Express your answer as a common fraction.

42. _____ (mi/h) The one-way distance from Sisters, Oregon to the top of the McKenzie Pass is 15 miles. Ember took 2.5 hours to ride her bike from Sisters to the top of the pass, and her return trip took 30 minutes. What was Ember's average speed, in miles per hour, for the entire trip?

43. _____ Willow bakes a small cake and eats $\frac{1}{6}$ of it. Caroline then eats $\frac{1}{4}$ of what is left. What fraction of the cake remains after Caroline eats her share? Express your answer as a common fraction.

44. _____ (inches) A particular circle has a radius greater than 0. The number of square inches in the area of the circle is 6 times the number of inches in its circumference. What is the circle's radius, in inches?
45. _____ If $a^2 + 2ab + b^2 = 16$ and $c^2 + 2cd + d^2 = 36$, what is the least possible value of the sum $a + b + c + d$?
46. _____ What is the 2016th positive even integer?
47. _____ (miles) A taxi charges \$2.50 for the first $\frac{1}{3}$ mile and \$0.45 for each $\frac{1}{6}$ mile thereafter. How many miles would the shortest ride costing \$7.90 be? Express your answer as a mixed number.
48. _____ The height of a cone is three times its base radius. A smaller cone is created by slicing parallel to the base so that the height of the smaller cone equals the base radius of the larger cone. What is the ratio of the volume of the smaller cone to the volume of the larger cone? Express your answer as a common fraction.
49. _____ (yards/minute) If a snake travels at a constant rate of 1 foot per second, how many yards per minute does it travel?
50. _____ (meters) Bjorn walks 40 laps around a circle of diameter 70 meters. Anna walks 30 laps around a square of side length 80 meters. Carol walks 50 laps around an equilateral triangle of side length 60 meters. In meters, what is the greatest distance that any one person walks?
51. _____ (minutes) It takes Leo 54 minutes to mow $\frac{3}{4}$ of his lawn. How many minutes does it take him to mow his entire lawn?
52. _____ If $x \Delta y = x + y - |x - y|$, what is the value of $(3 \Delta 4) - (2 \Delta 1)$?
53. _____ (yards) The length of two pieces of string laid end to end is 60 yards. The absolute difference between the lengths of the two pieces of string is 30 yards. How many yards long is the longer piece of string?
54. _____ (integers) How many 3-digit positive, odd integers are multiples of 5?
55. _____ (minutes) On Mondays, Wednesdays and Fridays Kole swims for 45 minutes. On Tuesdays and Thursdays he swims for 60 minutes. What is the mean number of minutes that Kole swims daily Monday through Friday?
56. _____ (miles) Abdul lives 4 miles west and 2 miles north of Central Middle School. Jamal lives 8 miles east and 7 miles north of the same school. What is the shortest distance, in miles, between Abdul's house and Jamal's house?

57. _____ (inches) Kent walks 15,000 feet per hour. How many inches does he walk each second?
58. _____ US dollar bills are printed in sheets of 32 bills with 4 columns and 8 rows per sheet. What is the probability that a given dollar bill was along an edge of its original sheet? Express your answer as a common fraction.
59. _____ The figure shows a square of side length 2 inches surrounded by four semicircles, each with a side of the square as its diameter. The total area of the figure can be written in simplest radical form, in terms of π , as $a + b\pi$ in². What is the value of $a + b$?
- 
60. _____ Using each of the digits 1, 5, 6 and 9 exactly once, what decimal number can be written that is closest in value to 60? Express your answer as a decimal to the nearest hundredth.
61. _____ The average of Len's grades on seven homework assignments is 83. If Len earned a grade of 79 on each of the first five assignments, what is the average of his grades on the last two assignments?
62. _____ (students) Each of the 26 eighth-grade students at Monarch Middle School is in orchestra, algebra or both. Of these students, 20 are in orchestra and 16 are in algebra. How many students are in both orchestra and algebra?
63. _____ (children) A day care facility has a rectangular play area that is 30 feet by 35 feet. Guidelines require a minimum of 48 ft² of usable activity area per child. What is the maximum number of children that can occupy this play area?
64. _____ Ky has a bag with 4 pieces of red and 2 pieces of green candy. He has another bag with 6 pieces of red and 4 pieces of green candy. If Ky randomly takes one piece of candy from each bag, what is the probability that both pieces of candy will be red? Express your answer as a common fraction.
65. _____ (ml) A mixture of 1% hydrochloric acid measures 24 ml. How many milliliters of 5% hydrochloric acid must be added to change the mixture to 4% hydrochloric acid?
66. _____ (inches) A photo that measures $4\frac{1}{2}$ inches long by $6\frac{1}{2}$ inches wide is re-sized to make a similar photo that is 6 inches long. How many inches wide is the re-sized photo? Express your answer as a mixed number.
67. _____ (°F) The average temperature in Chicago on January 3rd was -10 °F. The average temperature increased by 3 degrees every 7 days. In degrees Fahrenheit, what was the average temperature on January 24th?

68. _____ (°F) The number of times N that a cricket chirps per minute is given by the formula $T = 40 + \frac{N}{4}$, where T is the temperature in degrees Fahrenheit. What is the temperature in degrees Fahrenheit when a cricket chirps 36 times in 15 seconds?
69. _____ (units²) In square units, what is the greatest possible area of a triangle with perimeter 36 units? Express your answer in simplest radical form.
70. _____ What is the value of $12(p + 9) - 12(p - 3)$?
71. _____ Ten numbers have a mean of 32. Eight of the ten have a mean of 30 and the remaining two numbers differ by 4. What is the greater of these two numbers?
72. _____ (matches) The annual chess club tournament begins with 64 students in the first round. In each round, students are paired up for chess matches. The winner of each match advances to the next round and the loser is out of the tournament. How many matches will be played in the second round?
73. _____ (candies) Hannah has a bag with 8 red, 6 blue and 2 green candies. What is the least number of candies she must take from the bag, without looking, to ensure that she has at least 2 of the same color?
74. _____ (questions) Ms. Clark's semester exam consists of true-false questions, worth 3 points each, and essay questions, worth 11 points each. There are 20 questions worth a total of 100 points. How many of the exam questions are true-false questions?
75. _____ (cups) Louis has 12 sled dogs and 6 puppies. Each sled dog eats $2\frac{1}{2}$ cups of dog food twice a day and each puppy eats $\frac{2}{3}$ cup of dog food twice a day. How many cups of dog food does Louis need each day to feed the dogs and puppies?
76. _____ (percent) Last year, Martha invested \$12,000. She had \$4000 that earned 6% annual interest and \$6000 that earned 5% interest. If she earned \$600 in total interest, what annual percent interest did the rest of her money earn?
77. _____ The sum of the digits of a positive 2-digit number is 7. Reversing the digits creates a new 2-digit number that is 9 more than the original number. What is the original number?
78. _____ (inches) Fernando builds a cube out of $\frac{5}{8}$ -inch sugar cubes and another cube out of 1-inch sugar cubes. If the two constructed cubes are the same size, what is the least possible edge length, in inches, of the cubes he builds?
79. _____ (dollars) The value of Bill's estate doubles at the end of every year. Its value at the end of the third year is \$8000. In dollars, what is its value at the end of the sixth year?
80. _____ (♥) If $3 \clubsuit = 1 \diamond$, $2 \heartsuit = 1 \clubsuit$ and $1 \diamond = 2 \spadesuit$, how many ♥ are equivalent to 1 ♠?

MATHCOUNTS®

2016 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2016 MATHCOUNTS® Chapter Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Mady Bauer
for graciously and voluntarily sharing her solutions
with the MATHCOUNTS community
for many, many years!*

2016 Chapter Competition

Sprint Round

1. *Given:* Count backwards from 155 by 4.

Find: The 9th number.

The first number is 155.

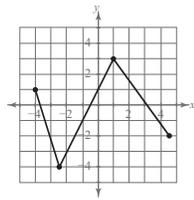

The second number is 151, or 4 less.

The ninth number is $4 \times 8 = 32$ less.

$$155 - 32 = 123 \quad \text{Ans.}$$

2. *Given:* The graph, as displayed below.

Find: The difference between the maximum and minimum values.

The highest point in terms of y is the third point from the right with coordinates $(1, 3)$. The lowest point in terms of y is the second point from the right with coordinates $(-2.5, -4)$ – at least it looks like around -2.5 . The difference in the y -coordinates is $3 - (-4) = 7$ **Ans.**

3. *Given:* $\frac{1}{b} = \frac{b}{a}, b = -1$

Find: a

Substituting -1 for b , we get $1/-1 = -1/a$.

Cross-multiplying, we find that

$$a = (-1)(-1) = 1 \quad \text{Ans.}$$

4. *Find:* The sum of all two-digit multiples of 3 that have a units digit of 1.

21 is the first two-digit multiple of 3

which has a units digit of 1. Each

successive two-digit multiple of 3 with a

units digit of 1 is 30 larger. There are

three in all: 21, 51 and 81. Their sum is

$$21 + 51 + 81 = 153 \quad \text{Ans.}$$

5. *Find:* the sum of the first 8 terms of the sequence beginning $-4, 5 \dots$ where each term is the sum of the previous two terms.

The first eight terms of the sequence are

$-4, 5, 1, 6, 7, 13, 20$ and 33 . Their sum is

$$-4 + 5 + 1 + 6 + 7 + 13 + 20 + 33 = 81 \quad \text{Ans.}$$

6. *Given:* The graph displayed below.

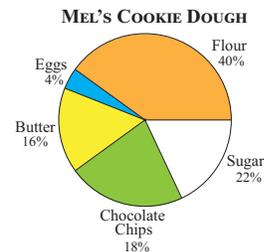

Find: the total cost to ship 3 packages weighing 1.8 lbs., 2 lbs. and 4.4 lbs.

It costs \$3 to ship the 1.8-lb. package, \$3.50 to ship the 2-lb. package and \$5 to ship the 4.4-lb. package. The total cost to mail all three packages is $3 + 3.50 + 5 = 11.50$ **Ans.**

7. *Given:* the graph below.

Find: the degree measure of the portion of the cookie that is flour.

The cookie is made of 40% flour and.

$$40\% \text{ of } 360^\circ \text{ is } 360 \times 0.4 = 144 \quad \text{Ans.}$$

8. *Given:* 3 zoguts and 4 gimuns costs \$18. 2 zoguts and 3 gimuns costs \$13.

Find: the cost of 1 zogut and 1 gimun

Let z = the cost of a zogut and g = the cost of a gimun. We can write the equations

$$3z + 4g = 18 \text{ (Eq. 1)}$$

$$2z + 3g = 13 \text{ (Eq. 2)}$$

Subtracting Eq. 2 from Eq. 1, we get

$$1z + 1g = 18 - 13 = 5 \text{ Ans.}$$

9. *Given:* A rectangular piece of paper with a 40-inch length. It is folded in half. The ratio of the long side of the original sheet to the short side of the original sheet is the same as the ratio of the long side of the folded sheet to the short side of the folded sheet.

Find: the length of the short side of the original sheet.

Let s = the length of the short side of the original sheet, which is also the long side of the folded sheet. The length of the short side of the folded sheet is $40/2 = 20$.

We have the ratio $\frac{40}{s} = \frac{s}{20}$. Cross-multiplying yields $s^2 = 800$. So the length of the short side of the original sheet is $s = \sqrt{800} = 10\sqrt{8} = 20\sqrt{2}$ Ans.

10. *Find:* the greatest multiple of 3 that can be formed using one or more of the digits 2, 4, 5 and 8, using each digit only once. A number is a multiple of 3 if the sum of its digits is divisible by 3. Since $8 + 5 + 4 + 2 = 19$, which is not divisible 3, we know that no number formed using all four digits will be a multiple of 3. The four combinations of three digits that can be used to form 3-digit numbers are 8, 5, 4; 8, 5, 2; 8, 4, 2; and 5, 4, 2. Since $8 + 5 + 4 = 17$, $8 + 4 + 2 = 14$ and $5 + 4 + 2 = 11$, none of which is divisible by 3, we know that no 3-digit number formed with these combinations of digits will be a multiple of 3. But $8 + 5 + 2 = 15$, which is divisible by 3. The greatest multiple of 3 formed using the given numbers is 852 Ans.

11. *Given:* $\frac{a^6b}{a^3b^5} = \frac{a^m}{b^n}$

Find: $m + n$

Simplifying the expression, we get

$$\frac{a^6b}{a^3b^5} = \frac{a^3}{b^4}$$

So $m = 3$, and $n = 4$. Therefore, $m + n = 3 + 4 = 7$ Ans.

12. *Given:* 8% of $x\%$ of 200 = 4

Find: x

Rewriting the percents as fractions, the problem statement can be expressed algebraically as

$$\frac{8}{100} \left(\frac{x}{100} \times 200 \right) = 4$$

Simplifying and solving for x , we get $16x = 400$ and $x = 25$ Ans.

13. *Given:* There are 192 9th-graders and 136 10th-graders entered in a drawing.

Find: the probability a 10th-grader wins the drawing.

The probability is $\frac{136}{192+136} = \frac{136}{328} = \frac{17}{41}$ Ans.

14. *Given:* $2^2 \cdot 4^4 = 2^k$

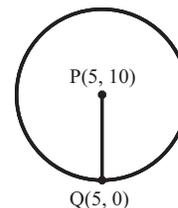

Find: k

$$2^k = 2^2 \cdot 4^4 = 2^2 \cdot (2^2)^4 = 2^2 \cdot 2^8 = 2^{10}.$$

Therefore, $k = 10$ Ans.

15. *Given:* A circle with center P(5, 10) intersects the x -axis at Q(5, 0).

Find: the area of the circle.

The radius of the circle drawn from P to Q, as shown, has length. This is the radius $10 - 0 = 10$. The area is $\pi r^2 = 100\pi$ Ans.

16. *Given:* Subtract 3 from $2x$ and divide the difference by 5. The result is 7.
Find: x
 The problem statement can be expressed algebraically as $\frac{2x-3}{5} = 7$. Solving for x , we see that $2x - 3 = 35$ and $2x = 38$. So, $x = 19$ **Ans.**

17. *Given:* Melina's ratio of 2-point shot attempts to 3-point shot attempts is 4:1.
Find: the percent of Melina's attempted shots that are 3-point shots.
 Of every 5 shot attempts, 1 is a 3-point shots and 4 are 2-point shots. So, the 3-point shots account for $\frac{1}{5} = 20\%$ **Ans.**

18. *Find:* the sum of the distinct prime factors of 2016.
 The prime factorization of 2016 is $2^5 \times 7 \times 3^2$. The distinct prime factors 2, 3 and 7 have the sum $2 + 3 + 7 = 12$ **Ans.**

19. *Given:* The opposite faces of a six-sided die add up to 7. Two identical six-sided dice are placed as shown.
Find: the sum of the number of dots on the two faces that touch each other.

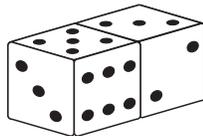

Figure 1

Since the dots on opposite faces of a die add to 7, it follows that the opposing sides must be 6 and 1, 5 and 2, 4 and 3. As Figure 1 shows, the first die is positioned so that the top face has 5 dots and the bottom face has 2 dots. The right face has 6 dots, and the left face has 1 dot. The front face has 3 dots, and the back face, which touches the front face of the second die, has 4 dots.

Now let's try to rotate the first die so it is positioned exactly like the second die so that corresponding sides on the dice have the same number of dots and are aligned the same way. If we rotate the first die so that the front face is now positioned on the top, we obtain the arrangement shown in Figure 2.

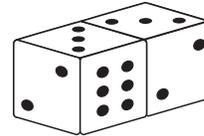

Figure 2

If we rotate the first die again so that the current front face is now on the right, we get the arrangement in Figure 3.

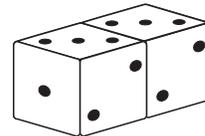

Figure 3

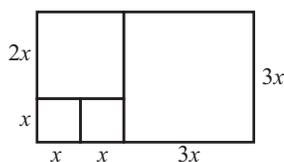

Now that all corresponding faces on the dice are the same, we can see that on the second die, the front face, which touches the back face of the first die, has 1 dot. The sum of these two values, then, is $4 + 1 = 5$ **Ans.**

20. *Find:* how many sets of two or three distinct positive integers have a sum of 8?
 There are 3 sets of two integers that have a sum of 8: $\{1, 7\}$, $\{2, 6\}$, $\{3, 5\}$. The pair $\{4, 4\}$ doesn't make it because the values aren't distinct. There are 2 sets of three integers that have a sum of 8: $\{1, 2, 5\}$, $\{1, 3, 4\}$. That makes the total number of sets $3 + 2 = 5$ **Ans.**

21. *Given:* $\frac{a+b}{2} = 3, \frac{b+c}{2} = 4, \frac{a+c}{2} = 5$
Find: $a + b + c$
 The three given equations can be rewritten as
 $a + b = 6$
 $b + c = 8$
 $a + c = 10.$
 Adding these three equations yields
 $2a + 2b + 2c = 24.$ Dividing both sides by 2, we get $a + b + c = 12$ **Ans.**

22. *Given:* The mean of a set of 5 numbers is $3k.$ Add a sixth number to the set and the mean increases by $k.$
Find: the ratio of the sixth number to the sum of the first 5 numbers.
 Let S be the sum of the first five numbers. Then we have $\frac{S}{5} = 3k$ and $S = 15k.$ Let x be the sixth number. Then $\frac{S+x}{6} = 3k + k$ and $S + x = 24k.$ Substituting $15k$ for S in $S + x = 24k$ yields $15k + x = 24k.$ So, $x = 9k.$
 Therefore, the ratio $\frac{x}{S}$ is $\frac{9k}{15k} = \frac{3}{5}$ **Ans.**

23. *Given:* a rectangle composed of 4 squares.
 The area of the rectangle is 240.
Find: the perimeter.

Let $x =$ the side length of the smallest square. The side length of the medium square is $2x,$ and the side length of the largest square is $3x.$ The rectangle has length $x + x + 3x = 5x$ and width $3x.$ The area is $(5x)(3x) = 240.$ Solving for $x,$ we get $15x^2 = 240,$ so $x^2 = 16$ and $x = 4$ (x can't be -4). Thus, the rectangle has length $5(4) = 20,$ width $3(4) = 12.$ The perimeter, then, is $2(20 + 12) = 64$ **Ans.**

24. *Find:* the least positive integer n such that $n!$ is divisible by 1000.
 Since $1000 = 2^3 \times 5^3,$ we are looking for n such that $n! = 2 \times 2 \times 2 \times 5 \times 5 \times 5 \times k.$ With factors of 2 and 4 we have three 2s. With the factors of 5, 10 and 15, we have three 5s. The least value is $n! = 1 \times 2 \times 3 \times \dots \times 14 \times 15.$ So, $n = 15$ **Ans.**

25. *Given:* $\triangle ABC$ is an isosceles triangle. $AB = AC, m\angle A = 32^\circ.$ Triangles ABC and PQR are congruent, and $m\angle PXC = 114^\circ.$
Find: the degree measure of $\angle PYC.$

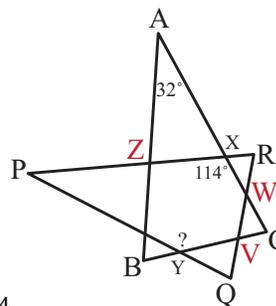

Figure 4

Since isosceles triangles ABC and PQR are congruent, $AB = AC = PQ = PR, m\angle P = m\angle A = 32^\circ$ and $m\angle B = m\angle C = m\angle Q = m\angle R = \frac{180-32}{2} = \frac{148}{2} = 74^\circ.$ Since $m\angle PXC = 114^\circ,$ it follows that $m\angle AXZ = 66^\circ.$

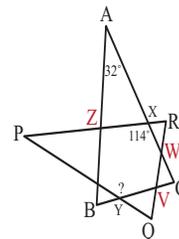

Figure 5

Now let's look at $\triangle RXW$ and $\triangle WCV,$ shown in Figure 5. By properties of vertical angles, $m\angle RXW = m\angle AXZ.$ We also know that $m\angle RWX = 180 - (74 + 66) = 180 - 140 = 40^\circ.$ Again, by properties of vertical angles, $m\angle WVC = m\angle RWX = 40^\circ.$

Since $m\angle R WX = 40^\circ$ and $m\angle C = 74^\circ$, it follows that $\triangle RXW \sim \triangle WCV$ (Angle-Angle) and $m\angle CVW = 66^\circ$.

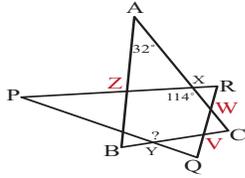

Figure 6

Now let's look at $\triangle YVQ$, shown in Figure 6. Once again, by properties of vertical angles $m\angle YVQ = m\angle CVW = 66^\circ$. Since $m\angle YVQ = 66^\circ$ and $m\angle Q = 74^\circ$, it follows that $\triangle WCV \sim \triangle YVQ$ and $m\angle VYQ = 40^\circ$. Since angles PYC and VYQ are supplementary, we know that $m\angle PYC = 180 - 40 = 140^\circ$ **Ans.**

26. *Given:* The integers 1-66 are arranged as shown.

Find: sum of the numbers in column D.

| A | B | C | D | E |
|---|---|----|----|----|
| 1 | 2 | 3 | | |
| | | 6 | 5 | 4 |
| 7 | 8 | 9 | | |
| | | 12 | 11 | 10 |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |

The numbers in column D all differ by 6 and range from 5 to 65. The sum of these numbers is $5 + 11 + \dots + 59 + 65 = 70 \times \frac{11}{2} = 35 \times 11 = 385$ **Ans.**

27. *Given:* On Monday, a single worker painted a fence alone for two hours. Then two more painters came and, together, they finished the job 1.5 hours later. On Tuesday, a single worker began painting an identical fence at 8:00 a.m. Later 2 more workers showed up and, together, the 3 workers finished the fence at 10:54.

Find: the number of minutes the first worker painted alone on Tuesday.

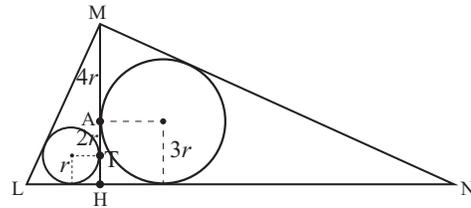

All three workers paint at the same rate; we will call this R units of fences per hour. For Monday, when the entire job was completed in 3.5 hours, we have $R \times 2 + 3R \times 1.5 = 6.5R$.

Now let T be the time worker 1 painted alone. For Tuesday, when the entire job was completed in 2.9 hours, we have $R \times T + 3R \times (2.9 - T) = 6.5R$. Setting these two equations equal to each other and solving for T , we get $6.5R = 8.7R - 2RT$ so $T = 1.1$ hours. Converting to minutes, $1.1 \times 60 = 66$ **Ans.**

28. *Given:* $\triangle LMN$ has altitude MH . Circles are inscribed in triangles MNH and MLH , tangent to altitude MH .

$$MA:AT:TH = 4:2:1$$

Find: the ratio of the smaller circle's area to the larger circle's area.

Let r be the radius of the smaller circle. So $TH = r$, $AT = 2r$ and $MA = 4r$. It follows, then, that the radius of the larger circle has length $AH = 2r + r = 3r$. The areas of the two circles are πr^2 and $\pi(3r)^2 = 9\pi r^2$, and the ratio of the areas is

$$\frac{\pi r^2}{9\pi r^2} = \frac{1}{9} \text{ **Ans.**}$$

29. *Given:* A bug crawls n miles at $n + 1$ mi/h on one day. The next day it crawls $2n + 1$ miles at $n^2 + n$ mi/h. The total time for the trip is 6 hours.

Find: the bug's average speed.

On the first day the bug spends

$\frac{n}{n+1}$ hours crawling. On the second day,

the bug spends $\frac{2n+1}{n^2+n}$ hours crawling. Since

the entire trip took a total of 6 hours over

the two days, we have $\frac{n}{n+1} + \frac{2n+1}{n^2+n} = 6$.

Solving for n , we get

$$\frac{n}{n+1} + \frac{2n+1}{n(n+1)} = 6$$

$$n + \frac{2n+1}{n} = 6(n+1)$$

$$n^2 + 2n + 1 = 6n^2 + 6n$$

$$5n^2 + 4n - 1 = 0$$

$$(5n - 1)(n + 1) = 0$$

$$n = \frac{1}{5} \text{ (} n \text{ can't be } -1\text{)}$$

Substituting, we find that, on the first day,

the bug crawled $\frac{1}{5}$ mile at $n + 1 =$

$1\frac{1}{5}$ mi/h. On the second day, it crawled

$2n + 1 = 1\frac{2}{5}$ miles at $n^2 + n = \frac{1}{25} + \frac{1}{5} =$

$\frac{6}{25}$ mi/h. This is a total of $\frac{1}{5} + 1\frac{2}{5} =$

$1\frac{3}{5}$ miles in 6 hours. So the average speed

was $1\frac{3}{5} \div 6 = \frac{8}{5} \times \frac{1}{6} = \frac{8}{30} = \frac{4}{15}$ **Ans.**

30. *Find:* the greatest 5-digit palindrome n such that $7n$ is a 6-digit palindrome.

Start by looking at a 5-digit palindrome with leading digit 9 of the form $9_ _ _ 9$.

Since $9 \times 7 = 63$, the last digit in the 6-digit product will be a 3, but there is no way to have the leading digit be a 3.

Next we check those with leading digit 8 of the form $8_ _ _ 8$.

Since $8 \times 7 = 56$, the last digit in the 6-digit product will be a 6, and the leading digit could possibly be a 6 depending on what the other digits are.

The greatest palindrome we can form is 89998, but $7 \times 89998 = 629986$, which is not a palindrome. We continue looking at palindromes of the form 89_98 in descending order. Notice that with each successive palindrome of less value, the resulting 6-digit product of 7 and the palindrome decreases by 700. Also, the second digit in the product will always remain a 2 and the fifth digit will always be an 8. Next, looking at 88_88 , the greatest palindrome we can form is 88988, but $7 \times 88988 = 622916$, which is not a palindrome. The fifth digit will always be a 1, so we are looking to bring the second digit down to a 1. We are subtracting 700 each time. We look at the second, third and fourth digit to figure out what multiple of 3 makes the second digit a 1 and the third and fourth digit equal. $229 - 63 = 166$. We can get to the 6-digit palindrome 616616 by multiplying 7 and 88088 **Ans.**

Target Round

1. *Given:* A season ski pass costs \$395. A day ticket costs \$40.

Find: How much money is saved with a season ski pass compared to 38 day tickets?

38 day tickets cost $\$40 \times 38 = \1520
 $\$1520 - \$395 = \$1125$ **Ans.**

2. *Given:* A string of numbers consists of one 1, two 2s, three 3s, etc.

Find: the 50th digit.

The sum of 1 through 9 is 45. Therefore, starting with the 46th digit we have 10101. The 50th digit is 1 **Ans.**

3. *Given:* Eunice takes 2 minutes 30 seconds to run around a quarter-mile track.

Find: How many minutes it takes her to run 1 mile.

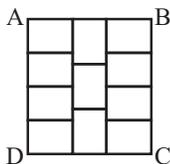

1 mile is 4 quarter-mile laps with each lap taking 2 minutes 30 seconds.

2 laps take 5 minutes.

4 laps take 10 minutes **Ans.**

4. *Given:* Rectangle ABCD is composed of 11 congruent rectangles. The length of AB is 33.

Find: the area of rectangle ABCD.

Let x = the width of one of the rectangles.

Let y = the length of the rectangle.

IF AB has length 33,

$$2y + x = 33$$

The length of EF is the same as the length of AD. Therefore, $4x = 3y$ and $x = \frac{3}{4}y$

Substituting back into the first equation:

$$2y + \frac{3}{4}y = 33$$

$$\frac{11}{4}y = 33$$

$$11y = 132$$

$$y = 12$$

$$EF = AD = 3y = 36$$

$$36 \times 33 = 1188 \text{ units}^2$$
 Ans.

5. *Given:* Sum of the first 5 terms of a sequence is 90 less than the sum of the next 5 terms.

Find: the absolute difference between two consecutive terms of this sequence. Terms of an arithmetic sequence differ by the same amount.

Let a = the first term and d be the common difference between consecutive terms. The sum of the first 5 terms is $a + a + d + a + 2d + a + 3d + a + 4d = 5a + 10d$. The sum of the next 5 terms is $a + 5d + a + 6d + a + 7d + a + 8d + a + 9d = 5a + 35d$. The difference between these two values is $(5a + 35d) - (5a + 10d) = 90$. Simplifying and solving for d yields

$$25d = 90 \text{ and } d = \frac{90}{25} = \frac{18}{5}$$
 Ans.

6. *Given:* the hour and minute hands of a clock create a 60° angle at 2:00.

Find: how many seconds later is the next time when the hour and minute hands create a 60° angle.

The minute hand takes 1 hour, 3600 seconds, to go around the clock.

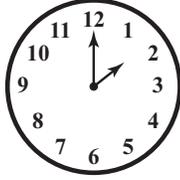

Therefore, the minute hand moves $\frac{360}{3600} =$

$\frac{1}{10}^\circ$ every second. The hour hand takes 12

hours, $12 \times 3600 = 43200$ seconds, to go around the clock. Therefore, the hour

hand moves $\frac{6}{720} = \frac{1}{120}^\circ$ every second.

Now let's look at a clock showing 2:00.

The minute hand is at 0° and the hour hand is at 60° . Every second the minute hand moves $\frac{1}{10}^\circ$ and the hour hand moves $\frac{1}{120}^\circ$. This means that each second the minute hand comes $\frac{1}{10} - \frac{1}{120} = \frac{12}{120} - \frac{1}{120} = \frac{11}{120}^\circ$ closer to the hour hand.

Let x = the number of seconds it will take for the two hands to coincide. Then $60 = \frac{11}{120}x$, and $x = \frac{120 \times 60}{11} = 654.\overline{54}$ seconds. At this point the hands are exactly on top of each other. It will take the same amount of time for the minute hand to go past the hour hand to form a 60° angle. $654.\overline{54} \times 2 = 1309.\overline{09} \approx 1309$ **Ans.**

7. *Given:* A bag contains some number of blue and exactly 11 yellow marbles. When 5 blue marbles are added, the probability of randomly drawing a blue marble exceeds 70%.

Find: the least possible number of blue marbles in the bag originally.

Let b = the original number of blue marbles. We have the following:

$$\frac{b+5}{b+5+11} > \frac{7}{10}$$

$$\frac{b+5}{b+16} > \frac{7}{10}$$

Cross-multiplying, we get

$$10b + 50 > 7b + 112. \text{ Solving for } b \text{ yields}$$

$$3b > 62, \text{ so } b > 20\frac{2}{3}. \text{ Substituting, the}$$

least integer greater than $20\frac{2}{3}$, we get

$$\frac{21+5}{21+16} = \frac{26}{37} \approx 70.207\%$$

when $b = 21$ **Ans.**

8. *Given:* A room has eight light switches. Initially, exactly 5 of the lights are on. Three people enter the room sequentially and independently flip one switch randomly. *Find:* the probability that after the third person has exited the room, exactly six of the lights are on.

In order to end up with exactly 6 lights on, the three people must turn two on and one off, in some order. Other options that would not result in six lights on are turning on three lights, turning off three lights or turning one on and two off.

There are $3 \times 2 \times 1 = 6$ ways to turn three lights on. This is because when the first person enters the room the number of lights off is 3, when the second person enters the room there are 2 lights off and when the third person enters the room there is 1 light off.

Similarly, there are $5 \times 4 \times 3 = 60$ ways to turn three lights off.

There are $5 \times 4 \times 5 = 100$ ways to turn two lights off then one on, in that order.

There are $5 \times 4 \times 5 = 100$ ways to turn one light off, one light on and one light off.

There are $3 \times 6 \times 5 = 90$ ways to turn one light on then two lights off.

There are $3 \times 2 \times 7 = 42$ ways to turn two lights on then one off.

There are $3 \times 6 \times 3 = 54$ ways to turn one light on, one light off then one light on.

There are $5 \times 4 \times 3 = 60$ ways to turn one light off then two lights on.

There are a total of $6 + 60 + 100 + 100 + 90 + 42 + 54 + 60 = 512$ ways for three of the eight switches to be flipped.

Of these 512 ways, $42 + 54 + 60 = 156$ ways to end with exactly 6 lights on.

The probability of exactly 6 lights being on after the third person exits the room is

$$\frac{156}{512} = \frac{39}{128} \text{ **Ans.**}$$

Team Round

1. *Given:* A package of 8 frankfurters costs \$5. A package of 12 buns costs \$3.

Find: the percent of the cost of a hot dog sandwich that comes from a bun.

A frankfurter costs $\frac{5}{8} = \$0.625$

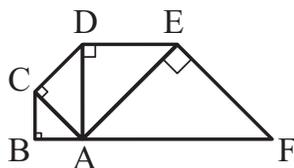

A bun costs $\frac{3}{12} = \$0.25$

$$\frac{0.25}{0.625 + 0.25} = \frac{0.25}{0.875} \approx 0.285714 =$$

28.5714% \approx 29% **Ans.**

2. *Given:* Triangles ABC, ACD, ADE and AEF are isosceles right triangles.

Find: the value of $\frac{AB}{AF}$.

Let $x =$ the length of AB. AC is the hypotenuse of triangle ABC. Since all the triangles are 45-45-90, we know the ratio of the side to the hypotenuse is 1 to $\sqrt{2}$. So $AC = x\sqrt{2}$, $AD = 2x$, $AE = 2\sqrt{2}x$ and $AF = 4x$.

$$\frac{AB}{AF} = \frac{x}{4x} = \frac{1}{4} \quad \mathbf{Ans.}$$

3. *Find:* the 6-digit number that has these properties:
- None of the digits repeat.
 - The ones digit is a prime number.
 - The ones digit is the sum of the tens and hundreds digits.
 - The thousands digit is the sum of the hundreds and ten-thousands digits.
 - The hundred-thousands digit is neither prime nor composite.
 - The sum of the digits is 21.
- The hundred-thousands digit is not prime, so it cannot be 2, 3, 5 or 7. It is also

not composite. So it can't be 4, 6, 8 or 9. Therefore, it must be 1.

The ones digit is prime. Therefore, it can be 2, 3, 5, or 7. But it is also the sum of the tens and hundreds digit. So the ones digit cannot be 2 because that would make the tens and hundreds digit both be 1.

The ones digit also cannot be 3 because then one of the tens or hundreds digits would be 1 and that is already taken by the hundred thousands digit.

So the ones digit can be 5 or 7.

Suppose the ones digit is 5.

Then the sum of the tens and hundreds digits is 5. That could be 1 and 4 or 2 and 3. 1 is already used. So let's now suppose that the tens digit is 3 and the hundreds digit is 2.

The sum of all the digits is 21. We have already used 1, 2, 3, and 5. So the other two values must add up to 10. That could be 1 and 9, 2 and 8, 3 and 7, or 4 and 6. Only 4 and 6 haven't been used.

If the thousands digit is 6, it would have to be the sum of the hundreds digit (2) and the ten-thousands digit, which would have to be 4. The number: 146,235 **Ans.**

4. *Given:* a bicycle tire has a diameter of 22 inches. A motorcycle tire has a diameter of 25 inches.
- Find:* how many more feet the motorcycle travels than the bicycle after each tire has made 1000 revolutions.
- After 1000 revolutions of the tire, the bicycle traveled $22,000\pi$ inches. The motorcycle traveled $25,000\pi$ inches. That's a difference of 3000π inches.
- Converting to feet: $\frac{3000\pi}{12} = 250\pi$ **Ans.**
5. *Find:* the sum of the positive integers from 1 through 500 that are divisible by 2, 3, 4, 5 and 6.

The LCM of 2, 3, 4, 5 and 6 is $2 \times 2 \times 3 \times 5 = 60$. The multiples of 60 between 1 and 500 are 60, 120, 180, 240, 300, 360, 420 and 480. Their sum is $60 + 120 + 180 + 240 + 300 + 360 + 420 + 480 = 540 \times 4 = 2160$ **Ans.**

6. *Given:* the mean, median, unique mode and range of 10 integers are all 10.
Find: greatest possible integer in the list.
 Since the mean is 10, the sum of the 10 integers is 100. The median is 10 which means that the fifth and sixth integers are both 10 or the average of the fifth and sixth integers is 10. However, since the mode is also 10, the fifth and sixth integers must be 10. This means the largest the minimum value could possibly be would be 10, and since the range is 10, this would make the maximum 20. The list of integers would be 10, 10, 10, 10, 10, 10, 10, 10, 20, but this doesn't work since this sums to 110. So how about 19 as the maximum?
 We can start with 9 and end with 19.
 $9 + 19 = 28$
 That leaves 8 integers between 10 and 18 to sum to $100 - 28 = 72$
 That's not going to work.
 How about a high of 18?
 That will work.
 We can start with 8 and end with 18.
 $8 + 18 = 26$
 That leaves 8 integers to sum to $100 - 26 = 74$
 8, 8, 8, 8, 10, 10, 10, 10, 10, 18
 These 10 numbers sum to 100 for a mean of 10. The median is 10, the mode is 10 and the range is 10. The greatest possible integer is 18 **Ans.**

7. *Given:* A 200 milliliter solution is 7% detergent.

Find: How many milliliters of 100% detergent need to be added so the solution will be 14% detergent?
 7% of 200 milliliters is 14 milliliters of detergent.

Let x = the amount we need to add to get a solution of 14% detergent.

$$\frac{14 + x}{200 + x} = 0.14$$

$$14 + x = 28 + 0.14x$$

$$0.86x = 14$$

$$x = \frac{14}{0.86} \approx 16.27906 \approx 16.3 \text{ ml } \mathbf{Ans.}$$

8. *Find:* how many 3-digit numbers are there such that each of the digits is prime and the sum of the digits is prime?
 The prime single digit numbers are 2, 3, 5 and 7.

Consider, first, that each digit is different. Forget using any other combination with one 2 because two odds plus one even will always be an even number.

$$3 + 5 + 7 = 15$$

This isn't prime.

Now consider that two of the digits are the same.

$$2 + 2 + 3 = 7$$

That works and there are 3 permutations.

$$2 + 2 + 5 = 9$$

That doesn't work.

$$2 + 2 + 7 = 11$$

That works. There are 3 permutations.

$$3 + 3 + 5 = 11$$

That works. There are 3 permutations.

$$3 + 3 + 7 = 13$$

That works. There are 3 permutations.

$$5 + 5 + 3 = 13$$

That works. There are 3 permutations.

$$5 + 5 + 7 = 17$$

That works. There are 3 permutations.

$$7 + 7 + 3 = 17$$

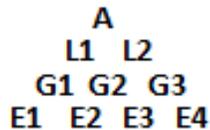

That works. There are 3 permutations.

$$7 + 7 + 5 = 19$$

That works. There are 3 permutations.

We do not need to consider 3 of the same prime because the sum of 3 of the same prime is always going to be divisible by 3. So we now have $8 \times 3 = 24$ numbers **Ans.**

9. *Find:* How many different paths from top to bottom spell ALGEBRA?

From the first line (with A) to the second line (with L) there are two paths (e.g., 2^1): AL1 and AL2.

From the second line to the third line (with G) there are 4 paths: AL1G1, AL1G2, AL2G2, AL2G3 (e.g., 2^2).

And we can see the pattern.

There are 2^3 paths to the fourth line (with E), 2^4 paths to the fifth line (with B), 2^5 paths to the sixth line (with R) and 2^6 paths to the seventh line (with A).

$$2^6 = 64 \text{ **Ans.**}$$

10. *Given:* The number of tokens Devin has is a square number less than 100. If Kevin gives Devin his tokens, Devin will have a total number of tokens that is still a square. If Devin gives Kevin the same number of tokens that Kevin already has, the number of tokens Devin is left with is also square.

Find: How many tokens does Kevin have?

List the number of squares less than 100:

$$1, 4, 9, 16, 25, 36, 49, 64, 81$$

For Devin to give Kevin the same number of tokens that Kevin already has, Devin must have more tokens than Kevin.

So what we have is the following:

Let d = the number of tokens Devin has

Let k = the number of tokens Kevin has

$d + k$ is a square

$d - k$ is a square

$d > k$

d cannot be 1 or 4, since Kevin would have more tokens than Devin.

Suppose $d = 9$

$$9 + 7 = 16; 9 - 7 = 2$$

This cannot work. There are no more values for k where $d > k$.

Suppose $d = 16$

$$16 + 9 = 25; 16 - 9 = 7$$

This cannot work. There are no more values for k where $d > k$.

Suppose $d = 25$.

$$25 + 11 = 36; 25 - 11 = 14$$

$$25 + 24 = 49; 25 - 24 = 1$$

And we have it.

$$k = 24 \text{ **Ans.**}$$

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

Copyright MATHCOUNTS, Inc. 2016. All rights reserved.

1. _____ Let $a @ b = \frac{a}{2a+b}$. What is the value of $5 @ 3$? Express your answer as a common fraction.

2. _____ rectangles

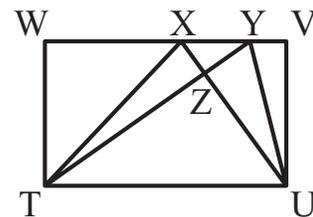

How many rectangles of any size are in the grid shown here?

3. _____ Given $7x + 13 = 328$, what is the value of $14x + 13$?

4. _____ What is the median of the positive perfect squares less than 250?

5. _____ If $\frac{x+5}{x-2} = \frac{2}{3}$, what is the value of x ?

6. _____ units² In rectangle TUVW, shown here, $WX = 4$ units, $XY = 2$ units, $YV = 1$ unit and $UV = 6$ units. What is the absolute difference between the areas of triangles TXZ and UYZ?

7. green
 marbles A bag contains 4 blue, 5 green and 3 red marbles. How many green marbles must be added to the bag so that 75 percent of the marbles are green?

8. miles MD rides a three wheeled motorcycle called a trike. MD has a spare tire for his trike and wants to occasionally swap out his tires so that all four will have been used for the same distance as he drives 25,000 miles. How many miles will each tire drive?

9. years Lucy and her father share the same birthday. When Lucy turned 15 her father turned 3 times her age. On their birthday this year, Lucy's father turned exactly twice as old as she turned. How old did Lucy turn this year?

10. The sum of three distinct 2-digit primes is 53. Two of the primes have a units digit of 3, and the other prime has a units digit of 7. What is the greatest of the three primes?

11. pounds Ross and Max have a combined weight of 184 pounds. Ross and Seth have a combined weight of 197 pounds. Max and Seth have a combined weight of 189 pounds. How many pounds does Ross weigh?

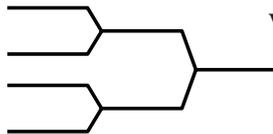

12. What is the least possible denominator of a positive rational number whose repeating decimal representation is $0.\overline{AB}$, where A and B are distinct digits?

13. _____ miles A taxi charges \$3.25 for the first mile and \$0.45 for each additional $\frac{1}{4}$ mile thereafter. At most, how many miles can a passenger travel using \$13.60? Express your answer as a mixed number.

14. _____ percent Kali is mixing soil for a container garden. If she mixes 2 m^3 of soil containing 35% sand with 6 m^3 of soil containing 15% sand, what percent of the new mixture is sand?

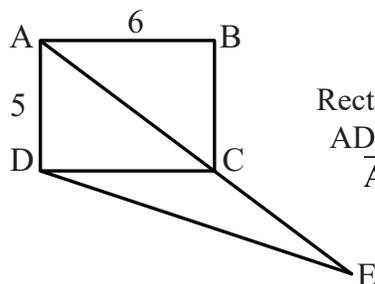

15. _____ laps Alex can run a complete lap around the school track in 1 minute, 28 seconds, and Becky can run a complete lap in 1 minute, 16 seconds. If they begin running at the same time and location, how many complete laps will Alex have run when Becky passes him for the first time?

16. _____ The Beavers, Ducks, Platypuses and Narwhals are the only four basketball teams remaining in a single-elimination tournament. Each round consists of the teams playing in pairs with the winner of each game continuing to the next round. If the teams are randomly paired and each has an equal probability of winning any game, what is the probability that the Ducks and the Beavers will play each other in one of the two rounds? Express your answer as a common fraction.

17. _____ A function $f(x)$ is defined for all positive integers. If $f(a) + f(b) = f(ab)$ for any two positive integers a and b and $f(3) = 5$, what is $f(27)$?

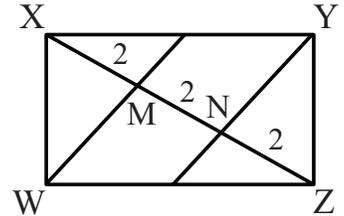

18. _____ units

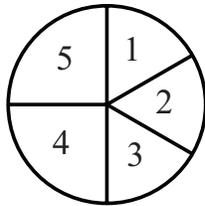

Rectangle ABCD is shown with $AB = 6$ units and $AD = 5$ units. If \overline{AC} is extended to point E such that \overline{AC} is congruent to \overline{CE} , what is the length of \overline{DE} ?

19. _____ The digits of a 3-digit integer are reversed to form a new integer of greater value. The product of this new integer and the original integer is 91,567. What is the new integer?

20. _____ units² Diagonal XZ of rectangle WXYZ is divided into three segments each of length 2 units by points M and N as shown. Segments MW and NY are parallel and are both perpendicular to XZ. What is the area of WXYZ? Express your answer in simplest radical form.

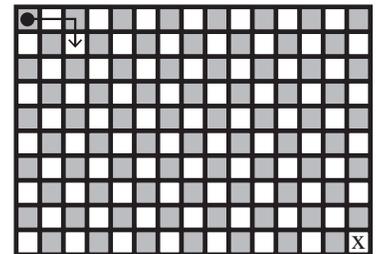

21. _____ A spinner is divided into 5 sectors as shown. Each of the central angles of sectors 1 through 3 measures 60° while each of the central angles of sectors 4 and 5 measures 90° . If the spinner is spun twice, what is the probability that at least one spin lands on an even number? Express your answer as a common fraction.

22. _____ orders The student council at Round Junior High School has eight members who meet at a circular table. If the four officers must sit together in any order, how many distinguishable circular seating orders are possible? Two seating orders are distinguishable if one is not a rotation of the other.

23. _____ moves Initially, a chip is placed in the upper-left corner square of a 15×10 grid of squares as shown. The chip can move in an L-shaped pattern, moving two squares in one direction (up, right, down or left) and then moving one square in a corresponding perpendicular direction. What is the minimum number of L-shaped moves needed to move the chip from its initial location to the square marked "X"?

24. _____ units On line segment AE, shown here, B is the midpoint of segment AC and D is the midpoint of segment CE. If $AD = 17$ units and $BE = 21$ units, what is the length of segment AE? Express your answer as a common fraction.

25. _____ There are twelve different mixed numbers that can be created by substituting three of the numbers 1, 2, 3 and 5 for a , b and c in the expression $a\frac{b}{c}$, where $b < c$. What is the mean of these twelve mixed numbers? Express your answer as a mixed number.
26. _____ If 738 consecutive integers are added together, where the 178th number in the sequence is 4,256,815, what is the remainder when this sum is divided by 6?
27. _____ points Consider a coordinate plane with the points $A(-5, 0)$ and $B(5, 0)$. For how many points X in the plane is it true that XA and XB are both positive integer distances, each less than or equal to 10?
28. _____ The function $f(n) = a \cdot n! + b$, where a and b are positive integers, is defined for all positive integers. If the range of f contains two numbers that differ by 20, what is the least possible value of $f(1)$?
29. _____ strings In the list of numbers 1, 2, ..., 9999, the digits 0 through 9 are replaced with the letters A through J, respectively. For example, the number 501 is replaced by the string "FAB" and 8243 is replaced by the string "ICED". The resulting list of 9999 strings is sorted *alphabetically*. How many strings appear before "CHAI" in this list?
30. _____ cm A 12-sided game die has the shape of a hexagonal bipyramid, which consists of two pyramids, each with a regular hexagonal base of side length 1 cm and with height 1 cm, glued together along their hexagons. When this game die is rolled and lands on one of its triangular faces, how high off the ground is the opposite face? Express your answer as a common fraction in simplest radical form.

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____ mi/h The end of each blade of a ceiling fan is two feet from the center of the fan and makes three full rotations per second. Given that there are 5280 feet in a mile, what is the speed, in miles per hour, of the end of one of the blades? Express your answer as a decimal to the nearest tenth.
2. _____ A, B, C, D and E in the decimal representations 0.ABC and 0.DE represent the digits 1, 2, 3, 4 and 5, in some order. What is the least possible absolute difference between the numbers 0.ABC and 0.DE? Express your answer as a decimal to the nearest thousandth.
3. _____ percent Approximately 70.8% of Earth's surface is covered with water; the rest is land. It is said that Mars, whose surface is covered entirely with land, has approximately the same amount of land as the earth. Based on this information, what percent of Earth's radius is Mars' radius? Express your answer to the nearest whole number.
4. (_____ , _____ , _____ , _____ , _____) Billy wrote a sequence of five numbers on the board, each an integer between 0 and 4, inclusive. Penny then wrote a sequence of five numbers that measured some statistics about Billy's sequence. In particular, Penny first wrote down the number of 0s in Billy's sequence. Then Penny wrote the number of 1s in Billy's sequence, and then the number of 2s, the number of 3s, and finally the number of 4s. It turned out that Penny's sequence was exactly the same as Billy's! What was this sequence? Express your answer as an ordered 5-tuple.
5. _____ If x is a number such that $3^x + 3^{x+2} = 9^x + 9^{x+2}$, then what is the value of 3^x ? Express your answer as a common fraction.

6. _____ times A standard U.S. dime has a mass of 2.268 grams. A standard U.S. nickel has a mass of 5.000 grams. Diane has a large bag of dimes, and Nick has a large bag of nickels. If both bags of coins have the same total mass, then the total value of Diane's coins is how many times the total value of Nick's coins? Express your answer as a decimal to the nearest tenth.

7. _____ For each positive integer n , $a_n = 9n + 2$ and $b_n = 7n + 3$. If the values common to both sequences are written as a sequence, the n th term of that sequence can be expressed as $pn + q$. What is the value of $p - q$?

8. _____ units²

Quadrilateral APBQ, shown here, has vertices $A(0, 0)$ and $B(8, 0)$, and vertices P and Q lie on the line given by the equation $4x + 3y = 19$. If $PQ = 3$ units, what is the area of quadrilateral APBQ? Express your answer as a common fraction.

9. _____ arrangements Eight blue and five orange tiles are arranged in an ordered line such that the tile on the left must be blue and every tile must be adjacent to at least one tile of the same color. For example, if an arrangement of four tiles was made, the only possibilities would be BBBB or BBOO. How many different arrangements are possible if all thirteen tiles must be used?

10. _____ bags Spring City is replanting the grass around a circular fountain in the center of the city. The fountain's diameter is 10 feet, and the grass extends out from the edge of the fountain 20 feet in every direction. Grass seed is sold in bags that will each cover 300 ft^2 of grass. How many whole bags of grass seed will the city need to purchase?

1. _____ (factors) How many positive integer factors does 2016 have?
2. _____ If x is a positive number such that $x\%$ of x is 289, what is the value of x ?
3. _____ (meters) Quadrilaterals ABCD and WXYZ are similar. The area of quadrilateral ABCD is five times that of quadrilateral WXYZ. If $BD = 10$ meters, what is XZ , in meters? Express your answer in simplest radical form.
4. _____ The six-digit number $31A,B2B$, where A and B represent distinct digits, is divisible by 225. What is the value of A ?
5. _____ What is the value of $\frac{37,037}{7007}$? Express your answer as a mixed number.
6. _____ If a number is increased by $p\%$, and then the new number is decreased by $p\%$, the result is 1% less than the original number. What is the value of p ?
7. _____ Given that $w - 3 = x + 5 = y - 7 = z + 9$, what is the absolute difference between the least and the greatest of the numbers w , x , y and z ?
8. _____ What is the units digit of the sum $4^1 + 4^2 + 4^3 + \dots + 4^{2016}$?
9. _____ (factors) If $c = 2! \cdot 3! \cdot 4!$, what is the total number of positive integer factors of c ?
10. _____ If $x > 1, y > 1, \frac{(xy^2)^{15}}{(x^2y)^9} = 1$ and $x = y^k$, where $k > 0$, what is the value of k ?
11. _____ Two standard, fair six-sided dice are rolled. If the sum of the numbers rolled is greater than or equal to 8, what is the probability that the sum is odd? Express your answer as a common fraction.
12. _____ (dollars) Tracee purchased two items, each originally priced at \$22.50. However, Tracee got a 12% discount on one item and a 28% discount on the other. What is the combined amount Tracee paid for these two items?
13. _____ (units)

The coordinates of three vertices of a cube are shown. What is the length of the space diagonal with endpoints A and D , in units? Express your answer in simplest radical form.
14. _____ What is the greatest 4-digit integer whose digits all are prime and for which the sum of the digits is prime?
15. _____ If $d = 123456^3 - 123^5$, what is the least prime factor of d ?

16. _____ (palindromes) Excluding the numbers in which all three digits are the same, how many 3-digit positive integer palindromes are there?
17. _____ (mm) Triangle ABC has integer side lengths and its perimeter is 18 mm. If $AB = AC$, what length of side BC, in millimeters, minimizes the area of triangle ABC?
18. _____ (values) How many integer values of x satisfy the inequality $|2x + 1| \leq |3 - x|$?
19. _____ (minutes) Each day, Todd rows 12 miles upriver and 12 miles back. His speed in still water is 9 mi/h. On Monday, the current was 1 mi/h, and on Tuesday the current was 3 mi/h. What is the absolute difference between the number of minutes Todd spent rowing on the two days?
20. _____ What is the value of $\left(x + \frac{1}{x}\right)^2$, if $x = \sqrt{\frac{5}{8}}$? Express your answer as a common fraction.
21. _____ If $6^4 \cdot 8^2 = 2^a \cdot 9^b$ for whole numbers a and b , what is the value of $a + b$?
22. _____ (inches) Two rectangles are similar. The smaller rectangle has length 9 inches and width 5 inches. The larger rectangle has length $4x - 3$ inches and width $2x + 2$ inches. What is the perimeter of the larger rectangle, in inches?
23. _____ (days) On the first day of a two-week reading project, Dirk spent 45 minutes reading. On each subsequent day, he read for 15 more minutes than he did the day before. On how many days did Dirk spend less than 10% of a 24-hour day reading?
24. _____ (miles) Susan's odometer displays 15,951 miles, a palindrome. What is the minimum number of miles she must drive before it displays another palindrome?
25. _____ The sum of three integers is 80. The ratio of the first integer to the second is 3:4, and the ratio of the second integer to the third is 4:9. What is the absolute difference between the greatest and least of these integers?
26. _____ In isosceles right triangle ABC, shown here, $AC = BC$. Point X is on side BC such that $CX = 6$ and $XB = 12$, and Y is on side AB such that $\overline{XY} \perp \overline{AB}$. What is the ratio of the area of triangle BXY to the area of triangle ABC? Express your answer as a common fraction.
27. _____ For any 3-digit number ABC, the 6-digit number ABC,ABC is always divisible by a 1-digit number greater than 1. What is that 1-digit number?

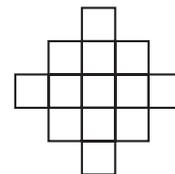

28. _____ (dollars) A half-dollar coin has the same weight as five dimes. Three pounds of half-dollar coins are worth \$60. How many dollars are three pounds of dimes worth?

29. _____ What is the sum of all positive integers k such that the equation $x^2 + 11x + k = 0$ has two integer solutions?

30. _____ What is the least integer greater than 1,000,000 that is divisible by 18?

31. _____ Denis chooses two different unit squares at random from the array of 13 unit squares shown. What is the probability that the two squares share an edge? Express your answer as a common fraction.

32. _____ A circle of diameter 3 inches is inside a circle of diameter 5 inches. What is the probability that a dart that lands inside the larger circle does not land inside the smaller circle? Express your answer as a common fraction.

33. _____ (minutes) A subway train arrives at a station at midnight on Sunday. An additional 240 trains arrive at the same station by midnight the following Sunday, with the last one arriving exactly one week after the original train. What is the average number of minutes between train arrivals at this station?

34. _____ What is the sum of the three missing digits in the subtraction problem $5\square,661 - \square2,83\square = 17,825$?

35. _____ (digits) How many digits are in the product $8^9 \cdot 5^{24}$?

36. _____ What is the value of the expression $\frac{20.16^2 - 1}{19.16}$? Express your answer as a decimal to the nearest hundredth.

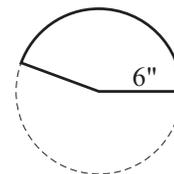

37. _____ (units²) The diameter and height of a closed cylinder are equal. If the volume of the cylinder is 128π units³, what is its surface area, in square units? Express your answer in terms of π .

38. _____ A 3-digit number, for which each digit is 1, 4 or 7, with repetition allowed, is chosen at random. What is the probability that the sum of the three digits is 12? Express your answer as a common fraction.

39. _____ If $x > 0$ and $\sqrt{3} \cdot \sqrt{7} \cdot \sqrt{10} \cdot \sqrt{x} = x$, what is the value of x ?

40. _____ What is the 7th term of the geometric sequence $9, 6, 4, \frac{8}{3}, \dots$? Express your answer as a common fraction.

41. _____ (inches) The lateral surface of a cone is constructed by rolling up a 160° sector cut from a circle of radius 6 inches. What is the radius of the base of this cone, in inches? Express your answer as a common fraction.

42. _____ (units²) On the coordinate plane, the five vertices of a pentagon are (0, 0), (4, 0), (6, 3), (4, 5) and (0, 3). What is the area of the pentagon, in square units?

43. _____ Given that $(2^{n+1})^2 = \frac{4^{2n}}{8^n}$, what is the value of n ?

44. _____ The integer 273 can be written as a sum of seven consecutive positive integers. What is the sum of the two greatest of these integers?

45. _____ (cm) A ball of copper in the shape of a sphere with radius 3 cm is reshaped into a cylindrical wire with radius 0.06 cm. What is the length, in centimeters, of the wire?

46. _____ If $\frac{3}{8}$ of $\frac{2}{7}$ of a number is 1 more than $\frac{3}{28}$ of $\frac{1}{8}$ of that same number, what is the number? Express your answer as a common fraction.

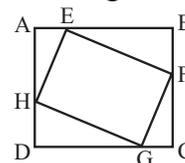

47. _____ (marbles) Ten green marbles are removed from a bag, leaving twice as many green marbles as red marbles. Fifteen red marbles are then removed from the bag, leaving five times as many green marbles as red marbles. How many green marbles were originally in the bag?

48. _____ What is the sum of all integer values of n between 75 and 100 such that n divided by 6 has remainder 5 and n divided by 4 has remainder 3?

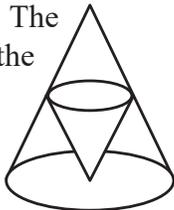

49. _____ (seconds) Mike and Mark start at opposite ends of a straight 100-yard track. They repeatedly run to the opposite end, turn around and run back. They run at the same constant speed, start at the same time, and pass each other for the first time after 7 seconds. How many seconds have elapsed when they pass each other for the fifth time?

50. _____ (ft²) What is the area, in square feet, of a square with diagonal length 6 feet?

51. _____ (in²) Rectangle EFGH is inscribed in rectangle ABCD so that the four similar right triangles are formed, as shown. If $m\angle BEF = 30^\circ$, $EF = 12$ inches and $FG = 2\sqrt{3}$ inches, what is the area of rectangle ABCD, in square inches? Express your answer in simplest radical form.

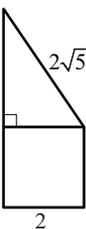

52. _____ What is the sum of the composite positive integers less than 100 that are not divisible by 2, 3 or 5?

53. _____ The equation $x^3 - 3x^2 + ax + b = 0$ has 1 and -2 as two of its three solutions. What is the value of $a + b$?
54. _____ If a positive 2-digit number is chosen at random, what is the probability that its digits differ by 1? Express your answer as a common fraction.
55. _____ What is the fifth digit to the right of the decimal point in the value of the difference $0.213 - 0.123$?
56. _____ In a particular sequence, the first term is 20, the second term is 16, and each subsequent term is the mean of all preceding terms. What is the 2016th term in the sequence?
57. _____ The set of all the positive 4-digit integers that can be formed using each of the digits 1, 2, 3 and 7 exactly once are arranged in increasing order. What is the 13th number?
58. _____ When Yin attempts to add all the positive integers from 1 through 99, he accidentally skips a number and gets the sum 4904. Which number did Yin skip?
59. _____ A small circular cone is inscribed in a large circular cone, as shown. The apex of the small cone is the center of the base of the large cone. If the base radius of the small cone measures half that of the large cone, what is the ratio of the volume of the small cone to the volume of the large cone? Express your answer as a common fraction.
- 
60. _____ What is the greatest integer less than 100 that cannot be written as a sum of two primes?
61. _____ What is the greatest proper divisor of $391^2 - 389^2$?
62. _____ If x and y are perfect squares such that $x + y = 65$ and $x > y$, what is the least possible value of $x - y$?
63. _____ (students) If the students at Conformity Middle School all weigh exactly 112 pounds each, how many of these students can safely stand on a bridge with a 10,000-pound weight limit?
64. _____ (units²) What is the area, in square units, of a rectangle with diagonal length 15 units and width 5 units? Express your answer in simplest radical form.

65. _____ (sculptures) Five ounces of clay are required for Theresa to complete each sculpture. What is the maximum number of sculptures she can complete using 15 pounds of clay?

66. _____ A bag contains 7 red tiles and 3 blue tiles. If two tiles are drawn from the bag at random, without replacement, what is the probability that the tiles will be different colors? Express your answer as a common fraction.

67. _____ (games) The Mudcats baseball team currently has 12 wins and 12 losses. What is the fewest number of consecutive games they must win to have won at least 70% of their games?

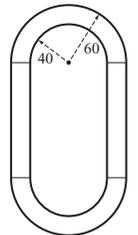

68. _____ (units²)  A square with sides of length 2 units is constructed on a right triangle with a hypotenuse of length $2\sqrt{5}$ units to form the figure shown. What is the total area of the figure, in square units?

69. _____ (times) On a 12-hour digital clock, sometimes all of the digits are the same (for example, 3:33). How many times during a 24-hour day are all of the digits the same?

70. _____ The reflection of $P(4, -5)$ across the line $x = 1$ is P' . If the reflection of P' across the line $y = 2$ is $P''(a, b)$, what is the value of $a + b$?

71. _____ The dimensions of a 9-inch by 12-inch rectangular picture are reduced by $x\%$. Then the dimensions of the smaller picture are reduced by $x\%$, resulting in a picture that measures 2.25 inches by 3 inches. What is the value of x ?

72. _____ (feet) A running track consists of two straight regions and two semicircular regions as shown. The inner and outer radii of the semicircles at each end are 40 feet and 60 feet, respectively. The straight parts are each 120 feet long. What is the absolute difference, in feet, between the inner and outer perimeters of the track? Express your answer in terms of π .

73. _____ In the sequence 37, 45, 53, 61, ..., each number after the first term is 8 greater than the previous term. What is the least integer greater than 500 in the sequence?

74. _____ If the value of an expression written in the form $a + \sqrt{b}$ is six less than half its square, what is the greatest value of $a + b$?

75. _____ When the decimal number $0.\overline{1234}$ is written as a common fraction, what is the sum of the numerator and denominator?

76. _____ (passwords) Samantha needs to choose a password with 6 distinct characters. The first two characters must be digits from 0 to 4, inclusive. The second two are lowercase letters of the alphabet, and the last two are digits from 5 to 9, inclusive. How many possible passwords can Samantha make?
77. _____ What is the sum of the solutions to $x^2 + 3x = 10$?
78. _____ (hours) The time in Sydney, Australia is 17 hours ahead of the time in Portland, Oregon. If it is 5:00 p.m. in Portland, how many hours after midnight is it in Sydney?
79. _____ Mr. Dexter has 30 desks in his classroom numbered 1 through 30. If Ken randomly sits at a desk, what is the probability that he will sit at a desk with a number that is not prime? Express your answer as a common fraction.
80. _____ If $\frac{3}{5 + \frac{1}{x}} = \frac{1}{4}$, what is the value of x ? Express your answer as a common fraction.

MATHCOUNTS®

2016 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2016 MATHCOUNTS® State Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Mady Bauer
for graciously and voluntarily sharing her solutions
with the MATHCOUNTS community
for many, many years!*

2016 State Competition

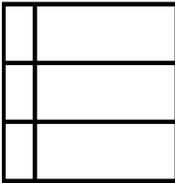

Sprint Round

1. Given: $a@b = \frac{a}{2a+b}$

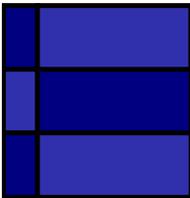

Find: $5@3$

$5@3 = \frac{5}{(2 \times 5) + 3} = \frac{5}{13}$ **Ans.**

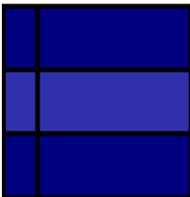

2. Find: the number of rectangles displayed in the diagram.

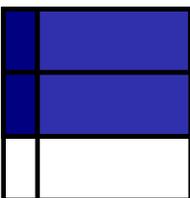

There are 6 rectangles that are one row high by one column wide.

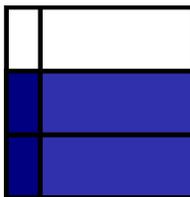

There are 3 rectangles that are one row high by two columns wide.

There are 4 rectangles that are two rows high by one column wide.

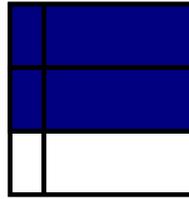

2 here

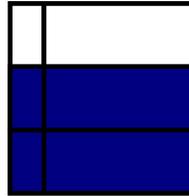

and 2 here

There are 2 rectangles that are two rows high by two columns wide.

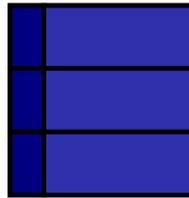

1 here

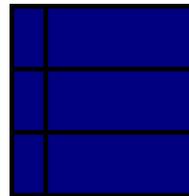

and 1 here

There are 2 rectangles that are three rows high by one column wide.

Finally, there is 1 rectangle three rows high by two columns wide.

The total number of rectangles is $6 + 3 + 4 + 2 + 2 + 1 = 18$ **Ans.**

3. Given: $7x + 13 = 328$

Find: the value of $14x + 13$

Multiply the equation by 2.

$14x + 26 = 656$

$14x + 26 - 13 = 656 - 13 = 643$ **Ans.**

4. Find: the median of the positive perfect squares less than 250.

The largest square less than 250 is 225 or 15^2 . That would be 15 integers so the median is the eighth one. $8^2 = 64$ **Ans.**

5. Given: $\frac{x+5}{x-2} = \frac{2}{3}$

Find: x

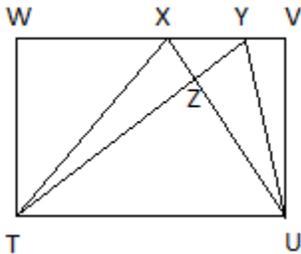

$$\frac{x+5}{x-2} = \frac{2}{3}$$

$$3x + 15 = 2x - 4$$

$$x = -19 \text{ Ans.}$$

6. Given: $WX=4$, $XY=2$, $YV=1$ and $UV=6$.

Find: the absolute difference between the areas of triangles TXZ and UYZ .

The area of triangle TXZ is equal to the area of triangle TXU minus TZU . The area of triangle UYZ is equal to the area of triangle TYU minus TZU . This means the difference in the area of triangles TXZ and UYZ is equal to the difference between TXU and TYU . The base of both triangles is TU . The height of both triangles is the same – a perpendicular from WV to TU . Therefore, the area of each triangle is the same. The difference between the two areas is 0. Ans.

7. Given: A bag has 4 blue, 5 green and 3 red marbles.

Find: How many green marbles must be added to the bag so that 75% of the marbles are green?

There are a total of $4 + 5 + 3 = 12$ marbles.

Let x = the number of green marbles added.

$$\frac{5+x}{12+x} = \frac{3}{4}$$

$$20 + 4x = 36 + 3x$$

$$x = 16 \text{ Ans.}$$

8. Given: MD swaps out the tires on his trike so that all four will have been used for the same distance as he drives 25,000 miles.

Find: How many miles does each tire drive.

Each tire will be on for $\frac{3}{4}$ of the trip.

$$\frac{3}{4} \times 25000 = 18750 \text{ Ans.}$$

9. Given: Lucy and her dad have the same birthday. When Lucy was 15 her father was 3 times her age. On this birthday, Lucy's father turned twice as old and Lucy did.

Find: How old is Lucy?

When Lucy was 15 her father was 45.

Currently, her Dad is twice her age. Let x represent the number of years since Lucy was 15. Then

$$2 \times (15 + x) = 45 + x$$

$$30 + 2x = 45 + x$$

$$x = 15$$

Her Dad is now $45 + 15 = 60$, and Lucy is $15 + 15 = 30$ Ans.

10. Given: The sum of three distinct 2-digit primes is 53. Two of the primes have a units digit of 3 and the other prime has a units digit of 7.

Find: the greatest of the three primes.

Let's list the 2-digit primes less than 53 that end in 3: 13, 23, 43.

Now list the 2-digit primes less than 53 that end in 7: 17, 37, 47.

Remove 43 and 47 because they are too large to be one of the three primes.

$$13 + 23 = 36$$

$$53 - 36 = 17$$

So the primes are 13, 17 and 23.

The greatest of the primes is 23. Ans.

11. Given: Ross and Max weigh 184 pounds.

Ross and Seth weigh 197 pounds. Max and Seth weigh 189 pounds.

Find: Ross' weight.

Let r = Ross' weight.

Let m = Max's weight.

Let s = Seth's weight.

$$r + m = 184$$

$$r + s = 197$$

$$m + s = 189$$

Adding these three equations yields

$$2r + 2m + 2s = 184 + 197 + 189 = 570$$

Doubling the third equations, we get

$$2m + 2s = 189 \times 2 = 378$$

Substituting this into the equation,

$$2r + 2m + 2s = 570, \text{ we get } 378 + 2r = 570$$

$$2r = 570 - 378 = 192$$

$$r = 96 \text{ **Ans.**}$$

12. Find: the least possible denominator of a positive rational number $0.\overline{AB}$ where A and B are distinct digits.

$$\text{Let } x = 0.\overline{AB}$$

$$\text{Then } 100x = AB.\overline{AB}$$

$$99x = AB$$

$$x = \frac{AB}{99}$$

$$99 = 11 \times 9$$

Suppose the denominator is 9. An example is

$$\frac{11}{99} = \frac{1}{9} \approx 0.\overline{11}$$

No, this doesn't work since $A = B$ and that violates the requirements. What about 11?

An example is:

$$\frac{9}{99} = \frac{1}{11} \approx 0.\overline{09}$$

Yes, in this case $A \neq B$.

$$11 \text{ **Ans.**}$$

13. Given: It costs \$3.25 for the first mile and \$0.45 for each additional $\frac{1}{4}$ mile.

Find: How many miles can be travelled for \$13.60

$$13.60 - 3.25 = 10.35$$

So, after the first mile there is \$10.35 left.

$$\frac{10.35}{0.45} = 23$$

So that's an additional 23 quarter miles.

$$1 + \frac{23}{4} = 1 + 5\frac{3}{4} = 6\frac{3}{4} \text{ **Ans.**}$$

14. Given: 2 m³ of soil containing 35% sand is mixed with 6 m³ of soil containing 15% sand.

Find: the percent of the new mixture that is sand

Of the 2 m³ mixture, $0.35 \times 2 = 0.7$ m³ is sand, and of the 6 m³ mixture, $0.15 \times 6 = 0.9$ m³ is sand.

Putting the two mixtures together gives us $2 + 6 = 8$ m³ of mixture, of which $0.7 + 0.9 = 1.6$ m³ is sand.

$$\frac{1.6}{8} = \frac{1}{5} = 20\% \text{ **Ans.**}$$

15. Given: Alex runs a lap in 1 minute, 28 seconds. Becky runs a complete lap in 1 minute, 16 seconds.

Find: How many complete laps will Alex have run when Becky passes him for the first time?

Alex runs at a rate of 88 seconds per lap and Becky at a rate of 76 seconds per lap. Let l = the length of the lap.

After one second Alex has run $\frac{1}{88}$ of a lap.

Becky has run $\frac{1}{76}$ of a lap. The difference is

$$\frac{1}{76} - \frac{1}{88} = \frac{88-76}{76 \times 88} = \frac{12}{76 \times 88} = \frac{3}{19 \times 88} = \frac{3}{1672}$$

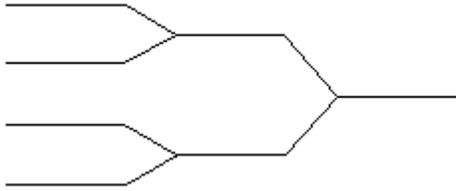

At a separation of $\frac{3}{1672}$ laps per second it will take $\frac{1672}{3}$ seconds to reach one lap difference.

$$\frac{1672}{3} = 557\frac{1}{3} \text{ seconds}$$

$$\frac{557\frac{1}{3}}{88} = 6\frac{1}{3} \text{ laps.}$$

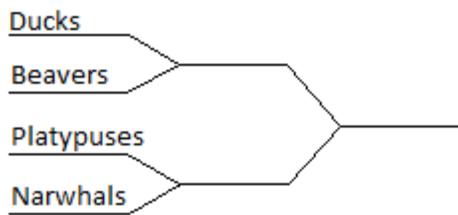

Therefore, Alex will have run 6 complete laps when Becky passes him. 6 **Ans.**

16. Given: Four teams, the Beavers, Ducks, Platypuses and Narwhals, are in a single-elimination tournament.

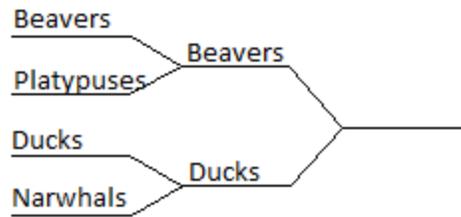

Find: The probability that the Ducks and the Beavers will play each other in one of the two rounds.

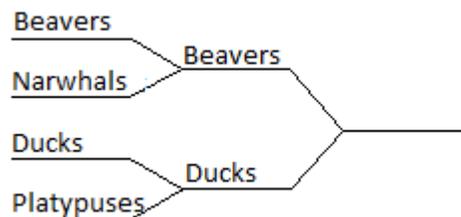

Let's start out with the Ducks and the Beavers playing each other in the first round.

There are 2 possibilities for the outcome of the Ducks versus Beavers game and 2 possibilities for the outcome of the Platypuses versus Narwhals game. There are $2 \times 2 = 4$ match-up possibilities for the final round. In 4 out of 4 of these possibilities the Ducks and the Beavers will play since they meet in the first round. If the Ducks and the Beavers do not play in the first round, there are two different first round scenarios. First, let's look at the Beavers playing the Platypuses and the Ducks playing the Narwhals in the first round. Again, there are $2 \times 2 = 4$ possible outcomes of these matchups. Of these possibilities, only 1 will the Beavers and the Ducks play each other, shown here.

In the other first round scenario the Beavers play the Narwhals and the Ducks play the Platypuses. Again, there are 4 possible outcomes and only 1, shown here, where the Beavers play the Ducks.

Of the three possible first round lineups, there are $4 + 4 + 4 = 12$ possible second round matchups. Out of these matchups the Ducks and the Beavers will end up playing each other in $4 + 1 + 1 = 6$ of the scenarios. So the probability is

$$\frac{6}{12} = \frac{1}{2} \text{ Ans.}$$

17. Given: $f(x)$ is defined for positive integers and $f(a) + f(b) = f(ab)$ and $f(3) = 5$.
 Find: $f(27)$
 $f(3) + f(3) = f(3 \times 3)$
 $f(9) = 5 + 5 = 10$
 $f(3) + f(9) = f(3 \times 9)$
 $f(27) = 5 + 10 = 15$ **Ans.**
18. Given: In rectangle ABCD, $AB = 6$ and $AD = 5$. AC is extended to point E so that \overline{AC} is congruent to \overline{CE} .
 Find: the length of \overline{DE}

Using this information, we can set up two ratios to solve for unknown distances.

$$2/NY = PY/2 \text{ and } NY = 2PY$$

Solving we get:

$$4 = NY \times PY$$

$$4 = 2PY \times PY$$

$$2 = PY^2$$

$$PY = \sqrt{2}$$

And therefore

$$NY = 2\sqrt{2}$$

Now we can use the Pythagorean theorem to find XY and YZ.

$$PY^2 + 2^2 = RY^2$$

$$(\sqrt{2})^2 + 4 = RY^2$$

$$6 = RY^2$$

$$RY = \sqrt{6}$$

Therefore, $XY = 2RY = 2\sqrt{6}$.

$$NY^2 + 2^2 = YZ^2$$

$$(2\sqrt{2})^2 + 4 = YZ^2$$

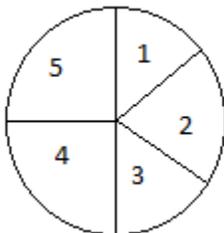

$$12 = YZ^2$$

$$YZ = 2\sqrt{3}$$

The area of rectangle WXYZ is

$$XY \times YZ = 2\sqrt{6} \times 2\sqrt{3} = 4\sqrt{18} = 12\sqrt{2} \text{ **Ans.**}$$

21. Given: A spinner is divided into 5 sectors. The angles of sections 1 through 3 measure 60° . The angles of sections 4 and 5 measure 90° . Find: the probability that at least one spin lands on an even number if the spinner is spun twice.

There are two even numbers, 2 and 4. The section labeled 2 is 60° , and the section labeled 4 is 90° . The probability of one spin

landing on an even number is, therefore, $\frac{60+90}{360} = \frac{150}{360} = \frac{5}{12}$.

The probability of one spin landing on an odd number is $1 - \frac{5}{12} = \frac{7}{12}$.

If you are spinning twice, there are three ways to get at least one even. You can spin two evens, an even and then an odd or an odd and then an even.

The probability of spinning two evens is

$$\frac{5}{12} \times \frac{5}{12} = \frac{25}{144}$$

The probability of spinning an even then an

$$\text{odd is } \frac{5}{12} \times \frac{7}{12} = \frac{35}{144}$$

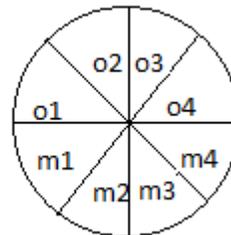

The probability of spinning an odd then an

$$\text{even is } \frac{7}{12} \times \frac{5}{12} = \frac{35}{144}$$

So the probability of spinning at least one

$$\text{even is } \frac{25}{144} + \frac{35}{144} + \frac{35}{144} = \frac{95}{144} \text{ **Ans.**}$$

22. Given: The student council has 8 members consisting of 4 officers and 4 other members. The 4 officers must sit together at the circular table. Find: How many distinguishable circular seating orders are possible?

Let o1 through o4 be the officers and m1 through m4 be the members.

There are $4! = 24$ ways that o1 through o4 can be ordered. Similarly, there are 24 ways that m1 through m4 can be ordered. $24 \times 24 = 576$ **Ans.**

23. Given: a chip is placed in the upper-left corner square of a 15×10 grid. The chip can move in an L-shaped pattern.

Find: the minimum number of L-shaped moves to move the chip to the square marked "X".

You need to move 9 down and 14 to the right.

Moving 14 to the right will take at least 7 L-shaped patterns that move 2 to the right and 1 down.

But, if we do 7 of those we end up at (15, 8) given that we started at (1, 1) and must end up at (15, 10).

So, can we do it with 8 L-shaped moves?

We can do 6 moves of (2 right, 1 down) to get us to (13, 7).

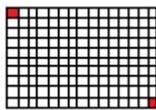

One move of (1 right, 2 down) will get us to (14, 9) leaving us with having to go (1, 1) more but there's no L-shaped move to get us there.

Again, after 6 moves, we can move (1 left, 2 down) to (12, 9). From there we are still going to need 2 more moves because

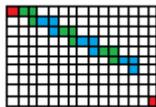

$$15 - 12 = 3.$$

It looks like it will take us 9 moves to get this to work.

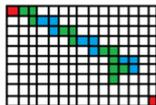

We start at (1, 1).

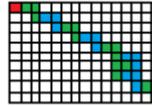

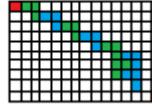

Now let's do 6 (2 right, 1 down) to get to (13, 7)

Now the 7th L-shaped move is 2 left and 1 down getting us to (11, 8).

This has positioned us to move 2 more L-shaped moves of 2 right and 1 down.

9 Ans.

24. Given: On line segment AE , B is the midpoint of segment AC and D is the midpoint of segment CE . $AD = 17$ and $BE = 21$.

Find: the length of segment AE .

$$AB = BC$$

$$CD = DE$$

$$\text{Let } x = AB$$

$$\text{Let } y = CD$$

Then the length of segment AD is $2x + y$ and the length of BE is $x + 2y$.

Since $AD = 17$ and $BE = 21$, we have

$$2x + y = 17$$

$$x + 2y = 21$$

Adding these two equations yields

$$3x + 3y = 38$$

$$3(x + y) = 38$$

$$x + y = \frac{38}{3}$$

The length of AE is $2x + 2y$.

$$2x + 2y = 2(x + y) = 2 \times \frac{38}{3} = \frac{76}{3} \text{ **Ans.**}$$

25. Given: There are 12 different mixed numbers that can be created by substituting three of the numbers 1, 2, 3 and 5 for a , b , and c in the expression $a\frac{b}{c}$ where $b < c$.

Find: the mean of the 12 numbers.

These are the 12 numbers:

$$1\frac{2}{3}, 1\frac{2}{5}, 1\frac{3}{5}$$

$$2\frac{1}{3}, 2\frac{1}{5}, 2\frac{3}{5}$$

$$3\frac{1}{2}, 3\frac{1}{5}, 3\frac{2}{5}$$

$$5\frac{1}{2}, 5\frac{1}{3}, 5\frac{2}{3}$$

Add up all the mixed numbers whose denominator is 2.

$$3\frac{1}{2} + 5\frac{1}{2} = 9$$

Add up all the mixed numbers whose denominator is 3.

$$1\frac{2}{3} + 2\frac{1}{3} + 5\frac{1}{3} + 5\frac{2}{3} = 13\frac{6}{3} = 15$$

Add up all the mixed numbers whose denominator is 5.

$$1\frac{2}{5} + 1\frac{3}{5} + 2\frac{1}{5} + 2\frac{3}{5} + 3\frac{1}{5} + 3\frac{2}{5} =$$

$$12\frac{12}{5} = 14\frac{2}{5}$$

Now, add them all up.

$$9 + 15 + 14\frac{2}{5} = 38\frac{2}{5} = \frac{192}{5}$$

Now determine the mean.

$$\frac{\frac{192}{5}}{12} = \frac{192}{5 \times 12} = \frac{192}{60} = 3\frac{12}{60} = 3\frac{1}{5} \text{ Ans.}$$

26. Given: 738 consecutive integers are added.

The 178th number in the sequence is 4,256,815.

Find: the remainder when the sum is divided by 6.

First, notice 738 is evenly divisible by 6 because it is even and its digits sum to 18, a multiple of 3.

The formula for adding the first n consecutive integers is $(n)(n + 1)/2$.

Let x represent the first integer in this sequence.

The sum of these 738 integers will be $(738)(738 + 1)/2 + 738x$

Because we know 738 is divisible by 6, we know $738x$ will also be divisible by 6 and therefore have remainder 0. We don't need to even find the value of x.

Now let's look at what still remains in the sum

$$(738)(738 + 1)/2 = (369)(738 + 1) =$$

$$369 \times 738 + 369$$

We know 6 evenly divides 369×738

So the remainder for this integer sum is equal to the remainder when 369 is divided by 6.

$$369 \div 6 = 61 \text{ remainder } 3. \text{ Ans.}$$

27. Given: A(-5,0) and B(5,0)

Find: How many points X are there such that XA and XB are both positive integer distances, each less than or equal to 10?

Let's assume that the point X is not on the x-axis. Then it's all about creating a triangle where one side is 10 and the other two are 10 or smaller.

Let's start with one of the other two sides being 10. The max length for the third side would be 19 but we are limited to lengths ≤ 10 . So the third side can be 1 through 10 for a total of 10 triangles.

Now let one of the other two sides be 9.

The max length for the third side is 18.

Again, with the limitations, and taking into account that the first two lines differ by one, the third side can be 2 through 10 or 9 possibilities.

Similarly for the second side having a length of 8, the third side can be 3 through 10 or 8 possibilities.

There's the pattern:

Second side is 7; third side is 4 through 10.

Second side is 6; third side is 5 through 10.

Second side is 5; third side is 6 through 10.

Second side is 4; third side is 7 through 10.

Second side is 3; third side is 8 through 10.

Second side is 2; third side is 9 through 10.

Second side is 1, third side is 10.

$$1 + 2 + \dots + 9 + 10 = 55$$

All of these triangles have been above the x-axis. But we can have the same triangles reflected over the x-axis.

That gives us, so far, $55 + 55 = 110$ possibilities.

All of these triangles assumed that X was not on the x-axis. But if it is, you could have X at $(-4,0), (-3,0), \dots, (3,0), (4,0)$

That's another 9 points.

$$110 + 9 = 119 \text{ Ans.}$$

28. Given: $f(n) = a \cdot n! + b$, where a and b are positive integers. The range of f contains two numbers that differ by 20.

Find: the least possible value of $f(1)$.

Two values, $f(y)$ and $f(x)$ must differ by 20.

$$f(y) - f(x) = a \cdot y! + b - (a \cdot x! + b)$$

$$f(y) - f(x) = a \cdot (y! - x!)$$

$$20 = a \cdot (y! - x!)$$

Since all the variable are positive integers, let's look at pairs integers that multiply to be 20: $1 \times 20, 2 \times 10, 4 \times 5$.

We want to minimize the value of a in order to minimize the value of $f(1)$.

Let's look at the value of the first 5 factorials:

$$1! = 1, 2! = 2, 3! = 6, 4! = 24, 5! = 120$$

If a is 1, then we need two factorials that differ by 20. There aren't two.

If a is 2, then we need two factorials that differ by 10. There aren't two.

If a is 4, then the factorials $6! - 1! = 5$ will work.

So we know a is 4, b can be any positive integer but we want to minimize $f(1)$ so lets pick b to be 1.

$$f(1) = 4 \cdot 1! + 1 = 5 \text{ Ans.}$$

29. Given: A list of numbers 1, 2, ... 9999 where the digits 0 through 9 are replaced with the letters A through J. The resulting list of 9999 strings is sorted alphabetically.

Find: How many strings appear before "CHAI"?

Alphabetic sorting is just what you find in the dictionary.

- Single digit numbers

0 (A) can't be considered so we start with 1.

1 and 2 (i.e., B and C) will be before CHAI.

That's two numbers.

- Double digit numbers.

Again, we can't start with A but we can start with B. 10-19 (BA-BJ) will appear before CHAI. For double digit numbers starting with C you have 20-27 (CA-CH) that will appear before CHAI. That's a total of 18 numbers.

- Three digit numbers.

Again, we can't start with A, but we can start with B. 100-199 (BAA-BJJ) will appear before CHAI. 200-269 (CAA-CGJ) will appear before CHAI. Moving to 270, that's the only one we can have (CHA). That's a total of $100 + 70 + 1 = 171$

- Four digit numbers.

As usual we start with B - we have 1000-1999 (BAAA-BJJJ) for 1000 numbers.

Then we have 2000-2699 (CAAA-CGJJ) or 700 numbers. Finally we have 2700-2707 (CHAA-CHAH) or 8 numbers.

That's a total of $1000 + 700 + 8 = 1708$

Now let's add them all up:

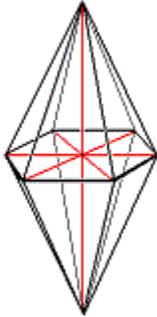

$$2 + 18 + 171 + 1708 = 1899 \text{ Ans.}$$

30. Given: A 12-sided die has the shape of a hexagonal bipyramid. Each has a hexagonal base with side 1 and height 1. The die is rolled and lands on one of its triangular faces.

Find: How high off the ground is the

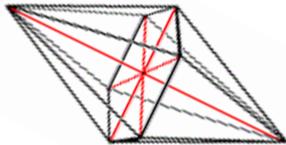

opposite face?

This is what a hexagonal bipyramid looks like.

Now the problem says that the bipyramid has landed on one of its sides. So let's rotate it onto its side.

And what do you notice about this image? Doesn't it look, in 2-dimensional space, like a rhombus? So what we have is a rhombus and what we are looking for is the height of the rhombus. If you think of one of the triangles of one of

the pyramids lying flat on the surface the height of the triangle is the length of the top and bottom of the rhombus. The triangles that connect the bottom triangle (lying flat on the surface) to its opposite side also use the height of the triangle as the length of the other two sides. That's why this is a rhombus. So we are given that the height of the hexagonal pyramid is 1 and that the hexagonal "connector" between the two pyramids has sides of length 1.

$$h = 1$$

x is just half of the height of a hexagon, or $\frac{\sqrt{3}}{2}$

So now we have to find y , which is the height of the triangles of the pyramid and the hypotenuse of the triangle formed with 1 and x .

$$1^2 + x^2 = y^2$$

$$1 + \left(\frac{\sqrt{3}}{2}\right)^2 = y^2$$

$$y^2 = 1 + \frac{3}{4} = \frac{7}{4}$$

$$y = \sqrt{\frac{7}{4}} = \frac{\sqrt{7}}{2}$$

The sides of the rhombus are, therefore, $\frac{\sqrt{7}}{2}$

Great! Now we just need the height of the rhombus. But that's not so easy. Or is it. We do know of two equations to get the area of the rhombus.

$A = bh$ where b is the side length of the rhombus and h is the height.

$$A = \frac{1}{2}d_1d_2$$

where d_1 and d_2 are the diagonals of the rhombus. Hmm, maybe we do know those. One of those diagonals, if you look back at the picture of the hexagonal bipyramid, is just the heights of each pyramid or $2 \times 1 = 2$

The other one is just the height of the hexagon or $\sqrt{3}$.

Now we can finally find the height!

$$bh = \frac{1}{2}d_1d_2$$

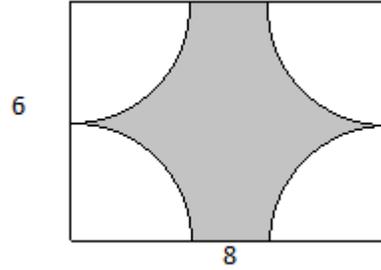

$$\frac{\sqrt{7}}{2}h = \frac{1}{2} \times 2 \times \sqrt{3} = \sqrt{3}$$

$$h = \frac{2 \times \sqrt{3}}{\sqrt{7}} = \frac{2 \times \sqrt{3} \times \sqrt{7}}{\sqrt{7} \times \sqrt{7}}$$

$$h = \frac{2\sqrt{21}}{7} \text{ Ans.}$$

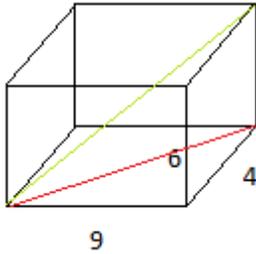

Target Round

- Given: The bug crawls 1 unit up, 2 units right, 3 units down and 4 units left. The bug repeats this set of moves 2015 more times.
Find: If the coordinates of the bug's final location are (a, b) , find $a + b$.
Starting at $(0, 0)$ moving up 1 unit puts the bug at $(0, 1)$. Moving to the right 2 units puts the bug at $(2, 1)$. Moving down three units puts the bug at $(2, -2)$. Moving 4 units to the left puts the bug at $(-2, -2)$. So the bug started at $(0, 0)$ and ended at $(-2, -2)$.
Since the bug will continue to move in the same pattern, we can see that for each move -2 is added to both the x and y coordinates.
At the end of 2016 moves the bug can be found at the coordinates $(-4032, -4032)$.
 $a + b = -4032 + -4032 = -8064$ Ans.
- Given: A rectangular piece of cardboard measures 6 by 8. It is trimmed identically on all four corners. Each corner is a quarter-circle.
Find: the perimeter of the resulting figure.

The four quarter-circles form a complete circle with radius 3. Its perimeter is $2\pi r = 6\pi$
Since the length of the longer side is 8 and we have 2 quarter-circles with radius 3, what remains of the original length is $8 - (2 \times 3) = 2$
Therefore, the perimeter of the resulting figure is $2 + 2 + 6\pi = 6\pi + 4$ Ans.

- Given: A coin is flipped four times.
Find: the probability of getting 2 heads and two tails.
This one is simple enough to just list the variations.
HHTT, HTHT, HTTH, TTHH, THTH, THHT
 $6 \times \left(\frac{1}{2}\right)^4 = \frac{6}{2^4} = \frac{6}{16} = \frac{3}{8} = 37.5\%$ Ans.
- Given: The areas of three faces of a rectangular prism are 54, 24 and 36.
Find: the length of the space diagonal.
Let l = the length of the prism.
Let w = the width of the prism.
Let h = the height of the prism. Then
 $lw = 54$
 $wh = 24$
 $lh = 36$
 $l^2w^2h^2 = 54 \times 24 \times 36 =$
 $9 \times 6 \times 4 \times 6 \times 9 \times 4 =$
 $9^2 \times 6^2 \times 4^2$
So, we have a $9 \times 6 \times 4$ rectangular prism.

First let's find the hypotenuse of the rectangle with sides 4 and 9.

Let x = the length of the red line.

$$4^2 + 9^2 = x^2$$

$$x^2 = 16 + 81 = 97$$

Now we can find the length of the space diagonal.

Let y = the length of the space diagonal.

$$y^2 = x^2 + 6^2$$

$$y^2 = 97 + 36 = 133$$

$$y = \sqrt{133} \text{ Ans.}$$

5. Given: Two 8 by 10 inch sheets are placed on top of a 2 by 3 foot table. The area of the table not covered by the paper is 708 in². Find: the area of the overlap of the two sheets of paper.
A 2 foot by 3 foot rectangular table is a 24 inch by 36 inch rectangular table. The area of the table is $24 \times 36 = 864$ in². The area not covered by the paper is 708 in² leaving $864 - 708 = 156$ in² that is covered by the paper. If each of the sheets of paper did not overlap each other, the amount of area taken by the paper would be $8 \times 10 \times 2 = 160$ in². That is 4 more than 156. 4 Ans.
6. Given: Each card in a deck of cards contains a number between 2 and 6. The deck has 4 cards of each value. Two of the cards are chosen at random without replacement. Find: the probability that the sum of their values is less than 10.

There are less ways to get sums of 10 or more than less than 10, so let's look at the probability of drawing those.

We can draw 4 + 6, 5 + 5, 5 + 6 or 6 + 6

The probability of drawing two of the same specific card is $\frac{4}{20} \times \frac{3}{19} = \frac{3}{95}$

The probability of drawing a specific pair of two different cards is $\frac{8}{20} \times \frac{4}{19} = \frac{8}{95}$

So for the four possible sums of 10 or more, we have two that are the same number and two that are different numbers. The

probability of picking one of these four sums is $2 \times \frac{3}{95} + 2 \times \frac{8}{95} = \frac{22}{95}$

So the probability of drawing two cards whose sum is less than 10 is

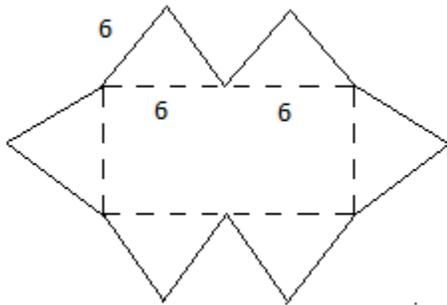

$$1 - \frac{22}{95} = \frac{73}{95} \text{ Ans.}$$

7. Given: $(x^2 + 3x + 6)(x^2 + ax + b) = x^4 + mx^2 + n$ for integers a, b, m, n . Find: the product of m and n .
 $(x^2 + 3x + 6)(x^2 + ax + b) = x^4 + ax^3 + bx^2 + 3x^3 + 3ax^2 + 3xb + 6x^2 + 6ax + 6b = x^4 + (a + 3)x^3 + (b + 3a + 6)x^2 + (3b + 6a)x + 6b = x^4 + mx^2 + n$
The coefficient of x^3 must be 0. Therefore, $a + 3 = 0$
 $a = -3$
The coefficient of x^2 is m . Therefore, $m = b + 3a + 6 = b + (3 \times -3) + 6 = b - 9 + 6 = b - 3$
The coefficient of x must be 0. Therefore, $3b + 6a = 0$
 $3b + (6 \times -3) = 0$
 $3b - 18 = 0$
 $3b = 18$
 $b = 6$
 $m = b - 3 = 6 - 3 = 3$
Finally, $n = 6b = 36$

$$m \times n = 3 \times 36 = 108 \text{ Ans.}$$

8. Given: The polygon is constructed from two squares and six equilateral triangles, each of side length 6. The polygon can be folded into a polyhedron by creasing along the dotted lines and joining adjacent edges as indicated by the arrows.

Find: the volume of the resulting polyhedron.

When you fold the polygon what you get is two square pyramids connected at an angle.

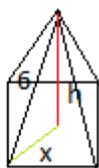

The volume of the polyhedron is the sum of the volume of two identical square pyramids. The volume of a square pyramid is $V = b^2 \frac{h}{3}$

where b is a base edge and h is the height.

The base edge, b , is just 6.

To find h , we need to find half the diagonal of the square.

Let x = half the diagonal of the square.

$$\text{Then } 6^2 + 6^2 = (2x)^2$$

$$36 + 36 = 4x^2$$

$$4x^2 = 72$$

$$x^2 = 18$$

$$x = 3\sqrt{2}$$

Now, we can determine the height.

$$h^2 + x^2 = 6^2$$

$$h^2 + (3\sqrt{2})^2 = 6^2$$

$$h^2 + 18 = 36$$

$$h^2 = 18$$

$$h = 3\sqrt{2}$$

The created polyhedron is twice the volume of the right square pyramid.

$$2V = 2b^2 \frac{h}{3} = 2(6)^2 \frac{3\sqrt{2}}{3} =$$

$$72\sqrt{2} \text{ Ans.}$$

Team Round

1. Given: The end of each blade of a fan is two feet from the center of the fan. Each blade makes three full rotations per second.

Find: the speed, in miles per hour, of the end of one of the blades.

One rotation is $2\pi r = 4\pi$ feet.

The blade travels 12π feet in three rotations (one second) or 720π feet in one minute. It travels $43,200\pi$ feet in one hour.

In miles per hour this is

$$\frac{43,200\pi}{5280} \approx 25.7$$

25.7 Ans.

2. Given: A, B, C, D, E in $0.ABC$ and $0.DE$ represent the digits 1, 2, 3, 4 and 5, in some order.

Find: the least possible absolute difference between the numbers $0.ABC$ and $0.DE$.

To minimize the difference, we need to make $0.ABC$ as close to $0.DE$ as close in value as possible.

The smallest possible difference between A and D is 1.

If $D < A$, then we want to maximize the value of E and minimize the value of BC . The largest possible value for E is 5 and the

smallest value for BC is 12. This makes the absolute difference $0.412 - 0.35 = 0.062$. Similarly, if $A < D$, then we want to maximize BC and minimize E. The largest possible value for BC is 54 and the smallest possible value for E is 1. This makes the absolute difference $0.31 - 0.254 = 0.056$. The least possible absolute difference is 0.056 **Ans.**

3. Given: 70.8% of Earth's surface is covered with water. Mars is entirely covered by land and the amount is approximately the same as the amount of land on Earth.
Find: What percent of Earth's radius is Mars' radius?
The surface area of a sphere is $4\pi r^2$
Let r_E = the radius of Earth.
Let r_M = the radius of Mars.
Then
 $0.292 \times 4\pi(r_E)^2 = 4\pi(r_M)^2$
 $0.292(r_E)^2 = (r_M)^2$
 $r_M \approx 0.54037r_E$
As a percentage, the radius of Mars is 54% of the radius of earth. 54% **Ans.**

4. Given: Billy wrote a sequence of 5 numbers, each an integer between 0 and 4. Penny wrote a sequence of five numbers that included the number of 0's, 1's, 2's, 3's and 4's in Billy's sequence. Penny's sequence is the same as Billy's.
Find: the sequence.
The sum of all 5 numbers must be 5 because the sequence is a count of how many times each number appears and we know there are only 5 numbers total present in the sequence. You can't have 5 of any number because 5 is not one of the numbers. You also can't have 4 of any number since only one other number could be used. And we're going to have to have

some values that we will have none of. For example, 11112 would translate to 04100. Similarly, you can't have 3 of one number and 2 of another number or 3 of one number, one of another number and one of a third number. For example, 01112 would translate to 13100.

Let's look at 2 of one number, 2 of another number and 1 of a third number.

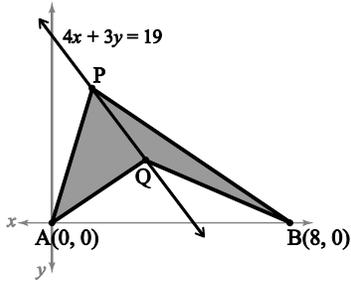

2 1 2 0 0 would translate to 2 1 2 0 0.

2 1 2 0 0 **Ans.**

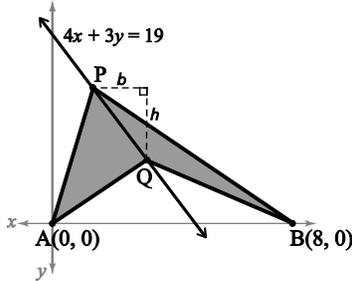

5. Given: $3^x + 3^{x+2} = 9^x + 9^{x+2}$
Find: 3^x
 $3^x + (3^x 3^2) = (3 \times 3)^x + (3 \times 3)^x (3 \times 3)^2$
 $3^x(1 + 3^2) = 3^x 3^x + 3^x 3^x 3^2 3^2$
 $3^x(10) = 3^x 3^x(1 + 3^4)$
 $10 = 3^x(82)$
 $3^x = 10/82 = 5/41$ **Ans.**
6. Given: A dime has a mass of 2,268 grams. A nickel has a mass of 5,000 grams. Diane has a bag of dimes and Nick has a bag of nickels. Both bags of coins have the same mass.
Find: how many times the total value of Nick's coins is Diane's coins.
Let x = the number of dimes.
Let y = the number of nickels.
 $2268x = 5000y$
 $\frac{x}{y} = \frac{5000}{2268} \approx 2.2045$
There are 2.2045 times as many dimes as there are nickels. The value of dimes to nickels is $\frac{10x}{5y} = 2 \frac{x}{y} \approx 4.409 \approx 4.4$ **Ans.**
7. Given: For each positive integer n ,
 $a_n = 9n + 2$ and
 $b_n = 7n + 3$
The values common to both sequences are written as a sequence. The n th term can be expressed as $pn+q$.

Find: the value of $p - q$
 Since a_n is multiples of 9 shifted by 2 and b_n is multiples of 7 shifted by 3. We just need to find the first common term, then we know all common terms following that will just be $9 \times 7 = 63$ more than the previous. Let's compare the first few values of a_n : 11, 20, 29, 38, 47 to the first few values of b_n : 10, 17, 24, 31, 38, 45. The first common value is 38. So the sequence of common values will be represented by the formula $38 + 63(n - 1) = 38 + 63n - 63 = 63n - 25$. Therefore, the value of p is 63 and the value of q is -25 , and $p - q = 63 - (-25) = 88$ **Ans.**

8. Given: Quadrilateral APBQ has vertices $A(0,0)$ and $B(8,0)$. Vertices P and Q lie on the line $4x + 3y = 19$. $PQ = 3$

Find: the area of quadrilateral $APBQ$.
 The slope of the line $4x + 3y = 19$ is $-4/3$.

If we draw in a right triangle with hypotenuse PQ , then we know the ratio of its height to its base is equal to the slope, rise over run, of the line (note: we can ignore the negative because we are talking about distance without direction) or $h/b = 4/3 \rightarrow h = 4/3 \times b$.

We also know, since it is a right triangle, that $b^2 + h^2 = 3^2$.
 We have two equations and two variables, so we can solve for the values of h and b .
 $b^2 + (4/3 \times b)^2 = 9$
 $b^2 + 16/9 \times b^2 = 9$
 $25/9 \times b^2 = 9$
 $b^2 = 81/25$
 $b = 9/5$
 Therefore, $h = 4/3 \times 9/5 = 12/5$.
 The area of the quadrilateral is the area of the triangle APB minus the area of triangle AQB . The difference in the height of these two triangles heights is h . So the area of the quadrilateral is
 $1/2 \times 8 \times h = 4 \times h = 4 \times 12/5 = 48/5$ **Ans.**

9. Given: 8 blue and 5 orange tiles are arranged in an ordered line such that the tile on the left must be blue and every tile must be adjacent to at least one tile of the same color.
 Find: How many different arrangements are possible if all 13 tiles must be used?
 The requirements are that B (for blue) must be the first tile (starting from the left) and that B's and O's (for orange) must always come in a minimum of two tiles of the same color. We have 5 orange tiles so we'll be able to have them in one group of 2 and one group of 3 (since we can't have a group of 1) and, of course, a group of 5. So let's start with a group of 5 orange tiles.
 - BBBBBOOOOO (#1)
 - BBBBBOOOOBB (#2)
 - BBBBOOOOBBBB (#3)
 - BBBBOOOOBBBB (#4)
 - BBBOOOOBBBBB (#5)
 - BBOOOOBBBBBB (#6)
 So much for the group of 5 tiles.
 Now let's work with 2 orange tiles always come before the group of 3 orange tiles.

- BBOOBBOOOBBBB (#7)
- BBOOBBOOOBBBB (#8)
- BBOOBBOOOBBB (#9)
- BBOOBBOOOBBO (#10)

Move the 2 orange tiles to the right by 1.

- BBBOOBBOOOBBBB (#11)
- BBBOOBBOOOBBB (#12)
- BBBOOBBOOOBBO (#13)

And one more move to the right.

- BBBBOOBBOOOBBB (#14)
- BBBBOOBBOOOBBO (#15)

And one more to the right

- BBBBBOOBBOOOBBO (#16)

And one more

- BBBBBOOBBOOOBBO (#17)

Now let's work with 3 orange tiles always before the 2 orange tiles. Inste

- BBOOOBBOOBBOBBB (#18)
- BBOOOBBOOBBOBBB (#19)
- BBOOOBBOOBBOBBB (#20)
- BBOOOBBOOBBOBBB (#21)

Now move the group of 3 O's to the right by one tile.

- BBBOOOBBOOBBOBBB (#22)
- BBBOOOBBOOBBOBBB (#23)
- BBBOOOBBOOBBOBBB (#24)

Now move the three tiles one more position to the right.

- BBBBBOOOBBOOBBOBBB (#25)
- BBBBBOOOBBOOBBOBBB (#26)

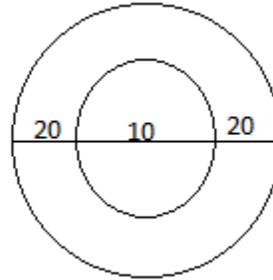

And one more to the right.

- BBBBBOOOBBOOBBOBBB (#27)

And one more

- BBBBBOOOBBOOBBOBBB (#28)

28 **Ans.**

The radius of the fountain itself is $\frac{10}{2} = 5$.

The radius of the entire area including the grass around the fountain is

$$\frac{20+10+20}{2} = \frac{50}{2} = 25$$

The area of the fountain is

$$\pi r^2 = \pi 5^2 = 25\pi$$

The area of the fountain **and** the grass is

$$\pi 25^2 = 625\pi$$

This makes the area of the grass

$$625\pi - 25\pi = 600\pi \approx 1963.49375$$

square feet. Each bag of grass covers 300 square feet.

$$\frac{1963.49375}{300} \approx 6.544979 \text{ bags.}$$

This means we must have 7 bags to cover the area completely.

7 **Ans.**

10. Given: A fountain's diameter is 10 feet. The grass extends out from the edge of the fountain 20 feet. Grass seed comes in bags that cover 300 sq. ft. of grass.

Find: How many whole bags of grass seed are needed to seed around the fountain?

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

State _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What is the result when one-third of one-half of one-fifth is divided by one-sixth? Express your answer as a common fraction.

2. _____ patterns Karthik is making a pattern that consists of three vertical stripes. He has a selection of stripes that are red, blue, green and white. If no two adjacent stripes can be the same color, how many different patterns can Karthik make? (The patterns red-blue-green and green-blue-red are considered different.)

3. _____ Ms. Parker has three types of inhabitants on her farm: humans, horses and spiders. The humans and horses are both mammals, but humans have 2 legs each while each horse has 4 legs. The spiders each have 8 legs and are not mammals. If the numbers of human legs, horse legs and spider legs are all equal, what is the ratio of mammal inhabitants to the total number of inhabitants? Express your answer as a common fraction.

4. _____ Joanna forms an arithmetic expression using each of $\frac{1}{10}$, $3\frac{1}{2}$ and $2\frac{4}{5}$ exactly once and using each of the two operators $+$ and \div exactly once with as many sets of parentheses as she wishes. What is the absolute difference between the greatest and the least possible values of Joanna's expression? Express your answer as a mixed number.

5. _____ laps Olar runs one lap around Carpenter Park in 6 minutes. Nori runs one lap around Carpenter Park in 8 minutes. If Olar and Nori start together and run in the same direction around the park, how many laps will Olar have completed the first time he and Nori are again together at the starting point?

6. _____ The flag of the United States, shown here, has a blue rectangle containing fifty white stars. The horizontal length of the canton is $\frac{2}{5}$ of the horizontal length of the flag. The remainder of the flag consists of thirteen alternating red and white stripes, all of equal width. Seven of the stripes are to the right of the canton. What fraction of the area of the flag is red? Express your answer as a common fraction.

7. _____ Graham is training to compete in the 1-mile race for his track team. His time, in minutes, on practice day n (where n is a positive integer) is given by the formula $T = \frac{8}{1 + 0.005n}$. For what value of n will Graham's time to run the 1-mile race first be less than 6 minutes?
8. _____ If $\left(a - \frac{1}{a}\right)^2 = 4$, what is the absolute value of $a^3 - \frac{1}{a^3}$?
9. _____ mi/h Matt left home traveling towards the mountains to go camping. His brother Mark started along the same route 2.1 hours later traveling at a rate 35 mi/h faster trying to catch up to Matt. What was Matt's average speed if it took Mark 1.2 hours to catch up to him?
10. _____ For what digit A do the 3-digit numbers A43 and A79 have a product of 43A,597?
11. _____ If $a = b - 1 = c - 3$ and $\frac{1}{a} + \frac{2}{b} + \frac{1}{c} = 1$ for some integer a , what is the value of the sum $a + b + c$?
12. _____ Three distinct vertices of a regular hexagon are chosen at random and a triangle is formed by joining the three vertices. What is the probability that the triangle formed is a right triangle? Express your answer as a common fraction.

13. _____ ways Kai has 100 identical blue rods, each of length 3 inches, and 100 identical white rods, each of length 1 inch. In how many ways can Kai arrange these rods in order from left to right to form a row that is exactly 10 inches in length? Here is one such arrangement to include.

14. _____ students Two of the eighth grade classes at Prime Middle School took a math test. Class A had an average of 84%, and class B had an average of 90%. The average for both classes combined was 88%. If the total number of students in the two classes was 48, how many students were in class A?

15. _____ Coco makes several lists of numbers using the following process. The first list of numbers contains one copy of the number 1. After that, when making the n th list, Coco writes down the number n , and then writes the previous list as the terms that precede n (to its left) and again as the terms that follow n (to its right). The first 4 lists are:

List 1: 1

List 2: 1, 2, 1

List 3: 1, 2, 1, 3, 1, 2, 1

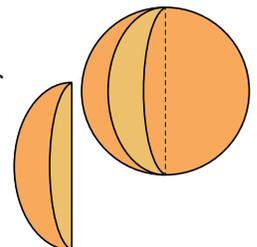

List 4: 1, 2, 1, 3, 1, 2, 1, 4, 1, 2, 1, 3, 1, 2, 1

What is the sum of all of the numbers in List 7?

16. _____ in² A parallelogram is inscribed in an equilateral triangle with two vertices on one side of the triangle and one vertex on each of the other two sides. If the equilateral triangle has side length 12 inches, what is the greatest possible area of the parallelogram? Express your answer in simplest radical form.

17. _____ in² A rectangular work of art consists of a total of 288 square tiles, each of side length 1 inch, arranged in 18 rows and 16 columns. If there is a $\frac{1}{8}$ -inch gap between every pair of adjacent tiles, what is the area of the entire work of art? Express your answer as a mixed number.

18. _____ cm² Marie has an orange that is a perfect sphere with a diameter of 7 cm. She cuts her orange into wedges by making two cuts from top to bottom through the middle. If one wedge has volume 7π cm³, what is the total surface area of this wedge? Express your answer as a common fraction in terms of π .

19. _____ sides Exactly four of the interior angles of a convex polygon are obtuse. What is the maximum number of sides this polygon could have?

20. _____ In a word sum, like the one shown, each letter represents a different digit from 0 to 9, with exactly one digit assigned to each letter. If leading zeros are allowed, that is, T or O may be 0, what is the value of $T + H + R + E + E$? $\begin{array}{r} \text{O N E} \\ \text{O N E} \\ + \text{O N E} \\ \hline \text{T H R E E} \end{array}$

21. _____ Manny has two red socks, two white socks and two blue socks. He plans to choose two socks at random to wear today, two of the remaining socks to wear tomorrow, and will wear the last two remaining socks the next day. What is the probability that on all three days Manny wears two different colored socks? Express your answer as a common fraction.

22. _____ If two positive integers a and b are relatively prime, then the quantity $ab - (a + b)$ is called their Frobenius number. If b is 2 more than 3 times the value of a , and a and b have Frobenius number 223, what is the value of $a + b$?

23. _____ units Circle O has radius 4 units, and point P lies inside the circle, 2 units from center O. Circle O' is the image of circle O rotated counterclockwise 90° about point P. If circle O' intersects circle O at points M and N, what is the length of segment MN? Express your answer in simplest radical form.

24. _____ If x , y and z are real numbers such that $4^y = x$, $x^{1+y} = 8$ and $2x = 2^z$, what is the value of z^2 ?

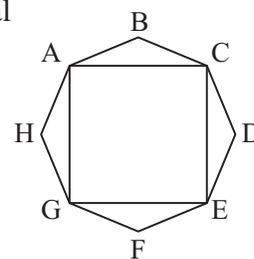

25. _____ What common fraction is equivalent to $\frac{\frac{1}{1^3} + \frac{1}{3^3} + \frac{1}{5^3} + \frac{1}{7^3} + \dots}{\frac{1}{1^3} + \frac{1}{2^3} + \frac{1}{3^3} + \frac{1}{4^3} + \dots}$?

26. _____ For positive integers a and b with $\frac{a^2}{b^3} = 9!$, what is the least possible value of $\frac{a}{b}$?

27. _____ An ant sits on one face of a cube. One minute later, the ant has moved to a random adjacent face. If every minute the ant randomly moves to an adjacent face, what is the probability that after exactly 4 minutes, the ant is on its original face? Express your answer as a common fraction.

28. _____ What is the remainder when the sum $1^2 + 2^2 + 3^2 + \dots + 2016^2$ is divided by 17?

29. _____ Octagon ABCDEFGH, shown here, has eight sides of equal length, and ACEG is a square. If the area of square ACEG is $\frac{7}{9}$ of the area of octagon ABCDEFGH, what is the ratio of the area of square BDFH to the area of octagon ABCDEFGH? Express your answer as a common fraction.

30. _____ cm In isosceles triangle ABC with base BC of length 23 cm, points P and Q are chosen on side BC with BP = QC = 9 cm. If segments AP and AQ trisect angle BAC, what is the perimeter of triangle ABC?

1. _____ sheets In September 2010, the US Bureau of Printing and Engraving began to print \$1 bills in sheets of 50. Before that, currency had been printed in sheets of 32. When printing 50 bills per sheet, how many fewer sheets are required to produce 57,600,000 bills than when printing 32 bills per sheet?

2. _____ Set A consists of all integers a such that $a = p^2 - 1$, where p is a prime greater than 3. What is the greatest common factor of all the numbers in set A?

3. _____ For the integer data set $\{11, 13, 15, 17, x, y\}$, the unique mode, median and mean form an increasing arithmetic sequence, in that order. What is the greatest possible value of y ?

4. _____ In pentagon $ABCDE$, shown here, $m\angle EAB = 60^\circ$. All other interior angles of the pentagon measure 120° . If $AB = AE = 2$ units and $BC = CD = DE = 1$ unit, what is the ratio of the area of triangle ACD to the area of pentagon $ABCDE$? Express your answer as a common fraction.

5. _____ inches A sphere is pressed partway into a soft plaster mold, leaving a shallow crater that is 18 inches wide and 2.5 inches deep. What is the radius of the sphere? Express your answer as a decimal to the nearest hundredth.

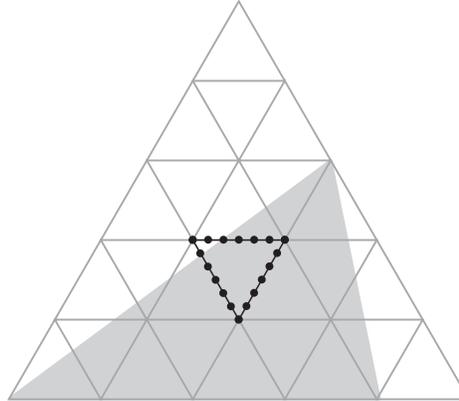

6. _____ $\frac{\text{ordered}}{\text{pairs}}$ When adding using the standard method, it is sometimes necessary to compose, or “carry,” a ten, a hundred, or a thousand. For example, when we add 15 to 16, we get 11 ones and compose a ten:

$$\begin{array}{r} \overset{1}{15} \\ + 16 \\ \hline 31 \end{array}$$

← “carried” from ones place

For how many ordered pairs (a, b) of three-digit numbers a and b does the addition $a + b$ require at least one digit to be carried?

7. _____ This array is composed of congruent equilateral triangles. Three vertices within the array are joined to form a shaded non-equilateral triangle, as shown. What fraction of the triangle with the dotted outline is shaded? Express your answer as a common fraction.

8. _____ When an unfair coin is flipped five times, the probability that it lands heads-up more times than tails-up is 31 times the probability that it lands heads-up five times. What is the probability of the coin landing heads-up on one flip? Express your answer as a common fraction.

1. _____ Mrs. McWitt has 35 desks numbered 1 through 35 in her classroom. If three students randomly sit at three different desks, what is the probability that each sits at a prime numbered desk? Express your answer as a common fraction.

2. _____ in² Marcela builds a model pyramid out of cubes, each of edge length 1 inch. She starts by making a 10×10 square base out of the cubes. Each additional layer of the pyramid is a square array of cubes with one fewer cube per side than the layer below it. The top layer consists of a single cube. If the pyramid is on the ground so that the bottom is not exposed, how many square inches of surface area are exposed?

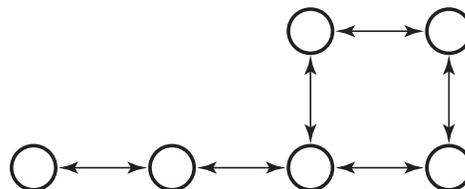

3. _____ When the array shown is completely filled-in, each circle contains a number. If the number in each circle below the top row is the sum of the two numbers closest to it on the row above, what is the value of x ?

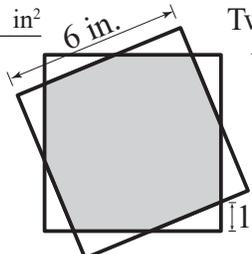

4. _____ feet A piece of fencing is made using a rectangular iron frame and several lengths of metal wire that span the interior of the frame. The wires form 45° angles and are attached to the back of the frame. In the interior of the frame, the wires intersect each other to form squares with 3-inch diagonals, as shown. How many feet of metal wire are visible within the frame with inner dimensions of 6 feet by 8 feet? Express your answer in simplest radical form.

5. _____ assignments When each circle in the given diagram is filled with one of the numbers 0, 1, 2, 10, 11, 12, 20, 21 or 22 (a number may be used more than once), we call it a *happy assignment* if, for every arrow, the values at the two endpoints have positive difference 1 or 10. How many happy assignments are there?

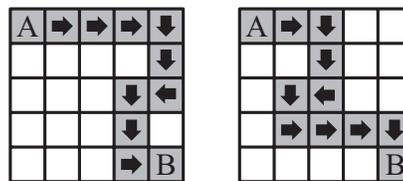

6. _____ Positive integer m has a units digit of 3 and is divisible by 7 and 11. Positive integer n has a units digit of 8 and is divisible by 7 and 17. What is the least possible absolute difference between m and n ?

7. _____  Two square tiles, each with sides of length 6 inches, are arranged so that one lies directly on top of the other. The top tile is then rotated counterclockwise about its center until one of the exposed corners of the bottom tile has height 1 inch, as shown. What is the area of the shaded intersection of the two tiles? Express your answer as a decimal to the nearest tenth.

8. _____ The display on a calculator is broken so that, when the calculator shows a number in decimal form, the tenths and hundredths digits of the number are never visible. Shawna enters a positive integer N in the calculator and presses a button that gives the reciprocal of the integer in decimal form. The nine digits following the missing digits in the display are all threes. What is the sum of all of the possible values of N ?

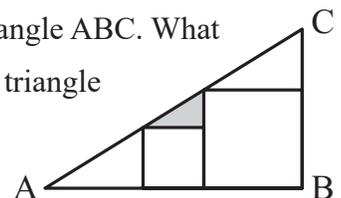

9. _____ snakes In a grid of unit squares, a *snake* is a sequence of distinct unit squares, beginning with the upper left corner and ending with the lower right corner, such that any two consecutive squares in the sequence share an edge and no four squares in the sequence share a single vertex. Examples of a snake and a non-snake are given for a 5×5 grid. How many different snakes are there in a 5×5 grid?

Snake

Not a Snake

10. _____ Two squares lie inside right triangle ABC so that each square has one side on leg AB . One side of the smaller square lies on a side of the larger square, and the larger square has a side on leg BC . Each square has a vertex on hypotenuse AC . The area of the shaded triangle is $\frac{9}{289}$ of the area of triangle ABC . What is the ratio of the area of the larger square to the area of triangle ABC ? Express your answer as a common fraction.

Vol. 36 Issue 2

Edward Wan Crowned National Champion at 2016 Raytheon MATHCOUNTS National Competition

Above: 2016 National Champion Edward Wan with Bhopinder Singh, Chair of the MATHCOUNTS Board of Directors (left) and Washington State Coach Bin Lan. Below: Wan during the Countdown Round.

To say that Edward Wan won the MATHCOUNTS Competition Series in some ways feels like an understatement. He won as a seventh grader, making him one of only a handful of national champions not in eighth grade—and the first since 2008. He was the Written Competition Champion in addition to the National Champion, making him only the third Mathlete® in the past 10 years to win both competitions.

Even rarer still, Edward scored a 46—a perfect score—on the Written Competition. Any Mathlete or teacher who has participated or coached in MATHCOUNTS understands how exceptional this is. The complexity and difficulty of MATHCOUNTS problems is taken as such a given that the Official Rules and Procedures of the Competition Series include this explanation:

MATHCOUNTS Competition Series scores do not conform to traditional grading scales. Coaches and students should view an Individual Score of 23 (out of a possible 46) as highly commendable.

Given this list of rare achievements, many would assume Edward is simply a prodigy, someone whose talent in mathematics is purely natural. But what makes Edward even more exceptional is this: *he did not qualify for the MATHCOUNTS National Competition last year.* A Mathlete, who less than a month ago received a perfect score on arguably one of the most challenging MATHCOUNTS tests ever written, was defeated at the Washington State Competition last year. In fact, when interviewed for a blog post by Microsoft, Edward summed up his achievement this year, compared to last year, with a simple adage: “Practice makes perfect.”

That Edward practiced and worked very hard for his achievement is a point that is probably not highlighted

enough in science, technology, engineering and mathematics (STEM) programs. Many people continue to view talent in STEM as something that we are born with, or born without. But the truth is, brilliant students like Edward cultivate their brilliance through effort, persistence and yes, failure. But when these students inevitably make a mistake—whether at the nation's most prestigious math competition or on a routine test at school—they rethink their strategies, learn from their errors and keep trying. Practice makes perfect. It is also what makes a national champion.

Edward Wan received a total of \$22,500 in scholarships, including the \$20,000 Donald G. Weinert College Scholarship, and a trip to U.S. Space Camp. A student at Lakeside Middle School in Seattle, Wan is the third Mathlete from Washington to be National Champion. He answered the winning question in just 6.95 seconds:

What is the remainder when 999,999,999 is divided by 32? (Answer: 31)

Wan was joined by 223 students from across the nation who competed at the [2016 Raytheon MATHCOUNTS National Competition](#) on May 8–9 at the Renaissance Washington, D.C. Downtown Hotel. National competitors represented all 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands, the Department of Defense and State Department.

One of the nation's most challenging math competitions, the 2016 National Competition began with a series of written exams on Sunday, May 8, requiring students to work both individually and collaboratively as part of their four-person state teams. On Monday, May 9, the 12 Mathletes with the highest scores on the Written Competition advanced to the Countdown Round, a fast-paced contest with one-on-one match-ups. Countdown Round participants must solve a series of difficult math problems, each in 45 seconds or less.

From left: Jason Liu of Nevada, Luke Robitaille of Texas, Andrew Cai of Texas (in front) and Wan at the Countdown Round.

Rankings for the Countdown Round were determined by the students' scores on the previous day's Written Competition. The four individuals with the highest written scores—who received a bye in the first round of the Countdown Round—were Wan; Luke Robitaille, a sixth grader from Euless, Texas; Jason Liu, an eighth grader from Reno, Nev.; and Benjamin Wright, an eighth grader from Sugar Land, Texas.

The two semifinalists were Liu and Ben Kang, an eighth grader from Falls Church, Va. The Countdown Round Runner-Up was Robitaille, who was also the Written Competition Runner-Up. Having two of the youngest Mathletes at the event in the final match-up was not lost on Countdown Round moderator Lou DiGioia: "Pretty remarkable! We have a seventh grader versus a sixth grader, so you know...no matter who wins this year, you'll just come back next year and try it again, all right?" It is safe to say that the 2017 Competition Series, and maybe even the 2017 Raytheon MATHCOUNTS National Competition, will have some familiar faces.

After winning the title of 2016 National Champion, Wan went on a media tour that included an appearance on *Live! with Kelly and Michael*, where he competed against hosts Kelly Ripa and Michael Strahan in a live math competition. The 2016 National Competition was featured on [WUSA9-TV's Great Day Washington](#) segment, and was also covered by multiple news outlets, including [Education Week](#), [The Seattle Times](#), [Deadspin](#) and [Microsoft On the Issues](#).

2016 NATIONAL COMPETITION WINNERS

NATIONAL CHAMPION:

Edward Wan, WA

- \$20,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

COUNTDOWN ROUND RUNNER-UP:

Luke Robitaille, TX

- \$7,500 Scholarship

COUNTDOWN ROUND SEMIFINALISTS:

Jason Liu, NV

Ben Kang, VA

- \$3,000 Scholarship each

WRITTEN COMPETITION

CHAMPION: Edward Wan, WA

- \$2,500 Scholarship

1ST PLACE TEAM: Texas

Andrew Cai, Luke Robitaille,
Benjamin Wright, Justin Yu

- \$2,000 Scholarship each
- Trip to U.S. Space Camp

WRITTEN COMPETITION

RUNNER-UP: Luke Robitaille, TX

COUNTDOWN ROUND QUARTERFINALISTS:

Benjamin Wright, TX

Brian Liu, NJ

Alex Xu, MI

Andrew Cai, TX

COUNTDOWN ROUND PARTICIPANTS:

Alex Wei, WA

Justin Yu, TX

Eric Wei, NY

Wentinn Liao, CA

2ND PLACE TEAM: California

3RD PLACE TEAM: Washington

Texas Wins Team Competition, Makes Countdown Round History

The team from Texas, under the leadership of Coach Isil Nal, took First Place in the Team Competition, and made MATHCOUNTS history with two new records! *All four* Texas team members were in the top 12 and participated in the Countdown Round—a first at the MATHCOUNTS National Competition. Texas was also the first team to have *two sixth-grade students* qualify for the Countdown Round.

From left: Cai, Benjamin Wright, Justin Yu, Robitaille, Texas Team Coach Isil Nal and Singh.

Team members Andrew Cai, a sixth-grade student from Sugar Land; Robitaille; Wright; and Justin Yu, an eighth-grade student from Richardson, stood out at the National Competition not only for their talent, but also for their team spirit and camaraderie. Despite competing against each other onstage during the Countdown Round, all four Mathletes were cheering for each other and their fellow competitors.

Each member of the Texas Team won a \$2,000 scholarship and a trip to U.S. Space Camp. The team from California won Second Place, with team members Nevin Liang, from Saratoga; Wentinn Liao, from Tracy; Brent Liu, from Fremont; and Ishika Shah, from Cupertino (all eighth graders). The Washington Team won Third Place, with team members eighth grader George Lan; eighth grader Axel Li; Wan; and seventh grader Alex Wei (all from Bellevue).

Celebrating Spirit at the National Competition

Spirit and sportsmanship were abundant at this year's National Competition. From students trading pins, to Countdown Round participants high-fiving and applauding each other—even after losing a match-up—the 2016 Mathletes exemplified the spirit of teamwork and community.

The Puerto Rico team won the 2016 Spirit Award, which is awarded to the team that best-demonstrates a positive attitude and support for fellow Mathletes. Team members Carlos Alvarado, Javier Mulero, Nico Proskauer Valerio and Osva Quiñones, and Coach Nestor Santiago each received a commemorative pin in recognition of their award.

MATHCOUNTS congratulates all 224 national competitors for advancing to the national level. This is a remarkable accomplishment and every Mathlete who participated at the event in Washington, D.C. should be incredibly proud of his or her success. The MATHCOUNTS National Competition results, as well as links to event photographs and the archived webcast on ESPN3 is available at www.mathcounts.org/nationalcompetition.

From left: Javier Mulero, Nico Proskauer Valerio, Carlos Alvarado, Osva Quiñones and Coach Nestor Santiago were presented the Spirit Stick.

Georgia won the Most Improved Award. From left: Holden Watson, Lawrence Zhou, Anup Bottu, Johnny Fang and Coach Sema Duzyol.

Above: Grand Prize Winners Club Leader Michael McFadden, Noemi Campbell, Drake Johnson, Grace Sistrunk and Max LeFevre are presented their Gold Level banner. Below: Jessica Pei runs in for the Countdown Round.

Singh and Pam Erickson, Vice President of Corporate Affairs at Raytheon, present plaques to Three-Time National Competitors, from left: Eric Wei of New York, Divyesh Gurnani of the Virgin Islands, Sruthi Parthasarathi of Ohio, Allen Wu of North Dakota, Edward Hu of Mississippi, Ragulan Sivakumar of Vermont, Kelvin Kang of Arkansas and James Hawkes of Maine.

“#MarbleChallenge” by Team GLU3 from Georgia Voted First Place Video at 2016 Math Video Challenge Finals

GLU3 from Georgia won the 2016 Math Video Challenge with their video, “[#MarbleChallenge](#).” Filmmakers Aaliyah Brown of Jonesboro, Jadon Edwards of Powder Springs, MacKenzy Jordan of Covington and Kennedy Spencer of Way Fairburn (all eighth graders), each received a \$1,000 college scholarship. Team Advisor Camille Jones of the Ron Clark Academy in Atlanta, has led three teams now to a First Place win in the program.

“#MarbleChallenge” is a story of two students, Jadon and Kennedy (playing themselves), who decide to try out a new game called the #MarbleChallenge, after seeing a GLUtube video starring Internet sensations KittenGal24 (MacKenzy) and GalaxyGalore (Aaliyah). The students drew their inspiration for “#MarbleChallenge” from the Broadway musical *Hamilton* and made their entire video a musical, using imaginative lyrics, jokes and rhymes to craft their story. One refrain in the video, for example, features [KittenGal24](#) setting up the winning game strategy for **Jadon**:

What's up—it's me KittenGal24!
With my help, we'll beat GalaxyGalore.
First, what relation do 1, 4 and 2, 3 have?
The sum is both 5? Yes, you're on the right path!
Five is the magic number to control the game.
Do you now understand? No, not really, please explain.
One is the lowest number that you can choose.
Four is the highest. Now I've got a clue!
One and four put together sums 5.
Two and three do the same—don't deny it.

From left, Singh, Kennedy Spencer, MacKenzy Jordan, Aaliyah Brown, Jadon Edwards, Team Advisor Camille Jones and Erickson at the Awards Ceremony and Banquet.

The video solved problem #78 from the [2015-2016 MATHCOUNTS School Handbook](#):

Jadon and Kennedy are playing a game with a bowl containing 39 marbles. Each player takes turns removing 1, 2, 3 or 4 marbles from the bowl. The person who removes the last marble loses. If Jadon takes the first turn to start the game, how many marbles should he remove to guarantee he is the winner?

“#MarbleChallenge” was one of [four finalist videos presented](#) at the 2016 Math Video Challenge Finals, which took place on Monday, May 9 at the Renaissance Washington, D.C. Downtown Hotel. Finalists presented their videos to the 224 Competition Series national competitors at the event, who then voted to determine the winning video.

2016 MATH VIDEO CHALLENGE FINALISTS

“BACK IN THE GOOD OLD DAYS” BY THE MATHTASTIC 4, OHIO

Kellie Keaton, Shadarria Robinson, Anaya Spencer, Jayla VanHorn + Team Advisor Stacy Ans-Duffy

“THE GREATEST PIZZA” BY MAPLE LAKE HOMESCHOOL MOVIE CLUB, PENNSYLVANIA

Louise Grabow, Eleanor Haines, Bruce Haines, Andrew Rucks + Team Advisor Jennifer Grabow

“LAURIE’S COINS” BY THE CREATIVE TEAM NAME, ILLINOIS

Amelia Jensen, Ela Kusmierz, Lauren Pokonosky, Sydney Williams + Team Advisor Jeanne Salazar

MATHCOUNTS, University of Oklahoma, Art of Problem Solving Offer Competition Math Online Course for the Summer

The online course, Competition Math for Middle School, is back by popular demand and will be offered from June 6

through August 12, 2016. The course, led by Professor Stacey Reeder of the University of Oklahoma, features content developed by Art of Problem Solving, plus tips and strategies from national-level MATHCOUNTS coaches.

More than 200 MATHCOUNTS coaches and math teachers took the course that was offered in Fall 2015. Offering the course during the summer—before classroom teaching, coaching and team practices begin—will allow even more educators to participate. The

course is designed to be a resource for both new and returning coaches so they can get their MATHCOUNTS students ready for the 2016-2017 Competition Series.

More information is available at mathcounts.ou.edu. All participants who successfully complete the course this summer will receive one graduate credit from the University of Oklahoma, which can be used in most school districts for continuing education credit. Educators interested in taking this course should register online by June 6, 2016.

Jacob Wachspres Wins 2016 MATHCOUNTS Alumni Scholarship

2016 FINALISTS

- Jeremy Du, MD
- Ina Flood, AK
- Adam Graunke, AZ
- Meghal Gupta, CA
- Trisha Hariani, GA
- Nithin Kannan, AZ
- Emma Kerwin, MA
- Sarah Koubek, NE
- Michael Kural, CT
- Hans Li, TX
- Celine Liang, CA
- Nancy Lu, PA
- Tristan Pollner, CA
- Shravan Ravishankar, KY
- Laura Seaberg, MD
- Kelsey Sucher, KY
- Richmund Tan, CA
- Megan Zhao, OH
- Geoffrey Zhang, FL

MATHCOUNTS created the Alumni Scholarship three years ago as a way to support students beyond middle school. This year's winner of the \$3,000 Alumni Scholarship was Jacob Wachspres of Yardley, Pennsylvania. Wachspres, a State Competitor from 2008-2011, was a finalist for the scholarship in 2015 and will attend Princeton University in the fall.

After his success as a middle school Mathlete, Wachspres went on to lead his high school's ARML team and volunteer at Boys and Girls Club of Trenton. After graduating from high school, he decided he wanted to do more to give back before starting college, so he joined Princeton's Bridge Year Program.

Through the Bridge Year Program, Wachspres has spent the past year working as a math teacher for elementary, middle and high school students in Bolivia. He described the experience as transformative for him, writing, "What I can say for sure...is that I am not done sharing that rush of bliss that MATHCOUNTS brought to me. The 'how' may not yet be clear...but I know that the arc of my life will inevitably put me in positions to spread the incredible joy math can bring."

The application for the 2017 MATHCOUNTS Alumni Scholarship will be available in the fall. More information is available at www.mathcounts.org/scholarship.

MATHCOUNTS would not be able to make a difference in the lives of hundreds of thousands of students each year without the support of our individual and corporate donors. Together we can help all students find their path to math.

■ **School Competition** ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. \$ _____

Three investors decided to buy a time machine, with each person paying an equal share of the purchase price. If the purchase price was \$6000, how much did each investor pay?

2. _____

What integer is closest to 10π ?

3. _____

What is the sum of the positive integer factors of 12?

4. _____

If $\blacklozenge = 8$ and $\blacksquare = 4$, what is the value of the expression $2 \times \blacklozenge - 4 \times \blacksquare$?

5. _____

If $5x + 2 = 7$, what is the value of $15x + 6$?

6. _____

What is the range of the four high scores in the table shown here?

HIGH SCORES

| Player | High Score |
|----------------|------------|
| PinkNinja | 5,736,750 |
| FR33DOM | 2,710,275 |
| Marsh-e-mallow | 919,475 |
| Gator-231 | 426,500 |

7. _____ Given that $4(n - 5) + 2 = 3(n - 1)$, what is the value of n ?

8. \$ _____ A concession stand sells a 16-ounce drink for \$4. If the price is directly proportional to the amount of drink served, what is the price of a 20-ounce drink?

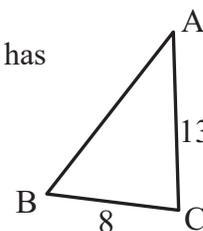

9. _____ What is the product of the greatest common factor of 4 and 10 and the least common multiple of 4 and 10?

10. _____ What is the arithmetic mean of the integers from 16 to 20, inclusive?

11. _____ combinations An ice cream shop offers chocolate, strawberry and vanilla flavors of ice cream and sprinkles for a topping. By choosing one flavor of ice cream and a topping of sprinkles or no sprinkles, how many different combinations are possible?

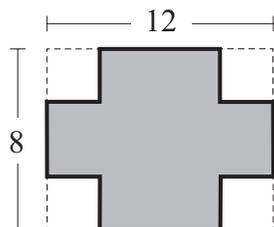

12. _____ cm In $\triangle ABC$, shown here, $AC = 13$ cm and $BC = 8$ cm. If $\triangle ABC$ has perimeter 36 cm, what is the length of side AB ?

13. _____ What is the value of the sum $2 + 4 + 6 + \dots + 18 + 20$?

14. _____ quarters Sammy goes to the store and buys \$1.80 worth of produce. He gives the clerk a \$5 bill and receives change consisting of only quarters, dimes, nickels and pennies. What is the greatest number of quarters he could receive?

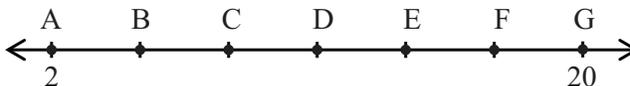

15. _____ inches

An 8-inch by 12-inch piece of cardboard has a 3-inch by 3-inch square cut out of each corner. What is the perimeter of the resulting figure, shown here?

16. _____ units² What is the area of the triangle enclosed by the lines $y = 0$, $x = 8$ and $y = x$?

17. _____ units If A through G are evenly spaced points on the number line shown, what is the value of $AC + DG$?

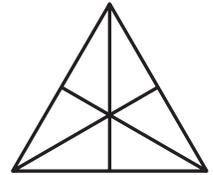

18. _____ What decimal is equivalent to $\frac{4}{5}$ percent?

19. _____ A fair 10-sided die, with faces numbered 1 through 10, is rolled once. What is the probability that the number rolled will be prime? Express your answer as a common fraction.

20. _____ points Five students had a mean score of 90 points on a test. One test was scored incorrectly, and that particular test score was later raised by five points. What is the new mean score?

21. _____ triangles How many triangles of any size are in the figure shown here?

22. _____ If p is prime and n is even such that $p + n = 47$ and $pn = 210$, what is the value of n ?

23. _____ If $a \# b = a^2(7 - b)$, what is the value of $(2 \# 5) \# 3$?

24. _____ number If the permutations of the letters in the word SURE are numbered 1 through 24 in alphabetical order, what number is RUSE?

25. _____ A line contains the points (6, 10) and (15, 22). If the line intersects the y -axis at (0, b), what is the value of b ?

26. _____ What is the value of k in the equation shown?

$$2 \cdot 4 \cdot 8 \cdot 5 \cdot 5 \cdot 5 \cdot 5 \cdot 5 = 10^k$$

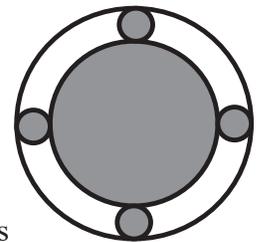

27. _____ Samhir writes down all of the odd numbers between 500 and 700 that are divisible by both 7 and 9. What is the sum of the numbers Samhir writes?

28. _____ Sasha's secret passcode is a nine-digit number that begins and ends with 6. The sum of every three consecutive digits in the number is 14. What is the fifth digit of Sasha's passcode?

29. _____ cm Coco buys a very large rectangular chocolate bar and decides that each day, she will cut the largest possible square off of the bar and eat it. When the remaining part of the chocolate bar is a square, she will eat all that is left. The table shows the area, in square centimeters, of the square Coco eats on each day. If Coco finishes the chocolate bar on Day 6, what was the length of the longer side of the chocolate bar when Coco bought it?

| Day | 1 | 2 | 3 | 4 | 5 | 6 |
|-------------------------------|-----|-----|----|----|---|---|
| Eaten Area (cm ²) | 225 | 225 | 81 | 36 | 9 | 9 |

30. _____ This figure shows five shaded circles within a circle of radius 7 units. The four small congruent shaded circles are tangent to the outer circle and to the large shaded circle. The radius of each of the smaller shaded circles is $\frac{1}{5}$ the radius of the large shaded circle. What fraction of the largest circle's area is shaded? Express your answer as a common fraction.

2017
■ School Competition ■
Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

3. _____ The table lists the number of Wednesdays on which the Norton Middle School cafeteria served each of four different entrées and each of three different desserts during the previous school year. If the entrée and dessert served each Wednesday were selected independently and randomly, based on this data, what is the probability that the Norton Middle School cafeteria served pizza and lemon cake on the first Wednesday of the previous school year? Express your answer as common fraction.

| Entree | | Dessert | |
|--------------|----|------------|----|
| Pizza | 15 | Lemon Cake | 20 |
| Chicken | 8 | Apple Pie | 8 |
| Fish & Chips | 10 | Brownies | 12 |

Team Round
Problems 1–10

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ If $11 \times n = 123,456,787,654,321$, what is the value of n ?

2. (_____ , _____) The point $(4, -2)$ is reflected over the line $y = x$. What are the coordinates of its image? Express your answer as an ordered pair.

3. _____  The ages, in years, of four members of a family are represented by a, b, c and d , where $a < b < c < d$. Their mean age is 34, their median age is 33, and the range of their ages is 32. What is the value of a ?

4. _____ base 7 What is the value of $32_4 + 43_5 + 54_6$ when written in base 7?

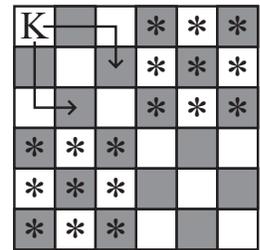

5. _____ Raquel uses six different digits to fill in the blanks below, writing one digit in each blank, so that the resulting addition statement is correct. What is the least possible sum of the six digits?

$$\underline{\quad} + \underline{\quad} = \underline{\quad}$$

6. _____ If a, b and c satisfy the equations $a^2 + b^2 = 313$, $b^2 + c^2 = 277$ and $a^2 + c^2 = 302$, what is the value of $a^2 + b^2 - c^2$?

7. _____ moves

A chess knight makes L-shaped moves on a grid of squares. During each move, the knight moves two squares either up, down, left, or right, then one square in a perpendicular direction. The knight starts on the square marked K in the 6-by-6 board shown here, and its two possible first moves are shown. What is the least number of moves the knight must make from the K in order to land at least once on each of the squares marked with a star?

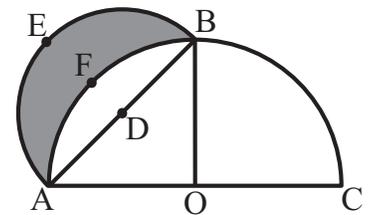

8. _____

A chess club has 8 girls and 6 boys. Two members, Zig and Zag, are fraternal twins of different genders. If a team of 3 girls and 3 boys is randomly selected for the district championship, what is the probability that exactly one of the twins is on the team? Express your answer as a common fraction.

9. _____ units²

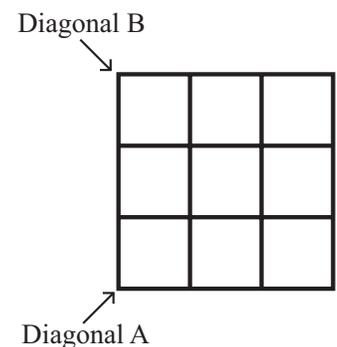

Triangle ABO is an isosceles right triangle, AC is a diameter of circle O, and AB is a diameter of circle D. If the semicircle centered at O has area 2π , what is the shaded area AEBF (which is called a *lune*)?

10. _____

Each cell in the 3-by-3 array of squares shown is filled with a digit from 1 to 9, inclusive. If the four listed conditions are satisfied, what is the resulting three-digit number when diagonal B is read from upper-left to lower-right?

- (1) Each digit from 1 through 9 is used exactly once.
- (2) Each row, read from left to right, forms an odd three-digit multiple of 3 that is not a multiple of 9.
- (3) Each column, read from top to bottom, forms an odd three-digit multiple of 3 that is not a multiple of 9.
- (4) Diagonal A, read from lower-left to upper-right, forms an odd three-digit multiple of 9.

Sprint Round Answers

- | | | |

STEMWORKS
CERTIFIED

Change the Equation has recognized MATHCOUNTS as having one of the nation's most effective STEM learning programs, listing the Math Video Challenge as an Accomplished Program in STEMworks.

The National Association of Secondary School Principals has placed all three MATHCOUNTS programs on the NASSP Advisory List of National Contests and Activities for 2016-2017.

HOW TO USE THIS SCHOOL HANDBOOK

If You're a New Coach

Welcome! We're so glad you're a coach this year.
Check out the **Guide for New Coaches**
starting on the next page.

If You're a Returning Coach

Welcome back! Thank you for coaching again.
Get the **2016-2017 Handbook Materials**
starting on page 8.

GUIDE FOR NEW COACHES

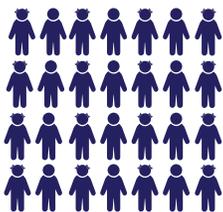

Welcome to the MATHCOUNTS® Competition Series! Thank you so much for serving as a coach this year. Your work truly does make a difference in the lives of the students you mentor. We've created this Guide for New Coaches to help you get acquainted with the Competition Series and understand your role as a coach in this program.

If you have questions at any point during the program year, please feel free to contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

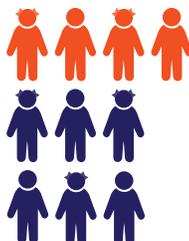

The MATHCOUNTS Competition Series in a Nutshell

The **MATHCOUNTS Competition Series** is a national program that provides students the opportunity to compete in live, in-person math contests against and alongside their peers. Created in 1983, it is the longest-running MATHCOUNTS program and is open to all sixth-, seventh- and eighth-grade students.

HOW DOES IT WORK? The Competition Series has 4 levels of competition—school, chapter, state and national. Here's what a typical program year looks like.

Schools register in the fall and work with students during the year. Coaches administer the **School Competition, usually in January.** Any number of students from your school can participate in your team meetings and compete in the School Competition. MATHCOUNTS provides the School Competition to coaches in November. Many coaches use this to determine which student(s) will advance to the Chapter Competition.

Between 1 and 10 students from each school advance to the local **Chapter Competition, which takes place in February.** Each school can send a team of 4 students plus up to 6 individual competitors. All chapter competitors—whether they are team members or individuals—participate in the individual rounds of the competition; then just the 4 team members participate in the team round. Schools also can opt to send just a few individual competitors, rather than forming a full team. Over 500 Chapter Competitions take place across the country.

Top students from each Chapter Competition advance to their **State Competition, which takes place in March.** Your school's registration fees cover your students as far as they get in the Competition Series. If your students make it to one of the 56 State Competitions, no additional fees are required.

Top 4 individual competitors from each State Competition receive an all-expenses-paid trip to the **National Competition, which takes place in May.** These 224 students combine to form 4-person state teams, while also competing individually for the title of National Champion.

WHAT DOES THE TEST LOOK LIKE? Every MATHCOUNTS competition consists of 4 rounds—Sprint, Target, Team and Countdown Round. Altogether the rounds are designed to take about 3 hours to complete. Here's what each round looks like.

Sprint Round

40 minutes
30 problems total
no calculators used
focus on speed and accuracy

Target Round

Approx. 30 minutes
8 problems total
calculators used
focus on problem-solving and mathematical reasoning

The problems are given to students in 4 pairs. Students have 6 minutes to complete each pair.

Team Round

20 minutes
10 problems total
calculators used
focus on problem-solving and collaboration

Only the 4 students on a school's team can take this round officially.

Countdown Round

Maximum of 45 seconds per problem
no calculators used
focus on speed and accuracy

Students with highest scores on Sprint and Target Rounds compete head-to-head. This round is optional at the school, chapter and state level.

HOW DO I GET MY STUDENTS READY FOR THESE COMPETITIONS? What specifically you do to prepare your students will depend on your schedule as well as your students' schedules and needs. But in general, working through lots of different MATHCOUNTS problems and completing practice competitions is the best way to prepare to compete. Each year MATHCOUNTS provides the *School Handbook* to all coaches, plus lots of additional free resources online.

The next sections of this Guide for New Coaches will explain the layout of the *MATHCOUNTS School Handbook* and other resources, plus give you tips on structuring your team meetings and preparation schedule.

The Role of the Competition Coach

Your role as the coach is such an important one, but that doesn't mean you need to know everything, be a math expert or treat coaching like a full-time job. Every MATHCOUNTS coach has a different coaching style and you'll find the style that works best for you and your students. But in general **every good MATHCOUNTS coach must do the following.**

- Schedule and run an adequate number of practices for participating students.
- Help motivate and encourage students throughout the program year.
- Select the 1-10 student(s) who will represent the school at the Chapter Competition in February.
- Take students to the Chapter Competition or make arrangements with parents and volunteers to get them there.

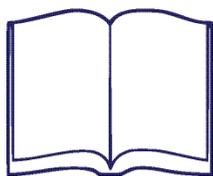

Looking for tools to help you become a top-notch coach? Check out our videos at the Coach Section of the MATHCOUNTS website!

You don't need to know how to solve every MATHCOUNTS problem to be an effective coach. In fact, many coaches have told us that they themselves improved in mathematics through coaching. Chances are, you'll learn with and alongside your students throughout the program year.

You don't need to spend your own money to be an effective coach. You can prepare your students using solely the free resources and this handbook. We give coaches numerous detailed resources and recognition materials so you can guide your Mathletes® to success even if you're new to teaching, coaching or competition math, and even if you use only the free resources MATHCOUNTS provides all competition coaches.

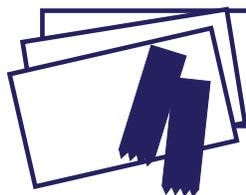

Making the Most of Your Resources

As the coach of a registered competition school, you already have received what we at MATHCOUNTS call the **School Competition Kit**. Your kit includes the following materials for coaches.

2016-2017 MATHCOUNTS School Handbook

The most important resource included in the School Competition Kit. Includes 250 problems.

Student Recognition Ribbons and Certificates

10 participation certificates and 1 ribbon for each registered chapter competitor.

You'll also get access to electronic resources. The following resources are available to coaches online at www.mathcounts.org/coaches. This section of the MATHCOUNTS website is restricted to coaches and you already should have received an email with login instructions. *If you have not received this email, please contact us at info@mathcounts.org to make sure we have your correct email address.*

Official 2017 MATHCOUNTS School Competition

Released in November 2016
Includes all 4 test rounds and the answer key

2016 MATHCOUNTS School, Chapter + State Competitions

Released in mid-April 2016
Each level includes all 4 test rounds and the answer key

MATHCOUNTS Problem of the Week

Released each Monday
Each multi-step problem relates to a timely event

You can use the **2017 MATHCOUNTS School Competition** to choose the students who will represent your school at the Chapter Competition. Sometimes coaches already know which students will attend the Chapter Competition. If you do not need the School Competition to determine your chapter competitors, then we recommend using it as an additional practice resource for your students.

The **2016-2017 MATHCOUNTS School Handbook** will be your primary resource for the Competition Series this year. It is designed to help your students prepare for each of the 4 rounds of the test, plus build critical thinking and problem-solving skills. This section of the Guide for New Coaches will focus on how to use this resource effectively for your team.

WHAT'S IN THE HANDBOOK? There is a lot included in the *School Handbook*, and you can find a full table of contents on pg. 8 of this book, but below are the sections that you'll use the most when coaching your students.

- **Handbook Problems:** 250 math problems divided into Warm-Ups, Workouts and Stretches. These problems in-

crease in difficulty as the students progress through the book. (pg. 13)

- **Solutions to Handbook Problems:** complete step-by-step explanations for how each problem can be solved. These detailed explanations are only available to registered coaches. (pg. 59)
- **Answers to Handbook Problems:** key available to the general public. Your students can access this key, but not the full solutions to the problems. (pg. 51)
- **Problem Index + Common Core State Standards Mapping:** catalog of all handbook problems organized by topic, difficulty rating and mapping to Common Core State Standards. (pg. 55)

There are 3 types of handbook problems to prepare students for each of the rounds of the competition. You'll want to have your students practice all of these types of problems.

| | | |
|--|---|--|
| <p style="text-align: center;">Warm-Ups</p> <p>14 Warm-Ups in handbook 10 questions per Warm-Up no calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Warm-Ups prepare students particularly for the Sprint and Countdown Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Workouts</p> <p>8 Workouts in handbook 10 questions per Workout calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Workouts prepare students particularly for the Target and Team Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Stretches</p> <p>3 Stretches in handbook Number of questions and use of calculators vary by Stretch</p> <p style="text-align: center;"><i>Each Stretch covers a particular math topic that could be covered in any round. These help prepare students for all 4 rounds.</i></p> <div style="text-align: center;">  </div> |
|--|---|--|

IS THERE A SCHEDULE I SHOULD FOLLOW FOR THE YEAR? On average coaches meet with their students for an hour once a week at the beginning of the year, and more often as the competitions approach. Practice sessions may be held before school, during lunch, after school, on weekends or at other times, coordinating with your school's schedule and avoiding conflicts with other activities.

Designing a schedule for your practices will help ensure you're able to cover more problems and prepare your students for competitions. We've designed the *School Handbook* with this in mind. Below is a suggested schedule for the program year that mixes in Warm-Ups, Workouts and Stretches from the *School Handbook*, plus free practice competitions from last year. This schedule allows your students to tackle more difficult problems as the School and Chapter Competition approach.

| | | | |
|---|---|--|--|
| <p>Mid-August – September 2016</p> <p>Warm-Ups 1, 2 + 3 Workouts 1 + 2</p> | <p>October 2016</p> <p>Warm-Ups 4, 5 + 6 Workout 3 Fractions Stretch</p> | <p>November 2016</p> <p>Warm-Ups 7 + 8 Workouts 4 + 5 Angles and Arcs Stretch</p> | <p>December 2016</p> <p>Warm-Ups 9, 10 + 11 Workout 6 Bases Stretch</p> |
| <p>January 2017</p> <p>Warm-Ups 12, 13 + 14 Workouts 7 + 8 <i>2017 MATHCOUNTS School Competition</i> <i>Select chapter competitors (optional at this time)</i></p> | | <p>February 2017</p> <p>Practice Competition: 2016 School Competition Practice Competition: 2016 Chapter Competition <i>Select chapter competitors (required by this time)</i> <i>2017 MATHCOUNTS Chapter Competition</i></p> | |

You'll notice that in January or February you'll need to select the 1-10 student(s) who will represent your school at the Chapter Competition. This must be done before the start of your local Chapter Competition. You'll submit the names of your chapter competitors either online at www.mathcounts.org/coaches or directly to your local Chapter Coordinator.

It's possible you and your students will meet more frequently than once a week and need additional resources. If that happens, don't worry! You and your Mathletes can work together using the **Interactive MATHCOUNTS Platform**, powered by NextThought. This free online platform contains numerous *MATHCOUNTS School Handbooks* and past competitions, not to mention lots of features that make it easy for students to collaborate with each other and track their progress. You and your Mathletes can sign up for free at mathcounts.nextthought.com.

And remember, just because you and your students will meet once a week doesn't mean your students can only prepare for MATHCOUNTS one day per week. Many coaches assign "homework" during the week so they can keep their students engaged in problem solving outside of team practices. Here's one example of what a 2-week span of practices in the middle of the program year could look like.

| Monday | Tuesday | Wednesday (Weekly Team Practice) | Thursday | Friday |
|---|--|--|---|--|
| -Students continue to work individually on Workout 4, due Wednesday | -Students continue to work on Workout 4 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 4 -Coach gives Warm-Up 7 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 5 as individual work, due Wednesday | -Students continue to work individually on Workout 5 |
| -Students continue to work individually on Workout 5, due Wednesday | -Students continue to work on Workout 5 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 5 -Coach gives Warm-Up 8 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 6 as group work, due Wednesday | -Students work together on Workout 6 using online Interactive Platform |

WHAT SHOULD MY TEAM PRACTICES LOOK LIKE? Obviously every school, coach and group of students is different, and after a few practices you'll likely find out what works and what doesn't for your students. Here are some suggestions from veteran coaches about what makes for a productive practice.

- Encourage discussion of the problems so that students learn from each other
- Encourage a variety of methods for solving problems
- Have students write math problems for each other to solve
- Use the **Problem of the Week** (posted online every Monday)
- Practice working in groups to develop teamwork (and to prepare for the Team Round)
- Practice oral presentations to reinforce understanding

On the following page is a sample agenda for a 1-hour practice session. There are many ways you can structure math team meetings and you will likely come up with an agenda that works better for you and your group. It also is probably a good idea to vary the structure of your meetings as the program year progresses.

MATHCOUNTS Team Practice Sample Agenda – 1 Hour

Review Problem of the Week (20 minutes)

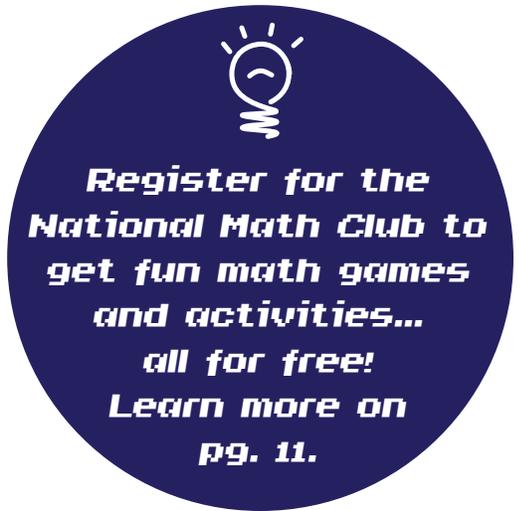

- Have 1 student come to the board to show how s/he solved the first part of the problem.
- Discuss as a group other strategies to solve the problem (and help if student answers incorrectly).
- Have students divide into groups of 4 to discuss the solutions to the remaining parts of the problem.
- Have 2 groups share answers and explain their solutions.

Timed Practice with Warm-Up (15 minutes)

- Have students put away all calculators and have one student pass out Warm-Ups (face-down).
- Give students 12 minutes to complete as much of the Warm-Up as they can.
- After 12 minutes is up, have students hold up pencils and stop working.

Play Game to Review Warm-Up Answers (25 minutes)

- Have students divide into 5 groups (size will depend on number of students in meeting).
- Choose a group at random to start and then rotate clockwise to give each group a turn to answer a question. When it is a group's turn, ask the group one question from the Warm-Up.
- Have the group members consult their completed Warm-Ups and work with each other for a maximum of 45 seconds to choose the group's official answer.
- Award 2 points for a correct answer on questions 1-3, 3 points for questions 4-7 and 5 points for questions 8-10. The group gets 0 points if they answer incorrectly or do not answer in 45 seconds.
- Have all students check their Warm-Up answers as they play.
- Go over solutions to select Warm-Up problems that many students on the team got wrong.

OK I'M READY TO START. HOW DO I GET STUDENTS TO JOIN? Here are some tips given to us from successful competition coaches and club leaders for getting students involved in the program at the beginning of the year.

- Ask Mathletes who have participated in the past to talk to other students about participating.
- Ask teachers, parent volunteers and counselors to help you recruit.
- Reach parents through school newsletters, PTA meetings or Back-to-School-Night presentations.
- Advertise around your school by:
 1. posting intriguing math questions (specific to your school) and referring students to the first meeting for answers.
 2. designing a bulletin board or display case with your MATHCOUNTS poster (included in your School Competition Kit) and/or photos and awards from past years.
 3. attending meetings of other extracurricular clubs (such as honor society) so you can invite their members to participate.
 4. adding information about the MATHCOUNTS team to your school's website.
 5. making a presentation at the first pep rally or student assembly.

Good luck in the competition! If you have any questions during the year, please contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

Critical 2016-2017 Dates

2016

Aug. 15 –
Dec. 16

Submit your school's registration to participate in the Competition Series and receive this year's School Competition Kit, which includes a hard copy of the *2016-2017 MATHCOUNTS School Handbook*. Kits are shipped on an ongoing basis between mid-August and December 31.

The fastest way to register is online at www.mathcounts.org/compreg. You also can download the MATHCOUNTS Competition Series Registration form and mail or email it with payment to:

MATHCOUNTS Foundation – Competition Series Registrations
1420 King Street, Alexandria, VA 22314
Email: reg@mathcounts.org

To add students to your school's registration, log in at www.mathcounts.org/coaches to access the Dashboard. **Questions?** Call the MATHCOUNTS national office at (703) 299-9006 or email us at info@mathcounts.org.

Nov. 1

The 2017 School Competition will be available online. All registered coaches can log in at www.mathcounts.org/coaches to download the competition.

Nov. 18
(postmark)

Deadline to register for the Competition Series at reduced registration rates (\$90 for a team and \$25 for each individual). After November 18, registration rates will be \$100 for a team and \$30 for each individual.

Dec. 16
(postmark)

Competition Series Registration Deadline

In some circumstances, late registrations might be accepted at the discretion of MATHCOUNTS and the local coordinator. *Late fees will apply. Register on-time to ensure your students' participation.*

2017

Early Jan.

If you have not been contacted with details about your upcoming competition, call your local or state coordinator. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

Late Jan.

If you have not received your School Competition Kit, contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

Feb. 1-28

Chapter Competitions

March 1-31

State Competitions

May 14-15

2017 Raytheon MATHCOUNTS National Competition in Orlando, FL

Other MATHCOUNTS Programs

MATHCOUNTS was founded in 1983 as a way to provide new avenues of engagement in math for middle school students. MATHCOUNTS began solely as a competition, but has grown to include 3 unique but complementary programs: the **MATHCOUNTS Competition Series**, the **National Math Club** and the **Math Video Challenge**. Your school can participate in all 3 MATHCOUNTS programs!

The **National Math Club** is a free enrichment program that provides teachers and club leaders with resources to run a math club. The materials provided through the National Math Club are designed to engage students of all ability levels—not just the top students—and are a great supplement for classroom teaching. This program emphasizes collaboration and provides students with an enjoyable, pressure-free atmosphere in which they can learn math at their own pace.

Active clubs also can earn rewards by having a minimum number of club members participate (based on school/organization/group size). **There is no cost to sign up for the National Math Club**, and registration is open to schools, organizations and groups that consist of at least 4 students in 6th, 7th and/or 8th grade and have regular in-person meetings. More information can be found at www.mathcounts.org/club, and the 2016-2017 School Registration Form is included on the next page.

The **Math Video Challenge** is an innovative program that challenges students to work in teams of 4 to create a video explaining the solution to a MATHCOUNTS handbook problem and demonstrating its real-world application. This project-based activity builds math, communication and collaboration skills.

Students post their videos to the contest website, where the general public votes for the best videos. The 100 videos with the most votes advance to judging rounds, in which 20 semifinalists and, later, 4 finalists are selected. This year's finalists will present their videos to the students competing at the 2017 Raytheon MATHCOUNTS National Competition, and the 224 Mathletes will vote to determine the winner. Members of the winning team receive college scholarships. **Registration is completely free** and open to all 6th, 7th and 8th grade students. More information can be found at videochallenge.mathcounts.org.

! The fastest way to register
your school is online at
www.mathcounts.org/clubreg!

2016-2017 **SCHOOL** REGISTRATION FORM

This registration form is for U.S. middle schools only. To register a non-school group (such as a Girl Scout Troop, Boys and Girls Club Chapter or math circle) for the National Math Club, please go to www.mathcounts.org/club to review eligibility requirements and register.

Step 1: Fill in your school's name and confirm eligibility to participate.

*required information

U.S. school with students in 6th, 7th and/or 8th grade

School Name* _____

There can be multiple clubs at the same U.S. school, as long as each club has a different club leader.

By signing below I, the club leader, affirm that the school named above is a U.S. school with students in sixth-, seventh- and/or eighth-grade and is therefore eligible to participate in the National Math Club. I affirm that I have permission to register the school above for this program and I understand that MATHCOUNTS can cancel my membership at any time if it is determined that my group is ineligible.

Club Leader Signature* _____

Step 2: Provide your information so we can send you materials and set up your online access.

*required information

Club Leader Name* _____ Club Leader Phone _____

Club Leader Email Address* _____

Club Leader Alternate Email Address _____

Club Address* _____

City, State ZIP* _____

Estimated total number of participating students in club (minimum 4 students)*: _____

My school previously participated in the National Math Club.

School Type (please check one)*: Public Charter Private Homeschool Virtual

Department of Defense or State Department schools, please provide additional information below.

Clubs located outside of the U.S. states or territories are not eligible to participate in the National Math Club unless they are in schools affiliated with the U.S. Department of Defense or State Department.

My school is sponsored by (please check one): U.S. Department of Defense (DoDDS)
 U.S. State Department

Country _____

Step 3: Almost done... just turn in your form.

Mail or email a scanned copy of this completed form to:
MATHCOUNTS Foundation, 1420 King Street, Alexandria, VA 22314
Email: reg@mathcounts.org

Questions?
Please call the national office at
703-299-9006

Warm-Up 1

1. _____ years A time capsule was sealed in 1940 and will be opened on the same date in 2017. How long will the capsule remain sealed?

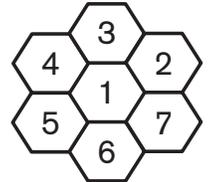

2. _____ large paper clips

The length of 5 small paper clips is equal to the length of 2 large paper clips. The length of 8 small paper clips is equivalent to the length of how many large paper clips? Express your answer as a mixed number.

3. _____ paths

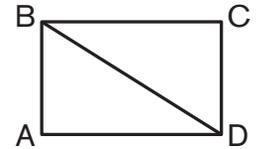

In the figure shown, if no cell may be visited more than once and not every cell must be visited, how many paths start in cell 1 and end in cell 7?

4. _____ What is the value of $4 \div \frac{2}{3} - 5$?

5. _____ What is the absolute difference between $\frac{1}{2}$ and $\frac{1}{3}$? Express your answer as a common fraction.

6. _____ cm If the perimeter of rectangle ABCD is 34 cm and $AB = 5$ cm, what is the perimeter of $\triangle ABD$?

7. _____ Harvey has a fair eight-sided die that has a different number from 1 to 8 on each side. If he rolls this die twice, what is the probability that the second number rolled is greater than or equal to the first number? Express your answer as a common fraction.

8. _____ In scientific notation, what is the product of 1.2×10^3 and 1.4×10^2 ? Express your answer to two significant figures.

9. _____ When the integer n is squared, the result is less than 150. What is the sum of all possible values of n ?

10. \$ _____ Minnie paid a one-time registration fee of \$30 for dance lessons. Additionally, she paid \$20 per lesson. If she took seven lessons, how much did she pay altogether?

Warm-Up 2

11. _____ pieces How many pieces that are exactly 5 inches long can Sue cut from a string that is 7 feet long?

12. _____ units How many units away from the origin is the point $(-3, -4)$?

13. _____ tables A hexagonal table that is by itself seats 6 people, one person at each side. A row of hexagonal tables is created by pushing together a certain number of hexagonal tables so that a side of one table meets a side of the next table, in the way shown here. If 50 people can sit at the row of tables that was created, how many tables are in the row?

14. _____ coins In Oregon, which has no sales tax, Gloria bought three notebooks for \$1.57 each. If she paid \$5.00, what is the least number of U.S. coins that she could get in change?

15. _____ g

| |
|----------|
| Fluorine |
| F |

 The mass of a fluorine atom is 3.16×10^{-23} g. What is the mass of 1,000,000,000 fluorine atoms? Express your answer in scientific notation to three significant figures.

16. _____ meals A restaurant offers a dinner special in which diners can choose any one of 3 appetizers, any one of 4 entrées, any two different side dishes out of 5 and any one of 6 desserts. How many different meals are possible?

17. _____ minutes It takes 15 machines 15 minutes to make 500 raviolis. The machines produce raviolis at a steady rate. How long would it take 75 of these machines to make 6000 raviolis?

18. _____ Four chips are distinctly labeled with the digits 2, 3, 1 and 7, one chip for each digit. Two chips are drawn at random without replacement and placed in the order in which they are drawn, from left to right, to form a two-digit number. What is the probability that the two-digit number is a prime number? Express your answer as a common fraction.

19. _____ The letters A, B, ... , Z are equally spaced in order on a number line, with A at 0 and Z at 25. What is the average of the two numbers that are 4 units from the letter M?

20. _____ units On a coordinate grid, point B is located 8 units below and 2 units to the left of $A(0, 6)$. What is the length of segment AB? Express your answer in simplest radical form.

Warm-Up 3

21. _____ What is the average of the integers from 13 to 31, inclusive?

22. _____ socks Kelly has 6 identical white socks and 5 identical black socks in a drawer. If she selects without looking, how many socks must she take from the drawer to be assured of a matching pair?

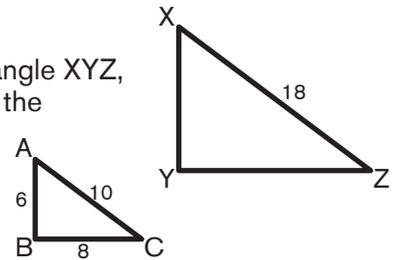

23. _____ For what value of m does $\frac{3}{m} = \frac{27}{72}$?

24. _____ chairs A room has 23 rows of 27 chairs each. How many chairs are in the room?

25. _____  Esme is thinking of two integers. One integer is 4 times the other, and their sum is 18 more than 3 times the smaller integer. What is the smaller of the integers Esme is thinking of?

26. _____ Right triangle ABC has side lengths 6, 8 and 10 units. Right triangle XYZ, with hypotenuse of length 18 units, is similar to $\triangle ABC$. What is the ratio of the area of $\triangle ABC$ to the area of $\triangle XYZ$? Express your answer as a common fraction.

27. _____ A number is randomly selected from the integers 1 through 25, inclusive. What is the probability that the number chosen is divisible by 2, 3, 4 or 5? Express your answer as a common fraction.

28. _____ sequences Using only 1s and 2s, in how many different ordered sequences can Siddarth write a sum that equals 5? For example, a sum of 3 can be written $1 + 2$, $2 + 1$ or $1 + 1 + 1$.

29. _____ miles Kevin takes a bus from home to school. The bus travels 8 miles west, then turns and travels 8 miles north, then turns and travels 7 miles west to the school. If the bus were able to travel directly from Kevin's house to the school, along a straight path, how much shorter would the trip be?

30. _____ What is the result when Ellen starts with the integer 123,456 and performs the following sequence of operations: subtract 6, divide by 10, subtract 5, divide by 10, subtract 4, divide by 10, subtract 3, divide by 10, subtract 2, divide by 10?

Workout 1

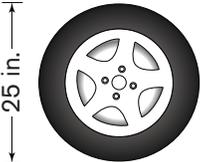

31. NZ\$ When one New Zealand dollar, NZ\$1.00, was worth US\$0.77, how much was US\$1.00 worth in New Zealand dollars?

32. pennies A jar contains some number of pennies. When pennies are removed 2, 3, 4, 5, 6 or 8 at a time, one penny is left over. There are no pennies left over when they are removed 7 at a time. What is the least number of pennies that could be in the jar?

33. lemmings The population of lemmings on an island in Norway varies drastically. In a base year, the population was n lemmings. The next year, it tripled. The third year, the number dropped by 3000 from the second year. The fourth year, the population was $\frac{1}{2}$ that of the third year. The fifth year, it increased by 1300 to a total of 1450 lemmings. What is the value of n ?

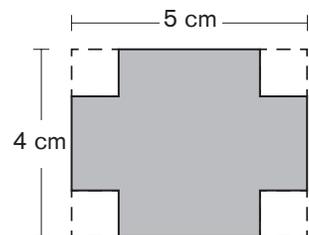

34. integers How many distinct positive four-digit integers can be formed using the digits 1, 2, 3 and 4 each once, such that no adjacent digits differ by more than 2?

35. rotations  The tires on a certain car are 25 inches in diameter. If the car is moving at a constant speed of 65 miles per hour, how many rotations per second is the front left tire making? Express your answer as a decimal to the nearest tenth. (1 mile = 5280 feet)

36. week Nish trains to run a half marathon, a distance of 13.1 miles. Her training starts in week 1 with two 2-mile runs and one 4-mile run. Each week thereafter, the distances of her runs increase by 10% over the previous week's distances; therefore, she runs 8.8 miles in week 2. In which week of training does she first exceed 13.1 miles for the week?

37. _____ Kylie writes a 1 after A, a 2 after B, and so on, writing a single digit in counting order after each of the first nine letters of the alphabet. When she reaches 10, she writes the 1 after J and the 0 after K. When she reaches the Z, the 1 from 18 follows it; then, she cycles back to the start of the alphabet, and the 8 follows the A. After what letter does Kylie write the 6 in 26?

38. cm² A dodecagon is formed when a 1-cm by 1-cm square is removed from each corner of a 4-cm by 5-cm rectangle as shown. What is the area of the dodecagon?

39. _____ Jesse added all but one of the first ten positive integers together. The sum was a perfect square. Which one of the first ten positive integers did Jesse not include?

40. purple marbles A bag contains 20 purple and 40 green marbles. How many purple marbles need to be added so that $\frac{5}{12}$ of the marbles will be green?

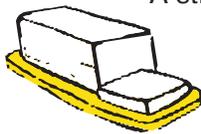

Workout 2

41. _____ feet A cube of cheese has edge length 1 inch and weighs 0.6 ounce. What is the edge length, in feet, of a cube of the same cheese that weighs 64.8 pounds? (1 pound = 16 ounces)

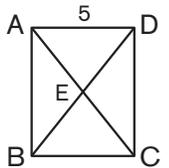

42. _____ integers How many positive integers from 1 to 100, inclusive have an even number of positive divisors?

43. _____ What is the coordinate of the point on a number line that is $\frac{2}{3}$ of the way from -1.3 to $3\frac{1}{8}$? Express your answer as a decimal to the nearest hundredth.

44. _____ calories A stick of butter is a $1\frac{1}{2}$ -inch by $1\frac{1}{2}$ -inch by $3\frac{1}{4}$ -inch rectangular prism and contains 800 calories. How many calories are in a pre-formed “pat” of butter measuring 1 inch by 1 inch by $\frac{3}{8}$ inch? Express your answer to the nearest whole number.

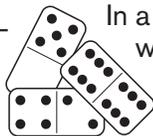

45. _____ degrees In rectangle ABCD, shown here, $AD = BC = 5$ units. Diagonals AC and BD, each of length 10 units, intersect at E. What is the degree measure of $\angle AEB$?

46. _____ What is the value of n if $4! + 5! = n!3!$?

47. _____ In a standard set of dominoes, a face of each domino has a line through the center, with 0 to 6 dots on each side of the line. Each possible combination of dots is used exactly once, one combination per domino. What is the probability that a randomly selected domino will have the same number of dots on both sides of the line? Express your answer as a common fraction.

48. _____ % Paige cuts a square out of a circular pizza. The corners of the square lie on the circumference of the pizza. To the nearest whole number, what percent of the pizza is left when Paige removes the square?

49. _____ zaggles In exchange for 5 ziggles and 4 zoggles, Jefferson gets 30 zaggles. In exchange for 2 ziggles and 3 zoggles, Monroe gets 19 zaggles. How many zaggles should Carter expect to get in exchange for 1 ziggle and 1 zoggle?

50. _____ feet When leaned against a vertical structure, a straight ladder can be used safely if its top is no more than 4 feet above the base of the structure for every foot that the bottom of the ladder is away from the base. How high can a 22-foot ladder safely reach up a vertical structure? Express your answer as a decimal to the nearest tenth.

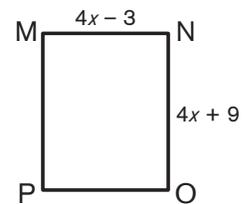

Warm-Up 4

51. _____ Jamie's scores on the first five tests in his algebra class were 81, 75, 86, 98 and 92. After three more tests the median of his test scores was 88. What is the greatest possible value for the lowest score on these three tests?

52. _____ Consider the set of all possible two-digit numbers that can be created using an unlimited supply of 1s, 3s, 7s and 9s. What is the greatest absolute difference between any two primes in this set?

53. _____ The mean of a and b is 8. The mean of b and c is 16. The mean of a and c is 14. What is the value of $a + b + c$?

54. _____ units Rectangle MNOP has length $4x + 9$ and width $4x - 3$. What is the absolute difference between the length and width of rectangle MNOP?

55. _____ The faces of a cube are randomly and independently painted either red or blue with equal likelihood. What is the probability that the cube has all blue faces? Express your answer as a common fraction.

56. _____ If $\textcircled{n} = n^2 - n$, what is the value of $\textcircled{\textcircled{5}}$?

57. _____ Kavon has a fair eight-sided die with each side having a different one of the digits 1 through 8. He rolls the die twice and writes down, in order, the results to form a two-digit number. What is the probability that his two-digit number is prime? Express your answer as a common fraction.

58. _____ What is the value of $2x^2 + 3y^2 - 4x + 2y - 17$ when $x = 3$ and $y = -2$?

59. _____ Colorado used to issue license plates with the format of two letters (excluding Q) followed by four digits from 0 through 9. Later the state switched to a format of three letters (excluding Q) followed by three digits. What is the ratio of the number of possible old-style plates to the number of possible new-style ones? Express your answer as a common fraction.

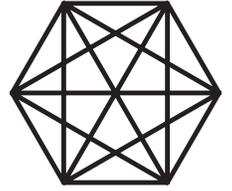

60. _____ What is $40\% \times \frac{2}{3} \times 24 \div 0.8$?

Warm-Up 5

61. _____ What is the value of $(2 \times 6^3 + 6^2) - 7 \times 6^2$?

62. _____ triangles The figure shown consists of a regular hexagon and all of its diagonals. How many triangles in the figure have at least two congruent sides?

63. _____ ways Fido has to climb five stairs. If he steps on at least three of the five stairs, but never climbs more than three stairs in one step, in how many possible ways can Fido climb the stairs?

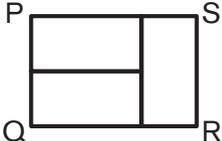

64. _____ The quotient $\frac{x^2(x^2)^3}{x^2}$ can be expressed as x^y . What is the integer value of y ?

65. \$ _____ A grocery store is required to charge customers an 8% sales tax on certain items. However, some purchases at the store, such as food products, are not subject to sales tax. During a certain month, the store sold \$400,000 worth of groceries, not including the sales tax. If the store also collected \$10,000 in sales tax that month, then what was the total amount (in dollars) of the store's sales that month that were not subject to sales tax?

66. _____ ways A school of 100 fish swims in the ocean and comes to a very wide horizontal pipe. The fish have three choices to get to the food on the other side: swim above the pipe, through the pipe or below the pipe. If we do not consider the fish individually, in how many ways can the entire school of fish be partitioned into three groups with each group choosing a different one of the three options and with at least one fish in each group?

67. _____ miles If Reid is traveling at a speed of 44 ft/s, how many miles will he travel in an hour given that 1 mile = 5280 feet?

68. _____ ways In how many different ways can the letters of CHAIRS be arranged?

69. _____ cm  The figure shows rectangle PQRS composed of three congruent rectangles. If the area of PQRS is 1536 cm^2 , what is its perimeter?

70. _____ What is the value of the following expression?

$$2^{0^{1^2}} - 2^{2^{1^0}}$$

Warm-Up 6

71. \$ _____ Amy's favorite lotion costs \$3.00 for 4 fluid ounces. At that same rate, what would she expect to pay for a quart of lotion? (1 quart = 32 fluid ounces)

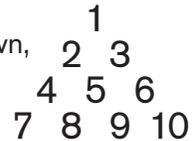

72. _____

| | | | |
|------------|----|---|----|
| Multiply → | | | |
| ↓ | 3 | 2 | 6 |
| | 4 | 1 | 4 |
| | 12 | 2 | 24 |

In the first grid, numbers were multiplied vertically and horizontally until a value was found for the shaded box. For instance, $3 \times 2 = 6$ and $4 \times 1 = 4$ were the results from the first two rows, and then $6 \times 4 = 24$ in the third column. The partially completed second grid follows the same rules, and both a and b are positive integers. What is the least possible value of $a + b$?

| | | | |
|------------|-----|-----|------|
| Multiply → | | | |
| ↓ | 18 | a | |
| | b | 4 | |
| | | | 5184 |

73. _____ The consecutive counting numbers are written in a triangular table, as shown, with one more number in each successive row. What is the sum of the numbers in the row that contains 25?

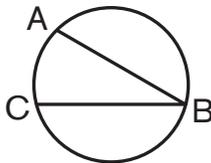

74. _____ In the arithmetic sequence 12, w , x , y , z , 47, what is the value of y ?

75. _____ cm² The width of a rectangle is one-third of its length. If the perimeter of the rectangle is 136 cm, what is its area?

76. _____ permuta-
tions How many three-letter permutations can be made using letters from ALASKA?

77. _____ inches

The circle shown has a diameter of 12 inches, $m\angle ABC = 30$ degrees and $AB = BC$. What is the length of minor arc AC? Express your answer in terms of π .

78. _____ If A represents a digit in the equation $0.0A = \sqrt{0.0049}$, what is the value of A ?

79. _____ The absolute difference between two numbers is 6, and the absolute difference between their squares is 24. What is the product of the two numbers?

80. _____ If $a \odot b$ is defined as $a^2 - 2b^2$. What is $5 \odot (4 \odot 3)$?

Workout 3

81. _____ The sum of eleven consecutive integers is 11. What is the least of these eleven integers?

82. _____ The mean of x and y is 12 and the mean of y and 12 is $\frac{z}{2}$. What is the mean of x and z ?

83. _____ cm Squares A and B have at least one point in common. The area of square A is 225 cm^2 and the area of square B is 16 cm^2 . What is the maximum distance between the centers of the squares? Express your answer as a common fraction in simplest radical form.

84. _____ In the number sequence 3, 5, 2, ..., after the first two terms, the n th term is defined as $a_n = a_{n-1} - a_{n-2}$. For example, $a_3 = a_2 - a_1 = 5 - 3 = 2$. What is the sum of the first 200 terms of this sequence?

85. _____ What is the sum of the positive integer factors of 2017?

86. _____ feet Oberon and Lance sit directly opposite each other at a large round table. Arthur sits at the same table, 20 feet from Oberon and 21 feet from Lance. What is the diameter of the table?

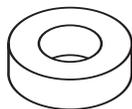

87. \$ _____ The cost of 1 binder with photos of celebrities on the cover plus the cost of 8 regular binders is a total of \$32.60. The cost of 1 binder with photos of celebrities on the cover plus the cost of 12 regular binders is a total of \$46.00. How much more does it cost to buy a celebrity binder than a regular binder?

88. _____ widgets Mr. Jones makes 3% commission on his sales of widgets. At a different company, Mr. Smith makes 5% commission selling the same widgets at the same price. Mr. Smith sold 500 fewer widgets than Mr. Jones, and they both earned the same commission. How many widgets did Mr. Smith sell?

89. _____ The table of values shows the relationship between x and y , which can be modeled with the equation $y = ax^b$, for integers a and b . What is the value of $a + b$?

| | | | | |
|-----|---|----|-----|-----|
| x | 2 | 3 | 5 | 6 |
| y | 8 | 27 | 125 | 216 |

90. _____ in² Donny needs to find the surface area of a dozen donuts so he can make enough glaze. He doesn't know how to calculate the exact surface area of a donut, so he makes an approximation based on a roll of 1-inch-wide masking tape, which has the same volume as the donut. The outer radius of the tape is 2.5 inches, and the inner radius is 1.5 inches. What surface area did Donny estimate for a dozen donuts? Express your answer in terms of π .

Workout 4

91. combinations On Saturday, three different football games are televised at noon and four different games are televised at 8 p.m. On Sunday, five different games are televised at noon. If Amanda watches one Saturday game at noon and another at 8 p.m. and one game at noon on Sunday, how many different combinations of games can she watch?

92. _____ If $a = 12$, $b = 4$, $c = 5$ and $x = \frac{1}{2}$, then what is the value of $\frac{\left(\frac{abc}{x}\right) - (6b^2 - 4)}{0.5}$?

93. hours At noon, Randy's family left the Texas-Oklahoma border, traveling north on I-35. At noon, Marco's family left their home in Minnesota, 1029 miles from the Texas-Oklahoma border, traveling south on I-35. If Randy's family is traveling 45 mi/h and Marco's family is traveling 53 mi/h, how many hours will it take for the two families to pass each other? Express your answer as a decimal to the nearest tenth.

94. _____ What is the 41st digit after the decimal point in the decimal expansion of $\frac{1}{27}$?

95. _____ For the integers 15, 17, 11, 13, x , y , the mode, median and mean form an increasing arithmetic sequence, in that order. If $x \leq y$, what is the greatest possible value of y ?

96. units²  The hypotenuse of a 5-12-13 right triangle is the diameter of a semicircle containing the right angle vertex, as shown. What is the total area of the shaded regions? Express your answer to the nearest whole number.

97. ways A group of 12 tourists will split up for two tours. A tour guide will lead one group on a hike. Another tour guide will lead the other group on a safari. If at least one tourist goes with each guide, in how many different ways can the tourists split up for the two tour groups?

98. intersections What is the maximum number of distinct intersections of 30 different coplanar circles?

99. % A sphere, a cone and a cylinder all have the same height and radius. The sphere and cone are completely filled with water. If the amount of water in the cylinder is the same as the total of the amounts in the sphere and cone, what percent of the cylinder's volume is filled?

100. _____ What is the sum of all the prime numbers less than 500 with only 3s and 4s as digits?

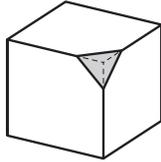

Warm-Up 7

101. _____ marbles Mac has 25 marbles, of which 20% are red. Thayer has 20 marbles, of which 75% are not red. What is the absolute difference between the numbers of red marbles they have?

102. _____ If $f(x) = x^2 - 2$ and $g(x) = 2x + 4$, what is the value of $f(g(-3))$?

103. _____

In the figure shown, a triangular pyramid has been cut off the corner of the cube so that an equilateral triangle face is formed. If each corner of the cube is cut off in this manner, what is the maximum sum of the number of faces, edges and vertices on the new polyhedron?

104. \$ _____ Four oranges cost a total of 90 cents. At this rate, what is the cost of 3 dozen oranges?

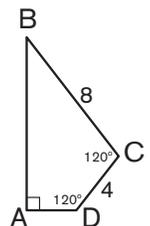

105. _____ When fully matured, a grape contains 80% water. After the drying process, called dehydration, the resulting raisin is only 20% water. What fraction of the original water in the grape remains after dehydration? Express your answer as a common fraction.

106. _____ The proper factors of a positive integer are all of the distinct positive integer factors of the number except the number itself. An abundant number is a positive integer whose proper factors sum to a value greater than the number. Which abundant number less than 50 has the greatest proper factor sum?

107. _____ If $(AAA)^3 = A6,926,0A7$, what digit does A represent?

108. _____ liters A Vermont syrup maker has 100 liters of a mixture that is $\frac{1}{4}$ maple syrup and $\frac{3}{4}$ base. She wants to add enough maple syrup to bring the ratio of maple syrup to base up to 1:1. If she has to evaporate 90% of the maple sap to get the maple syrup to add to that mixture, how many liters of maple sap does she need to start with?

109. _____ units² In quadrilateral ABCD, $m\angle C = m\angle D = 120$ degrees, $m\angle A = 90$ degrees, $BC = 8$, $CD = 4$. What is the area of ABCD? Express your answer in simplest radical form.

110. _____ arrange-ments Zzyzx Road is in California near Nevada. How many five-letter arrangements of the letters in the English alphabet follow Zzyzx alphabetically?

Warm-Up 8

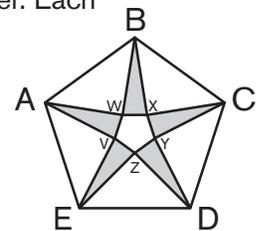

111. _____ If $\frac{x}{y} = 10$, $x = 3z$ and $z = 20$, what is the value of y ?

112. _____ Cora has five balls—two red, two blue and one yellow—which are indistinguishable except for their color. She has two containers—one red and one green. If the balls are randomly distributed between the two containers, what is the probability that the two red balls will be alone in the red container? Express your answer as a common fraction.

113. _____ units² What is the area of a circle that has diameter AB with endpoints $A(-2, 4)$ and $B(10, 2)$? Express your answer in terms of π .

114. _____ sets An arithmetic sequence of integers has 20 as the first term and 56 as the last term. How many different sets of integers form such a sequence?

115. _____ degrees In the figure, regular pentagons $ABCDE$ and $VWXYZ$ have the same center. Each side of pentagon $ABCDE$ is the hypotenuse of an isosceles right triangle. In each right triangle, the vertex opposite the hypotenuse is a vertex of pentagon $VWXYZ$. Each side of the smaller regular pentagon $VWXYZ$ is also the base of one of the shaded acute isosceles triangles. What is the degree measure of the vertex angle of each shaded triangle?

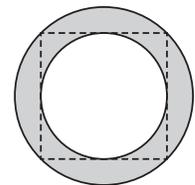

116. _____ A 12-foot by 12-foot square bathroom needs to be tiled with 1-foot square tiles. Two of the tiles are the wrong color. If the tiles are placed randomly, what is the probability that the two wrong-colored tiles share an edge? Express your answer as a common fraction.

117. _____ What digit is in the units place in the product $3^{17} \times 7^{23}$?

118. _____ What is the geometric mean of 14 and 126?

119. _____ in² The figure shows a square inscribed in a circle of radius 12 inches, and another circle inscribed within that square. What is the area of the shaded region between the two circles? Express your answer in terms of π .

120. _____ base 3 What is the value of the sum $321_5 + 321_4$ when written in base 3?

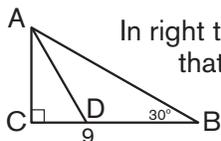

Workout 5

121. _____ A set of six different positive integers has a median and mean of 6. If the largest number in the set is 12, what is the largest possible sum for the three largest numbers?

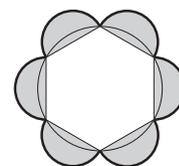

122. _____ $\frac{\text{minutes}}{\text{per mile}}$ Nathan ran 2.5 miles at a pace of 7 minutes 36 seconds per mile. If he wishes to complete the entire 5-mile run at an average pace of 7 minutes 24 seconds per mile, what should his pace be for the next 2.5 miles? Express your answer as a decimal to the nearest tenth.

123. _____ The graphs of $y = x^2 - 3x + 3$ and $4x - 12y = -19$ intersect in two points. What is the sum of the x -coordinates of those points? Express your answer as a common fraction.

124. _____ cm In right triangle ABC, $m\angle B = 30$ degrees and $BC = 9$ cm. If D is on side BC so that segment AD bisects acute $\angle A$, what is DC?

125. _____ units A regular hexagon is inscribed in a circle of radius 1 unit. On each side of the hexagon, a semicircle is constructed with the side of the hexagon as a diameter, as shown. What is the perimeter of the figure formed by these semicircles? Express your answer as a decimal to the nearest tenth.

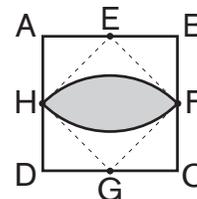

126. _____ integers For how many three-digit positive integers is the sum of the digits of the integer equal to 9?

127. _____ A toy manufacturer produces blue yo-yos and red yo-yos simultaneously at the same rate. During production, yo-yos of each color exit the assembly line in random order. What is the probability that the next four yo-yos that exit are all the same color? Express your answer as a common fraction.

128. _____ cm Ginger wants to make bubble tea in a cylinder-shaped cup with inside measurements of diameter 6 cm and height 12 cm. After she places 48 identical spherical tapioca bubbles into her empty cup, exactly 100π mL of liquid will fill the cup right to the top. Given that $1 \text{ mL} = 1 \text{ cm}^3$, what is the radius of each tapioca bubble? Express your answer as a decimal to the nearest tenth.

129. _____ m^2 Square ABCD, shown here, has side length 2 meters, and E, F, G and H are midpoints of the sides. The curved lines are arcs of circles with centers at E and G. What is the area of the shaded region? Express your answer as a decimal to the nearest hundredth.

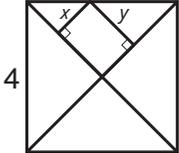

130. _____ Tony chooses a positive integer k . After his friends make the following five statements, Tony says that exactly two of them are correct. What is the least possible value of k ?

- a. Bruce guesses that k is a multiple of 15.
- b. Steven guesses that k is a multiple of 18.
- c. Thor guesses that k is a multiple of 20.
- d. Clint guesses that k is a multiple of 28.
- e. Natasha guesses that k is a multiple of 60.

Workout 6

131. _____ Caynan wrote a sequence of consecutive integers beginning with -37 . If the sum of the integers he wrote is 200, what is the greatest integer in the sequence Caynan wrote?

132. _____  In the figure, the segments of lengths x and y lie on perpendiculars to the diagonals of a square of side length 4. The sum $x + y$ can be written in the form \sqrt{z} . What is the value of z ?

133. _____ A box contains 26 slips of paper, each showing a different letter of the alphabet. If two slips of paper are drawn from the box at the same time, what is the probability that both letters appear in the word ALGEBRA? Express your answer as a common fraction.

134. \$ _____ In Swimmington, where Maxwell lives, the charge for water usage is 0.15 cent per gallon. Maxwell has a cylindrical pool of height 4.5 feet and diameter 24 feet. What is the cost for Maxwell to fill his pool so that the water surface is 3 inches below the top of the pool, given that 1 gallon = 231 in³? Express your answer to the nearest whole number.

135. _____ base 8 What is 10111010_2 , when written in base 8?

136. _____ spheres Solid metal spheres with diameter $\frac{1}{6}$ inch are dropped into a rectangular prism tank, where they sink to the bottom. The tank is 10 inches wide by 15 inches long by 8 inches deep, and the water level is currently 3 inches. How many spheres does it take to raise the water level 1 inch? Express your answer to the nearest hundred.

137. _____ % Recently, the manufacturer changed how Leon's favorite pens are sold. The price of a box of pens has been reduced by 10%, and there are now 25% fewer pens per box. What is the percent change in the cost per pen?

138. _____ What is the greatest integer n such that $n!$ has n digits?

139. _____ Adam has a triangle with vertices labeled 1 through 3. Jayvon has an octagon with vertices labeled 1 through 8. Each boy starts at position 1 and counts consecutive vertices on his polygon, continuing in the same direction, until he has reached 120 and is back at the vertex labeled 1. Percy did the same activity with his polygon, and he also finished at the vertex labeled 1. If Percy's polygon is not a triangle or an octagon, what is the sum of all the possible numbers of sides his polygon might have?

140. _____ On Mars a day is called a sol. Mars has a 668-sol year with a 7-sol week. If a regular Martian year has 95 weeks, and a leap year is one week longer, what fraction of the years are leap years? Express your answer as a common fraction.

Warm-Up 9

141. _____ Two positive integers have a sum of 11 and a product of 24. What is the absolute difference between those two numbers?

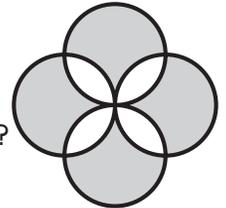

142. _____ Becca and Varun are walking side by side at the same constant speed. Becca steps onto a moving walkway and continues to walk at the same speed, while Varun walks alongside, maintaining his speed. When Becca reaches the end, Varun has covered only two-fifths of the length of the walkway. What is the ratio of the walkway's rate to Becca and Varun's walking speed? Express your answer as a common fraction.

143. _____ % Two sides of a regular pentagon are doubled and a new pentagon is formed. By what percent is the perimeter increased?

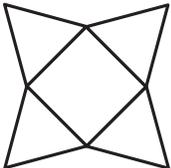

144. _____ quarters Joe has some nickels, dimes and quarters. He has 37 coins in all, with 4 more nickels than dimes and 2 more quarters than nickels. How many quarters does Joe have?

145. _____ numbers A *repeating* integer is one in which a sequence of digits occurs two or more times to make the entire number. The 4-digit number 4242 is a repeating integer. How many numbers are six-digit repeating integers?

146. _____ cm² Lucky draws a four-leaf clover by shading portions of four overlapping circles of radius 2 cm as shown. What is the area of the shaded regions?

147. _____ dates Eve's cousin, Fin, lives in a different country. According to a postcard Eve got, Fin plans to visit the U.S., but Eve can't tell the exact date of Fin's visit, because of the way the date is written. Eve doesn't know if the date format used in Fin's country is M/D or D/M, where M and D are different and represent the two-digit month and two-digit day, respectively. For how many dates in the year would both interpretations of the date written on the postcard result in a valid date?

148. _____  The net of a square pyramid, shown here, is a square with an equilateral triangle on each of its sides. The side length of the square can be expressed as $6x - 6$ or $2x + 14$, for the same value of x . When the net is folded to form a square pyramid, its surface area can be expressed in simplest radical form as $a^2(\sqrt{b} + c)$. What is the value of $a + b + c$?

149. _____ What single digit does D represent when $2D \times D51 = 807D$?

150. _____ extensions

The numbers 2 through 9 on a telephone keypad, like the one shown, are associated with the letters of the alphabet. Each person in a particular office is assigned a phone extension based on the first three letters of his or her last name. For instance, John DOE has the extension 363, and Marvella JOHnson has the extension 564. How many unique three-digit extensions can be assigned using the digits 2 through 9?

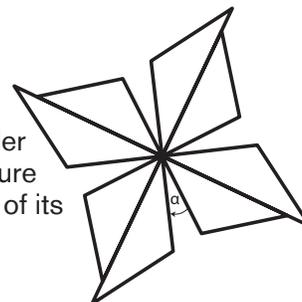

Warm-Up 10

151. _____ inches Keaton wants to build a rectangular prism with volume 2016 in^3 so that the length of each edge is a whole number of inches. What is the least possible sum of the three dimensions of the prism he builds?

152. _____ Cody's ZIP code is a five-digit number whose digits are all different. In this number, there are two pairs of adjacent digits in which the digits differ by 1. There is a pair of adjacent digits in which one digit is 4 times the other. There is a pair of adjacent digits whose sum is 10, as well as a pair of non-adjacent digits whose sum is 10. The sum of all five digits is a multiple of 10. If the leftmost digit of the number is 7, what is Cody's ZIP code?

153. _____ The product of the 3-digit number ABC and its reverse, CBA , is 140,209. If A , B and C each represent a different digit, what is the value of $A + B + C$?

154. _____ degrees A fan design has four pairs of similar isosceles triangles that create four blades, as shown. In each pair of triangles, the base of the smaller triangle is a segment of the base of the larger triangle, and the measure of the vertex angle of each triangle is twice the sum of the measures of its base angles. What is the degree measure of the angle labeled α ?

155. _____ teams  Twelve couples participate in a fitness retreat. One strength-building exercise requires participants to form teams of three so that the two people who make up a couple are not on the same team. How many different teams of three can be formed in this manner?

156. _____ What common fraction is equivalent to $0.\overline{327}$?

157. _____ Parallel lines l , m and n are in a plane with line m a distance of 1 cm from each of the lines l and n . Line l is tangent to a circle that has radius 3 cm. Lines m and n intersect the circle, and the four points of intersection are connected to form a trapezoid. If the area of the trapezoid is expressed in the form $\sqrt{a} + \sqrt{b} \text{ cm}^2$, what is the value of the product ab ?

158. _____ What is the value of the expression $\frac{2017^2 + 11(2017) - 42}{2014}$?

159. _____ What is the greatest integral value of n for which $32!$ has 2^n as a factor?

160. _____ combinations

Storm places coins, having a total value of at least \$1.00, in a bag. The coins may include pennies, nickels, dimes and quarters, but no more than three of any single denomination. How many different combinations of coins can Storm place in the bag?

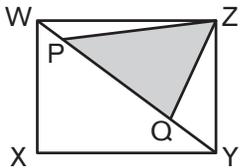

Warm-Up 11

161. _____ Three students each flip three fair coins. What is the probability that all three students get the same number of tails? Express your answer as a common fraction.

162. _____ years Twins Taylor and Tyler were born on 05/02/07. This date is referred to as a *sum date* because the sum of the month and day is equal to the two-digit year: $05 + 02 = 07$. How many years in the 21st century will have a sum date in each month during that year?

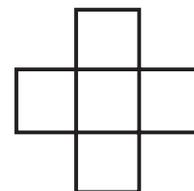

163. _____ cm^2

The area of rectangle WXYZ is 90 cm^2 . P and Q are points on diagonal WY such that $3(WP + QY) = 2PQ$. What is the area of triangle PQZ?

164. _____ There are 50 equally spaced points marked on a circle. Sara numbers them clockwise from 1 to 50. Starting at 1, she then draws congruent, connected segments between points that are 8 spaces apart, moving clockwise from the end of the previous segment. For example, the first segment is drawn from 1 to 9, and the second from 9 to 17. What is the sum of the numbers on the endpoints of the 23rd segment drawn?

165. _____ colorings The five squares of the diagram shown are to be colored orange, yellow, green, blue and indigo, with exactly one color per square. Two colorings are the same if one is just a rotation of the other (but not if the diagram must be flipped over). How many distinct colorings are there?

166. _____ What is the greatest four-digit palindrome that is divisible by 7 and 8?

167. _____ players Tryouts were held for three positions on the school basketball team: center, guard and forward. There were 4 players who tried out for center, 10 for guard and 10 for forward. These numbers include 1 player who tried out for center and guard, 3 who tried out for center and forward, and 4 who tried out for guard and forward. All six of these counts include 1 player who tried out for all three positions. If 17 players, in all, tried out for the team, how many players tried out only for guard?

168. _____ cm When ice melts and becomes water, its volume decreases by 8%. A cylindrical block of ice completely fills a container with a height of 10 cm and a radius of 4 cm. When all of the ice melts, what will be the height of the water in the cylinder? Express your answer as a decimal to the nearest tenth.

169. _____ values A triangle exists with side lengths $2x$, $3x + 7$ and $6x - 5$ for how many integer values of x ?

170. _____ If x and y are integers, such that $x > y$, $(x + y)^2 = 9$ and $x^2 + y^2 = 29$, what is the smallest possible value for x ?

Workout 7

171. _____ in² A circular pizza is cut along four diameters into eight identical sectors. If the total perimeter of each sector is 10 inches, what is the area of the whole pizza? Express your answer as a decimal to the nearest tenth.

172. _____ minutes Because of a traffic jam, Alana's 18-mile commute to work took 4 minutes longer than usual, and her average speed was decreased by 9 mi/h. How many minutes did it take her to get to work that day?

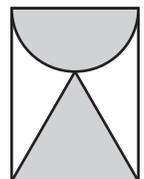

173. _____ g_n The standard gravitational acceleration of an object near Earth's surface is $g_n \approx 32 \text{ ft/s}^2$. Kingda Ka is a roller coaster at the Six Flags amusement park in Jackson, New Jersey. It accelerates from a stop to 128 mi/h in 3.5 seconds. What is the acceleration of the roller coaster as a multiple of g_n ? Express your answer as a decimal to the nearest tenth.

174. _____ % To the nearest whole percent, what percent of all positive integers are not multiples of 2, 3, 4, 5 or 6?

175. _____ Seventy-five bingo balls, each with a different positive integer from 1 through 75, are placed in a cage. A random ball is selected, its number is announced, and the ball is returned to the cage. This process occurs a total of 20 times. What is the probability that at least one ball is selected more than once? Express your answer as a decimal to the nearest hundredth.

176. _____ Tina and Tricia play on a softball team. Tina has 8 hits out of 20 times at bat, and Tricia has 6 hits out of 16 times at bat. Based on their past performance, what is the probability that both girls will get a hit the next time they bat? Express your answer as a common fraction.

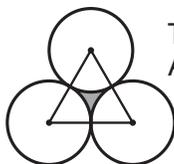

177. _____ % To create a new flag design, Howard paints a semicircle and an equilateral triangle inscribed in a rectangle as shown. What percent of the flag does the painted area cover? Express your answer to the nearest whole number.

178. _____ The inhabitants of the planet Rundia run footraces similar to those run on Earth. However, Rundians measure the distances that they run in *bars*, where one bar measures four-fifths of a meter, and they measure time in *ticks*, where there are 100 ticks in one minute. Rundian sprinter Sejes Wesno can run a 100-bar race in 11.53 ticks. The great Earth sprinter Usain Bolt ran a 100-meter race in 9.58 seconds. If Wesno is k times as fast as Bolt, what is the value of k ? Express your answer as a decimal to the nearest hundredth.

179. _____ Jason's line has a slope of $-\frac{1}{3}$ and contains the point (5, -2). Amisha's line is perpendicular to Jason's and passes through the point (4, 1). If the intersection of these lines is (x, y) , what is the value of $x + y$? Express the answer as a common fraction.

180. _____ units²

Three circles, each having radius 4 units, are externally tangent to each other. A triangle joins the centers of the circles. What is the area of the shaded region within the triangle but outside the circles? Express your answer as a decimal to the nearest tenth.

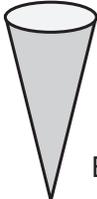

Workout 8

181. _____ units² In square WXYZ, point V is the midpoint of side YZ, and the area of $\triangle XYV$ is $\frac{4}{5}$ unit². What is the area of square WXYZ? Express your answer as a common fraction.

182. _____ tokens Ali gives Stan a closed box that contains at least one of each token worth 5, 11 or 19 points. Ali says that the tokens have a combined value of 56 points. How many tokens are in the box?

183. _____ Xera and Yeta use this method to decide who will sit in the front passenger seat of the car. Xera throws a standard six-sided die, after which Yeta picks a card from a standard deck of 52 cards, with replacement. They continue to take turns die-throwing and card-picking until either Xera wins by rolling a four or Yeta wins by picking a card with a four. What is the probability that Yeta wins? Express your answer as a common fraction.

184. _____ %  When a cone's height is decreased by a factor of four, to maintain the same volume, the radius must be increased by a factor of two, or 100%. When the cone's height is decreased by a factor of three, by what percent must the radius be increased to maintain the same volume? Express your answer to the nearest whole number. 

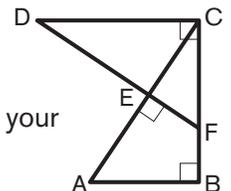

185. _____ integers Given the expression $\frac{n^2 - 9}{n^2 - 4}$, for how many positive integers n from 1 to 2016, inclusive, is the GCF of the numerator and denominator greater than 1?

186. _____ values The mean, the median and the mean of all modes of the integers 7, 4, 5, 6, 5, x are equal. How many possible values are there for x ?

187. _____ A box contains 15 slips of paper, each bearing a different natural number from 1 to 15, inclusive. If three of these slips are randomly drawn, one at a time, without replacement, what is the probability that three consecutive numbers are drawn in increasing order? Express your answer as a common fraction.

188. _____ inches A rectangle has a diagonal of length 8 inches and an area of 26 square inches. What is its perimeter? Express your answer in simplest radical form.

189. _____ units In pentagon ABCDE, with right angles ABC, BCD and AEF, as shown, $AE = 14$, $DE = 18$ and $EF = 8$. What is the length of side BC? Express your answer in simplest radical form.

190. _____ hours Pump P can fill a water tank in 12 hours, and Pump Q can fill the same tank in 15 hours. The two pumps started filling the tank at the same time and worked together until the tank was 60% full. At that point, Pump P was turned off, and Pump Q continued to fill the tank until it was completely full. How many hours did it take to completely fill the tank?

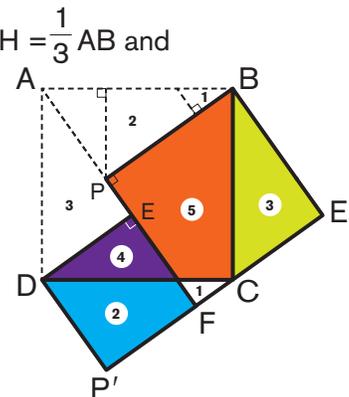

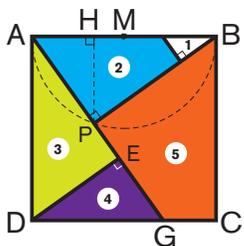

Warm-Up 12

191. _____ minutes The digital clock shown can display up to four digits to represent the hour and the minute. For how many minutes in a 12-hour period does the digit 0 appear on the clock?

192. _____ What is the absolute difference between $1.\overline{18}$ and $2.\overline{36}$? Express your answer as a common fraction.

193. _____ inches A square is dissected into five pieces as shown on the left, with $AH = \frac{1}{3} AB$ and $AM = MP = MB$. The pieces are shaded and numbered. The pieces are rearranged so as to form two squares, one with twice the area of the other. The rearrangement of the pieces is shown on the right, overlaid on top of the original square. If square $DEFP'$ in the second picture has a side length of 1 inch, then what is the side length of the original square? Express your answer in simplest radical form.

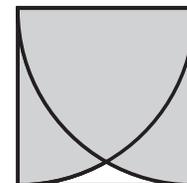

194. _____ arrangements How many arrangements of all eight letters in TRESPASS do not have S as the final letter?

195. _____ Four vertices of a regular octagon are chosen at random. What is the probability that a square can be made by connecting the vertices? Express your answer as a common fraction.

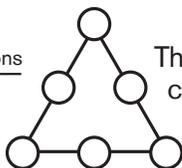

196. _____ mi/h A private jet made a trip from Denver to Los Angeles in 3 hours, flying against a steady headwind. On the return trip the wind speed doubled and became a tailwind. The return trip took only 2.5 hours. If the plane's speed on the return trip was 450 mi/h, what was the speed of the original headwind?

197. _____ In the square shown, the side lengths are 6 cm, and the intersecting arcs are quarter-circles. The area of the shaded region, expressed in simplest radical form in terms of π , is $a\pi + b\sqrt{c}$ cm². What is the value of $a + b + c$?

198. _____ prisms A rectangular prism with length \geq width \geq height has positive integer dimensions and a volume of 60 units³. How many different prisms are there that meet these conditions?

199. _____ solutions The numbers 1, 2, 3, 4, 5 and 6 are to be placed in this figure, one number per circle, so that the sums of the numbers on each side of the triangle are the same. How many distinct solutions are there, not including rotations and reflections?

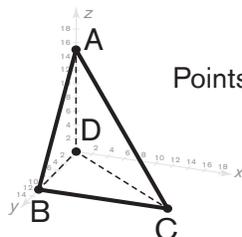

200. _____ minutes Xena runs halfway across a field in 1 minute. The next fourth of the field takes her $\frac{2}{3}$ of a minute to cross, the next eighth takes $\frac{4}{9}$ of a minute, and so on, with each half of the previous distance taking $\frac{2}{3}$ of the previous time. How many minutes does it take Xena to cross the field?

Warm-Up 13

201. _____ Given $a - b = 3$ and $a^2 + b^2 = 65$, what is the value of $a^3 - b^3$?
202. _____ integers How many positive three-digit integers have one digit equal to the average of the other two digits?
203. _____ marbles A bag contains only red marbles and green marbles, two of which are to be drawn without replacement. There are at least two marbles of each color in the bag. If the probability of both marbles being red is half the probability of both marbles being green, then what is the minimum possible number of marbles in the bag?
204. _____ $M(a, b)$ is the midpoint of the longest side of the triangle bounded by the lines $x + 2y = 8$, $5x + 2y = 48$ and $x - 2y = 0$. What is the value of $a + b$? Express the answer as a common fraction.
205. _____ A math club has 16 members. The coach wants to select three boys and three girls to represent their school at a tournament. There are six times as many ways to choose the girls as there are ways to choose the boys. What is the ratio of girls to boys in the club? Express your answer as a common fraction.
206. _____ The number 3638 has a digital sum of $3 + 6 + 3 + 8 = 20$ and a digital product of $3 \times 6 \times 3 \times 8 = 432$. What is the absolute difference between the least and greatest four-digit numbers that each have a digital sum of 20 and a digital product of 432?
207. _____ Jebediah has two coins in his pocket. One is a fair coin, while the other has heads on both sides. He pulls one coin out at random and flips it three times. If the coin lands heads all three times, what is the probability that it is the fair coin? Express your answer as a common fraction.
208. _____ people What is the minimum number of people that must be in a room to ensure that there are three people who, when considered pairwise, all know each other or three people who, when considered pairwise, all do not know each other?
209. _____ % Tire pressure is directly proportional to temperature on a temperature scale where zero degrees is absolute zero. Given that temperatures in degrees Celsius (C) and degrees Fahrenheit (F) are related by the formula $F = \frac{9}{5}C + 32$, and absolute zero is -273.15°C , by what percent does tire pressure decrease when the temperature drops from 80°F to 40°F ? Express your answer to the nearest whole number.

210. _____ units

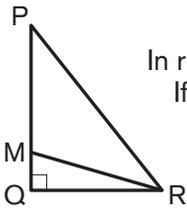

Points $A(0, 0, 15)$, $B(0, 12, 0)$, $C(16, 12, 0)$ and $D(0, 0, 0)$ determine the vertices of a tetrahedron as shown. What is the shortest distance from B to the face ADC ? Express your answer as a common fraction.

Warm-Up 14

211. _____ chords Eight points on a circle are labeled. How many chords can be drawn connecting any two of these points?
212. _____ Tad draws three cards at random, without replacement, from a deck of ten cards numbered 1 through 10. What is the probability that no two of the cards drawn have numbers that differ by 1? Express your answer as a common fraction.
213. _____ people Twelve people have sheared $\frac{1}{3}$ of a field of pine trees in 7 days. How many more people need to be added to the crew to shear the rest of the trees in the field in the next 6 days?
214. _____ If three distinct integer lattice points are randomly selected from the interior of the circle defined by $x^2 + y^2 = 8$, what is the probability that they are the vertices of a triangle? Express your answer as a common fraction.
215. _____ numbers For how many four-digit numbers is the sum of the digits equal to the product of the digits?
216. _____ cubes A cube has one red, one green, one yellow and three blue faces. How many distinct cubes satisfying this description are possible?

217. _____ units

In right triangle PQR, shown here, M is on PQ such that $PM = MR$. If $PQ = 12$ units and $QR = 9$ units, what is the value of MQ ? Express your answer as a common fraction.

218. _____ Karla writes down six different prime numbers in increasing order. She notices that the product of the first three prime numbers she has written is equal to the sum of the last three prime numbers she has written. What is the least possible value of the last prime number Karla wrote?
219. _____ Circle A has center $(0, 0)$ with radius 4. Circle B has center $(40, 40)$ with radius 6. The radius of circle B increases at twice the rate as the radius of circle A increases. When the circles are externally tangent at $P(x, y)$, which is located between the centers of circles A and B, what is the value of x ? Express your answer as a fraction in simplest radical form.

220. _____ ways

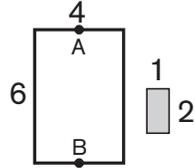

Figure 1

Figure 1 shows a 2×1 gray rectangle and a 6×4 white rectangle with the midpoints of two sides labeled A and B. If the larger rectangle cannot be rotated, in how many ways can 12 of the gray rectangles be arranged inside the white rectangle so that none crosses a segment from A to B? One such arrangement is shown in Figure 2, but not in Figure 3.

YES

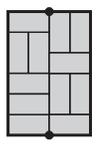

Figure 2

NO

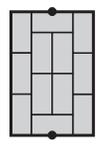

Figure 3

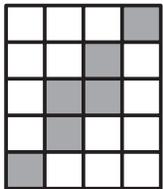

Fractions Stretch

Solve the following problems. Express any non-integer answer as a common fraction.

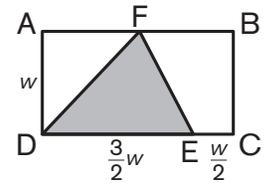

221. _____ What fraction of 100 is 25?

222. _____ What fraction of $\frac{3}{8}$ is $\frac{9}{16}$?

223. _____ What is the value of $\sqrt{\frac{3}{11} \div \frac{11}{12}}$?

224. _____  What fractional part of this grid of 20 unit squares is shaded?

225. _____ What fraction of the area of rectangle ABCD is the area of inscribed triangle DEF?

226. _____ On a number line, what common fraction is $\frac{3}{4}$ of the way from $\frac{1}{2}$ to $\frac{3}{4}$?

227. _____ What is the reciprocal of $\frac{1}{2 + \frac{1}{3}}$?

228. _____ What common fraction is equal to $0.\overline{75}$?

229. _____ If $\frac{1}{\frac{1}{1 + \frac{1}{3}} + \frac{1}{\frac{1}{3} + \frac{1}{n}}} = \frac{5}{12}$, what is the value of n ?

230. _____ If $\frac{2x}{x-3} - 2 = \frac{4}{x+2}$, what is the value of x ?

Angles and Arcs Stretch

SECANT

a line that intersects the circle at two points

CHORD

a line segment whose endpoints are two points on the circle

TANGENT

a coplanar line that intersects the circle at a single point of tangency

CENTRAL ANGLE

an angle with its vertex at the center of the circle

INSCRIBED ANGLE

an angle with its vertex on the circle and whose sides are chords of the circle

MAJOR ARC

an arc of the circle with measure greater than or equal to 180°

MINOR ARC

an arc of the circle with measure less than 180°

ANGLE AND ARC MEASURES

In the figures below, observe how the degree measure of $\angle AXB$ decreases as the distance between the vertex of the angle and the center of the circle increases.

| | | | |
|--|--|---|--|
| | | | |
| $m\widehat{AB} = 80^\circ$ $m\widehat{CD} = 80^\circ$ $m\angle AOB = 80^\circ$ | $m\widehat{AB} = 80^\circ$ $m\widehat{CD} = 40^\circ$ $m\angle AXB = 60^\circ$ | $m\widehat{AB} = 80^\circ$ $m\widehat{CD} = 0^\circ$ $m\angle AXB = 40^\circ$ | $m\widehat{AB} = 80^\circ$ $m\widehat{CD} = 40^\circ$ $m\angle AXB = 20^\circ$ |
| Figure I | Figure II | Figure III | Figure IV |

- In Figure I, angles AOB and COD are central angles of circle O that intercept arcs AB and CD, respectively. The degree measure of a central angle and the arc it intercepts are equal.

$$m\angle AOB = m\widehat{AB} \text{ and } m\angle COD = m\widehat{CD}$$

- In Figure II, vertical angles AXB and CXD, formed by the intersection of chords AC and BD inside circle O, intercept arcs AB and CD, respectively. The degree measure of vertical angles formed by two chords intersecting inside a circle is half the sum of the measures of their intercepted arcs.

$$m\angle AXB = m\angle CXD = \frac{1}{2}(m\widehat{AB} + m\widehat{CD})$$

- In Figure III, $\angle AXB$ is inscribed in circle O. The degree measure of an inscribed angle is half the measure of the intercepted arc.

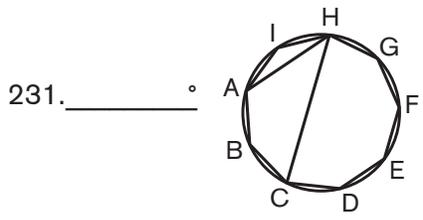

$$m\angle AXB = \frac{1}{2}m\widehat{AB}$$

- In Figure IV, $\angle AXB$, formed by the intersection of two secants at point X outside of circle O, intercepts arcs AB and CD. The degree measure of an angle formed by two secants, two tangents or a secant and a tangent is half the difference of the measures of its intercepted arcs.

$$m\angle AXB = \frac{1}{2}(m\widehat{AB} - m\widehat{CD})$$

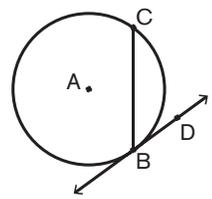

It may appear that there are four different formulas for calculating the four types of angles. But in each case, the measure of the angle in question is, essentially, the average of the measures of the intercepted arcs. In Figure IV, note that, with respect to $\angle AXB$, \widehat{AB} appears concave, while \widehat{CD} appears convex. So the measure of $\angle AXB$ can be thought of as the average of 80° and -40° .

Solve the following problems by using what you've learned about angles and arcs. Express any non-integer value as a decimal to the nearest tenth.

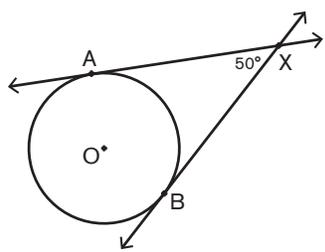

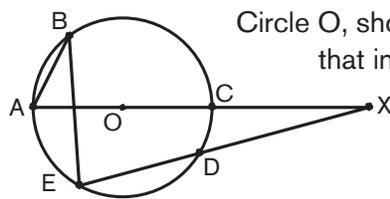

Regular nonagon ABCDEFGHI is inscribed in a circle, as shown. What is $m\angle AHC$?

232. _____ ° In circle A, shown here, \overleftrightarrow{BD} is tangent to the circle at B, and major \widehat{BC} has measure 230° . What is $m\angle CBD$?

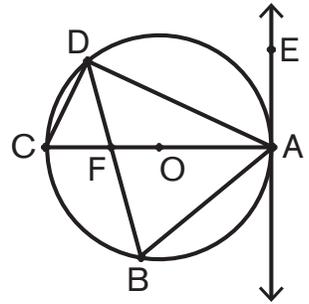

233. _____ ° Circle O, shown here with chords AB and BE, has secants AC and DE that intersect at X. If $m\angle ABE = 35^\circ$ and $m\angle AXE = 15^\circ$, what is the measure of \widehat{CD} ?

234. _____ ° In this figure, lines AX and BX are tangent to circle O at A and B, respectively. If $m\angle AXB = 50^\circ$, what is the measure of major \widehat{AB} ?

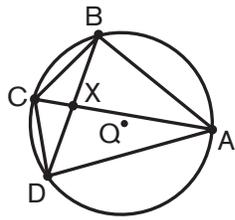

Use the figure at the right for questions 235 through 238.

- 235. _____ ° What is $m\angle ABD$?
- 236. _____ ° What is $m\widehat{AB}$?
- 237. _____ ° What is $m\angle BAE$?
- 238. _____ ° What is $m\angle CFD$?

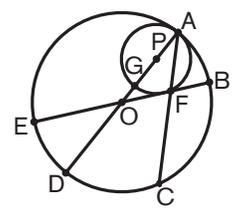

\overleftrightarrow{AE} is tangent to circle O
 $\overleftrightarrow{AE} \perp \overline{AC}$
 $m\angle BDC = 40^\circ$
 $m\widehat{AD} = 125^\circ$

239. _____ ° Quadrilateral ABCD is inscribed in circle Q, as shown, with diagonals intersecting at X. If $m\widehat{AB} = 110^\circ$, $m\widehat{BC} = 60^\circ$ and $AB = BD$, what is $m\angle CXD$?

240. _____ ° Circle P is internally tangent to circle O at A, as shown. \overline{AC} and \overline{BE} intersect at F, which is also the point of tangency between \overline{BE} and circle P. \overline{AD} and \overline{BE} are diameters of circle O, and \overline{AG} is a diameter of circle P. If $m\widehat{CD} = 50^\circ$, what is the measure of minor \widehat{BC} ?

Bases Stretch

The **base 10** number system, the number system we are most familiar with, uses the digits 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9. Numerals with these digits in the ones, tens, hundreds and higher places express specific numerical quantities. In base 10, the number 245, for example, is composed of 2 hundreds, 4 tens and 5 ones. That is, $2(10^2) + 4(10^1) + 5(10^0) = 200 + 40 + 5 = 245$.

A **base b** number system uses the digits 0, 1, ..., $b - 1$. Numerical quantities are expressed with these digits in the b^0 , b^1 , b^2 and higher places. In base b , if $b \geq 6$, the numeral 245_b represents the number $2(b^2) + 4(b^1) + 5(b^0)$. In base 8, for example, $245_8 = 2(8^2) + 4(8^1) + 5(8^0) = 2(64) + 4(8) + 5(1) = 128 + 32 + 5 = 165$.

Bases greater than 10 use letters to represent the digits greater than 9. For example, the 12 digits used in base 12 are 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A and B. The numeral 10 in base 12 has 1 twelve and 0 ones. That is, $10_{12} = 1(12^1) + 0(12^0) = 1(12) + 0(1) = 12 + 0 = 12$.

Practice Problems

What is the representation of each of the following in base 10?

241. _____ 24_9

242. _____ 24_8

243. _____ 24_7

What is the representation of 24 in each of the following bases?

244. _____ base 9

245. _____ base 8

246. _____ base 7

Now try these.

247. _____ What is the representation of 4991 in base 12?

248. _____ What is the representation of $3BB_{12}$ in base 6?

249. _____ If $523_b = 262$, what is the value of b ?

250. _____ If $441_b = n^2$ and $351_b = (n - 2)^2$, for some $b < 10$, what is the value of n ?

OFFICIAL RULES + PROCEDURES

The following rules and procedures govern all MATHCOUNTS competitions. The MATHCOUNTS Foundation reserves the right to alter these rules and procedures at any time. **Coaches are responsible for being familiar with the rules and procedures outlined in this handbook.** Coaches should bring any difficulty in procedures or in student conduct to the immediate attention of the appropriate chapter, state or national official. Students violating any rules may be subject to immediate disqualification.

Any questions regarding the MATHCOUNTS Competition Series Official Rules + Procedures articulated in this handbook should be addressed to the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

REGISTRATION

The fastest and easiest way to register for the MATHCOUNTS Competition Series is online at www.mathcounts.org/compreg.

For your school to participate in the MATHCOUNTS Competition Series, a school representative is required to complete a registration form and pay the registration fees. A school representative can be a teacher, administrator or parent volunteer who has received expressed permission from his/her child's school administration to register. By completing the Competition Series Registration Form, the coach attests to the school administration's permission to register students for MATHCOUNTS.

School representatives can register online at www.mathcounts.org/compreg or download the Competition Series Registration Form and mail or email a scanned copy of it to the MATHCOUNTS national office. Refer to the Critical 2016-2017 Dates on pg. 10 of this handbook for contact information.

WHAT REGISTRATION COVERS: Registration in the Competition Series entitles a school to:

- 1) send 1-10 student(s)—depending on number registered—to the Chapter Competition. *Students can advance beyond the chapter level, but this is determined by their performance at the competition.*
- 2) receive the School Competition Kit, which includes the *2016-2017 MATHCOUNTS School Handbook*, one recognition ribbon for each registered student, 10 student participation certificates and a catalog of additional coaching materials. *Mailings of School Competition Kits will occur on a rolling basis through December 31, 2016.*
- 3) receive online access to the 2017 School Competition, along with electronic versions of other competition materials at www.mathcounts.org/coaches. *Coaches will receive an email notification no later than November 1, 2016 when the 2017 School Competition is available online.*

Your state or chapter coordinator will be notified of your registration, and then you will be informed of the date and location of your Chapter Competition. **If you have not been contacted by mid-January with competition details, it is your responsibility to contact your local coordinator** to confirm that your registration has been properly routed and that your school's participation is expected. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

DEADLINES: The sooner your Registration Form is received, the sooner you will receive your preparation materials. To guarantee your school's participation, submit your registration by one of the following deadlines:

| | |
|---|---|
| <i>Early Bird Discount Deadline:</i> November 18, 2016 | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by November 18, 2016 |
| <i>Regular Registration Deadline:</i> December 16, 2016* | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by December 16, 2016 |

*Late Registrations may be accepted at the discretion of the MATHCOUNTS national office and your local coordinators, but are not guaranteed. If a school's late registration is accepted, an additional \$20 processing fee will be assessed.

REGISTRATION FEES: The cost of your school's registration depends on when your registration is postmarked/mailed/submitted online. The cost of your school's registration covers the students for the entire Competition Series; there are no additional registration fees to compete at the state or national level. Title I schools (as affirmed by a school's administration) receive a 50% discount off the total cost of their registration.

| Number of Registered Students | Registration Postmarked by 11/18/2016 | Postmarked between 11/18/2016 and 12/16/2016 | Postmarked after 12/16/2016 (+ Late Fee) |
|--------------------------------------|--|---|---|
| 1 individual | \$25 | \$30 | \$50 |
| 2 ind. | \$50 | \$60 | \$80 |
| 3 ind. | \$75 | \$90 | \$110 |
| 1 team of 4 | \$90 | \$100 | \$120 |
| 1 tm. + 1 ind. | \$115 | \$130 | \$150 |
| 1 tm. + 2 ind. | \$140 | \$160 | \$180 |
| 1 tm. + 3 ind. | \$165 | \$190 | \$210 |
| 1 tm. + 4 ind. | \$190 | \$220 | \$240 |
| 1 tm. + 5 ind. | \$215 | \$250 | \$270 |
| 1 tm. + 6 ind. | \$240 | \$280 | \$300 |

ELIGIBILITY REQUIREMENTS

Eligibility requirements for the MATHCOUNTS Competition Series are different from other MATHCOUNTS programs. Eligibility for the National Math Club or the Math Video Challenge does not guarantee eligibility for the Competition Series.

WHO IS ELIGIBLE:

- U.S. students enrolled in the 6th, 7th or 8th grade can participate in MATHCOUNTS competitions.
- Schools that are the students' official school of record can register.
- Any type of school, of any size, can register—public, private, religious, charter, virtual or homeschools—but virtual and homeschools must fill out additional forms to participate (see pgs. 41-42).
- Schools in 50 U.S. states, District of Columbia, Guam, Puerto Rico and Virgin Islands can register.
- Overseas schools that are affiliated with the U.S. Departments of Defense and State can register.

WHO IS NOT ELIGIBLE:

- Students who are not full-time 6th, 7th or 8th graders cannot participate, even if they are taking middle school math classes.
- Academic centers, tutoring centers or enrichment programs that do not function as students' official school of record cannot register. *If it is unclear whether your educational institution is considered a school, please contact your local Department of Education for specific criteria governing your state.*
- Schools located outside of the U.S. states and territories listed on the previous page cannot register.
- Overseas schools not affiliated with the U.S. Departments of Defense or State cannot register.

NUMBER OF STUDENTS ALLOWED: A school can register a maximum of one team of four students and six individuals; these 1-10 student(s) will represent the school at the Chapter Competition. Any number of students can participate at the school level. Prior to the Chapter Competition, coaches must notify their chapter coordinator of which students will be team members and which students will compete as individuals.

NUMBER OF YEARS ALLOWED: Participation in MATHCOUNTS competitions is limited to 3 years for each student, but there is no limit to the number of years a student may participate in school-based coaching.

WHAT TEAM REGISTRATION MEANS: Members of a school team will participate in the Target, Sprint and Team Rounds. Members of a school team also will be eligible to qualify for the Countdown Round (where conducted). Team members will be eligible for team awards, individual awards and progression to the state and national levels based on their individual and/or team performance. It is recommended that your strongest four Mathletes form your school team. Teams of fewer than four will be allowed to compete; however, the team score will be computed by dividing the sum of the team members' scores by four (see pg. 45), meaning, teams of fewer than four students will be at a disadvantage. *Only one team (of up to four students) per school is eligible to compete.*

WHAT INDIVIDUAL REGISTRATION MEANS: Students registered as individuals will participate in the Target and Sprint Rounds, but not the Team Round. Individuals will be eligible to qualify for the Countdown Round (where conducted). Individuals also will be eligible for individual awards and progression to the state and national levels. A student registered as an "individual" may not help his/her school's team advance to the next level of competition. *Up to six students may be registered in addition to or in lieu of a school team.*

HOW STUDENTS ENROLLED PART-TIME AT TWO SCHOOLS PARTICIPATE: *A student may compete only for his/her official school of record.* A student's school of record is the student's base or main school. A student taking limited course work at a second school or educational center may not register or compete for that second school or center, even if the student is not competing for his/her school of record. MATHCOUNTS registration is not determined by where a student takes his or her math course. If there is any doubt about a student's school of record, the chapter or state coordinator must be contacted for a decision before registering.

HOW SMALL SCHOOLS PARTICIPATE: MATHCOUNTS does not distinguish between the sizes of schools for Competition Series registration and competition purposes. Every "brick-and-mortar" school will have the same registration allowance of up to one team of four students and/or up to six individuals. A school's participants may not combine with any other school's participants to form a team when registering or competing.

HOW HOMESCHOOLS PARTICIPATE: Homeschools and/or homeschool groups in compliance with the homeschool laws of the state in which they are located are eligible to participate in MATHCOUNTS competitions in accordance with all other rules. Homeschool coaches must complete the 2016-2017 Homeschool + Virtual School Participation Form, verifying that students from the homeschool or homeschool group are in the 6th, 7th or 8th grade and that each homeschool complies with applicable state laws. Forms can be downloaded at www.mathcounts.org/competition and must be submitted to the MATHCOUNTS national office in order for registrations to be processed.

HOW VIRTUAL SCHOOLS PARTICIPATE: Virtual schools that want to register must contact the MATHCOUNTS national office by December 9, 2016 for specific registration details. Any student registering as a virtual school student must compete in the MATHCOUNTS Chapter Competition assigned according to the student's home address. Additionally, virtual school coaches must complete the 2016-2017 Homeschool + Virtual School Participation Form, verifying that the students from the virtual school are in the 6th, 7th or 8th grade and that the virtual school complies with applicable state laws. Forms must be submitted to the national office in order for registrations to be processed; forms can be downloaded at www.mathcounts.org/competition.

WHAT IS DONE FOR SUBSTITUTIONS OF STUDENTS: Coaches determine which students will represent the school at the Chapter Competition. Coaches cannot substitute team members for the State Competition unless a student voluntarily releases his/her position on the school team. Additional requirements and documentation for substitutions (such as requiring parental release or requiring the substitution request be submitted in writing) are at the discretion of the State Coordinator. A student being added to a team need not be a student who was registered for the Chapter Competition as an individual. Coaches cannot make substitutions for students progressing to the State Competition as individuals. At all levels of competition, student substitutions are not permitted after on-site competition registration has been completed.

WHAT IS DONE FOR RELIGIOUS OBSERVANCES: A student who is unable to attend a competition due to religious observances may take the written portion of the competition up to one week in advance of the scheduled competition. In addition, all competitors from that student's school must take the Sprint and Target Rounds at the same earlier time. If the student who is unable to attend the competition due to a religious observance: (1) is a member of the school team, then the team must take the Team Round at the same earlier time; (2) is not part of the school team, then the team has the option of taking the Team Round during this advance testing or on the regularly scheduled day of the competition with the other school teams. The coordinator must be made aware of the team's decision before the advance testing takes place. Advance testing will be done at the discretion of the chapter and state coordinators. If advance testing is deemed possible, it will be conducted under proctored conditions. Students who qualify for an official Countdown Round but are unable to attend will automatically forfeit one place standing.

WHAT IS DONE FOR STUDENTS WITH SPECIAL NEEDS: Reasonable accommodations may be made to allow students with special needs to participate. However, many accommodations that are employed in a classroom or teaching environment cannot be implemented in the competition setting. Accommodations that are not permissible include, but are not limited to: granting a student extra time during any of the competition rounds or allowing a student to use a calculator for the Sprint or Countdown Rounds. A request for accommodation of special needs must be directed to chapter or state coordinators in writing at least three weeks in advance of the Chapter or State Competition. This written request should thoroughly explain a student's special need, as well as what the desired accommodation would entail. In conjunction with the MATHCOUNTS Foundation, coordinators will review the needs of the student and determine if any accommodations will be made. In making final determinations, the feasibility of accommodating these needs at the National Competition will be taken into consideration.

LEVELS OF COMPETITION

There are four levels in the MATHCOUNTS Competition Series: school, chapter (local), state and national. Competition questions are written for 6th, 7th and 8th graders. The competitions can be quite challenging, particularly for students who have not been coached using MATHCOUNTS materials. All competition materials are prepared by the national office.

SCHOOL COMPETITIONS (TYPICALLY HELD IN JANUARY 2017): After several months of coaching, schools registered for the Competition Series should administer the 2017 School Competition to all interested

students. The School Competition should be an aid to the coach in determining competitors for the Chapter Competition. *Selection of team and individual competitors is entirely at the discretion of the coach and does not need to be based solely on School Competition scores.* School Competition materials are sent to the coach of a school, and it may be used by the teachers and students only in association with that school's programs and activities. The current year's School Competition questions must remain confidential and may not be used in outside activities, such as tutoring sessions or enrichment programs with students from other schools. For updates or edits, please check www.mathcounts.org/coaches before administering the School Competition.

It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better math skills in all students, not just in those students who will be competing. Therefore, it is suggested that the coach postpone selection of competitors until just prior to the Chapter Competition.

CHAPTER COMPETITIONS (HELD FROM FEB. 1–28, 2017): The Chapter Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be conducted. The chapter and state coordinators determine the date and location of the Chapter Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The winning team will advance to the State Competition. Additionally, the two highest-ranking competitors not on the winning team (who may be registered as individuals or as members of a team) will advance to the State Competition. This is a minimum of six advancing Mathletes (assuming the winning team has four members). Additional teams and/or individuals also may progress at the discretion of the state coordinator, but the policy for progression must be consistent for all chapters within a state.

STATE COMPETITIONS (HELD FROM MAR. 1–31, 2017): The State Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be included. The state coordinator determines the date and location of the State Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The four highest-ranked Mathletes and the coach of the winning team from each State Competition will receive an all-expenses-paid trip to the National Competition.

2017 RAYTHEON MATHCOUNTS NATIONAL COMPETITION (HELD MAY 14–15 IN ORLANDO, FL): The National Competition consists of the Sprint, Target, Team and Countdown Rounds (conducted officially). Expenses of the state team and coach to travel to the National Competition will be paid by MATHCOUNTS. The national program does not make provisions for the attendance of additional students or coaches. All national competitors will receive a plaque and other items in recognition of their achievements. Winning teams and individuals also will receive medals, trophies and college scholarships.

COMPETITION COMPONENTS

The four rounds of a MATHCOUNTS competition, each described below, are designed to be completed in approximately three hours:

TARGET ROUND (approximately 30 minutes): In this round eight problems are presented to competitors in four pairs (six minutes per pair). The multi-step problems featured in this round engage Mathletes in mathematical reasoning and problem-solving processes. *Problems assume the use of calculators.*

SPRINT ROUND (40 minutes): Consisting of 30 problems, this round tests accuracy, with the time period allowing only the most capable students to complete all of the problems. *Calculators are not permitted.*

TEAM ROUND (20 minutes): In this round, interaction among team members is permitted and encouraged as they work together to solve 10 problems. *Problems assume the use of calculators.*

Note: The order in which the written rounds (Target, Sprint and Team) are administered is at the discretion of the competition coordinator.

COUNTDOWN ROUND: A fast-paced oral competition for top-scoring individuals (based on scores on the Target and Sprint Rounds), this round allows pairs of Mathletes to compete against each other and the clock to solve problems. Calculators are not permitted.

At Chapter and State Competitions, a Countdown Round (1) may be conducted officially, (2) may be conducted unofficially (for fun) or (3) may be omitted. However, the use of an official Countdown Round must be consistent for all chapters within a state. In other words, *all* chapters within a state must use the round officially in order for *any* chapter within a state to use it officially. All students, whether registered as part of a school team or as individual competitors, are eligible to qualify for the Countdown Round.

An official Countdown Round determines an individual's final overall rank in the competition. If a Countdown Round is used officially, the official procedures as established by the MATHCOUNTS Foundation must be followed, as described below.*

- The top 25% of students, up to a maximum of 10, are selected to compete. These students are chosen based on their Individual Scores.
- The two lowest-ranked students are paired; a question is read and projected, and students are given 45 seconds to solve the problem. A student may buzz in at any time, and if s/he answers correctly, a point is scored. If a student answers incorrectly, the other student has the remainder of the 45 seconds to answer.
- Three total questions are read to the pair of students, one question at a time, and the student who scores the higher number of points (not necessarily 2 out of 3) progresses to the next round and challenges the next-higher-ranked student.
- If students are tied in their matchup after three questions (at 1-1 or 0-0), questions should continue to be read until one is successfully answered. The first student who answers an additional question correctly progresses to the next round.
- This procedure continues until the 4th-ranked Mathlete and his/her opponent compete. For the final four matchups, the first student to correctly answer three questions advances.
- The Countdown Round proceeds until a 1st place individual is identified. More details about Countdown Round procedures are included in the 2017 School Competition.

**Rules for the Countdown Round change for the National Competition.*

An unofficial Countdown Round does not determine an individual's final overall rank in the competition, but is done for practice or for fun. The official procedures do not have to be followed. Chapters and states choosing not to conduct the round officially must determine individual winners solely on the basis of students' scores in the Target and Sprint Rounds of the competition.

SCORING

MATHCOUNTS Competition Series scores do not conform to traditional grading scales. Coaches and students should view an Individual Score of 23 (out of a possible 46) as highly commendable.

INDIVIDUAL SCORE: calculated by taking the sum of the number of Sprint Round questions answered correctly and twice the number of Target Round questions answered correctly. There are 30 questions in the Sprint Round and eight questions in the Target Round, so the maximum possible Individual Score is $30 + 2(8) = 46$. If used officially, the Countdown Round yields final individual standings.

TEAM SCORE: calculated by dividing the sum of the team members' Individual Scores by four (even if the team has fewer than four members) and adding twice the number of Team Round questions answered correctly. The highest possible Individual Score is 46. Four students may compete on a team, and there are 10 questions in the Team Round. Therefore, the maximum possible Team Score is $((46 + 46 + 46 + 46) \div 4) + 2(10) = 66$.

TIEBREAKING ALGORITHM: used to determine team and individual ranks and to determine which individuals qualify for the Countdown Round. In general, questions in the Target, Sprint and Team Rounds increase in difficulty so that the most difficult questions occur near the end of each round. In a comparison of questions to break ties, generally those who correctly answer the more difficult questions receive the higher rank. The guidelines provided below are very general; competition officials receive more detailed procedures.

- ***Ties between individuals:*** the student with the higher Sprint Round score will receive the higher rank. If a tie remains after this comparison, specific groups of questions from the Target and Sprint Rounds are compared.
- ***Ties between teams:*** the team with the higher Team Round score, and then the higher sum of the team members' Sprint Round scores, receives the higher rank. If a tie remains after these comparisons, specific questions from the Team Round will be compared.

RESULTS DISTRIBUTION

Coaches should expect to receive the scores of their students, as well as a list of the top 25% of students and top 40% of teams, from their competition coordinators. In addition, single copies of the blank competition materials and answer keys may be distributed to coaches after all competitions at that level nationwide have been completed. *Before distributing blank competition materials and answer keys, coordinators must wait for verification from the national office that all such competitions have been completed.* Both the problems and answers from Chapter and State Competitions will be posted on the MATHCOUNTS website following the completion of all competitions at that level nationwide, replacing the previous year's posted tests.

Student competition papers and answers will not be viewed by or distributed to coaches, parents, students or other individuals. Students' competition papers become the confidential property of MATHCOUNTS.

ADDITIONAL RULES

All answers must be legible.

Pencils and paper will be provided for Mathletes by competition organizers. However, students may bring their own pencils, pens and erasers if they wish. They may not use their own scratch paper or graph paper.

Use of notes or other reference materials (including dictionaries and translation dictionaries) is prohibited.

Specific instructions stated in a given problem take precedence over any general rule or procedure.

Communication with coaches is prohibited during rounds but is permitted during breaks. All communication between guests and Mathletes is prohibited during competition rounds. Communication between teammates is permitted only during the Team Round.

Calculators are not permitted in the Sprint and Countdown Rounds, but they are permitted in the Target, Team and Tiebreaker (if needed) Rounds. When calculators are permitted, students may use any calculator (including programmable and graphing calculators) that does not contain a QWERTY (typewriter-like) keypad. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. Smart phones, laptops, tablets, iPods®, personal

digital assistants (PDAs) and any other “smart” devices are not considered to be calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.

Coaches are responsible for ensuring their students use acceptable calculators, and students are responsible for providing their own calculators. Coordinators are not responsible for providing Mathletes with calculators or batteries before or during MATHCOUNTS competitions. Coaches are strongly advised to bring backup calculators and spare batteries to the competition for their team members in case of a malfunctioning calculator or weak or dead batteries. Neither the MATHCOUNTS Foundation nor coordinators shall be responsible for the consequences of a calculator’s malfunctioning.

Pagers, cell phones, tablets, iPods® and other MP3 players should not be brought into the competition room. Failure to comply could result in dismissal from the competition.

Should there be a rule violation or suspicion of irregularities, the MATHCOUNTS coordinator or competition official has the obligation and authority to exercise his/her judgment regarding the situation and take appropriate action, which might include disqualification of the suspected student(s) from the competition.

FORMS OF ANSWERS

The following rules explain acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Competition answers will be scored in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lb 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not have a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}, 1\frac{1}{2}$
Problem: What is the sum of the lengths of the radius and the circumference of a circle of diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$
Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}, \frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Acceptable Simplified Forms: $\frac{7}{2}, \frac{3}{\pi}, \frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}, \frac{1}{3}, 3.5, 2:1$

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is $\sqrt{15} \times \sqrt{5}$ expressed in simplest radical form? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent, unless otherwise specified. Examples:

Acceptable Forms: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not do any intermediate rounding (other than the “rounding” a calculator performs) when calculating solutions. All rounding should be done at the end of the calculation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3
Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form. Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

VOCABULARY AND FORMULAS

The following list is representative of terminology used in the problems but should not be viewed as all-inclusive. It is recommended that coaches review this list with their Mathletes.

| | | |
|--------------------------------------|---|--|
| absolute difference | decimal | infinite series |
| absolute value | degree measure | inscribe |
| acute angle | denominator | integer |
| additive inverse (<i>opposite</i>) | diagonal of a polygon | interior angle of a polygon |
| adjacent angles | diagonal of a polyhedron | interquartile range |
| algorithm | diameter | intersection |
| alternate exterior angles | difference | inverse variation |
| alternate interior angles | digit | irrational number |
| altitude (<i>height</i>) | digit-sum | isosceles |
| apex | direct variation | kite |
| area | dividend | lateral edge |
| arithmetic mean | divisible | lateral surface area |
| arithmetic sequence | divisor | lattice point(s) |
| base 10 | dodecagon | LCM |
| binary | dodecahedron | linear equation |
| bisect | domain of a function | mean |
| box-and-whisker plot | edge | median of a set of data |
| center | endpoint | median of a triangle |
| chord | equation | midpoint |
| circle | equiangular | mixed number |
| circumference | equidistant | mode(s) of a set of data |
| circumscribe | equilateral | multiple |
| coefficient | evaluate | multiplicative inverse (<i>reciprocal</i>) |
| collinear | expected value | natural number |
| combination | exponent | nonagon |
| common denominator | expression | numerator |
| common divisor | exterior angle of a polygon | obtuse angle |
| common factor | factor | octagon |
| common fraction | factorial | octahedron |
| common multiple | finite | ordered pair |
| complementary angles | formula | origin |
| composite number | frequency distribution | palindrome |
| compound interest | frustum | parallel |
| concentric | function | parallelogram |
| cone | GCF | Pascal's Triangle |
| congruent | geometric mean | pentagon |
| convex | geometric sequence | percent increase/decrease |
| coordinate plane/system | height (<i>altitude</i>) | perimeter |
| coordinates of a point | hemisphere | permutation |
| coplanar | heptagon | perpendicular |
| corresponding angles | hexagon | planar |
| counting numbers | hypotenuse | polygon |
| counting principle | image(s) of a point(s) (<i>under a transformation</i>) | polyhedron |
| cube | improper fraction | polynomial |
| cylinder | inequality | prime factorization |
| decagon | | prime number |

| | | |
|--|-------------------------|----------------------------------|
| principal square root | revolution | supplementary angles |
| prism | rhombus | system of equations/inequalities |
| probability | right angle | tangent figures |
| product | right circular cone | tangent line |
| proper divisor | right circular cylinder | term |
| proper factor | right polyhedron | terminating decimal |
| proper fraction | right triangle | tetrahedron |
| proportion | rotation | total surface area |
| pyramid | scalene triangle | transformation |
| Pythagorean Triple | scientific notation | translation |
| quadrant | sector | trapezoid |
| quadrilateral | segment of a circle | triangle |
| quotient | segment of a line | triangular numbers |
| radius | semicircle | trisect |
| random | semiperimeter | twin primes |
| range of a data set | sequence | union |
| range of a function | set | unit fraction |
| rate | significant digits | variable |
| ratio | similar figures | vertex |
| rational number | simple interest | vertical angles |
| ray | slope | volume |
| real number | slope-intercept form | whole number |
| reciprocal (<i>multiplicative inverse</i>) | solution set | x-axis |
| rectangle | space diagonal | x-coordinate |
| reflection | sphere | x-intercept |
| regular polygon | square | y-axis |
| relatively prime | square root | y-coordinate |
| remainder | stem-and-leaf plot | y-intercept |
| repeating decimal | sum | |

The list of formulas below is representative of those needed to solve MATHCOUNTS problems but should not be viewed as the only formulas that may be used. Many other formulas that are useful in problem solving should be discovered and derived by Mathletes.

CIRCUMFERENCE

Circle $C = 2 \times \pi \times r = \pi \times d$

AREA

Circle $A = \pi \times r^2$

Square $A = s^2$

Rectangle $A = l \times w = b \times h$

Parallelogram $A = b \times h$

Trapezoid $A = \frac{1}{2}(b_1 + b_2) \times h$

Rhombus $A = \frac{1}{2} \times d_1 \times d_2$

Triangle $A = \frac{1}{2} \times b \times h$

Triangle $A = \sqrt{s(s-a)(s-b)(s-c)}$

Equilateral triangle $A = \frac{s^2\sqrt{3}}{4}$

SURFACE AREA AND VOLUME

Sphere $SA = 4 \times \pi \times r^2$

Sphere $V = \frac{4}{3} \times \pi \times r^3$

Rectangular prism $V = l \times w \times h$

Circular cylinder $V = \pi \times r^2 \times h$

Circular cone $V = \frac{1}{3} \times \pi \times r^2 \times h$

Pyramid $V = \frac{1}{3} \times B \times h$

Pythagorean Theorem $c^2 = a^2 + b^2$

Counting/
Combinations ${}_n C_r = \frac{n!}{r!(n-r)!}$

ANSWERS

In addition to the answer, we have provided a difficulty rating for each problem. Our scale is 1-7, with 7 being the most difficult. These are only approximations, and how difficult a problem is for a particular student will vary. Below is a general guide to the ratings:

Difficulty 1/2/3 - One concept; one- to two-step solution; appropriate for students just starting the middle school curriculum.

4/5 - One or two concepts; multistep solution; knowledge of some middle school topics is necessary.

6/7 - Multiple and/or advanced concepts; multistep solution; knowledge of advanced middle school topics and/or problem-solving strategies is necessary.

Warm-Up 1

| Answer | Difficulty | Answer | Difficulty |
|-------------------|------------|----------------------|------------|
| 1. 77 | (1) | 6. 30 | (4) |
| 2. $3\frac{1}{5}$ | (2) | 7. $9/16$ | (4) |
| 3. 11 | (2) | 8. 1.7×10^5 | (2) |
| 4. 1 | (2) | 9. 0 | (3) |
| 5. $1/6$ | (2) | 10. 170 or 170.00 | (2) |

Warm-Up 2

| Answer | Difficulty | Answer | Difficulty |
|----------------------------|------------|------------------|------------|
| 11. 16 | (2) | 16. 720 | (3) |
| 12. 5 | (3) | 17. 36 | (5) |
| 13. 12 | (3) | 18. $7/12$ | (4) |
| 14. 5 | (3) | 19. 12 | (3) |
| 15. 3.16×10^{-14} | (4) | 20. $2\sqrt{17}$ | (4) |

Warm-Up 3

| Answer | Difficulty | Answer | Difficulty |
|---------|------------|-------------|------------|
| 21. 22 | (2) | 26. $25/81$ | (4) |
| 22. 3 | (2) | 27. $18/25$ | (4) |
| 23. 8 | (2) | 28. 8 | (4) |
| 24. 621 | (1) | 29. 6 | (4) |
| 25. 9 | (4) | 30. 1 | (2) |

Workout 1

| Answer | Difficulty | Answer | Difficulty |
|----------|------------|--------|------------|
| 31. 1.30 | (3) | 36. 7 | (4) |
| 32. 721 | (4) | 37. Q | (3) |
| 33. 1100 | (4) | 38. 16 | (2) |
| 34. 12 | (4) | 39. 6 | (3) |
| 35. 14.6 | (4) | 40. 36 | (4) |

Workout 2

| Answer | Difficulty | Answer | Difficulty |
|----------|------------|-----------|------------|
| 41. 1* | (3) | 46. 4 | (4) |
| 42. 90 | (3) | 47. $1/4$ | (4) |
| 43. 1.65 | (3) | 48. 36 | (4) |
| 44. 41 | (1) | 49. 7 | (4) |
| 45. 120 | (4) | 50. 21.3 | (4) |

Warm-Up 4

| Answer | Difficulty | Answer | Difficulty |
|------------|------------|-------------|------------|
| 51. 88 | (4) | 56. 380 | (3) |
| 52. 86 | (3) | 57. $15/64$ | (4) |
| 53. 38 | (4) | 58. -3 | (2) |
| 54. 12 | (2) | 59. $2/5$ | (4) |
| 55. $1/64$ | (3) | 60. 8 | (3) |

* The plural form of the units is always provided in the answer blank, even if the answer appears to require the singular form of the units.

Warm-Up 5

| Answer | Difficulty | | | |
|------------------------------|------------|----------|-----|--|
| 61. 216 | (2) | 66. 4851 | (5) | |
| 62. 38 | (4) | 67. 30 | (3) | |
| 63. 11 | (4) | 68. 720 | (3) | |
| 64. 6 | (3) | 69. 160 | (5) | |
| 65. 275,000 or 275,000.00 | (4) | 70. -3 | (4) | |

Warm-Up 6

| Answer | Difficulty | | | |
|-----------------|------------|------------|-----|--|
| 71. 24 or 24.00 | (2) | 76. 34 | (4) | |
| 72. 17 | (3) | 77. 2π | (5) | |
| 73. 175 | (3) | 78. 7 | (3) | |
| 74. 33 | (4) | 79. -5 | (4) | |
| 75. 867 | (4) | 80. 17 | (4) | |

Workout 3

MATHCOUNTS Problems Mapped to Common Core State Standards (CCSS)

Forty-three states, the District of Columbia, four territories and the Department of Defense Education Activity (DoDEA) have adopted the Common Core State Standards (CCSS). As such, MATHCOUNTS considers it beneficial for teachers to see the connections between the *2016-2017 MATHCOUNTS School Handbook* problems and the CCSS. MATHCOUNTS not only has identified a general topic and assigned a difficulty level for each problem but also has provided a CCSS code in the Problem Index (pages 56-57). A complete list of the Common Core State Standards can be found at www.corestandards.org.

The CCSS for mathematics cover K-8 and high school courses. MATHCOUNTS problems are written to align with the NCTM Standards for Grades 6-8. As one would expect, there is great overlap between the two sets of standards. MATHCOUNTS also recognizes that in many school districts, algebra and geometry are taught in middle school, so some MATHCOUNTS problems also require skills taught in those courses.

In referring to the CCSS, the Problem Index code for each of the Standards for Mathematical Content for grades K-8 begins with the grade level. For the Standards for Mathematical Content for high school courses (such as algebra or geometry), each code begins with a letter to indicate the course name. The second part of each code indicates the domain within the grade level or course. Finally, the number of the individual standard within that domain follows. Here are two examples:

- *6.RP.3* → *Standard #3 in the Ratios and Proportional Relationships domain of grade 6*
- *G-SRT.6* → *Standard #6 in the Similarity, Right Triangles and Trigonometry domain of Geometry*

Some math concepts utilized in MATHCOUNTS problems are not specifically mentioned in the CCSS. Two examples are the Fundamental Counting Principle (FCP) and special right triangles. In cases like these, if a related standard could be identified, a code for that standard was used. For example, problems using the FCP were coded 7.SP.8, S-CP.8 or S-CP.9 depending on the context of the problem; SP → Statistics and Probability (the domain), S → Statistics and Probability (the course) and CP → Conditional Probability and the Rules of Probability. Problems based on special right triangles were given the code G-SRT.5 or G-SRT.6, explained above.

There are some MATHCOUNTS problems that either are based on math concepts outside the scope of the CCSS or based on concepts in the standards for grades K-5 but are obviously more difficult than a grade K-5 problem. When appropriate, these problems were given the code SMP for Standards for Mathematical Practice. The CCSS include the Standards for Mathematical Practice along with the Standards for Mathematical Content. The SMPs are (1) Make sense of problems and persevere in solving them; (2) Reason abstractly and quantitatively; (3) Construct viable arguments and critique the reasoning of others; (4) Model with mathematics; (5) Use appropriate tools strategically; (6) Attend to precision; (7) Look for and make use of structure and (8) Look for and express regularity in repeated reasoning.

PROBLEM INDEX

It is difficult to categorize many of the problems in the *MATHCOUNTS School Handbook*. It is very common for a MATHCOUNTS problem to straddle multiple categories and cover several concepts. This index is intended to be a helpful resource, but since each problem has been placed in exactly one category and mapped to exactly one Common Core State Standard (CCSS), the index is not perfect. In this index, the code **9 (3) 7.SP.3** refers to problem 9 with difficulty rating 3 mapped to CCSS 7.SP.3. For an explanation of the difficulty ratings refer to page 51. For an explanation of the CCSS codes refer to page 55.

SOLUTIONS

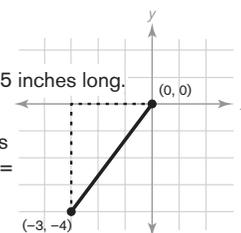

The solutions provided here are only *possible* solutions. It is very likely that you or your students will come up with additional—and perhaps more elegant—solutions. Happy solving!

Warm-Up 1

1. Subtract the year the capsule was sealed, 1940, from the year it will be opened, 2017. This difference is the amount of time in between, or $2017 - 1940 = 77$ years.
2. This can be done using the proportion $5/2 = 8/x$, x being the number of large paper clips equivalent in length to 8 small paper clips. To find x , multiply each side of the equation by x and then by $2/5$. The result is $x = 16/5$ large clips, which as a mixed number is $3\frac{1}{5}$ large paper clips.
3. One path goes directly from cell 1 to cell 7. To find all the other paths, we will systematically list five clockwise paths and then five counterclockwise paths that end in cell 7. The 11 paths are 1-7, 1-2-7, 1-3-2-7, 1-4-3-2-7, 1-5-4-3-2-7, 1-6-5-4-3-2-7, 1-6-7, 1-5-6-7, 1-4-5-6-7, 1-3-4-5-6-7, 1-2-3-4-5-6-7.
4. Dividing by $2/3$ is the same as multiplying by $3/2$, so $4 \div (2/3) - 5 = 4 \times (3/2) - 5 = 6 - 5 = 1$.
5. The absolute difference, or the absolute value of the difference, can be thought of as the positive difference. To find the positive difference between the two values, subtract the smaller fraction from the larger fraction as follows: $(1/2) - (1/3) = (3/6) - (2/6) = 1/6$.
6. If the perimeter of rectangle ABCD is 34 cm, then the semiperimeter is half that measure, or 17 cm, and side AD must measure $17 - 5 = 12$ cm. To find the length of diagonal BD, we use the Pythagorean Theorem as follows: $5^2 + 12^2 = x^2 \rightarrow 25 + 144 = x^2 \rightarrow 169 = x^2 \rightarrow x = 13$. (5-12-13 is one of several Pythagorean Triples memorized by competitive Mathletes.) The perimeter of $\triangle ABD$ is $5 + 12 + 13 = 30$ cm.
7. There are $8 \times 8 = 64$ ways the two rolls of the eight-sided die can occur. This will be the denominator of our probability fraction. If the first roll of the die is a 1, then the second roll can be any of the 8 numbers for it to be greater than or equal to the first roll. If the first roll is a 2, then the second roll can be any of 7 possibilities, excluding 1. With a 3, we can have 6 possibilities, etc. The total number of acceptable rolls for the second die is, thus, $8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 36$. The probability is $36/64 = 9/16$.
8. The product $1.2 \times 10^3 \times 1.4 \times 10^2$ can be rewritten as $1.2 \times 1.4 \times 10^3 \times 10^2$, which is $1.68 \times 10^{3+2} = 1.68 \times 10^5 \approx 1.7 \times 10^5$.
9. The square of a positive integer is equal to the square of its opposite. For example $5^2 = (-5)^2$. So all the integers n that satisfy the requirement come in pairs of opposites. Therefore, their sum is 0.
10. If Minnie took 7 lessons, and lessons cost \$20 each, she paid $7 \times 20 = \$140$, plus the \$30 registration fee, for a total of $140 + 30 = \$170$.

Warm-Up 2

11. A string that is 7 feet long is $7 \times 12 = 84$ inches long, which is $16 \times 5 + 4$. So, Sue can cut 16 pieces of string that are 5 inches long.
12. As the figure shows, the segment from the point $(-3, -4)$ to the origin $(0, 0)$ is the hypotenuse of a right triangle with legs of length 3 and 4 units. This is the well-known 3-4-5 right triangle that satisfies the Pythagorean Theorem as follows: $3^2 + 4^2 = 9 + 16 = 25 = 5^2$. The distance from $(-3, -4)$ to the origin is 5 units.
13. The hexagonal tables that are on the ends seat 5 people each. The other $50 - 2 \times 5 = 40$ people are seated at hexagonal tables that are in the middle of the row and seat only 4 people each. Thus, $40 \div 4 = 10$ more tables are needed in between the two end tables. That's a total of $2 + 10 = 12$ tables.
14. The three notebooks cost $3 \times 1.57 = \$4.71$. The change from \$5.00 would be 29¢. The fewest coins Gloria could get in change would be a quarter and four pennies, which is 5 coins.
15. The number 1,000,000,000 is 10^9 as a power of 10. When we multiply numbers in scientific notation, we can add the exponents that have the same base. The mass of 1,000,000,000 fluorine atoms is $10^9 \times 3.16 \times 10^{-23} = 3.16 \times 10^{9-23} = 3.16 \times 10^{-14}$ g.

16. Each of the 3 possible appetizers can be combined with each of the 4 entrées for $3 \times 4 = 12$ meals so far. The two side dishes can be selected in $5 \times 4 \div 2 = 10$ ways. We divide by 2 because the $5 \times 4 = 20$ ways would include duplicates of every pair of side dishes chosen the other way around. We now have $12 \times 10 = 120$ meals with an appetizer, an entrée and two side dishes. Each of these 120 meals can be combined with any of the 6 desserts for $120 \times 6 = 720$ meals.

17. If 15 machines make 500 raviolis in 15 minutes, then $15 \times 5 = 75$ machines would make $5 \times 500 = 2500$ raviolis in the same amount of time, 15 minutes. To get from 2500 raviolis to 6000 raviolis, those 75 machines would need to run for $6000/2500$ or $12/5$ times as long and $12/5 \times 15 = 36$ minutes.

18. Let's list all $4 \times 3 = 12$ possible two-digit numbers that can be made from the four digits and count those that are prime: 12, 13, 17, 21, 23, 27, 31, 32, 37, 71, 72, 73. Seven of these numbers are prime, so the probability is **7/12**.

19. The two letters that are 4 units from the letter M are I and Q. These are the 9th and 17th letters in the alphabet, so they would be placed at 8 and 16 on the number line. Not surprisingly, the average of these two numbers is exactly the number of M, which is **12**.

20. The location of point B is $(-2, -2)$, but we don't really need to know this. The more important information is the lengths of the legs of the right triangle that can be formed on the grid with points A and B at opposite ends of the hypotenuse, and these lengths were given. Using the Pythagorean Theorem, we can find the length of segment AB as follows: $2^2 + 8^2 = x^2 \rightarrow 4 + 64 = x^2 \rightarrow 68 = x^2 \rightarrow x = \sqrt{68} = \sqrt{4 \times 17} = \sqrt{4} \times \sqrt{17} = 2\sqrt{17}$ units.

Warm-Up 3

21. The average of an arithmetic sequence is the average of its first and last terms. In this case, we have $(13 + 31) \div 2 = 44 \div 2 = 22$.

22. Suppose Kelly first selects a white sock and then selects a black sock. The third sock she selects must match either the white or the black, forming a pair either way. Thus, she must select **3** socks to be assured of a matching pair.

23. The fraction $27/72$ expressed as a common fraction is $3/8$. So m must be **8**.

24. The total number of chairs in the room must be $23 \times 27 = 621$. Most students will use the standard algorithm for multiplying two-digit integers. But to quickly multiply these two numbers, we can write the product as the difference of two squares: $(25 - 2)(25 + 2) = 25^2 - 2^2 = 625 - 4 = 621$.

25. Without equations, we might think about this problem as follows: Since the larger number is 4 times the smaller number, then the sum of the two numbers must be 5 times the smaller number. This same sum is 3 times the smaller number plus 18, so 18 must be 2 times the smaller number and the smaller number is **9**. If we write equations, we have $y = 4x$ and $x + y = 3x + 18$. Replacing the y in the second equation with $4x$, we get $x + 4x = 3x + 18 \rightarrow 5x = 3x + 18 \rightarrow 2x = 18 \rightarrow x = 9$. This matches our earlier thinking exactly.

26. The ratio of the hypotenuse of $\triangle ABC$ to the hypotenuse of $\triangle XYZ$ is $10/18$, or $5/9$. This is a one-dimensional scale factor. The area of the triangles is two-dimensional, so we have to use this scale factor twice. The ratio we want is $5/9 \times 5/9 = 25/81$.

27. There are seven numbers from 1 through 25, inclusive, that are *not* divisible by 2, 3, 4 or 5. They are 1, 7, 11, 13, 17, 19 and 23. The other $25 - 7 = 18$ numbers *are* divisible by one or more of 2, 3, 4 or 5, so the probability is **18/25**.

28. The **8** ordered sequences that Siddarth can use to write 5 as a sum of 1s and 2s are $1 + 1 + 1 + 1 + 1$, $2 + 1 + 1 + 1$, $1 + 2 + 1 + 1$, $1 + 1 + 2 + 1$, $1 + 1 + 1 + 2$, $2 + 2 + 1$, $2 + 1 + 2$ and $1 + 2 + 2$. In general, the number of distinct ordered sequences containing only 1s and 2s and having a sum of n is the n th Fibonacci number, where the first and second terms are 1 and 2, respectively.

29. Kevin's bus traveled 15 miles west and 8 miles north for a total of 23 miles. The direct path would be the hypotenuse of a triangle with legs of length 8 miles and 15 miles. Using the Pythagorean Theorem, we can find the length of the hypotenuse as follows: $8^2 + 15^2 = x^2 \rightarrow 64 + 225 = x^2 \rightarrow 289 = x^2 \rightarrow x = 17$. (This is another Pythagorean Triple that serious Mathletes should memorize.) Kevin's bus would travel 17 miles on the direct route, which is shorter by $23 - 17 = 6$ miles.

30. Ellen would get the following sequence of calculations: $123,456 - 6 = 123,450 \rightarrow 123,450 \div 10 = 12,345 \rightarrow 12,345 - 5 = 12,340 \rightarrow 12,340 \div 10 = 1234 \rightarrow 1234 - 4 = 1230 \rightarrow 1230 \div 10 = 123 \rightarrow 123 - 3 = 120 \rightarrow 120 \div 10 = 12 \rightarrow 12 - 2 = 10 \rightarrow 10 \div 10 = 1$.

Workout 1

31. The exchange rate in the other direction is the reciprocal of 0.77, or $1 \div 0.77$, which is 1.2987012.... So US\$1.00 is about NZ\$**1.30**.

32. We are looking for a multiple of 7 that is one more than a multiple of 2, 3, 4, 5, 6 and 8. The LCM of 2, 3, 4, 5, 6 and 8 is $3 \times 5 \times 8 = 120$, so 121 will leave a remainder of 1 if we divide by 2, 3, 4, 5, 6 or 8. Unfortunately 121 is not a multiple of 7; it's 2 more than a multiple of 7. Let's try $2 \times 120 + 1 = 241$. This is 3 more than a multiple of 7 or $3 \pmod{7}$. The pattern continues with $361 = 4 \pmod{7}$, $481 = 5 \pmod{7}$ and $601 = 6 \pmod{7}$, but finally $721 = 0 \pmod{7}$. The least number of pennies that could be in the jar is **721** pennies.

33. For the first through fifth years, we have populations of n , then $3n$, then $3n - 3000$, then $(3n - 3000)/2$, then finally $(3n - 3000)/2 + 1300 = 1450$ lemmings. Now, starting at the fifth year and working backwards, we have $(3n - 3000)/2 = 150$, then $3n - 3000 = 300$, then $3n = 3300$, then at the start $n = 1100$ lemmings.

34. With no restrictions, $4 \times 3 \times 2 \times 1 = 24$ positive integers can be formed from the four given digits. The restriction means that we cannot have a 1 next to a 4. There are 3 ways to place a 4 and a 1 next to each other; as the first two digits, the middle two digits and the last two digits. There are 2 ways to order the 4 and the 1 and 2 ways to order the 3 and the 2, for $3 \times 2 \times 2 = 12$ integers. This eliminates 12 of the 24 integers and leaves **12** integers.

35. A tire with a diameter of 25 inches has a circumference of 25π inches, so it's covering 25π inches per rotation. Here is a single expression that uses units cancellation to convert 65 miles per hour to the number of tire rotations per second.

$$\frac{1 \text{ rotation}}{25\pi \text{ inches}} \times \frac{12 \text{ inches}}{1 \text{ foot}} \times \frac{5280 \text{ feet}}{1 \text{ mile}} \times \frac{65 \text{ miles}}{1 \text{ hour}} \times \frac{1 \text{ hour}}{60 \text{ minutes}} \times \frac{1 \text{ minute}}{60 \text{ seconds}} = \frac{12 \times 5280 \times 65 \text{ rotations}}{25\pi \times 60 \times 60 \text{ seconds}} \approx \mathbf{14.6} \text{ rotations per second}$$

36. To increase a number by 10%, multiply by 1.1. In week 2, Nish runs $8 \times 1.1 = 8.8$ miles, as stated. In week 3, she runs $8.8 \times 1.1 = 9.68$ miles. In week 4, she runs $9.68 \times 1.1 = 10.648$ miles. In week 5, she runs $10.648 \times 1.1 = 11.7128$ miles. In week 6, she runs $11.7128 \times 1.1 = 12.88408$ miles. In week 7, she runs $12.88408 \times 1.1 = 14.172488$ miles. The first week of training in which Nish exceeds 13.1 miles is week **7**.

37. We are told that the 8 from 18 follows the A in the second time through the alphabet. There are 8 more two-digit numbers from 19 to 26, inclusive. This is 16 more digits that must follow 16 more letters after the A. We want the 17th letter of the alphabet, which is **Q**.

38. The area of the original rectangle is $4 \times 5 = 20 \text{ cm}^2$. The dodecagon is 4 cm^2 less, so it's **16** cm^2 .

39. The sum of the first ten positive integers is $10 \times 11 \div 2 = 55$. The nearest perfect square less than 55 is 49, so the **6** must not have been included in the sum.

40. If we want the green marbles to be $5/12$ of the marbles, then the 40 green marbles must be 5 parts, so each part is $40 \div 5 = 8$. The total number of marbles needs to be $8 \times 12 = 96$. There are $20 + 40 = 60$ marbles so far, so $96 - 60 = 36$ purple marbles must be added.

Workout 2

41. The second cube of cheese weighs $64.8 \times 16 = 1036.8$ ounces. This type of cheese weighs 0.6 ounce per cubic inch. So the cube of cheese weighing 1036.8 ounces would have volume $1036.8 \div 0.6 = 1728 \text{ in}^3$ and edge length $\sqrt[3]{1728} = 12$ inches = **1** foot.

42. Only the perfect squares have an odd number of divisors. There are $\sqrt{100} = 10$ perfect squares from 1 to 100, inclusive. That means there are $100 - 10 = 90$ integers with an even number of factors.

43. The distance from -1.3 to $3 \frac{1}{8}$, or 3.125, is $1.3 + 3.125 = 4.425$ units. One-third of this distance is 1.475 and $2/3$ is 2.95. If we add 2.95 to -1.3 or subtract 1.475 from 3.125, we get to the same point that is $2/3$ of the way between the endpoints: $-1.3 + 2.95 = 1.65$.

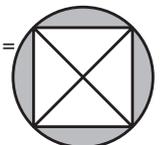

44. The stick of butter has a volume of $1.5 \times 1.5 \times 3.25 = 7.3125 \text{ in}^3$. The pat of butter has a volume of $1 \times 1 \times 0.375 = 0.375 \text{ in}^3$. The number of calories in a pat of butter is $\frac{800 \text{ calories}}{1.5 \times 1.5 \times 3.25 \text{ in}^3} \times \frac{1 \times 1 \times 0.375 \text{ in}^3}{1 \text{ pat}} \approx \mathbf{41}$ calories.

45. The two diagonals bisect each other, so triangles AED and BEC must be equilateral, with side lengths of 5 and angles of 60 degrees. The measure of $\angle AEB$ is the supplement of 60, which is $180 - 60 = 120$ degrees.

46. The expression $4! + 5!$ can be rewritten as $4!(1 + 5) = 6 \times 4 \times 3! = 24 \times 3!$. This means that $n! = 24$, so $n = 4$.

47. There are 28 dominoes in a full set. There are $7 \times 6 \div 2 = 21$ dominoes with different numbers of dots on the two sides of the line and 7 with the same number of dots on both sides of the line, called doubles. The probability that one of the doubles is selected at random is $7/28 = 1/4$.

48. Since we are looking for a percent, we can assign a radius of 1 unit to our circular pizza. The area of the pizza is then $1^2 \times \pi = \pi$ units². The inscribed square can be cut into four isosceles right triangles that have legs of 1 unit. Each triangle has an area of $1/2$ units² and the four of them can be rearranged to form 2 unit squares. The difference $\pi - 2$ is the area of the four segments that remain when Paige removes the square. As a percent, this is $(\pi - 2)/\pi \times 100\% \approx \mathbf{36\%}$.

49. If we combine what Jefferson and Monroe exchange, we get a total of 7 ziggles and 7 zoggles exchanged for a total of 49 zaggles. Dividing these totals by 7, we find that Carter can expect to exchange 1 ziggle and 1 zoggle for **7** zaggles.

50. Assuming that the ground is perpendicular to the vertical structure, we can draw a right triangle with legs of x and $4x$ feet and a hypotenuse of 22 feet. We can then use the Pythagorean Theorem and solve for x as follows: $x^2 + (4x)^2 = 22^2 \rightarrow 1x^2 + 16x^2 = 484 \rightarrow 17x^2 = 484 \rightarrow x^2 = 484/17 \rightarrow x = \sqrt{(484/17)} \rightarrow x \approx 5.336$. This is the value of x , which tells us how far the base of the ladder can be from the wall. We want to know how high the ladder can safely reach up the vertical structure, which is $4x$, or about $4 \times 5.336 \approx 21.3$ feet.

Warm-Up 4

51. From least to greatest, Jamie's first five tests scores were 75, 81, 86, 92, 98. We want to maximize the value of the lowest of the next three test scores so that the median of all eight scores is 88. The median will be the average of the 4th and 5th scores in an ordered list of the eight scores. There is no way to get a median of 88 with two of the five known scores being the 4th and 5th scores. We could let two of the unknown scores be 87 and 89 to get a median of 88. In this case the third unknown score just has to be greater than or equal to 89, and the lowest of these three scores is 87. We could let 86 be the 4th score and make the 5th score 90 to get a median of 88. Then the lowest of the three unknown scores would be 86. If we let the 4th and 5th scores both be 88, we get a median of 88, and the final unknown score can have any value greater than or equal to 88. Further analysis shows that if the lowest of the unknown scores is greater than 88, the median would be 89 or more. Therefore, the greatest possible value of the lowest of the final three scores is **88**.

52. The least and greatest possible two-digit primes containing only 1s, 3s, 7s and 9s as digits are 11 and 97, respectively. The absolute difference between these two values is $97 - 11 = 86$.

53. The sum of each pair of numbers is twice the mean of the pair. From the information given, we can write the following system of equations: $a + b = 16$, $b + c = 32$ and $a + c = 28$. Adding these three equations, we get $2a + 2b + 2c = 76$. So $a + b + c$ will be half of 76, or **38**.

54. The difference between the length and the width of the rectangle is $(4x + 9) - (4x - 3) = 4x + 9 - 4x + 3 = 12$ units.

55. Each of the six faces of the cube can be painted one of two colors, so there are $2^6 = 64$ equally likely possible ways to color the six faces. Some of these ways will look the same under rotation, but only one of them is all blue, so the probability is **1/64**.

56. We first evaluate $n^2 - n$ for $n = 5$ to get $25 - 5 = 20$. Now we evaluate $n^2 - n$ for $n = 20$ to get $400 - 20 = 380$.

57. The possible two-digit primes that use only the digits 1 through 8 are 11, 13, 17, 23, 31, 37, 41, 43, 47, 53, 61, 67, 71, 73 and 83. That's 15 out of $8 \times 8 = 64$ possible outcomes when an eight-sided die is rolled twice. So the probability is **15/64**.

58. Substituting the given values of x and y , we get $2 \times 3^2 + 3 \times (-2)^2 - 4 \times 3 + 2 \times (-2) - 17 = 2 \times 9 + 3 \times 4 - 12 - 4 - 17 = 18 + 12 - 12 - 21 = 18 - 21 = -3$.

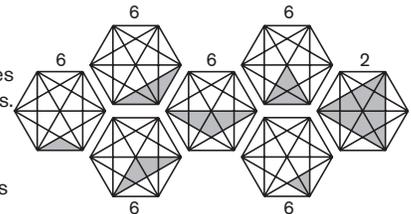

59. The number of possible old-style plates is $25 \times 25 \times 10 \times 10 \times 10 \times 10$. The number of possible new-style plates is $25 \times 25 \times 25 \times 10 \times 10 \times 10$. The ratio is $(25 \times 25 \times 10 \times 10 \times 10 \times 10) / (25 \times 25 \times 25 \times 10 \times 10 \times 10) = 10/25 = 2/5$.

60. Since $40\% = 2/5$ and $0.8 = 4/5$, we have $2/5 \times 2/3 \times 24 \div 4/5 = (2 \times 2 \times 24 \times 5) / (5 \times 3 \times 4) = 8$.

Warm-Up 5

61. We will factor out a common factor of 6^2 to make the calculations simpler. We have $(2 \times 6^3 + 6^2) - 7 \times 6^2 = (2 \times 6 \times 6^2 + 6^2) - 7 \times 6^2 = 6^2 \times (12 + 1 - 7) = 6^2 \times 6 = 6^3 = 216$.

62. There are seven types of triangles in the figure that have at least two sides congruent. As shown, six types occur in six different locations and one type occurs in just two locations. That's a total of $6 \times 6 + 2 = 38$ triangles.

63. This problem is similar to problem 28, which asked in how many ways Sidarth could write 5 as a sum of 1s and 2s. Since Fido never climbs more than three stairs in one step, instead of just partitioning the stairs into groups of 1 and 2, we can also include groups of 3.

There is 1 way for Fido to climb the stairs if he steps on each stair ($1 + 1 + 1 + 1 + 1$).

There are 4 ways for Fido to climb the stairs if he steps on exactly four stairs ($2 + 1 + 1 + 1$; $1 + 2 + 1 + 1$; $1 + 1 + 2 + 1$; $1 + 1 + 1 + 2$).

There are 6 ways for Fido to climb the stairs if he steps on exactly three stairs ($2 + 2 + 1$; $2 + 1 + 2$; $1 + 2 + 2$; $3 + 1 + 1$; $1 + 3 + 1$; $1 + 1 + 3$).

These are the $1 + 4 + 6 = 11$ ways Fido can climb the five stairs.

64. The x^2 term in the numerator "cancels" the x^2 in the denominator since x^2/x^2 is 1. That leaves $(x^2)^3 = x^2 \cdot x^2 \cdot x^2 = x^6$. So $y = 6$.

79. Let's call the two numbers p and q . From the information given, we can write two equations: $|p - q| = 6$ and $|p^2 - q^2| = 24$, which means that $p - q = 6$ or $p - q = -6$ and $p^2 - q^2 = 24$ or $p^2 - q^2 = -24$. Factoring $p^2 - q^2$, we get $(p - q)(p + q) = 24$ or $(p - q)(p + q) = -24$. We can substitute 6 for $p - q$ in these two equations to get $6(p + q) = 24$ and $6(p + q) = -24$, which means that $p + q = 4$ or $p + q = -4$. (Note: Substituting -6 for $p - q$ in the two equations yields the same result.) Now we know that the difference of the two numbers is 6 or -6 and their sum is 4 or -4 . Now we can solve the four systems of equations, as shown, to see that the product is $5 \times (-1) = 1 \times (-5) = -5$.

| | | | |
|-------------------------|--------------------------|--------------------------|-------------------------|
| $p + q = 4$ | $p + q = 4$ | $p + q = -4$ | $p + q = -4$ |
| $\underline{p - q = 6}$ | $\underline{p - q = -6}$ | $\underline{p - q = -6}$ | $\underline{p - q = 6}$ |
| $2p = 10$ | $2p = -2$ | $2p = -10$ | $2p = 2$ |
| $p = 5 \quad q = -1$ | $p = -1 \quad q = 5$ | $p = -5 \quad q = 1$ | $p = 1 \quad q = -5$ |

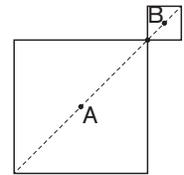

80. We start inside the parentheses and evaluate as follows: $4 \ominus 3 = 4^2 - 2 \times 3^2 = 16 - 18 = -2$. Now we evaluate $5 \ominus -2 = 5^2 - 2 \times (-2)^2 = 25 - 8 = 17$.

Workout 3

81. The average of eleven integers with a sum of 11 must be $11/11 = 1$. Since the integers are consecutive, 1 is also the median. In this case the median is the sixth integer in the ordered list. Therefore, the least of the eleven integers must be $1 - 5 = -4$. A student who doesn't know these properties might approach solving the problem differently. Since the sum of eleven *positive* integers would be greater than 11, we deduce that the consecutive integers in question must include negative values, and when summing these integers, opposites will add to zero, thus leaving only a few consecutive positive integers to add to 11. We can start by considering the eleven integers from -5 to 5, but these integers have a sum of 0. If, however, we consider the integers from -4 to 6, we see that the consecutive integers from -4 to 4 sum to 0, and the final two integers, 5 and 6, sum to 11. Once again we conclude that the least integer is -4 .

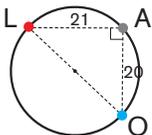

82. The mean of x and y is 12. So the sum of x and y must be $2 \times 12 = 24$, and $x = 24 - y$. The mean of y and 12 is $z/2$. So $(y + 12)/2 = z/2$, and $z = y + 12$. Using these two expressions for x and z , we can write their mean as $(x + z)/2 = (24 - y + y + 12)/2 = 36/2 = 18$.

83. Square A has area 225 cm^2 , so it must have side length $\sqrt{225} = 15 \text{ cm}$ and diagonal length $15\sqrt{2} \text{ cm}$. Square B has area 16 cm^2 , so it must have side length $\sqrt{16} = 4 \text{ cm}$ and diagonal length $4\sqrt{2} \text{ cm}$. These squares, with centers labeled A and B, are positioned so that A, B and the common vertex are collinear, as shown. This arrangement gives us the greatest distance between A and B, half the sum of the diagonal lengths of the two squares. That distance is $\frac{15\sqrt{2} + 4\sqrt{2}}{2} = \frac{19\sqrt{2}}{2} \text{ cm}$.

84. If we continue the sequence, we get a repeating pattern: 3, 5, 2, -3 , -5 , -2 , 3, 5, 2, -3 , -5 , -2 , ... We note that the sum of the six repeating terms is 0. So for any integer n that is a multiple of 6, the sum of the first n terms of this sequence will be 0. The greatest multiple of 6 that is less than 200 is 198. So the sum of the first 198 terms will be 0, making the sum of the first 200 terms $3 + 5 = 8$.

85. Using divisibility rules, we can quickly determine that 2017 is not divisible by 2, 3 or 5. We might then try dividing by 7, 11, 13, etc., and begin to suspect that 2017 is a prime number. To be sure, we would have to try dividing by all the prime numbers less than or equal to the square root of 2017. Since $45 \times 45 = 2025$, we can be sure that 2017 is prime if it has none of the following primes as factors: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41 and 43. Since none of them is a factor, we conclude that 2017 is prime, and the sum of its factors is $1 + 2017 = 2018$.

86. Because of the way that Oberon, Lance and Arthur are seated, a right triangle is formed with legs of length 20 feet and 21 feet. The hypotenuse is a diameter of the circle. You may recognize these two values as being part of the 20-21-29 Pythagorean Triple. Those who do not can use the Pythagorean Theorem to calculate the diameter as $\sqrt{(20^2 + 21^2)} = \sqrt{(400 + 441)} = \sqrt{841} = 29$ feet.

87. Comparing the two transactions, we see that the extra $12 - 8 = 4$ regular binders in the second transaction have to account for the $46.00 - 32.60 = \$13.40$ difference in cost. Therefore, a regular binder must cost $13.40 \div 4 = \$3.35$. Using this and the information from the first transaction, we calculate the cost of the celebrity binder to be $32.60 - 8 \times 3.35 = 32.60 - 26.80 = 5.80$. The difference between the cost of a celebrity binder and that of a regular binder is $5.80 - 3.35 = \$2.45$.

88. Let p represent the price of a widget. Since Mr. Jones sold n widgets, he earned $0.03 \times p \times n$, and Mr. Smith earned $0.05 \times p \times (n - 500)$. These two commission amounts are equal, so we can write the equation $0.03pn = 0.05p(n - 500) \rightarrow 0.03n = 0.05n - 25$. Solving for n , we get $0.03n = 0.05n - 25 \rightarrow 0.02n = 25 \rightarrow n = 1250$. So Mr. Jones sold 1250 widgets, and Mr. Smith sold $1250 - 500 = 750$ widgets.

89. The y values in the table appear to be the cubes of the corresponding x values. This would suggest that $a = 1$ and $b = 3$, which results in the sum $a + b = 1 + 3 = 4$. Alternatively, from the table of values we have the following equations: $27 = a \times 3^b$ and $8 = a \times 2^b$. Dividing these two equations yields $27/8 = 3^b/2^b$, so $b = 3$, $a = 1$ and $a + b = 1 + 3 = 4$.

90. We need to consider the top and bottom surfaces, which are both rings, and the inner and outer lateral surfaces. The top and bottom surfaces each have area $(2.5^2 - 1.5^2)\pi = (6.25 - 2.25)\pi = 4\pi \text{ in}^2$. The inner lateral surface has area $2 \times 1.5 \times \pi \times 1 = 3\pi \text{ in}^2$. The outer lateral surface has area $2 \times 2.5 \times \pi \times 1 = 5\pi \text{ in}^2$. The total surface area Donny calculated for each roll of tape was $4\pi + 4\pi + 3\pi + 5\pi = 16\pi \text{ in}^2$. That means the estimated surface area for a dozen donuts is $16\pi \times 12 = 192\pi \text{ in}^2$.

Workout 4

91. For each of the 3 games Amanda could watch at noon on Saturday, there are 4 games she could watch at 8 p.m. and then 5 games the next day. So there are $3 \times 4 \times 5 = 60$ combinations of games she can watch.

92. When the values of a , b and c are substituted into the expression, we get $\frac{\frac{12 \times 4 \times 5}{1/2} - (6 \times 4^2 - 4)}{0.5} = \frac{\frac{240}{1/2} - (96 - 4)}{0.5} = \frac{480 - 92}{0.5} = \frac{388}{0.5} = 776$.

93. The two families are approaching each other at $45 + 53 = 98$ mi/h. Since time = distance \div rate and the two families start out 1029 miles apart, it will take $1029 \div 98 = 10.5$ hours for them to pass each other.

94. Using a calculator to divide 1 by 27, we see that this is a non-terminating decimal with three digits repeating: 0.037037.... The third digit of the repeating pattern, the 7, will be in the 3rd, 6th, 9th, ..., 36th, 39th and 42nd places after the decimal point. Because the 42nd place contains the digit 7, the place before that, the 41st place, will contain the digit 3.

95. Since the mode, median and mean form an increasing sequence and we are trying to maximize the value of y , let's start by assuming $x = 11$ and $y \geq 17$. Our list of integers is now, from least to greatest, 11, 11, 13, 15, 17, y . Now these integers have a mode of 11, a median of 14 and a sum of $67 + y$. The difference between the median and the mode is $14 - 11 = 3$. So in order for the mode, median and mean to form an increasing sequence, the mean must be $14 + 3 = 17$. We can write the following equation for the mean: $(67 + y) \div 6 = 17$. Solving for y , we see that $67 + y = 102$, so $y = 35$, which is the greatest possible value of y .

96. The semicircle has radius $13/2 = 6.5$ and area $(\pi \times 6.5^2) \div 2 = 21.125\pi$ units². The area of the triangle is $(1/2) \times 5 \times 12 = 30$ units². The difference between these two areas, $21.125\pi - 30 \approx 36$ units², is the total area of the shaded regions.

97. Each of the 12 tourists has two choices for a tour. That would be $2^{12} = 4096$ different ways to split into two groups. But we cannot allow all the tourists to go on either one of the tours, so our answer is $4096 - 2 = 4094$ ways.

98. It's virtually impossible to draw 30 circles carefully enough to count the number of distinct intersections. You might try drawing one circle and then adding more circles, one at a time, and counting intersections to see if a pattern emerges. Doing so reveals that with 1 circle, there are 0 intersections; with 2 circles, there are, at most, 2 intersections; with 3 circles, there are, at most, 6 intersections; with 4 circles, there are, at most, 12 intersections. Organizing these findings in a table like the one shown, we see that for n circles, there appear to be $n(n - 1)$ distinct intersections. Therefore, 30 circles will have, at most, $30 \times 29 = 870$ intersections. Alternatively, since every pair of circles intersects in, at most, 2 points, and there are ${}_{30}C_2$ ways to select a pair from a collection of 30 circles, it follows that there are $2 \times (30 \times 29) / 2 = 30 \times 29 = 870$ intersections.

| | | | | | | |
|----------------------|---|---|---|----|-----|------------|
| Circles | 1 | 2 | 3 | 4 | ... | n |
| Intersections | 0 | 2 | 6 | 12 | ... | $n(n - 1)$ |

99. The sphere has radius r , so its "height" would be $2r$. This means the height of both the cone and the cylinder is $2r$. The volume of the cylinder is $\pi \times r^2 \times h = \pi \times r^2 \times 2r = 2 \times \pi \times r^3$. The volume of the cone is $(1/3) \times \pi \times r^2 \times h = (1/3) \times \pi \times r^2 \times 2r = (2/3) \times \pi \times r^3$. The volume of the sphere is $(4/3) \times \pi \times r^3$. The volumes of the cone and sphere, combined, are $(2/3) \times \pi \times r^3 + (4/3) \times \pi \times r^3 = 2 \times \pi \times r^3$, which is exactly the volume of the cylinder. So 100% of the cylinder is filled.

100. Let's list all the odd numbers less than 500 that we can create with 3s and 4s and strike through those that are not prime: 3, ~~33~~, 43, ~~333~~, ~~343~~, 433, 443. The sum of the primes among them is $3 + 43 + 433 + 443 = 922$.

Warm-Up 7

101. Mac has $25 \times 0.2 = 5$ red marbles, and Thayer also has $20 \times 0.25 = 5$ red marbles. Thus, the absolute difference between the numbers of red marbles they have is 0 marbles.

102. First we evaluate $g(-3) = 2(-3) + 4 = -6 + 4 = -2$. Next we evaluate $f(-2) = (-2)^2 - 2 = 4 - 2 = 2$.

103. A cube has 6 faces, 12 edges and 8 vertices. When each vertex is cut off, 1 new equilateral triangle face is created, though the size of the triangle can vary. There is a net gain of, at most, 3 edges for a maximum of $8 \times 3 = 24$ additional edges. There is also a net gain of, at most, 2 vertices, for a maximum of $8 \times 2 = 16$ additional vertices. At most, the sum of the number of faces, edges and vertices will be $(6 + 8) + (12 + 24) + (8 + 16) = 14 + 36 + 24 = 74$. Note that this maximum can be achieved if the cube is cut so that for each new triangle face none of its vertices reaches the midpoint of an edge of the cube (Fig. 1). Otherwise, the resulting solid would have fewer edges and vertices (Fig. 2).

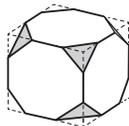

Figure 1

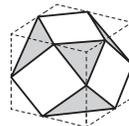

Figure 2

104. Since 4 oranges cost 90 cents, 1 dozen oranges cost $3 \times 90 = 270$ cents. Therefore, 3 dozen oranges cost $3 \times 270 = 810$ cents, or **\$8.10**.

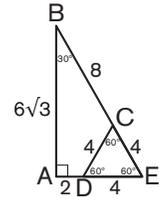

105. Let's imagine that we have 100 pounds of fully matured grapes, consisting of 80 pounds of water and 20 pounds of what we will call pulp. After the drying process, the amount of pulp is still 20 pounds, but the raisins are now only 20% water. The pulp accounts for the other 80%, and the raisins must weigh 25 pounds since 20 is 80% of 25. So, 5 out of 80 pounds of water remain, which is $5/80 = 1/16$ of the original water.

106. We are looking for a number with lots of factors, probably a number that is a multiple of both 2 and 3, which makes it a multiple of 6. It turns out that **48** has the greatest sum of proper factors. That sum is $1 + 2 + 3 + 4 + 6 + 8 + 12 + 16 + 24 = 76$.

107. We see that $(AAA)^3$ has a units digit of 7, which can only occur if the number being cubed has a units digit of 3, so $A = 3$.

108. First, we note that the syrup maker initially has 25 liters of maple syrup and 75 liters of base. She will need to add 50 liters of maple syrup to make the ratio 1:1. Since 90%, or $9/10$ of the amount of sap will evaporate, she can obtain those 50 liters of maple syrup from $50 \times 10 = 500$ liters of maple sap.

109. Suppose we extend sides AD and BC to intersect at E, as shown. Since the $m\angle B = 360 - (90 + 120 + 120) = 360 - 330 = 30$ degrees, it follows that $\triangle ABE$ is a 30-60-90 right triangle. The area of ABCD is the area of $\triangle ABE$ minus the area of $\triangle CDE$. Within the small triangle, since $m\angle C = m\angle D = 180 - 120 = 60$ degrees, we know that $\triangle CDE$ is equilateral, so $CD = DE = CE = 4$ units. The area of an equilateral triangle with side length s is $(1/4) \times s^2\sqrt{3}$. So $\triangle CDE$ has area $(1/4) \times 16\sqrt{3} = 4\sqrt{3}$ units². For $\triangle ABE$, $BE = 8 + 4 = 12$ units. In a 30-60-90 right triangle, the length of the short leg is half that of the hypotenuse, and the length of the long leg is $\sqrt{3}$ times the length of the short leg. So $AE = 12 \div 2 = 6$ units, and $AB = 6\sqrt{3}$ units. Triangle ABE, then, has area $(1/2) \times 6 \times 6\sqrt{3} = 18\sqrt{3}$ units². Therefore, the area of ABCD is $18\sqrt{3} - 4\sqrt{3} = 14\sqrt{3}$ units².

110. The next 2 five-letter arrangements that follow Zzyzx alphabetically are Zzyzy and Zzyzz. The remaining arrangements are of the form Zzz __. There are $26 \times 26 = 676$ ways to fill in the last two letters, so following Zzyzx alphabetically, there are $2 + 676 = 678$ arrangements.

Warm-Up 8

111. We know that $z = 20$. So, $x = 3 \times 20 = 60$. Thus, $60/y = 10$ and $y = 60/10 = 6$.

112. There are $2^5 = 32$ different ways the balls can be distributed between the two containers. Having the two red balls alone in the red container is just one of these 32 possibilities. The probability of this occurring, therefore, is $1/32$.

113. The diameter of the circle, which is the distance from A to B, is $d = \sqrt{(10 - (-2))^2 + (2 - 4)^2} = \sqrt{(12^2 + (-2)^2)} = \sqrt{(144 + 4)} = \sqrt{148} = 2\sqrt{37}$ units. The radius of the circle is half this amount, which is $\sqrt{37}$ units, so the area of the circle is $\pi \times r^2 = \pi \times (\sqrt{37})^2 = 37\pi$ units².

114. Since the sequence is arithmetic, the difference of $56 - 20 = 36$ must be divided into equal intervals. We can do this using the factors of 36. If we list the factors of 36 in pairs, we can think of the first factor as the number of intervals and the second factor as the size of each interval: 1×36 , 2×18 , 3×12 , 4×9 , 6×6 , 9×4 , 12×3 , 18×2 and 36×1 . That makes **9** possible sets of integers that form arithmetic sequences.

115. If you don't recall that the interior angle measures of a regular pentagon are 108 degrees, you can subdivide the pentagon into three triangles. Since the sum of the interior angles of a triangle is 180 degrees, the sum of the interior angles of the pentagon must be $3 \times 180 = 540$ degrees. Divide by 5, and we find that each interior angle measures 108 degrees. The isosceles right triangles have angle measures of 45, 45 and 90. The vertex angle of each shaded triangle is what is left when two 45-degree angles are subtracted from the 108-degree angle, which is **18** degrees.

116. There are $12 \times 12 = 144$ tiles on the bathroom floor. We can group the tiles into three categories: 4 corner tiles, 40 edge tiles and 100 interior tiles. There is a $100/144$ chance that the first of the wrong-colored tiles is placed among the 100 interior tiles. If this happens, there is a $4/143$ chance that the other wrong-colored tile shares an edge with it. There is a $40/144$ chance that the first wrong-colored tile is one of the 40 tiles around the edge of the room. If this happens, there is a $3/143$ chance that the other wrong-colored tile shares an edge with it. Finally, there is a $4/144$ chance that the first wrong-colored tile is placed in one of the 4 corners. If this happens, there is a $2/143$ chance that the other wrong-colored tile shares an edge with it. The total probability, then, that the two wrong-colored tiles share an edge is $(100/144) \times (4/143) + (40/144) \times (3/143) + (4/144) \times (2/143) = 528/(144 \times 143) = (11 \times 48)/(144 \times 143) = 1/39$. Alternatively, there are 11 ways for tiles to share an edge in each row and 11 ways in each column, for a total of $2 \times 12 \times 11$ ways. Dividing this by the number of ways to place the two tiles, which is $(144 \times 143)/2$, we get $(2 \times 12 \times 11) \div (144 \times 143)/2 = (2 \times 12 \times 11 \times 2)/(144 \times 143) = 1/39$.

117. The units digits of the powers of 3 repeat in a cycle of four numbers: 3, 9, 7, 1. Since $17 \equiv 1 \pmod{4}$, the units digit of 3^{17} will be the first number in this pattern, which is 3. Similarly, the units digits of the powers of 7 repeat in the pattern 7, 9, 3, 1. Since $23 \equiv 3 \pmod{4}$, the units digit of 7^{23} will be the third number in this pattern, which is 3. The units digit of the product $3^{17} \times 7^{23}$ will be the product of the units digits of 3^{17} and 7^{23} , which is $3 \times 3 = 9$.

118. The geometric mean of two numbers is the square root of the product of the two numbers. For 14 and 126, the geometric mean is $\sqrt{(14 \times 126)} = \sqrt{(14 \times 14 \times 9)} = \sqrt{(14^2 \times 3^2)} = 14 \times 3 = 42$.

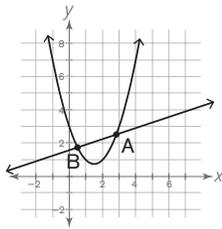

119. The area of the larger circle is $\pi \times 12^2 = 144\pi$ inches². The diagonal of the square is the same as the diameter of the circle, which is $2 \times 12 = 24$ inches. By the properties of 45-45-90 right triangles, we know that the side length of the square is $24/\sqrt{2} = 12\sqrt{2}$, which is also the diameter of the smaller circle. So the radius of the smaller circle is $12\sqrt{2} \div 2 = 6\sqrt{2}$. The area of the smaller circle, then, is $\pi \times (6\sqrt{2})^2 = 72\pi$. The shaded region has area $144\pi - 72\pi = 72\pi$ in².

120. The base-10 value of 321_5 is $3 \times 5^2 + 2 \times 5^1 + 1 \times 5^0 = 75 + 10 + 1 = 86$. The base-10 value of 321_4 is $3 \times 4^2 + 2 \times 4^1 + 1 \times 4^0 = 48 + 8 + 1 = 57$. Their base-10 sum is $86 + 57 = 143$. We can write 143 as a sum of powers of 3 as follows: $143 = 1 \times 3^4 + 2 \times 3^3 + 0 \times 3^2 + 2 \times 3^1 + 2 \times 3^0$. Therefore, the sum in base 3 is **12022**.

Workout 5

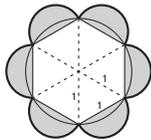

121. If six numbers have a mean of 6, then their sum must be $6 \times 6 = 36$. Since we want to maximize the sum of the largest three numbers, we should minimize the sum of the smallest three numbers. The least possible sum would be $1 + 2 + 3 = 6$. We need to see if this works with the given conditions. With 6 as the median and 12 as the greatest number in the set, we could have 1, 2, 3, 9, 9, 12. But this won't work because the set does not contain six different integers. If we change the third and fourth numbers to 4 and 8, respectively, we have 1, 2, 4, 8, 9, 12. The median is still 6, and there are no duplicates in the set. The sum of the three largest numbers is $8 + 9 + 12 = 29$.

122. Because Nathan ran 12 seconds per mile slower than his goal in the first half of the run, it would seem that he should run 12 seconds per mile faster than his goal in the second half. That would be a pace of 7 minutes 12 seconds per mile, or **7.2** minutes per mile. We should confirm this using a different approach. To complete the 5-mile run at an average pace of 7 minutes 24 seconds per mile, or 7.4 minutes per mile, Nathan must finish in $7.4 \times 5 = 37$ minutes. Running at a pace of 7 minutes 36 seconds per mile, or 7.6 minutes per mile, for the first 2.5 miles took $7.6 \times 2.5 = 19$ minutes. Nathan would then need to complete the final 2.5 miles in $37 - 19 = 18$ minutes. This confirms that his pace should be $18 \div 2.5 = 7.2$ minutes per mile.

123. Let's get an idea of what the functions $y = x^2 - 3x + 3$ and $4x - 12y = -19$ look like and how they intersect each other by graphing them on a coordinate grid as shown. We have a line that intersects a parabola at two points. Solving the second equation for y yields $4x - 12y = -19 \rightarrow 12y = 4x + 19 \rightarrow y = (4x + 19)/12$. Setting the expressions for y equal to each other and solving for x , we get $x^2 - 3x + 3 = (4x + 19)/12 \rightarrow 12(x^2 - 3x + 3) = 4x + 19 \rightarrow 12x^2 - 36x + 36 = 4x + 19 \rightarrow 12x^2 - 40x + 17 = 0$. Factoring the quadratic equation gives us $(2x - 1)(6x - 17) = 0$. So $2x - 1 = 0$ and $x = 1/2$ or $6x - 17 = 0$ and $x = 17/6$. The sum of these x -coordinates is $1/2 + 17/6 = (3 + 17)/6 = 20/6 = 10/3$. Alternatively, the sum of the roots of a quadratic equation is always the opposite of the coefficient of the linear term when the quadratic is written with leading coefficient 1. The equation $12x^2 - 40x + 17 = 0$ written in the required form is $x^2 - (10/3)x + (17/12)$. The sum of the roots, then, is the opposite of $-10/3$, which is **10/3**.

124. ABC is a 30-60-90 right triangle. The ratio of the short leg to the long leg of a 30-60-90 triangle is 1 to $\sqrt{3}$, so the length of AC must be $9 \div \sqrt{3} = 3\sqrt{3}$ cm. Triangle ACD is also a 30-60-90 triangle, so the same ratio applies and length DC must be $3\sqrt{3} \div \sqrt{3} = 3$ cm.

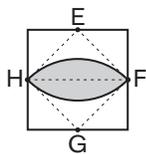

125. The diameter of the circle is $1 \times 2 = 2$ units. If we use the vertices of the hexagon to draw three diameters, we divide the hexagon into 6 equilateral triangles, as shown. The side length of the regular hexagon, also the diameter of each semicircle, then, is 1 unit. When paired, the six semicircles together make three circles of diameter 1 unit. The sum of their circumferences, which is also the perimeter we seek, is $3 \times \pi \times 1 \approx 9.4$ units.

126. This organized list shows all the three-digit positive integers whose digits have a sum of 9. There are $9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 45$ such integers.

| | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 108 | 207 | 306 | 405 | 504 | 603 | 702 | 801 | 900 |
| 117 | 216 | 315 | 414 | 513 | 612 | 711 | 810 | |
| 126 | 225 | 324 | 423 | 522 | 621 | 720 | | |
| 135 | 234 | 333 | 432 | 531 | 630 | | | |
| 144 | 243 | 342 | 441 | 540 | | | | |
| 153 | 252 | 351 | 450 | | | | | |
| 162 | 261 | 360 | | | | | | |
| 171 | 270 | | | | | | | |
| 180 | | | | | | | | |

127. There are $2 \times 2 \times 2 \times 2 = 16$ ways the next four yo-yos can exit the assembly line. In only 2 of these 16 ways do the yo-yos all have the same color (all blue or all red), so the probability is $2/16$, or **1/8**.

128. The diameter of the cup is 6 cm, so the radius is 3 cm. The volume of the cup is $\pi \times r^2 \times h = \pi \times 3^2 \times 12 = 108\pi$ cm³. The 100π mL of tea will occupy 100π cm³ of space, so the spherical bubbles need to occupy the remaining $108\pi - 100\pi = 8\pi$ cm³. Each spherical bubble has volume $8\pi \div 48 = \pi/6$ cm³. So $4/3 \times \pi \times r^3 = \pi/6$. Solving for r , we get $r^3 = (1/6) \times (3/4) \rightarrow r^3 = 1/8 \rightarrow r = \sqrt[3]{(1/8)} = 0.5$ cm.

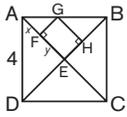

129. Square ABCD has side length 2 m, so the right triangle at each corner has side length 1 m and hypotenuse length $\sqrt{2}$ m. The hypotenuse length is also the radius of the arcs of the circles. Since triangles EFH and GFH are right triangles, it follows that the area of each sector is $1/4$ of the area of a circle with radius $\sqrt{2}$ m. As the figure shows, the area of the shaded region is the difference between the combined areas of the sectors, $2(1/4 \times \pi \times (\sqrt{2})^2) = \pi$ m², and the combined area of triangles EFH and GFH, $(\sqrt{2})^2 = 2$ m². Therefore, the shaded region has area $\pi - 2 \approx 1.14$ m².

130. We should consider the LCMs of all pairs of guesses, as shown in the table. The value of k cannot be 60, because that would make three statements correct. The next possibility is 90, which would make only Bruce and Steven correct. The least possible value of k , then, is **90**.

| |
|-------------------|
| LCM(15, 18) = 90 |
| LCM(15, 20) = 60 |
| LCM(15, 28) = 420 |
| LCM(15, 60) = 60 |
| LCM(18, 20) = 180 |
| LCM(18, 28) = 252 |
| LCM(18, 60) = 180 |
| LCM(20, 28) = 140 |
| LCM(20, 60) = 60 |
| LCM(28, 60) = 420 |

Workout 6

131. The consecutive integers from -37 to 37 have a sum of zero, so we should start with 38 and add consecutive integers until we get a sum of 200 . Five times 40 is 200 , so let's try $38 + 39 + 40 + 41 + 42$. This works. The greatest integer in Caynan's sequence is **42**.

132. In the figure, right triangle AFG is isosceles with legs of length x , and rectangle $EFGH$ has sides of lengths x and y . That means that $AE = x + y$. Square $ABCD$, with side length 4 units, has diagonal length $4\sqrt{2}$ units. Notice that AE is half the diagonal length, so we can write $x + y = 2\sqrt{2} = \sqrt{(2^2 \times 2)} = \sqrt{8}$. Therefore, $z = \mathbf{8}$.

133. Two letters can be chosen from the 26 slips of paper in $26 \times 25 \div 2 = 325$ different ways. The 7 -letter word $ALGEBRA$ contains 6 different letters, which can be paired in $6 \times 5 \div 2 = 15$ different ways. The probability that two randomly drawn slips are one of those pairs is $15/325 = \mathbf{3/65}$.

134. The radius of the pool is 12 feet $= 12 \times 12 = 144$ inches. Since 4.5 feet $= 12 \times 4 + 6 = 54$ inches, we know that Maxwell will fill the pool to a height of $54 - 3 = 51$ inches. So the volume of water used is $\pi \times 144^2 \times 51 = 1,057,536\pi$ in³. That's $1,057,536\pi/231$ gallons of water. Since every gallon costs 0.15 cent, this will cost $1,057,536\pi/231 \times 0.0015 \approx \mathbf{\$22}$.

135. The place values for this binary number, from left to right, are $2^7, 2^6, 2^5, 2^4, 2^3, 2^2, 2^1$ and 2^0 . So $10111010_2 = 1 \times 2^7 + 0 \times 2^6 + 1 \times 2^5 + 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 = 128 + 32 + 16 + 8 + 2$. Since 8 is a power of 2 , there is no need to find the base 10 value of this number to convert it to base 8 . We know that $128 = 2 \times 8^2, 32 + 16 + 8 = (4 + 2 + 1) \times 8^1 = 7 \times 8^1$ and $2 = 2 \times 8^0$. Therefore, $10111010_2 = 2 \times 8^2 + 7 \times 8^1 + 2 \times 8^0 = \mathbf{272}$ base 8 .

136. To raise the water in the tank by 1 inch, the metal spheres will need to occupy $10 \times 15 \times 1 = 150$ in³ of space. Each sphere has a radius of $1/6 \div 2 = 1/12$ inch and a volume of $4/3 \times \pi \times (1/12)^3 = \pi/1296$ in³. To raise the water level 1 inch, it takes $150 \div (\pi/1296) \approx \mathbf{61,900}$ spheres.

137. If Leon's favorite pens were previously x dollars for a box of n pens, then the cost per pen was x/n dollars per pen. A reduction of 10% in the price means that each box now costs $0.9x$. With 25% fewer pens, each box now contains $0.75n$ pens. So the cost per pen is now $0.9x/0.75n = 1.2(x/n)$. That's an increase in cost of $1.2 - 1 = 0.2 = \mathbf{20\%}$ per pen.

138. This problem is a calculator exploration. When the numbers begin displaying in scientific notation, it helps to recognize that the number of digits is one more than the exponent. Using the calculator, we see that $10!$ has 7 digits; $15!$ has 13 digits; $20!$ has 19 digits; $21!$ has 20 digits; $22!$ has 22 digits. This means that 22 is the *least* integer for which $n!$ has n digits. Continuing on, we see that $23!$ has 23 digits; $24!$ has 24 digits; $25!$ has 26 digits. Since the number of digits keeps increasing at least as fast as the number does when we pass 24 , it follows that **24** is the greatest integer for which $n!$ has n digits.

| | | | |
|---|----|----|-----|
| 1 | 3 | 5 | 15 |
| 2 | 6 | 10 | 30 |
| 4 | 12 | 20 | 60 |
| 8 | 24 | 40 | 120 |

139. The number of sides on Percy's polygon must be a factor of 120 . Once we've listed the factors, it's not difficult to find the sum by using a calculator. If, however, we had to find the sum without the aid of a calculator, we could arrange the factors in an array such as the one shown to find the sum more directly. The sum of the numbers in the first column, $1 + 2 + 4 + 8 = 15$, times the sum of the numbers in the first row, $1 + 3 + 5 + 15 = 24$, is $15 \times 24 = 360$, which is the sum of all the factors of 120 . Since we cannot have a polygon with fewer than 3 sides, and since Percy's polygon is not a triangle or an octagon, we need to subtract $1 + 2 + 3 + 8 = 14$ from that sum. Our answer is $360 - 14 = \mathbf{346}$.

140. On Mars a standard year has 95 weeks and each week has 7 sols, for a total of $95 \times 7 = 665$ sols. During a leap year, there is one more week, or an additional 7 sols, for a total of 672 sols. Since Mars has a 668 -sol year, there are an average of 668 sols per year. If we let n and m represent the number of standard years and leap years, respectively, we have $(665n + 672m) \div (n + m) = 668 \rightarrow 665n + 672m = 668n + 668m \rightarrow 4m = 3n \rightarrow m/n = 3/4$. The ratio of leap years to standard years is 3 to 4 . So 3 out of every 7 years, or $\mathbf{3/7}$ of the years, are leap years.

Warm-Up 9

141. There are many pairs of numbers to consider with a sum of 11 . However, there are only four factor pairs of 24 to consider: $1 \times 24, 2 \times 12, 3 \times 8$ and 4×6 . The pair 3 and 8 have a sum of 11 and an absolute difference of $8 - 3 = \mathbf{5}$.

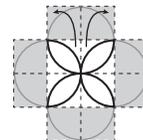

142. Varun walked $2/5$ of the length of the walkway, so Becca must have also walked $2/5$ of the length of the walkway. In the same amount of time, the walkway took her the other $3/5$ of the length of the walkway. The ratio of the walkway's speed to Becca and Varun's speed is $3/5$ to $2/5 = \mathbf{3/2}$.

143. Suppose the original pentagon has side length 1 unit and perimeter $1 \times 5 = 5$ units. When two sides of this pentagon are doubled, the perimeter of the new pentagon is $1 \times 3 + 2 \times 2 = 3 + 4 = 7$ units. The increase in the perimeter is $(7 - 5)/5 = 2/5 = \mathbf{40\%}$.

144. Let d represent the number of dimes Joe has. Joe has 4 more nickels than dimes, so he has $d + 4$ nickels. He has 2 more quarters than nickels, so he has $d + 4 + 2 = d + 6$ quarters. Joe has a total of 37 coins, so we can write the equation $d + d + 4 + d + 6 = 37$. This simplifies to $3d + 10 = 37$. So $3d = 27$, and $d = 9$. If follows, then, that Joe has $d + 6 = 9 + 6 = \mathbf{15}$ quarters.

145. A six-digit repeating integer can take three different forms: a three-digit sequence occurring twice, a two-digit sequence occurring three times or one digit occurring six times. There are $9 \times 10 \times 10 = 900$ ways to choose a three-digit repeating sequence, and there are $9 \times 10 = 90$ ways to choose a two-digit repeating sequence, for a total of $900 + 90 = 990$ repeating integers. But the 9 sequences of one digit occurring six times (111111 to 999999) have been counted twice, which means that $990 - 9 = 981$ numbers are six-digit repeating integers.

146. In the figure shown, each circle is divided into quarters. The arrows show how the pieces can be rearranged to form four congruent shaded rectangles. Each rectangle is 2 cm by 4 cm, so the total area of the shaded regions is $4 \times (2 \times 4) = 32 \text{ cm}^2$.

147. The two-digit representations of all the months are valid days. The two-digit representation of only 12 days represent valid months. Thus, there would be $12 \times 12 = 144$ dates for which both interpretations are valid. But we need to exclude the 12 dates for which the month and day are the same. That leaves $144 - 12 = 132$ dates.

148. We can set the two expressions equal to one another and solve for x . We have $6x - 6 = 2x + 14 \rightarrow 4x = 20 \rightarrow x = 5$. The square base of the pyramid, then, has side length $2x + 14 = 2 \times 5 + 14 = 10 + 14 = 24$ units and area 576 units^2 . The four triangular sides of the pyramid each have side length 24 units, height $12\sqrt{3}$ units and area $(1/2) \times 24 \times 12\sqrt{3} = 144\sqrt{3} \text{ units}^2$. The surface area of the pyramid is $4 \times 144\sqrt{3} + 576 = 576\sqrt{3} + 576$, which can be rewritten as $24^2(\sqrt{3} + 1)$. Therefore, $a = 24$, $b = 3$, $c = 1$ and $a + b + c = 24 + 3 + 1 = 28$.

149. It's probably safe to assume that D doesn't represent 0, 1, 2, 5, 7 or 8 since those digits are shown in the equation. That leaves 3, 4, 6 and 9 as the possible digit that D represents. Since there are only four possibilities, we could start trying them to see which one makes the equation true. If D represents 3, we get $23 \times 351 = 8073$. If D represents 4, 6 or 9, the equation is not true. Therefore, D must represent the digit 3.

150. Using only the digits 2 through 9, the number of unique three-digit extensions that can be assigned is $8 \times 8 \times 8 = 512$ extensions.

Warm-Up 10

151. The rectangular prism should be as close to a cube as possible, given the available factors. The prime factorization of 2016 is $2^5 \times 3^2 \times 7$. We want to assign these prime factors to three groups that have as close to the same product as possible. One triple with a product of 2016 is $8 \times 14 \times 18$, which makes the sum of the dimensions $8 + 14 + 18 = 40$. Another triple is $9 \times 14 \times 16$, for which $9 + 14 + 16 = 39$. The triple with the lowest sum, however, is $12 \times 12 \times 14$, with a sum of $12 + 12 + 14 = 38$.

152. There are two pairs of digits that have to have a sum of 10, and the sum of all the digits has to be a multiple of 10. Since there are only five digits, this means that one of the digits has to be a zero. Also, since the leftmost digit of the number is 7 and we need two pairs of adjacent numbers that differ by 1, it makes sense for the zero to be the rightmost digit. For the first and second digits to differ by 1, the second digit needs to be 6 or 8. The 8 is more promising since it is also a multiple of 4 and allows us to put 2, which is $8 \div 4$, in the third place. So far we have 782_0. The missing digit adjacent to the 2 needs to be 1 or 3. The sum of that digit and 7 has to be 10, so the missing digit is 3, and the ZIP code is 78230.

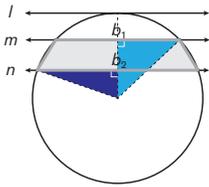

153. We might consider trying to find the prime factorization of 140,209, but it's not divisible by 2, 3, 5, 7 or 11, so this approach could take a while. (It turns out that ABC and CBA are the two prime factors of 140,209.) Another approach is to consider the units digit 9. Only 1×9 , 3×3 and 7×7 yield a units digit of 9. In our problem, A, B and C must each represent a different digit, so this means A and C can only be 1 and 9. At this point, we can just try different values of B, and it turns out that $149 \times 941 = 140,209$. The value of $A + B + C$ is $1 + 4 + 9 = 14$.

154. Since all the triangles are similar, corresponding angles are congruent. So we can let x represent the measure of each of the base angles of each triangle. Then the vertex angle has degree measure $(x + x) \times 2 = 4x$. The sum of the measures of the angles in a triangle is 180 degrees. We have $x + x + 4x = 180$, so $6x = 180$ and $x = 30$. We can see that 8 of these base angles come together at the center of the fan, leaving a total of $360 - 8 \times 30 = 360 - 240 = 120$ degrees for the congruent angles in the spaces between the blades. Angle α measures $120 \div 4 = 30$ degrees.

155. The twelve couples amount to 24 participants. So when forming a team of three people, there are 24 choices for the first team member. Since the individual with whom the first team member is coupled is no longer an option for this team, there are 22 choices for the second team member. Again, the individuals with whom the first two team members are coupled cannot be part of this team. That means there are 20 choices for the third team member, which gives us a total of $24 \times 22 \times 20 = 10,560$ ways to form a team of three. But this includes the 6 orders in which each team can be assembled. Therefore, the number of different teams of three that can be formed is $10,560 \div 6 = 1760$ teams.

156. The algebra below shows one way to find the fraction that is equivalent to the repeating decimal. Let x represent the common fraction equivalent to 0.327. Then $10x = 3.27$ and $1000x = 327.\overline{27}$. Subtracting these two equations yields the following:

$$\begin{array}{r} 1000x = 327.\overline{27} \\ -10x = \quad 3.\overline{27} \\ \hline 990x = 324 \\ x = \frac{324}{990} = \frac{18}{55} \end{array}$$

157. The area of a trapezoid with height h and bases of length b_1 and b_2 is $1/2 \times h \times (b_1 + b_2)$. The figure shows the trapezoid in the circle. To find b_2 , we can construct the right triangle shown on the left in the circle. This triangle has a hypotenuse of length 3 cm and a short leg of length 1 cm. The long leg, then, has length $\sqrt{3^2 - 1^2} = \sqrt{8}$ cm. So, $b_2 = 2\sqrt{8}$ cm. To find b_1 , we can construct the right triangle shown on the right in the circle. This triangle has a hypotenuse of length 3 cm and a short leg of length 2 cm. The long leg, then, has length $\sqrt{3^2 - 2^2} = \sqrt{5}$ cm. So, $b_1 = 2\sqrt{5}$ cm. We know that the distance between the bases is 1 cm, so the area of the trapezoid is $1/2 \times h \times (b_1 + b_2) = 1/2 \times 1 \times (2\sqrt{8} + 2\sqrt{5}) = \sqrt{8} + \sqrt{5}$ cm². Therefore, $ab = 8 \times 5 = 40$.

158. Let $n = 2017$ and substitute to get the following: $(n^2 + 11n - 42)/(n - 3)$. Now we can simplify the numerator by factoring. For the fraction, we get $(n + 14)(n - 3)/(n - 3)$, which simplifies to $n + 14$. Substituting 2017 for n yields the answer: $n + 14 = 2017 + 14 = 2031$.

159. We need to know how many 2s we can factor out of $32! = 32 \times 31 \times 30 \times \dots \times 3 \times 2 \times 1$. We can factor a 2 out of each of the 16 multiples of 2 from 1 to 32; we can factor another 2 out of each of the 8 multiples of 4; we can factor another 2 out of each multiple of 8, and so forth. There are $16 + 8 + 4 + 2 + 1 = 31$ factors of 2, so $n = 31$.

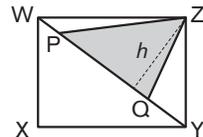

160. First, we should note that the total value of the coins will be less than \$1 if all the allowed 3 quarters are not used. We now have an easier problem to solve: how many combinations of dimes, nickels and pennies are there with a total value of at least 25¢, using no more than three of any single denomination? If all 3 dimes are used, then combining them with any combination of 0, 1, 2 or 3 nickels and 0, 1, 2 or 3 pennies gives us a total value greater than \$1, and that's $4 \times 4 = 16$ combinations. If 2 dimes are used, then there must be at least 1 nickel, and combined with any combination of 0, 1 or 2 of the remaining nickels and 0, 1, 2 or 3 pennies, the total value is greater than or equal to \$1, for another $3 \times 4 = 12$ combinations. If 1 dime is used, then all 3 nickels must be used. Adding to that, 0, 1, 2 or 3 pennies yields another 4 combinations. In all, there are $16 + 12 + 4 = 32$ combinations.

Warm-Up 11

161. There are $2 \times 2 \times 2 = 8$ possible outcomes when three coins are flipped. The outcome of 0 tails can occur 1 way and has a probability of $1/8$. The outcome of 1 tail can occur 3 ways, so the probability of this outcome is $3/8$. The outcome of 2 tails can also occur 3 ways, so the probability of this outcome is also $3/8$. The outcome of 3 tails can occur 1 way and has a probability of $1/8$. So, the probability that all three students get 0 tails is $1/8 \times 1/8 \times 1/8 = 1/512$, as is the probability that all three get 3 tails. The probability that all three get 1 tail is $3/8 \times 3/8 \times 3/8 = 27/512$, as is the probability that all three get 2 tails. Therefore, the probability that all three get the same number of tails is $(1 + 1 + 27 + 27)/512 = 56/512 = 7/64$.

162. The earliest possible sum date is 01/01/02, but the year 2002 will have *only* this one sum date. When determining the earliest year with 12 sum dates, we have to make sure that December has a sum date as well. This doesn't happen until 12/01/13. The latest possible sum date is 12/31/43, but this is again the *only* sum date for the year. When finding the latest year with 12 sum dates, we have to make sure that January and February have sum dates. The year 2032 works for January (01/31/32), but February 29th for this leap year will only give us $2 + 29 = 31$. The year 2031 is not a leap year, so February will not have a sum date. We have to go back to 2030 for February to give us $2 + 28 = 30$. This means the years from 2013 to 2030 all have 12 sum dates, one for each month. That's a total of $2030 - 2012 = 18$ years.

163. Since $3(WP + QY) = 2PQ$, we know that $(WP + QY)/PQ = 2/3$ and that $PQ = 3/5 \times WY$. Diagonal WY divides rectangle WXYZ into two congruent right triangles, each with area equal to half that of WXYZ, or $90 \div 2 = 45$ cm². We can write the following equation for the area of $\triangle WYZ$: $1/2 \times WY \times h = 45$, where h is the altitude from Z to WY, as shown. The area of $\triangle PQZ$, then, is $1/2 \times PQ \times h = 1/2 \times 3/5 \times WY \times h = 3/5 \times 45 = 3 \times 9 = 27$ cm².

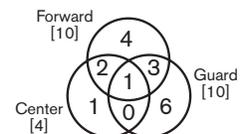

164. Starting at the point number 1 and drawing segments between points that are 8 spaces apart, we see that the 23rd segment drawn will be to point number $(1 + 23 \times 8) \bmod 50 = 185 \bmod 50 = 35$. The other endpoint of the segment will be point number $35 - 8 = 27$. The sum of these numbers is $27 + 35 = 62$.

165. If the figure could not be rotated, there would be $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$ ways to assign the colors. Each distinct coloring can be rotated 0, 90, 180 or 270 degrees, which makes the number of distinct colorings $120 \div 4 = 30$ colorings.

166. Suppose the number is ABBA. Its value is $1001A + 110B$. Because 1001 is divisible by 7 but 110 is not, B must be divisible by 7, which means that it must be 0 or 7. If $B = 7$, then the only way for $A77A$ to be divisible by 8 is for A to be 6, and the four-digit number 6776 is a palindrome divisible by both 7 and 8. Otherwise $B = 0$, and the only way for $A00A$ to be divisible by 8 is for A to be 8, and the four-digit number 8008 is a palindrome divisible by both 7 and 8. The larger of the two palindromes that meet the conditions is **8008**.

167. The Venn diagram shows how the 17 players tried out for the different positions. We started with the 1 player who tried out for all three positions and then filled in the numbers for the players who tried out for exactly two positions. There must have been **6** players who tried out only for guard.

168. We can ignore the area of the base of the cylinder, because the height of the water will drop in proportion with the drop in volume. The height will be $100\% - 8\% = 92\%$ of the original 10 cm, so it will be $0.92 \times 10 = 9.2$ cm.

169. The Triangle Inequality tells us that in a triangle, the longest side length is always less than the sum of the other two side lengths. In other words, the following three inequalities must be true: $2x + 3x + 7 > 6x - 5$, $2x + 6x - 5 > 3x + 7$, $3x + 7 + 6x - 5 > 2x$. Simplifying each inequality yields the following: $x < 12$, $x > 12/5$, $x > -2/7$. So, $12/5 < x < 12$. Therefore, 3, 4, 5, 6, 7, 8, 9, 10 and 11 are the **9** integer values of x for which a triangle exists with the resulting side lengths.

| x | y | $(x + y)^2$ |
|-----|-----|-------------|
| -10 | 1 | 81 |
| -5 | 2 | 9 |
| -2 | 5 | 9 |
| -1 | 10 | 81 |
| 1 | -10 | 81 |
| 2 | -5 | 9 |
| 5 | -2 | 9 |
| 10 | -1 | 81 |

170. If we expand $(x + y)^2 = 9$, we get $x^2 + 2xy + y^2 = 9$. Since we are told that $x^2 + y^2 = 29$, we can substitute to get $2xy + 29 = 9$. So $2xy = -20$ and $xy = -10$. The table shows the values of $(x + y)^2$ for ordered pairs of integers whose product is -10 . Notice that though there are four ordered pairs for which $(x + y)^2 = 9$, only two have $x > y$, and the smallest value of x is **2**.

Workout 7

171. The curved part of the perimeter of each sector of pizza is $C/8$, and $C = 2 \times \pi \times r$. So, the curved part of the perimeter is $C/8 = (2 \times \pi \times r)/8 = (\pi \times r)/4$. The total perimeter of each sector is $r + r + (\pi \times r)/4 = (8r + \pi r)/4 = r(8 + \pi)/4$. Since this perimeter is 10 inches, the value of r must be $10 \div (8 + \pi)/4 = 10 \times 4/(8 + \pi) \approx 3.59$ inches. Now to find the area of the pizza, we square the radius and multiply by π , which is $3.59^2 \times \pi \approx 40.5$ in².

172. Let's say that Alana usually travels at r mi/h and takes t hours to drive the 18 miles to work. Distance = rate \times time, so we have $18 = rt$. With the traffic, she averaged $r - 9$ mi/h and took $t + 1/15$ hour. Since the same distance was covered, we can set two expressions for the distance equal to each other to get $rt = (r - 9)(t + 1/15) \rightarrow rt = rt - 9t + r/15 - 9/15 \rightarrow 9t + 9/15 = r/15 \rightarrow 135t + 9 = r$. Now we can substitute this for r in the equation $18 = rt$ to get $18 = (135t + 9)t \rightarrow 18 = 135t^2 + 9t \rightarrow 0 = 15t^2 + t - 2 \rightarrow 0 = (5t + 2)(3t - 1)$. So $5t + 2 = 0$ and $t = -2/5$, or $3t - 1 = 0$ and $t = 1/3$. The measure of time cannot be a negative number, which means it would normally take Alana $1/3$ hour = 20 minutes to get to work. On this particular day with the traffic jam, it took her $20 + 4 = 24$ minutes.

173. First we convert 128 miles per hour to feet per second as follows: $\frac{128 \text{ miles}}{1 \text{ hour}} \times \frac{5280 \text{ feet}}{1 \text{ mile}} \times \frac{1 \text{ hour}}{60 \text{ minutes}} \times \frac{1 \text{ minute}}{60 \text{ seconds}} = \frac{128 \times 5280 \text{ feet}}{60 \times 60 \text{ seconds}} = \frac{675,840 \text{ feet}}{3600 \text{ seconds}}$. It takes 3.5 seconds to reach this speed, so the acceleration must be $675,840/3600 \times 1/3.5 = 675,840/12,600$ feet/second². This is faster than the acceleration due to gravity. In fact, it is about $675,840/12,600 \div 32 \approx 1.7 g_n$.

174. Half of all positive integers are multiples of 2, but we need to focus on the other half, which are not multiples of 2. Of these numbers, one-third are multiples of 3 and the other two-thirds are not. Putting these two ideas together, we can state that $1/2 \times 2/3 = 1/3$ of positive integers are not divisible by 2 or 3. Similar reasoning suggests that we keep the $4/5$ of these numbers that are not divisible by 5. We don't need to check for multiples of 4 since they are multiples of 2, and multiples of 6, since they are multiples of 2 and 3, which we have already considered. Therefore, $1/2 \times 2/3 \times 4/5 = 4/15 \approx 27\%$ of the positive integers are not multiples of 2, 3, 4, 5 or 6.

175. Let's use the method of subtracting the probability of the complement of the desired outcome from 1, since it's easier to calculate the probability that no ball is selected more than once. Thus, the probability that at least one ball is selected more than once is $1 - 75/75 \times 74/75 \times 73/75 \times \dots \times 57/75 \times 56/75 \approx 0.94$.

176. The probability that they both get a hit is $8/20 \times 6/16 = 3/20$.

177. If we let the width of the flag be 2 units, then the semicircle has radius 1 unit, and based on properties of 30-60-90 right triangles, the triangle has height $\sqrt{3}$ units. Therefore, the flag has a length of $1 + \sqrt{3}$ units and a total area of $2 \times (1 + \sqrt{3}) = 2 + 2\sqrt{3}$ units². The area of the semicircle is $1/2 \times \pi \times r^2 = 1/2 \times \pi \times 1^2 = \pi/2$ units². The area of the triangle is $1/2 \times b \times h = 1/2 \times 2 \times \sqrt{3} = \sqrt{3}$ units². Therefore, the painted area covers $100\% \times (\pi/2 + \sqrt{3})/(2 + 2\sqrt{3}) \approx 60\%$.

178. Using units cancellation, we get $\frac{100 \text{ bars}}{11.53 \text{ ticks}} \times \frac{4 \text{ meters}}{5 \text{ bars}} \times \frac{100 \text{ ticks}}{1 \text{ minute}} \times \frac{1 \text{ minute}}{60 \text{ seconds}} = \frac{100 \times 4 \times 100 \text{ meters}}{11.53 \times 5 \times 60 \text{ seconds}} = \frac{40,000 \text{ meters}}{3459 \text{ seconds}}$.

Usain Bolt ran 100 meters in 9.58 seconds. So, if $(100/9.58)k = 40,000/3459$, then $k = 40,000/3459 \times 9.58/100 \approx 1.11$.

179. To find the equation of Jason's line, we will use the slope $-1/3 = m$ and the point $(5, -2) = (x, y)$. Substituting these values into the point-slope form $y - y_1 = m(x - x_1)$, we see that the equation for Jason's line is $y - (-2) = (-1/3)(x - 5) \rightarrow y + 2 = (-1/3)x + 5/3 \rightarrow y = (-1/3)x - 1/3$. Amisha's line is perpendicular to Jason's, so its slope is the negative reciprocal of $-1/3$, which is 3. We can find the equation of Amisha's line by using the slope $3 = m$ and the point $(4, 1) = (x, y)$. Again, substituting these values into the point-slope form, we see that the equation of Amisha's line is $y - 1 = 3(x - 4) \rightarrow y - 1 = 3x - 12 \rightarrow y = 3x - 11$. Now we can set these two expressions for y equal to each other to get $(-1/3)x - 1/3 = 3x - 11 \rightarrow -1x - 1 = 9x - 33 \rightarrow 32 = 10x \rightarrow x = 32/10 = 16/5$. Now, let's substitute this value for x in Amisha's equation to get the value of the y -coordinate. We have $y = 3 \times 16/5 - 11 = 48/5 - 11 = (48 - 55)/5 = -7/5$. The sum $x + y$ is $16/5 + (-7/5) = 9/5$.

180. At each vertex of the triangle, the sector of the circle is $1/6$ of a full circle. The three sectors have a combined area equivalent to $3/6 = 1/2$ of a circle with a radius of 4 units. That area is $1/2 \times \pi \times r^2 = 1/2 \times \pi \times 4^2 = 8\pi$ units². The triangle has side length equal to twice the radius of a circle, or 8 units, and its altitude is $4\sqrt{3}$ units. Thus, the triangle has area $1/2 \times b \times h = 1/2 \times 8 \times 4\sqrt{3} = 16\sqrt{3}$ units². The shaded region within the triangle but outside the circles has area $16\sqrt{3} - 8\pi \approx 2.6$ units².

Workout 8

181. Triangle XYV is $1/2 \times 1/2 = 1/4$ of the area of square $WXYZ$. The area of the square must be $4 \times 4/5 = 16/5$ units².

182. We know there is at least one of each denomination, which amounts to $5 + 11 + 19 = 35$ points. That leaves $56 - 35 = 21$ points to account for. There cannot be another 19-point token. The remaining 21 points can only include two 5-point tokens and one 11-point token. To verify, we have $3 \times 5 + 2 \times 11 + 1 \times 19 = 15 + 22 + 19 = 56$ points and a total of $3 + 2 + 1 = 6$ tokens.

183. Each round of this "game" consists of Xera rolling a die followed by Yeta picking a card, with replacement. In any round, Yeta can win only after Xera first rolls a number other than four. The probability that Yeta wins in any round, then, is $(5/6) \times (1/13) = 5/78$. It is possible for there to be no winner in a round, but we are interested in the probability that when there is a winner, the winner is Yeta. Since the probability that there is no winner in a round is $(5/6) \times (12/13) = 60/78$, it follows that $1 - (60/78) = 18/78$ is the probability that there is a winner in a round. Therefore, the probability that Yeta will win the game is the $(5/78)/(18/78) = 5/18$.

184. The volume of a cone is $1/3 \times \pi \times r^2 \times h$. Notice that we multiply by the height h and the square of the radius r . This is why doubling the radius can compensate for reducing the height by one-fourth. We get the same volume because $2^2 \times 1/4 = 4/4 = 1$. If we decrease the height to $1/3$ of what it was, the radius has to increase by a number that when squared is 3. That number is $\sqrt{3}$. Since $\sqrt{3} \approx 1.73$, the radius must increase by a factor of $1.73 - 1 = 0.73$, or **73%**.

185. The expression $(n^2 + 9)/(n^2 + 4)$ can be factored to get $((n - 3)(n + 3))/((n - 2)(n + 2))$. Since $n - 3$ and $n - 2$, as well as $n + 3$ and $n + 2$, each differ by 1, $(n - 3)/(n - 2)$ and $(n + 3)/(n + 2)$ are both common fractions. We need to look at $(n - 3)/(n + 2)$ and $(n + 3)/(n - 2)$ to see when either of these is not a common fraction, which will also make the expression $((n - 3)(n + 3))/((n - 2)(n + 2))$ not a common fraction. The pair $n - 3$ and $n + 2$, as well as $n + 3$ and $n - 2$, each differ by 5. When the value of $n - 3$ is a multiple of 5, the value of $n + 2$ will also be a multiple of 5, as is the case with $n + 3$ and $n - 2$. So when any of these factors is a multiple of 5, there will be a multiple of 5 in both the numerator and denominator, and the expression will not be a common fraction. Each multiple of 5 in our range can be assigned to the pair $n - 3$ and $n + 2$, as well as the pair $n + 3$ and $n - 2$. The smallest multiple of 5 we consider is $1 \times 5 = 5$ and the largest is $403 \times 5 = 2015$. So we have 403 integers that can be used twice, and the number of integers n from 1 to 2016 that yield a GCF greater than 1 for the numerator and denominator is $403 \times 2 = 806$.

186. In ascending order, the five known numbers are 4, 5, 5, 6 and 7. In an ordered list of six numbers, the median is the mean of the third and fourth values. If $x \leq 5$, then the third and fourth values will have a mean of 5. If $x \geq 6$, then the mean of the third and fourth values is $(5 + 6)/2 = 5.5$. Since there are only two possible values for the median, let's see if there are two values of x that will give us the same overall mean and mean of modes as those two values. The sum of the five known numbers is $4 + 5 + 5 + 6 + 7 = 27$. In order for the mean of the six values to be 5, the sum of all six values would have to be $6 \times 5 = 30$, so $x = 3$. The six values 3, 4, 5, 5, 6 and 7 have a mode of 5, so the mean, median and mean of modes are all 5 when $x = 3$. Similarly, in order for the six numbers to have a mean of 5.5, their sum must be $5.5 \times 6 = 33$, so $x = 6$. The six values 4, 5, 5, 6, 6 and 7 have modes 5 and 6, making the mean of the modes $(5 + 6)/2 = 5.5$. So the mean, median and mean of the modes are all 5.5 when $x = 6$. Therefore, 3 and 6 are the **2** possible values of x .

187. There are 13 possible sets of three consecutive numbers in the range 1 to 15. The first starts with 1 and the last starts with 13. There are $15 \times 14 \times 13$ ways to randomly draw three of the slips. The probability is, thus, $13/(15 \times 14 \times 13) = 1/(15 \times 14) = 1/210$.

188. Construct a rectangle with length a inches, width b inches and diagonal 8 inches. It has area $a \times b = 26$ in² and perimeter $2a + 2b = 2(a + b)$. We have a right triangle with legs a and b inches and hypotenuse 8 inches. Using the Pythagorean Theorem, we can write $a^2 + b^2 = 8^2$. Recall that $(a + b)^2 = a^2 + 2ab + b^2$, which can be rewritten as $a^2 + b^2 + 2ab$. Substituting $8^2 = 64$ for $a^2 + b^2$ and 26 for ab , we get $a^2 + b^2 + 2ab = 64 + 2 \times 26 = 64 + 52 = 116 = (a + b)^2$ and $a + b = \sqrt{116} = 2\sqrt{29}$. The perimeter of the rectangle, then, is $2(a + b) = 2 \times 2\sqrt{29} = 4\sqrt{29}$ inches.

189. There are four similar triangles in the figure, so we will be able to use proportional reasoning to find some of the unknown lengths. Triangles CDF and ECF are similar, so if we let $CF = x$, we can write and solve the following proportion: $x/8 = 26/x \rightarrow x^2 = 8 \times 26 \rightarrow x^2 = 208 \rightarrow x = \sqrt{208} = 4\sqrt{13}$ units. If we let $CE = y$, we can use the Pythagorean Theorem with triangle CEF as follows: $8^2 + y^2 = (\sqrt{208})^2 \rightarrow y^2 = (\sqrt{208})^2 - 8^2 \rightarrow y^2 = 144 \rightarrow y = 12$. Now, using similar triangles ECF and BCA, we can find the length of side BC. If we let $BC = z$, we can write and solve the following proportion: $4\sqrt{13}/12 = 26/z \rightarrow 4\sqrt{13} \times z = 12 \times 26 \rightarrow z = (12 \times 26)/(4\sqrt{13}) = (4\sqrt{13})/(4\sqrt{13}) = (312 \times 4\sqrt{13})/(16 \times 13) = 6\sqrt{13}$ units.

190. Since Pump P takes 12 hours to fill the tank, it must fill $1/12$ of the tank each hour. Similarly, since Pump Q takes 15 hours, it must fill $1/15$ of the tank each hour. Together the two pumps fill $1/12 + 1/15 = 5/60 + 4/60 = 9/60 = 3/20$ of the tank each hour. At this rate, it will take $20/3$ hours to fill the tank. When Pump P was turned off, 60% of the total time, or $0.6 \times 20/3 = 4$ hours had elapsed. To fill the remaining 40% of the tank, Pump Q needed another $0.4 \times 15 = 6$ hours. It must have taken a total of $4 + 6 = 10$ hours to completely fill the tank.

Warm-Up 12

191. From left to right, we'll label the four spaces on the clock (two for the hour and two for the minutes) 1, 2, 3 and 4 so they are easily referenced in this solution. For 5 minutes every hour, there is a 0 in the 4th space of the clock's display when the 3rd space does not show 0 (:10, :20, :30, :40 and :50). For the first 10 minutes of every hour, there is a 0 in the 3rd space of the clock's display (:00 to :09). Not including the hour from 10:00 to 10:59, which we will consider separately, that's $10 \times 5 = 15$ minutes every hour for 11 hours a day, which is $15 \times 11 = 165$ minutes. From 10:00 to 10:59, there is a 0 in the 2nd space of the clock's display for all 60 minutes (10:). There is never a 0 in the 1st space of the clock's display. Our total is $165 + 60 = 225$ minutes.

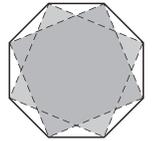

192. Rather than try to subtract with repeating decimals, we should convert each of these numbers to fractions. If we let $x = 1.\overline{18}$ and $y = 2.\overline{36}$, we can convert these repeating decimals as follows:

$$\begin{array}{r} 100x = 118.\overline{18} \\ -x = \underline{1.\overline{18}} \\ \hline 99x = 117 \\ x = \frac{117}{99} = \frac{13}{11} \end{array} \qquad \begin{array}{r} 100y = 236.\overline{6} \\ -10y = \underline{23.\overline{6}} \\ \hline 90y = 213 \\ y = \frac{213}{90} = \frac{71}{30} \end{array}$$

$$\text{Therefore, } |1.\overline{18} - 2.\overline{36}| = \left| \frac{13}{11} - \frac{71}{30} \right| = \left| \frac{13 \times 30 - 71 \times 11}{11 \times 30} \right| = \left| \frac{390 - 781}{330} \right| = \frac{391}{330}.$$

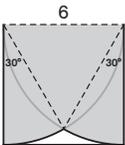

193. It should be noted that this dissection and rearrangement of one square into two other squares is essentially a proof of the Pythagorean Theorem. The area of square DEFP is $1 \times 1 = 1 \text{ in}^2$. Square FPBE is said to have twice the area, so it has area 2 in^2 and side length $\sqrt{2}$ inches. It follows, then, that the original square has area $1 + 2 = 3 \text{ in}^2$ and side length $\sqrt{3}$ inches.

194. There would be $8!$ arrangements of an eight-letter word if all the letters were different. Since the three identical Ss in TRESPASS can be rearranged in $3! = 3 \times 2 \times 1$ ways, we have to divide $8!/3! = 8 \times 7 \times 6 \times 5 \times 4 = 6720$. Thus, there are 6720 arrangements of the letters in TRESPASS. Since 5 of the 8 letters are not S, there must be $5/8 \times 6720 = 4200$ arrangements that do not have S as the final letter. (This is actually true for any position in the word.) Alternatively, there are ${}^7C_3 = 7!(4! \times 3!) = (7 \times 6 \times 5)/(3 \times 2 \times 1) = 210/6 = 35$ ways to place the Ss, and there are $5! = 120$ ways to permute the remaining letters. Again, there are $35 \times 120 = 4200$ arrangements.

195. There are ${}^8C_4 = (8 \times 7 \times 6 \times 5) / (4 \times 3 \times 2 \times 1) = 70$ different ways to choose 4 of the 8 vertices in a regular octagon. Only 2 of these ways will be the vertices of a square, as shown. So the probability is $2/70 = 1/35$.

196. If we multiply the plane's speed on the return trip by the time it took, we find that the distance traveled was $450 \times 2.5 = 1125$ miles. To travel this same distance took 3 hours on the first trip, so the average speed was $1125 \div 3 = 375 \text{ mi/h}$. If we let r be the rate of the plane and w be the rate of the wind, then for the first trip we have $r - w = 375$ and for the return trip we have $r + 2w = 450$. Solving this system of equations yields $(r + 2w) - (r - w) = 450 - 375 \rightarrow 3w = 75 \rightarrow w = 25$, so the speed of the original headwind was **25** mi/h.

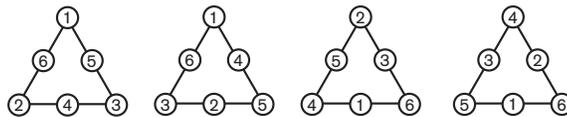

197. The figure shows how we can construct an equilateral triangle from three radii of the quarter-circles. Since the area of an equilateral triangle with side length s is $s^2\sqrt{3}/4$, this triangle of side length 6 cm has area $6^2\sqrt{3}/4 = 36\sqrt{3}/4 = 9\sqrt{3} \text{ cm}^2$. The remaining sectors each have a combined degree measure of $30 + 30 = 60$, so their combined area is $1/6$ the area of a circle of radius 6 cm, or $1/6 \times \pi \times r^2 = 1/6 \times \pi \times 6^2 = 6\pi \text{ cm}^2$. The total area of the shaded region, then, is $6\pi + 9\sqrt{3} \text{ cm}^2$, so the value of $a + b + c$ is $6 + 9 + 3 = 18$.

198. We need to write 60 as a product of three factors representing the prism's length l , width w and height h such that $l \geq w \geq h$. We have the following organized list of dimensions: $60 \times 1 \times 1$, $30 \times 2 \times 1$, $20 \times 3 \times 1$, $15 \times 4 \times 1$, $15 \times 2 \times 2$, $12 \times 5 \times 1$, $10 \times 6 \times 1$, $10 \times 3 \times 2$, $6 \times 5 \times 2$ and $5 \times 4 \times 3$. These are the dimensions for the **10** prisms that are possible.

199. There are ${}^6C_3 = 20$ ways to select the three numbers for the circles along a side of the triangle. For each of the six circles to be filled with a different number from 1 to 6, the largest sum that can include the number 1 is $1 + 5 + 6 = 12$, and the smallest sum that can include the number 6 is $1 + 2 + 6 = 9$. If the sums of the numbers along all three sides are to be equal, these sums must range from 9 to 12. Each of the sums 9, 10, 11 and 12 can be obtained in three ways as follows:

$$\begin{aligned} 9 &= 1 + 2 + 6 = 1 + 3 + 5 = 2 + 3 + 4 \\ 10 &= 1 + 3 + 6 = 1 + 4 + 5 = 2 + 3 + 5 \\ 11 &= 1 + 4 + 6 = 2 + 3 + 6 = 2 + 4 + 5 \\ 12 &= 1 + 5 + 6 = 2 + 4 + 6 = 3 + 4 + 5 \end{aligned}$$

The figure shows filled-in figures for these **4** solutions.

200. Recall that the infinite series $1/2 + 1/4 + 1/8 + 1/16 + \dots$ converges to 1. Thus, the time it takes to run 1 length of the field is $t = 1 + 2/3 + (2/3)^2 + (2/3)^3 + \dots$. If we multiply both sides of the equation by $3/2$, we get $(3/2)t = 3/2 + 1 + 2/3 + (2/3)^2 + (2/3)^3 + \dots$. Our infinite series appears again. Substituting, we get $(3/2)t = 3/2 + t \rightarrow (1/2)t = 3/2 \rightarrow t = 3$ minutes.

Warm-Up 13

201. We can factor the difference of cubes to be $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$. We know the values of $a - b$ and $a^2 + b^2$. To find ab , let's square both sides of the first equation to get $a - b = 3 \rightarrow a^2 - 2ab + b^2 = 9$. Substituting 65 for $a^2 + b^2$, we get $65 - 2ab = 9 \rightarrow 2ab = 56 \rightarrow ab = 28$. We now have the values for $a^2 + b^2$ and ab . Substituting in the factorization of $a^3 - b^3$, we see that $a^3 - b^3$ is $3 \times (65 + 28) = 3 \times 93 = 279$.

202. To solve this problem, we will consider three cases.

Case I: The first case includes numbers with all three digits the same, of which there are 9.

Case II: The next case includes numbers with 0 as one of the three digits. The digits in each of these 4 numbers can be arranged to form 4 different numbers that meet our criteria, for a total of $4 \times 4 = 16$.

Case III: The final case includes numbers with three distinct digits from 1 to 9. The digits in each of these 16 numbers can be arranged to form 6 different numbers that meet our criteria, for a total of $16 \times 6 = 96$.

Altogether, that's $9 + 16 + 96 = 121$ integers.

203. There must be more green marbles than red marbles since the probability is greater that the two marbles will be green. Since there are at least two marbles of each color, the smallest case we can try is 3 green marbles and 2 red marbles. The probability that the marbles are both green is $3/5 \times 2/4 = 3/10$ and the probability that they are both red is $2/5 \times 1/4 = 1/10$. This makes 2 reds one-third as likely as 2 greens. Increasing the number of green marbles with just 2 red marbles makes the probability of 2 reds even less likely than 2 greens. So, let's try 4 green and 3 red marbles. The probabilities are $p(2 \text{ greens}) = 4/7 \times 3/6 = 2/7$ and $p(2 \text{ reds}) = 3/7 \times 2/6 = 1/7$. This has 2 reds half as likely as 2 greens. The minimum number of marbles is 7. Some students may work this out as a combinatorics question: If you have 4 greens and 3 reds, then you have "4 choose 2" = $4 \times 3 \div 2 = 6$ ways to choose 2 greens and "3 choose 2" = $3 \times 2 \div 2 = 3$ ways to choose 2 reds, which is half as many ways.

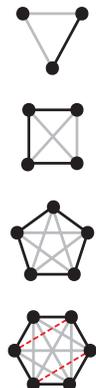

204. Let's find the three points of intersection. If we add our first equation to the third equation, we get $x + 2y + x - 2y = 8 + 0 \rightarrow 2x = 8 \rightarrow x = 4$. Substituting this for x in the first equation, we get $4 + 2y = 8 \rightarrow 2y = 4 \rightarrow y = 2$. So, one point of intersection is (4, 2). Subtracting the first equation from the second equation, we get $5x + 2y - (x + 2y) = 48 - 8 \rightarrow 4x = 40 \rightarrow x = 10$. Substituting this for x in the first equation gives us $10 + 2y = 8 \rightarrow 2y = -2 \rightarrow y = -1$ and a second intersection point of (10, -1). For the last point of intersection, adding the second equation and the third equation yields $5x + 2y + x - 2y = 48 + 0 \rightarrow 6x = 48 \rightarrow x = 8$. Substituting into the third equation, we see that $8 - 2y = 0 \rightarrow -2y = -8 \rightarrow y = 4$ and the third point of intersection is (8, 4). We need to determine which is the longest side. The distance between two points is determined by the formula $d^2 = (x_1 - x_2)^2 + (y_1 - y_2)^2$. But we can tell by looking at a plot of the points of intersection, without actually calculating the distances between them, that the greatest distance will be between the points (4, 2) and (10, -1). The midpoint of the segment joining (4, 2) and (10, -1) is the point whose coordinates are the averages of the coordinates of the endpoints $((4 + 10)/2, (2 + (-1))/2) = (7, 1/2)$. Therefore, the sum of the coordinates of the midpoint of the longest side is $7 + 1/2 = 15/2$.

205. If there were eight girls and eight boys, there would be the same number of ways to choose three of each. If there are nine girls and seven boys there are ${}^9C_3 = (9 \times 8 \times 7) \div (3 \times 2 \times 1) = 84$ ways to choose three girls and ${}^7C_3 = (7 \times 6 \times 5) \div (3 \times 2 \times 1) = 35$ ways to choose three boys, but $84 \div 35 \neq 6$. With ten girls and six boys, then there are ${}^{10}C_3 = (10 \times 9 \times 8) \div (3 \times 2 \times 1) = 120$ ways to choose three girls and ${}^6C_3 = (6 \times 5 \times 4) \div (3 \times 2 \times 1) = 20$ ways to choose three boys. This works since $120 \div 20 = 6$. The ratio of girls to boys, then, is $10/6 = 5/3$.

206. We will start with the prime factorization of 432, which is $3 \times 3 \times 3 \times 2 \times 2 \times 2 \times 2$. We will use these factors to make four single-digit factors of 432, starting with the greatest possible four-digit number, which gives us $9 \times 8 \times 6 \times 1 = 432$. Unfortunately, $9 + 8 + 6 + 1 = 24$, not 20. The next largest four-digit possibility gives us $9 \times 8 \times 3 \times 2 = 432$, but $9 + 8 + 3 + 2 = 22$, not 20. Let's now try $9 \times 6 \times 4 \times 2 = 432$, which gives us $9 + 6 + 4 + 2 = 21$, not 20. On the next try, we get $9 \times 4 \times 4 \times 3 = 432$ and $9 + 4 + 4 + 3 = 20$. This means 9443 is the greatest number we can make. At the other extreme, we can make the number 2666, which meets the requirements that $2 \times 6 \times 6 \times 6 = 432$ and $2 + 6 + 6 + 6 = 20$. The difference between these two numbers is $9443 - 2666 = 6777$.

207. The probability that Jebediah picks the fair coin is $1/2$. The probability of flipping heads on a fair coin is $1/2$. Therefore, the probability that he picks the fair coin and then flips three heads in a row is $1/2 \times 1/2 \times 1/2 \times 1/2 = 1/16$. The probability that Jebediah picks the two-headed coin is also $1/2$. But the probability of flipping heads on the two-headed coin is 1. So the probability that he picks the two-headed coin and then flips three heads in a row is $1/2 \times 1 \times 1 \times 1 = 1/2$. The probability of flipping three heads in a row, then, is $1/16 + 1/2 = (1 + 8)/16 = 9/16$. The probability this outcome occurs as a result of picking the fair coin is $(1/16)/(9/16) = 1/16 \times 16/9 = 1/9$.

208. One way to visualize this is using dots to represent people and colored lines between them to represent their relationship. A gray line is used to indicate that 2 people do not know each other, while a black line indicates that they do. We want to be able to color all of the lines connecting the dots without creating any monochromatic triangles (a connected group of three dots in which all three lines are the same color). Let's see if there is a scenario in which no 3 people all know each other and no 3 people are all strangers for 3, 4, 5, 6, ... people in a room. The first three figures show an example of one such scenario involving 3, 4 and 5 people in a room. At 6 people it becomes difficult to find one such example. As the last figure shows, we can draw seven of the nine connections among 6 people without producing any monochromatic triangles. But either way we color the final two connections results in two monochromatic triangles. Let's verify that with 6 people there must be at least 3 people who all know each other or who all do not know each other. For a 6-person group every individual has a connection to 5 others. Of the 5 lines leaving each individual, at least 3 must be the same color. If we look at these 3 lines and 4 dots and draw in the other connections, we see that it is impossible to choose a color without creating a 3-person group that either are all connected by black lines or all connected by gray lines. Thus, the minimum number of people must be 6. (Note: This is a special case of Ramsey's Theorem.)

209. We are given the formula $F = (9/5)C + 32$, but we need to convert Fahrenheit to Celsius, so $C = (5/9)(F - 32)$. Converting 80°F to $^\circ\text{C}$, we get $(5/9)(80 - 32) = 240/9^\circ\text{C}$. Converting 40°F to $^\circ\text{C}$, we get $(5/9)(40 - 32) = 40/9^\circ\text{C}$. To each of these numbers we need to add 273.15 to establish how far the temperature is from absolute zero. The percent decrease is $(240/9 - 40/9)/(240/9 + 273.15) \times 100\% \approx 7\%$.

210. Three of the four faces of the tetrahedron are right triangles. Angles ADC, ADB and DBC are all 90-degree angles. The distance from B to the face ACD can be thought of as an altitude of triangle BDC drawn from B to side DC. The side lengths of triangle BDC are 12, 16, and 20 units, a multiple of the 3-4-5 Pythagorean Triple. The area of right-triangle BDC is $1/2 \times 12 \times 16 = 96 \text{ units}^2$. The length of side DC is 20 units, so for altitude h , we have $96 = 1/2 \times 20 \times h \rightarrow 96 = 10h \rightarrow h = 96/10 = 48/5$ units.

Warm-Up 14

211. The number of chords that can be drawn in this circle with 8 points is ${}_8C_2 = 8!/(6! \times 2!) = (8 \times 7)/(2 \times 1) = 28$ chords.

212. There are ${}_{10}C_3 = 10!/(7! \times 3!) = (10 \times 9 \times 8)/(3 \times 2 \times 1) = 120$ ways to choose three cards from the deck of ten numbered cards. There are 8 sets of three consecutive numbers: 1-2-3, 2-3-4, 3-4-5, ..., 7-8-9, 8-9-10. There are 9 sets of two consecutive numbers: 1-2, 2-3, 3-4, ..., 8-9, 9-10. Each of these pairs of consecutive numbers has 8 choices for the third number in the set, for a total of $9 \times 8 = 72$, but the sets of three consecutive numbers have been counted twice here. So, in all, there are $72 - 8 = 64$ sets of three cards with two or more consecutive integers. Therefore, the probability of not drawing one of these sets is $1 - 64/120 = 56/120 = 7/15$.

213. It would take the original 12 people another 14 days to finish shearing the other $2/3$ of the field of pine trees. The goal is to accomplish this in 6 days instead of 14 days, so $14/6$ times as many people are needed. That would be $14/6 \times 12 = 28$ people, which means that $28 - 12 = 16$ people must be added to the crew.

214. The general equation of a circle with center $(0, 0)$ and radius r is $x^2 + y^2 = r^2$. So the circle's radius is $\sqrt{8} = 2\sqrt{2}$ units. This is the length of the diagonal of a square with side length 2 units, so our circle passes through the point $(2, 2)$. Figure 1 shows the 21 lattice points that are in the interior of this circle. There are ${}_{21}C_3 = 21!/(18! \times 3!) = (21 \times 20 \times 19)/(3 \times 2 \times 1) = 7980/6 = 1330$ ways to choose 3 points. That's the total number of outcomes possible. To determine the number of favorable outcomes, we will use complementary counting and find the sets of three points that *cannot* make a triangle. A triangle cannot be made if the three chosen points are collinear. Considering first the horizontal rows of points, there is ${}_3C_3 = 1$ way to choose all three points in both the top and bottom rows, and there are ${}_5C_3 = 10$ ways to choose three points from the three middle rows. That's $1 + 1 + 10 + 10 + 10 = 32$ ways so far. By symmetry, there are also 32 ways to choose three collinear points from the vertical columns. Now let's consider the diagonals from the top left to the bottom right at a 45-degree angle. There are $1 + 4 + 1 + 4 + 1 = 11$ ways to choose three collinear points on these diagonals. Using symmetry again, we can say there are another 11 ways on the other 45-degree diagonals. Besides these, there are another 4 sets of three collinear points that are shown in Figure 2. The total is $32 + 32 + 11 + 11 + 4 = 90$ ways that do not work, so the other $1330 - 90 = 1240$ sets of three points must make triangles. The probability, then, is $1240/1330 = 124/133$.

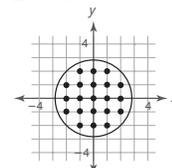

Figure 1

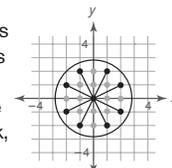

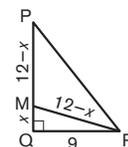

Figure 2

215. There is no four-digit number with all the digits the same for which the sum of the digits equals the product of the digits. So we are looking for a four-digit number with at least two distinct digits. Consider the four-digit number ABCD, where $A > B \geq C \geq D$ and let's assume that $A \times B \times C \times D = A + B + C + D$. Since B, C and D are all less than A, we can write the following inequality: $A \times B \times C \times D < A + A + A + A \rightarrow A \times B \times C \times D < 4 \times A$. Dividing both sides by A, we get $B \times C \times D < 4$. So, the product $B \times C \times D$ can have a value of 1, 2 or 3. Given that $B \geq C \geq D$, the only possibilities for BCD, then, are 311, 211 and 111. Let's test these three options. If BCD = 311, we have $A \times 3 \times 1 \times 1 = A + 3 + 1 + 1 \rightarrow 3 \times A = A + 5 \rightarrow 2 \times A = 5 \rightarrow A = 5/2$, which cannot be true. If BCD = 211, we have $A \times 2 \times 1 \times 1 = A + 2 + 1 + 1 \rightarrow 2 \times A = A + 4 \rightarrow A = 4$, so the four-digit combination 4211 works. Finally, if BCD = 111, we have $A \times 1 \times 1 \times 1 = A + 1 + 1 + 1 \rightarrow A = A + 3$, which cannot be true. Therefore, the only combination of four digits that exists for which the sum of the digits equals the product of the digits is 4, 2, 1, 1. Since two of the four digits are the same, there are $4!/2! = (4 \times 3 \times 2 \times 1)/(2 \times 1) = 24/2 = 12$ possible arrangements of these four digits. Therefore, the number of four-digit numbers with this property is 12 numbers.

216. The three blue faces can intersect at one vertex, or they can be in a row of three adjacent faces of the cube. If the three blues intersect at a vertex, then the red, yellow and green sides can be placed in 2 different orientations that are mirror images of each other. If the three blues are in a row, then there are 3 ways the red, green and yellow faces can be arranged. That's a total of $2 + 3 = 5$ cubes.

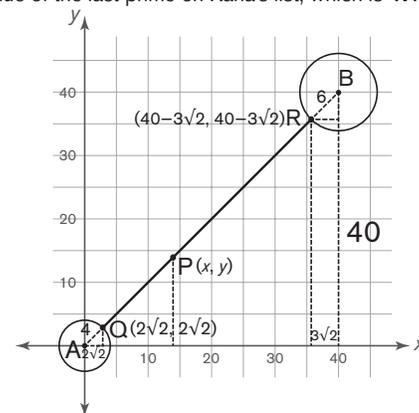

217. Let $MQ = x$. Since $PQ = 12$, it follows that $MP = MR = 12 - x$. Given that $QR = 9$, we can use the Pythagorean Theorem to find the side lengths of right triangle MQR. We have $x^2 + 9^2 = (12 - x)^2 \rightarrow x^2 + 81 = 144 - 24x + x^2 \rightarrow 81 = 144 - 24x \rightarrow 24x = 63 \rightarrow x = 63/24 = 21/8$. Therefore, $MQ = 21/8$ units.

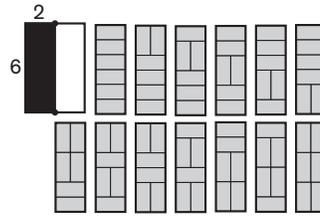

218. Karla could not have the number 2 on her list of six different primes since 2 would make the product of the first three primes even and the sum of the last three primes, which are all odd, must be odd. We are looking for a least possible value for the greatest number on Karla's list, so it makes sense to look at the least possible odd product of primes, which is $3 \times 5 \times 7 = 105$. Now, let's look for three different primes with a sum of 105. Their average would be $105 \div 3 = 35$. We should try to use two primes slightly above the average and one prime well below the average. After a bit of guessing and checking, we find that $17 + 41 + 47 = 105$. When we consider the products $3 \times 5 \times 11 = 165$ and $3 \times 5 \times 13 = 195$, after more guessing and checking, we see that there aren't three primes between 11 and 47 whose sum is 165 or three primes between 13 and 47 whose sum is 195. So, we conclude that starting with the product $3 \times 5 \times 7$ will yield the least possible value of the last prime on Karla's list, which is 47.

219. The graph shows the initial positions of the two circles, with the segment from Q on circle A to R on circle B. Based on properties of 45-45-90 right triangles, Q has coordinates $(2\sqrt{2}, 2\sqrt{2})$ and R has coordinates $(40 - 3\sqrt{2}, 40 - 3\sqrt{2})$. Since the radius of circle B grows at twice the rate that the radius of circle A does, it follows that the distance along segment QR from Q to the point of tangency P is one-third the distance from Q to R. Similarly, for $P(x, y)$, x must be

$$\frac{1}{3} \times ((40 - 3\sqrt{2}) - 2\sqrt{2}) + 2\sqrt{2} = \frac{40 - 5\sqrt{2}}{3} + 2\sqrt{2} = \frac{40 - 5\sqrt{2} + 6\sqrt{2}}{3} = \frac{40 + \sqrt{2}}{3}$$

220. Since none of the 1×2 rectangles can cross the center line, let's consider the number of arrangements of tiles on each side of the line. As the figure shows, there are 13 different ways to tile one side of the 6×4 rectangle. So, with 13 ways to tile the left side and 13 ways to tile the right side, there are $13 \times 13 = 169$ ways to tile the whole 6×4 rectangle.

Fractions Stretch

221. Dividing, we see that $25/100 = 1/4$.

222. Dividing, we see that $9/16 \div 3/8 = 9/16 \times 8/3 = 3/2$.

223. Start by simplifying the expression under the radical symbol. We have $\sqrt{(3/11 \div 11/12)} = \sqrt{(3/11 \times 12/11)} = \sqrt{(36/11^2)} = 6/11$.

224. Of the 20 unit squares, 6 are shaded. That represents $6/20 = 3/10$ of the squares.

225. The area of the triangle is $1/2 \times (3/2)w \times w = (3/4)w^2$. The area of the rectangle is $2w^2$. Thus, the triangle's area is $(3/4)/2 = 3/4 \times 1/2 = 3/8$ of the rectangle's area.

226. The difference between $3/4$ and $1/2$ is $3/4 - 2/4 = 1/4$, and $3/4$ of that is $3/4 \times 1/4 = 3/16$. The common fraction that is $3/16$ more than $1/2$ is $8/16 + 3/16 = 11/16$.

227. The reciprocal of $1/(2 + 1/3) = 2 + 1/3 = 6/3 + 1/3 = 7/3$.

228. Let $x = 0.7\bar{5}$. Then $10x = 7.\bar{5}$ and $100x = 75.\bar{5}$. Subtracting, we see that $100x - 10x = 75.\bar{5} - 7.\bar{5} \rightarrow 90x = 68 \rightarrow x = 68/90 = 34/45$.

229. Let's start by simplifying the denominator. We get $\frac{1}{\frac{1}{n} + \frac{1}{3}} + \frac{1}{\frac{1}{3} + \frac{1}{n}} = \frac{1}{\frac{n+3}{3n}} + \frac{1}{\frac{n+3}{3n}} = \frac{2}{\frac{n+3}{3n}} = 2 \times \frac{3n}{n+3} = \frac{6n}{n+3}$. Since 1 divided by this

fraction is simply the reciprocal $(n+3)/(6n)$, we now have $(n+3)/(6n) = 5/12$. Cross-multiplying gives us $12n + 36 = 30n \rightarrow 18n = 36 \rightarrow n = 2$.

230. Simplifying the left-hand side of the equation, we get $(2x - 2(x-3))/(x-3) = 4/(x-3) \rightarrow 6/(x-3) = 4/(x-3)$. Cross-multiplying, we see that $6(x-3) = 4(x-3) \rightarrow 6x + 12 = 4x - 12 \rightarrow 2x = -24 \rightarrow x = -12$.

Angles and Arcs Stretch

231. Vertex H is on the circle, so the measure of inscribed angle AHC is half the measure of intercepted \widehat{AC} . Since the regular nonagon divides the 360° of the circle into nine 40° arcs, it follows that $m\widehat{AC} = 80^\circ$, making $m\angle AHC = 1/2 \times m\widehat{AC} = 1/2 \times 80 = 40^\circ$.

232. Vertex B is on the circle, so the measure of inscribed $\angle CBD$ is half the measure of intercepted minor \widehat{BC} . Since the measure of major \widehat{BC} is 230° , it follows that minor \widehat{BC} measures $360 - 230 = 130^\circ$, making $m\angle CBD = 1/2 \times m\widehat{BC} = 1/2 \times 130 = 65^\circ$.

233. The measure of inscribed $\angle ABE$ is 35° , so the measure of intercepted \widehat{AE} is $2 \times m\angle ABE = 2 \times 35 = 70^\circ$. Angle AXE has measure 15° and intercepts arcs AE and CD. So, $m\angle AXE = 1/2 \times (m\widehat{AE} - m\widehat{CD}) \rightarrow 15 = 1/2 \times (70 - m\widehat{CD}) \rightarrow 30 = 70 - m\widehat{CD} \rightarrow m\widehat{CD} = 70 - 30 = 40^\circ$.

234. The measure of angle AXB, which intercepts major and minor \widehat{AB} , is 50° . If $m\widehat{AB}$ represents the measure of minor \widehat{AB} , then $m\angle AXB = 1/2 \times (m\widehat{AB} - (360 - m\widehat{AB})) \rightarrow 50 = 1/2 \times (2 \times m\widehat{AB} - 360) \rightarrow 100 = 2 \times m\widehat{AB} - 360 \rightarrow 2 \times m\widehat{AB} = 460 \rightarrow m\widehat{AB} = 460 \div 2 = 230$. Therefore, major \widehat{AB} has measure 230° .

235. Inscribed $\angle ABD$ intercepts \widehat{AD} , which has measure 125° . Therefore, $m\angle ABD = 1/2 \times m\widehat{AD} = 1/2 \times 125 = 62.5^\circ$.

236. Since \widehat{AC} is a diameter of circle O, we know that $m\widehat{AB} + m\widehat{BC} = 180^\circ$. We are told that inscribed $\angle BDC$, which intercepts \widehat{BC} , has measure 40° . It follows, then, that $m\widehat{BC} = 2 \times 40 = 80^\circ$, and $m\widehat{AB} = 180 - 80 = 100^\circ$.

237. Inscribed $\angle BAE$ intercepts \widehat{ADB} , so $m\angle BAE = 1/2 \times m\widehat{ADB}$. Arc ADB is composed of arcs ADC (a semicircle) and BC. From the previous problem, we know that $m\widehat{BC} = 80^\circ$, so $m\widehat{ADB} = 180 + 80 = 260^\circ$. It follows that $m\angle BAE = 1/2 \times 260 = 130^\circ$.

238. Angles CFD and AFB intercept arcs CD and AB, respectively. These two angles are congruent and have measure equal to $\frac{1}{2} \times (m\widehat{CD} + m\widehat{AB})$. Semicircle ADC is composed of arcs AD and CD of measure 125° and $180 - 125 = 55^\circ$, respectively. From Problem 236, we know that $m\widehat{AB} = 100^\circ$. Therefore, $m\angle CFD = m\angle AFB = \frac{1}{2} \times (55 + 100) = \frac{1}{2} \times 155 = 77.5^\circ$.

239. Angles CXD and AXB intercept arcs CD and AB, respectively. The measure of these two congruent angles is $\frac{1}{2} \times (m\widehat{CD} + m\widehat{AB})$. We are told that $m\widehat{AB} = 110^\circ$, and because $AB = BD$, it follows that $m\widehat{AB} = m\widehat{BCD} = 110^\circ$. In addition, since \widehat{BCD} is composed of arcs BC and CD, we have $m\widehat{BCD} = m\widehat{BC} + m\widehat{CD} \rightarrow 110 = 60 + m\widehat{CD} \rightarrow m\widehat{CD} = 110 - 60 = 50^\circ$. Now that we have the measures of arcs AB and CD, we have $m\angle CXD = \frac{1}{2} \times (50 + 110) = \frac{1}{2} \times 160 = 80^\circ$.

240. Angle DAC intercepts arcs CD and FG of circles O and P, respectively. So $m\widehat{FG} = m\widehat{CD} = 50^\circ$. Semicircle AFG is composed of arcs AF and FG, so we have $m\widehat{AF} + 50 = 180 \rightarrow m\widehat{AF} = 180 - 50 = 130^\circ$. Since $\angle AOB$, which intercepts arcs AF and FG, is in the exterior of circle P, it follows that $m\angle AOB = \frac{1}{2} \times (m\widehat{AF} - m\widehat{FG}) = \frac{1}{2} \times (130 - 50) = \frac{1}{2} \times 80 = 40^\circ$. In addition, $\angle AOB$ is a central angle of circle O that intercepts \widehat{AB} , so $m\widehat{AB} = 40^\circ$ as well. Diameter AD of circle O creates a semicircle composed of arcs AB, BC and CD. Therefore, $m\widehat{AB} + m\widehat{BC} + m\widehat{CD} = 180 \rightarrow 40 + m\widehat{BC} + 50 = 180 \rightarrow 90 + m\widehat{BC} = 180 \rightarrow m\widehat{BC} = 180 - 90 = 90^\circ$.

Bases Stretch

241. For base 9, the place values for a two-digit numeral are $9^1 = 9$ and $9^0 = 1$. Therefore, $24_9 = 2(9^1) + 4(9^0) = 2(9) + 4(1) = 18 + 4 = 22$.

242. For base 8, the place values for a two-digit numeral are $8^1 = 8$ and $8^0 = 1$. Therefore, $24_8 = 2(8^1) + 4(8^0) = 2(8) + 4(1) = 16 + 4 = 20$.

243. For base 7, the place values for a two-digit numeral are $7^1 = 7$ and $7^0 = 1$. Therefore, $24_7 = 2(7^1) + 4(7^0) = 2(7) + 4(1) = 14 + 4 = 18$.

244. The greatest power of nine that goes into 24 is 9, and $24 \div 9 = 2 \text{ r } 6$. Therefore, $24 = 2(9^1) + 6(9^0) = 26$ base 9.

245. The greatest power of eight that goes into 24 is 8, and $24 \div 8 = 3 \text{ r } 0$. Therefore, $24 = 3(8^1) + 0(8^0) = 30$ base 8.

246. The greatest power of seven that goes into 24 is 7, and $24 \div 7 = 3 \text{ r } 3$. Therefore, $24 = 3(7^1) + 3(7^0) = 33$ base 7.

247. For base 12, the place values for a four-digit numeral are $12^3 = 1728$, $12^2 = 144$, $12^1 = 12$ and $12^0 = 1$. The greatest power of 12 that goes into 4991 is 1728, and $4991 \div 1728 = 2 \text{ r } 1535$. The greatest power of 12 that goes into 1535 is 144, and $1535 \div 144 = 10 \text{ r } 95$. The greatest power of 12 that goes into 95 is 12, and $95 \div 12 = 7 \text{ r } 11$. Recall, in base 12, that 10 = A and 11 = B. Therefore, 4991 = **2A7B** base 12.

248. In base 12, the first three place values are $12^2 = 144$, $12^1 = 12$ and $12^0 = 1$, and $B = 11$. So, $3BB_{12} = 3(144) + 11(12) + 11(1) = 432 + 132 + 11 = 575$ base 10. We now need to convert this to base 6. The greatest power of 6 that goes into 575 is $6^3 = 216$, and $575 \div 216 = 2 \text{ r } 143$. The greatest power of 6 that goes into 143 is $6^2 = 36$, and $143 \div 36 = 3 \text{ r } 35$. The greatest power of 6 that goes into 35 is 6, and $35 \div 6 = 5 \text{ r } 5$. Therefore, $3BB_{12} = 2355$ base 6.

249. If $523_b = 262$, then $5 < b < 10$ (since 262 is less than 523 and since 5 is a digit in base b). So the possible values for b are 6, 7, 8 and 9. If we try $b = 6$, we get $523_6 = 5(36) + 2(6) + 3(1) = 180 + 12 + 3 = 195$. If $b = 7$, we get $523_7 = 5(49) + 2(7) + 3(1) = 245 + 14 + 3 = 262$. Thus, $b = 7$. Alternatively, since $523_b = 5(b^2) + 2(b) + 3(1) = 5b^2 + 2b + 3$, we can solve the following quadratic equation: $5b^2 + 2b + 3 = 262 \rightarrow 5b^2 + 2b - 259 = 0 \rightarrow (5b + 37)(b - 7) = 0 \rightarrow 5b + 37 = 0$ or $b - 7 = 0 \rightarrow b = -37/5$ or $b = 7$. Since b must be positive and an integer, we conclude that the answer is $b = 7$.

250. Since 5 is a digit in base b , we know that $b > 5$, and we are told that $b < 10$. The possible values of b , then, are 6, 7, 8 and 9. We could try each of these to determine for which value of b both of the given equations hold true. Let's, instead, solve this problem algebraically. We know that $441_b = 4(b^2) + 4(b^1) + 1(b^0) = 4b^2 + 4b + 1$ and $351_b = 3(b^2) + 5(b^1) + 1(b^0) = 3b^2 + 5b + 1$, so we can write the following equations: $4b^2 + 4b + 1 = n^2$ and $3b^2 + 5b + 1 = (n - 2)^2$. Factoring the left-hand side of the first equation yields $(2b + 1)^2 = n^2$, so $n = 2b + 1$. Substituting this for n in the second equation, we get $3b^2 + 5b + 1 = (2b + 1 - 2)^2 \rightarrow 3b^2 + 5b + 1 = (2b - 1)^2 \rightarrow 3b^2 + 5b + 1 = 4b^2 - 4b + 1 \rightarrow b^2 - 9b = 0 \rightarrow b(b - 9) = 0 \rightarrow b = 0$ or $b - 9 = 0 \rightarrow b = 9$. Therefore, $b = 9$, and we have $441_9 = 4(81) + 4(9) + 1(1) = 324 + 36 + 1 = 361 = 19^2$, so $n = 19$. If we substitute this value for n in $(n - 2)^2$, we confirm that $(19 - 2)^2 = 17^2 = 289 = 3(81) + 5(9) + 1(1) = 351_9$. So $n = 19$.

2016-2017 ADDITIONAL STUDENTS REGISTRATION FORM

The fastest way to add students to your school's registration is by logging in to your Coach Dashboard at www.mathcounts.org/coaches!

Step 1: Tell us about your school so we can find your original registration (please print legibly).

Coach Name _____ School Name _____
 Coach Email Address _____
 School Address _____ City, State ZIP _____

Step 2: Tell us how many students you are adding to your school's registration. Following the instructions below.

Please circle the number of additional students you will enter in the Chapter Competition and the associated cost below (depending on the date your registration is postmarked). The cost is \$30 per student added, whether that student will be part of a team or will compete as an individual. The cost of adding students to a previous registration is not eligible for an Early Bird rate.

| # of Students You Are Adding | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|------|------|-------|-------|-------|-------|-------|-------|-------|
| Regular Rate (postmarked by Dec. 16, 2016) | \$30 | \$60 | \$90 | \$120 | \$150 | \$180 | \$210 | \$240 | \$270 |
| Late Registration (postmarked after Dec. 16, 2016) | \$50 | \$80 | \$110 | \$140 | \$170 | \$200 | \$230 | \$260 | \$290 |

My school qualifies for the **50% Title I discount**, so the Amount Due in Step 4 will be half the amount I circled above. Principal signature required below to verify Title I eligibility.
 Principal Name _____ Principal Signature _____

Step 3: Tell us what your school's FINAL registration should be (including all changes/additions).

| Total # of Registered Students | 1 (1 individual) | 2 (2 ind) | 3 (3 ind) | 4 (1 team) | 5 (1 tm, 1 ind) | 6 (1 tm, 2 ind) | 7 (1 tm, 3 ind) | 8 (1 tm, 4 ind) | 9 (1 tm, 5 ind) | 10 (1 tm, 6 ind) |
|--------------------------------|---------------------|--------------|--------------|---------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|
| | | | | | | | | | | |

Step 4: Almost done... just fill in payment information and turn in your form!

Amount Due \$ _____ Check (payable to MATHCOUNTS Foundation) Money Order Purchase Order # _____ (must include copy of P.O.)
Credit card payments cannot be accepted with paper registrations. To pay with a credit card, please register online at www.mathcounts.org/compreg.

IMPORTANT! By submitting this form you (1) agree to adhere to the rules of the MATHCOUNTS Competition Series; (2) attest you have the school administrator's permission to register students for this program under this school's name; and (3) affirm the above named school is a U.S. school eligible for this program and not an academic or enrichment center. The coach will receive an emailed confirmation and receipt once this additional students registration has been processed.

Questions?

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What integer is closest in value to 21.476?

2. _____ mL

What is the volume of the solution in the beaker? Express your answer to the nearest hundred.

3. _____ Debbie is counting by fives. If the first number she says is 110, what is the fifth number Debbie says?

4. _____ What is the difference between seven times six and five times four?

5. _____ ounces A carton of one dozen jumbo eggs has a total weight of 32 ounces. If the carton itself weighs 2 ounces, how much does each egg weigh, on average? Express your answer as a decimal to the nearest tenth.

6. _____ feet Given that 3 feet = 1 yard and 240 yards = 1 cable, how many feet are equal to 1 cable?

7. _____ Velma earned the following scores on seven science quizzes: 88, 95, 84, 100, 86, 99, 94. What is the median of Velma's quiz scores?

8. _____ students When half of the students in Mr. Freeman's class joined the National Math Club, there were 13 students who did not join. What is the total number of students in Mr. Freeman's class?

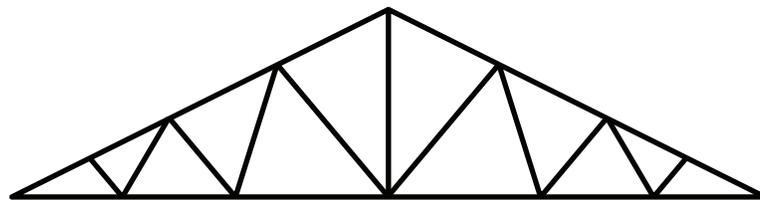

9. _____ What is the value of $100 - \frac{10}{0.1}$?

10. _____ units Points A through F are evenly spaced on the number line shown. How many units long is segment CF?

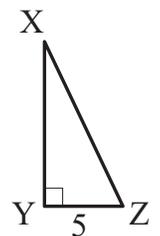

11. _____ students The number of 8th graders who responded to a poll of 6th and 8th graders was one-fourth of the number of 6th graders who responded. If a total of 100 students responded to the poll, how many of the students who responded were 6th graders?

12. _____ triangles How many triangles of any size are in the Belgian truss shown?

13. _____ cats The ratio of dogs to cats in a pet store is 7:5. If there are 6 more dogs than cats, how many cats are in the pet store?

14. _____ inches Right triangle XYZ, with $YZ = 5$ inches, has area 30 in^2 . What is the length of side XY?

15. _____ What is the value of $\left(\frac{1}{3}\right)^{-2}$?

16. _____ If the sum of the positive integer a and 5 is less than 12, what is the sum of all possible values of a ?

17. _____ percent The table shows the five methods of transportation that the 360 students who attend Newburg Middle School use to get to school. If every student chooses exactly one of these as his or her primary method of transportation to school, what percent of the students bike to school?

| TRANSPORTATION TO NEWBURG MIDDLE SCHOOL | |
|---|------------|
| Method of Transportation | # Students |
| Car | 66 |
| Bus | 138 |
| Bike | 90 |
| Scooter | 18 |
| Walk | 48 |

18. _____ large jugs A camel can carry a maximum weight equal to either 18 identical large jugs of water or 30 identical small jugs of water. If the camel is loaded with 25 small jugs of water, how many additional large jugs of water can the camel carry?

19. _____ What decimal is equivalent to $\frac{1}{2}$ percent?

20. _____ What is the sum of the solutions of $x^2 + 5x + 6 = 0$?

21. _____ What is the quotient when 1000 is divided by $2^3 \times 5^2$?
22. \$ _____ On the side of a taxi, fares are listed as \$2.25 for the first $\frac{1}{2}$ mile and 75¢ for each additional $\frac{1}{4}$ mile. What is the fare for a 3-mile ride in this taxi?
23. _____ boys Last summer, 150 students attended the Apollo Math Camp, of whom 96 were girls and 54 were boys. Also, 68 were 7th graders and 82 were 8th graders. How many 8th-grade boys attended the camp if 40 of the girls were 7th graders?
24. _____ What is the largest sum that results when one of the arrangements of the digits of 2017 is added to one of the arrangements of the digits of 2016, if none of the digits 0, 1 or 2 can occupy the same position in both numbers?
25. _____ pairs How many pairs of positive integers x and y are solutions of $\frac{x}{12} + \frac{y}{36} = 1$?

26. _____ What positive value should replace x in this statement to make it true?

$$55 \times 59 - 53 \times 57 = x^2 - 1$$

27. _____ The Pythagoreans proved this pattern:

$$1^2 = 1$$

$$2^2 = 1 + 3$$

$$3^2 = 1 + 3 + 5$$

$$4^2 = 1 + 3 + 5 + 7$$

Nicomachus discovered this pattern:

$$1^3 = 1$$

$$2^3 = 3 + 5$$

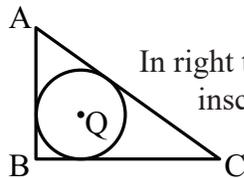

$$3^3 = 7 + 9 + 11$$

$$4^3 = 13 + 15 + 17 + 19$$

What is the value of s in this equation:

$$1^3 + 2^3 + 3^3 + 4^3 + 5^3 + 6^3 + 7^3 + 8^3 = s^2$$

28. _____ in²

In right triangle ABC, shown here, $m\angle B = 90^\circ$ and $AB = 6$ inches. If inscribed circle Q has area 4π in², what is the area of triangle ABC?

29. _____ Yu has 12 coins, consisting of 5 pennies, 4 nickels and 3 dimes. He tosses them all in the air. What is the probability that the total value of the coins that land heads-up is exactly 30 cents? Express your answer as a common fraction.

30. _____ ordered quintuples
quintuples How many ordered quintuples (a, b, c, d, e) have coordinates of value $-1, 0$ or 1 and satisfy $a + b^2 + c^3 + d^4 + e^5 = 2$?

Target Round
Problems 1 & 2

Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

7. _____ $\frac{\text{ft}}{\text{s}}$ Three-fifths of the way up a hill, Jack and Jill realized that they had forgotten their bucket. Jill continued up the hill, while Jack went back down the hill to get the bucket. Two minutes after turning back, Jack reached the bottom of the hill at the exact same time that Jill reached the top. If the total distance from the bottom to the top of the hill is 1260 feet, what is the absolute difference in Jack's downhill speed and Jill's uphill speed, in feet per second? Express your answer as a decimal to the nearest tenth.
8. _____ Twenty-five chips, each marked with a different integer from 1 through 25, are placed in a jar. A student draws a chip from the jar and tells everyone the number. The chip is then returned to the jar. Nine more students do the same thing. What is the probability that at least two of the ten students draw the same chip? Express your answer as a decimal to the nearest hundredth.

Team Round
Problems 1–10

School _____

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ A *Lagado number* is a number of the form $3n + 1$ where n is a nonnegative integer. A *Lagado prime* is a Lagado number greater than 1 which is not divisible by any Lagado number other than 1 and itself. What is the fifth Lagado prime?

2. _____ in² A circle is inscribed in a right isosceles triangle whose legs are 8 inches long. How many square inches are in the area of the shaded portion? Express your answer as a decimal rounded to the nearest hundredth.

3. _____ pairs A standard deck of playing cards has 52 cards divided into four suits (clubs, diamonds, hearts, spades). Each suit consists of nine “number cards”, each containing a different number from 2 to 10, and four “face cards” that include a jack, a queen, a king and an ace. In the game of Cribbage, points are earned if you can combine two cards that sum to 15. Jacks, queens and kings each have a value of 10, aces each have a value of 1, and all number cards have a value of the number shown. How many different unordered pairs of two cards sum to 15 in a standard 52-card deck?

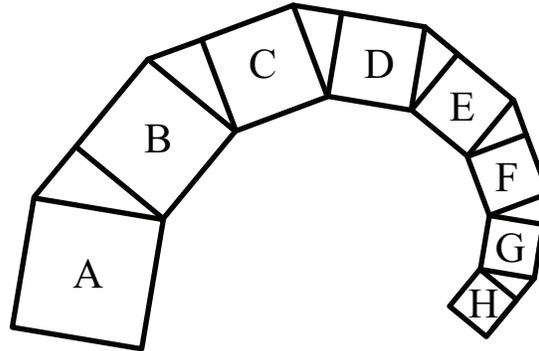

4. _____ The sequence 1, 3, 6, 10, 15, ... is called the *triangular numbers*, and the n th element of the sequence is found by adding the first n positive integers. What is the positive integer that, when multiplied by any triangular number, always yields a product one less than a perfect square?

5. _____ Points A(-7, 4) and B(13, -11) are two points in the coordinate plane. P is on segment AB and divides it so that $AP:PB = 2:3$. What is the product of the coordinates of P?

6. _____ What is the greatest number that evenly divides the sum of any six consecutive whole numbers?

7. _____ All of the possible sequences of four consecutive positive integers less than 200 are created. One of these sequences is called orderly if the smallest member is divisible by 2, the next smallest member is divisible by 3, the next smallest is divisible by 4, and the largest is divisible by 5. What is the probability that a randomly-selected sequence is orderly? Express your answer as a common fraction.

8. _____ This *Pythagorean Claw* is composed of eight squares, labeled A through H and seven 30-60-90 right triangles. For each triangle, its hypotenuse is the side of a square, and the side opposite its 60-degree angle is the side of a different square. Which letter represents the largest square with area less than one-half that of square A?

9. _____ What is the greatest two-digit prime number such that the sum of its digits is also a prime number?

10. _____ If n is a positive integer less than 100, what is the sum of all possible values of n for which $n^2 + 55$ is a perfect square?

1. _____ If $f(x) = x^2 - 3$ and $g(x) = 2x + 1$, what is $f(g(3))$?
2. _____ What is the value of $\frac{(2^4)^9}{(4^8)^2}$?
3. _____ Robin rolls two fair octahedral dice, each with faces numbered 1 through 8. What is the probability that the sum of the numbers she rolls is 8? Express your answer as a common fraction.
4. _____ What is 120% of 45% of 1200?
5. _____ What is the greatest two-digit prime number whose digits are both prime numbers?
6. _____ What is the value of $212^2 - 211^2$?
7. _____ (inches) A stalk of corn is 32 inches tall. It grows by 25% of its height each month for the next three months. What is the height of the stalk, in inches, at the end of the 3-month period? Express your answer as a decimal to the nearest tenth.
8. _____ Three-fourths of the sum $x + 3$ is four less than twice x . What is the value of x ?
9. _____ (inches) A rhombus has an area of 84 in^2 and a diagonal of length 14 inches. What is the length, in inches, of the other diagonal?
10. _____ (squares) How many squares of any size are in this figure consisting of adjacent unit squares surrounding a larger square? 
11. _____ If a , b and c are positive integers such that $a + b + c = 7$, what is the least possible value of $a! + b! + c!$?
12. _____ What is the value of the sum $\frac{1}{9} + \frac{2}{9} + \frac{3}{9} + \frac{4}{9} + \frac{5}{9} + \frac{6}{9} + \frac{7}{9} + \frac{8}{9}$?

13. _____

If the gray region of the figure shown is a quarter-circle centered at A, what is the probability that a tiny drop of ink that falls at random onto square ABCD lands on the gray region? Express your answer as a common fraction in terms of π .

14. _____

The mean of seven of Charlotte's scores is 80. The mean of three of those scores is 60. What is the mean of the other four scores?

15. _____

What common fraction has a value that is halfway between $\frac{13}{18}$ and $\frac{5}{6}$?

16. _____

If $16^{x+3} = 2^{5x}$, what is the value of x ?

17. _____

What is the value of $1 + 2 - 4 + 8 + 16 - 32$?

18. _____

A person who has a quarters and b nickels has \$5.60 more than a person who has a nickels and b quarters. What is the value of $a - b$?

19. _____ (integers)

For how many positive integers m does the line given by $y = mx$ intersect the segment with endpoints $(20, 17)$ and $(17, 20)$?

20. _____ (times)

An earthquake that measures $x + 1$ on the Richter scale is 10 times as strong as an earthquake that measures x on the same scale for any positive number x . How many times stronger is an earthquake that measures 6.9 than one measuring 4.9 on the Richter scale?

21. _____ (minutes)

At the time 2:58 p.m., the digits displayed on a clock form an arithmetic sequence in the order in which they appear. How many minutes later will the digits displayed next form an arithmetic sequence?

22. _____

What is the value of $(1 + 3 + 5 + \dots + 2017) - (2 + 4 + 6 + \dots + 2016)$?

23. _____ (cents)

Rebecca uses a \$20 bill to pay for five notebooks that cost \$3.97 each including tax. How many cents should Rebecca receive in change?

24. _____ (permutations)

How many permutations of three different letters can be made from the letters of LINES?

25. _____ Jess selects a 3-digit positive integer at random. What is the probability that she selects a number with at least one odd digit? Express your answer as a common fraction.

26. _____ What is the value of $(5^{-1} + 6^{-1})^{-1}$? Express your answer as a common fraction.

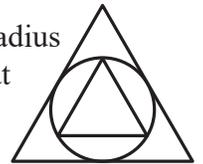

27. _____ (packages) A 120-pound box contains packages of candy, each with a total weight of 6 ounces. Ignoring the weight of the packaging, how many packages of candy are in the box?

28. _____ For what positive real number x , is $(x + 3)$ the reciprocal of $(x - 3)$? Express your answer in simplest radical form.

29. _____ What is the least integer x for which $x^{(x^2-9)} = 1$?

30. _____ The arithmetic mean of ten numbers is 37. What number can be added to the set so that the arithmetic mean of the eleven numbers is 41?

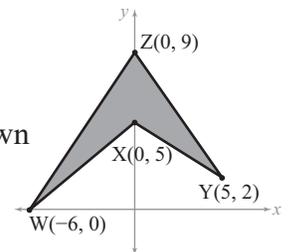

31. _____ This figure shows an equilateral triangle with an inscribed circle of radius 5 cm that is circumscribed around a smaller equilateral triangle. What is the ratio of the area of the smaller triangle to the area of the larger triangle? Express your answer as a common fraction.

32. _____ What is the least positive integer that contains each of the digits from 1 to 3 at least once and is divisible by 9?

33. _____ If $2x + 3 = 1000$, what is the value of $4x^2 - 9$?

34. _____ (units²) What is the area, in square units, of quadrilateral WXYZ, shown here, with coordinates $W(-6, 0)$, $X(0, 5)$, $Y(5, 2)$ and $Z(0, 9)$?

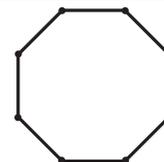

35. _____ (in²) A diagonal on one face of a cube measures $4\sqrt{3}$ inches. What is the total surface area of the cube, in square inches?

36. _____ The lines given by the equations $2y + ax + 6 = 0$ and $4y + x - 30 = 0$ are perpendicular. What is the value of a ?

37. _____ (outcomes) Six identical cupcakes are distributed to two friends. If each friend gets at least one cupcake, how many possible outcomes are there?
38. _____ What is the value of the sum $2 + 2(2) + 2(2)(2) + 2(2)(2)(2)$?
39. _____ (arrange-
ments) Bill, Melissa and three friends are seated at a round table. Melissa does not sit next to Bill. Assume that two arrangements are considered the same if they are rotations of each other. How many distinct seating arrangements are possible?
40. _____ Given that $x + \frac{1}{x} = 4$, what is the value of $x^4 + \frac{1}{x^4}$?
41. _____ In the arithmetic sequence 12, w , x , y , z , 47, what is the value of y ?
42. _____ What is the 2017th odd positive integer?
43. _____ If $(x + y)^2 = 31$ and $(x - y)^2 = 29$, what is the value of xy ? Express your answer as a common fraction.
44. _____ (pounds) Madeline has eight dogs. The mean weight of the lightest six is 40 pounds. The mean weight of the heaviest six is 55 pounds. What is the least possible range of weights of her dogs?
45. _____ (questions) The Trivia Nite Quiz has 25 questions. Each correct answer adds four points, each wrong answer subtracts one point, and skipped questions are ignored. Liz answered all of the questions and had 12 wrong answers. Malaika got the same score without any wrong answers. How many questions did Malaika skip?
46. _____ (points) How many points on the circle given by $x^2 + y^2 = 169$ have a pair of integer coordinates?
47. _____ What is the value of the arithmetic series $26 + 39 + 52 + \dots + 143$?
48. _____ The two distinct solutions of the equation $x^2 + bx + c = 0$ are reciprocals. What is the value of c ?

49. _____

Three vertices of a regular octagon are chosen at random to form the vertices of a triangle. What is the probability that such a triangle is isosceles? Express your answer as a common fraction.

50. _____ (cm²)

Nine different rectangles can be formed by choosing a width from the set {1 cm, 3 cm, 4 cm} and a length from the set {6 cm, 10 cm, 11 cm}. What is the mean of the areas of these nine rectangles, in square centimeters?

51. _____

The mean and unique mode of the list 3, 4, 5, x are the same integer. What is the value of x ?

52. _____ (units)

What is the length, in units, of a tangent from the point (10, 0) to the circle given by $x^2 + y^2 = 25$? Express your answer in simplest radical form.

53. _____

Let A be the set {3, 6, 9, 12} and B be the set of prime numbers between 30 and 50. One value from A and one value from B are chosen at random. What is the probability that their sum contains at least one 5 as a digit? Express your answer as a common fraction.

54. _____

What is the slope of the line containing the points (-2, 3) and (1, 9)?

55. _____ (in²)

A wooden cube, 4 inches on each edge, is cut into eight 2-inch cubes. What is the sum of the surface areas of the eight cubes, in square inches?

56. _____

Three tennis balls are stacked tightly in a cylindrical can. What fraction of the volume of the can is filled by the balls? Express your answer as a common fraction.

57. _____

What is the product of all real numbers x such that $x^3 + 2x^2 - 6x - 12 = 0$?

58. _____

What is the value of $25^2 - (20)(30)$?

59. _____

What is the sum of all four-digit positive integers that contain each of the digits 6, 7, 8 and 9?

60. _____ What is the geometric mean of $\sqrt{7}$ and $7\sqrt{7}$?
61. _____ In a sequence of numbers, each term after the second is the sum of the two previous terms. The first three terms are 3, 3, 6. What is the value of the first term greater than 200?
62. _____ (arrange-
ments) How many more unique arrangements of the letters in the name JESSE are there than in the name ALANA?
63. _____ What is the greatest value of x such that $x^2 - 11x + 30 = 0$?
64. _____ What is the value of the expression:
 $1 \times 9 + 2 \times 99 + 3 \times 999 + 4 \times 9999 + 5 \times 99999$?
65. _____ (in²) Two 8.5-inch by 11-inch sheets of paper are lying flat on an otherwise unoccupied 2-foot by 3-foot tabletop. Exactly 700 in² of the table are not covered by the sheets of paper. What is the area of the overlap of the two sheets, in square inches?
66. _____ Square WXYZ in the coordinate plane has vertices W(2, -7), X(-6, 8), Y(9, 16) and Z(a , b). What is the value of $a + b$?
67. _____ What is the least value of x that is a solution of $5 + \frac{3}{x} = \sqrt{5 + \frac{3}{x}}$? Express your answer as a common fraction.
68. _____ (feet) On a scale model of a building, one room measures $2\frac{3}{8}$ inches long by $1\frac{7}{8}$ inches wide. If the actual room is 19 feet long, how many feet wide is it?
69. _____ (units) Two legs of a right triangle have lengths 10 and 15. What is the length of the hypotenuse, in units? Express your answer in simplest radical form.
70. _____ Jim eats two-fifths of a chocolate bar and leaves the remaining three-fifths in the kitchen. Marie comes in and eats one-third of the remaining bar, and then Sage finds it and eats one-fourth of what's left. What fraction of the original chocolate bar remains? Express your answer as a common fraction.

71. _____ (frapts) On Mercury, 13 farfels equal 14 freks, 7 freks equal 16 fremps, 8 fremps equal 11 frindels, 12 frindels equal 9 frapts. How many frapts is 26 farfels?
72. _____ (cubes) How many cubes of edge length 0.5 inches are needed to fill a cube with edge length 2 inches?
73. _____ What is the slope of the perpendicular bisector of the segment connecting points (20, 15) and (19, 84)? Express your answer as a common fraction.
74. _____ What is the arithmetic mean of $27^{-\frac{1}{3}}$, $27^{-\frac{2}{3}}$ and 27^{-1} ? Express your answer as a common fraction.
75. _____ (cm) Larry needs three pieces of ribbon totaling 30 meters in length for an art project. He needs one piece of ribbon that is 15 cm longer than twice the length of the shortest piece, and he needs another piece that is 30 cm shorter than three times the length of the second piece. What is the length of the shortest piece of ribbon that Larry needs, in centimeters?
76. _____ (hours) How many hours are in $\frac{1}{28}$ of one week?
77. _____ What is the sum of the odd integers from 1 through 17, inclusive?
78. _____ If $\frac{48}{2x+5y} = \frac{24}{3x-2y}$, what is the ratio of x to y ? Express your answer as a common fraction.
79. _____ (dollars) Rich works for Wall Smart earning \$20 per hour. By mistake his wage was reduced by 50%. To attempt to fix the mistake, his reduced wage is increased by 50%. How many dollars does Rich currently earn per hour?
80. _____ For what value of c does the parabola given by $y = x^2 - 10x + c$ have exactly one x -intercept?

MATHCOUNTS®

2017 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2017 MATHCOUNTS® Chapter Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2017 Chapter Competition Sprint Round

1. The real number 21.476 is not an integer. It is greater than 20.500 but less than 21.500, so **21** is the nearest integer.
2. The highest mark on the beaker is 500 mL, so the other numbers at the lower-level marks are also in terms of milliliters. The top of the blue region, corresponding to the amount of solution in the beaker, is very close to the 300 mark—certainly much closer than to the 200 and 400 marks. Therefore, to the nearest 100 mL, the volume of the solution in the beaker is **300** mL.
3. The first number Debbie says is 110;
the second number is 5 more, so 115;
the third number is 5 more, so 120;
the fourth number is 5 more, so 125;
the fifth number is 5 more, so **130**.
More generally, the n th number Debbie would say is $110 + 5(n - 1)$. Here $n = 5$.
4. Remember that multiplications are to be done before subtractions unless overridden by parentheses. We can explicitly write the parentheses to remind ourselves:
 $7 \times 6 - 5 \times 4 = (7 \times 6) - (5 \times 4) = 42 - 20 = \mathbf{22}$.
5. One dozen eggs is 12 eggs. The eggs plus the carton weigh 32 oz, of which 2 oz is the carton, leaving 30 oz for the eggs. Since 12 eggs weigh 30 oz, the average weight for each egg is $\frac{30 \text{ oz}}{12 \text{ egg}} = \frac{6 \times 5 \text{ oz}}{6 \times 2 \text{ egg}} = \frac{5 \text{ oz}}{2 \text{ egg}} = \mathbf{2.5}$ ounces per egg.
6. $1 \text{ cbl} = 240 \text{ yd} = 240 \text{ yd} \times \frac{3 \text{ ft}}{1 \text{ yd}} = \mathbf{720 \text{ ft}}$.
7. Putting Velma's 7 scores in increasing order yields 84; 86; 88; 94; 95; 99; 100. For 7 scores, $(7 + 1)/2 = 4$ yields the fourth score being the median, with 3 below and 3 above. The fourth score is **94**.
8. Since $1/2$ of the students joined, $1 - 1/2 = 1/2$ did not join, which constitutes 13 students. Therefore, the total number of students is $\frac{13}{1/2} = 13 \times 2 = \mathbf{26}$.
9. Remember that multiplications are to be done before subtractions unless overridden by parentheses. We can explicitly write the parentheses to remind ourselves:
 $100 - \frac{10}{0.1} = 100 - \left(\frac{10}{0.1}\right) = 100 - \left(\frac{10 \times 10}{10 \times 0.1}\right) = 100 - \left(\frac{100}{1}\right) = 100 - 100 = \mathbf{0}$.
10. There are 5 gaps going from A through F corresponding to $(20 - 10)$ units = 10 units. Therefore, each gap is $10 \text{ units} / 5 = 2$ units long. Going from C through F covers 3 gaps, so the length of that segment is $3 \text{ gap} \times \frac{2 \text{ units}}{\text{gap}} = \mathbf{6 \text{ units}}$.
11. Let n be the number of 6th graders. Then $n/4$ is the number of 8th graders. The two together total 100 students, so $100 = n + \frac{1}{4}n = \frac{5}{4}n$, so $n = \frac{4}{5} \times 100 = \mathbf{80}$.

12. There are 12 “unit” triangles—six in the left half and six in the right half. The truss as a whole is 1 triangle. The only question left now is how many compound (bigger than unit) triangles but smaller than the whole truss. Starting from the left vertex of the truss, each segment connecting the bottom edge and the upper left edge of the truss combined with the bottom and upper left edges toward the left vertex form a triangle. The leftmost connecting segment forms a unit triangle so it must not be counted again. However, the other 5 connecting segments do form a triangle not yet counted; there are likewise 5 such compound triangles in the right half of the truss. Adding them together yields $12 + 1 + 5 + 5 = \mathbf{23}$ triangles in total.
13. For each group of 5 cats there are 7 dogs, which is 2 more than the number of cats. Since we want 3 times that difference, we need 3 times as many cats, so 3×5 cats = **15** cats.
14. The base of the triangle is 5 in.
The area enclosed by the triangle is 30 in^2 ,
which is half the base times the height (h),
Therefore, $30 \text{ in}^2 = \frac{1}{2} \times 5 \text{ in} \times h$, so
 $h = 2 \times \frac{30 \text{ in}^2}{5 \text{ in}} = 2 \times 6 \text{ in} = \mathbf{12}$ in.
15. $\left(\frac{1}{3}\right)^{-2} = \left(\frac{3}{1}\right)^2 = 3^2 = \mathbf{9}$.
16. $a + 5 < 12$ and $a > 0$, so $0 < a < 12 - 5 = 7$. Thus, a can be any integer from 1 through 6, the sum of which would be the 6th triangular number, $6(6 + 1)/2 = 6 \times 7/2 = 3 \times 7 = \mathbf{21}$.
17. Since 90 students bike out of the total 360 students, this corresponds to a percentage of
 $\frac{90}{360} \times 100\% = \frac{\cancel{90}}{\cancel{90} \times 4} \times 100\% = \mathbf{25\%}$.
18. If the camel is carrying 25 small jugs, then the camel can carry $30 - 25 = 5$ more small jugs or
 $5 \text{ small} \times 18 \text{ large}/30 \text{ small} = \mathbf{3}$ large jugs.
19. $\frac{1}{2}\% = 0.5 \times 0.01 = \mathbf{0.005}$.
20. The quadratic $x^2 + 5x + 6 = 0$ factors to $(x + 2)(x + 3) = 0$. So, the solutions are $x = -2$ and $x = -3$,
which sum to $-2 + (-3) = \mathbf{-5}$.
21. $\frac{1000}{2^3 \times 5^2} = \frac{1000}{2 \times 2^2 \times 5^2} = \frac{1000}{2 \times 10^2} = \frac{1000}{2 \times 100} = \frac{10}{2} = \mathbf{5}$.
22. The first $\frac{1}{2}$ mi costs \$2.25. For a 3 mi ride, there remains $2\frac{1}{2}$ mi = $\frac{5}{2}$ mi = $\frac{10}{4}$ mi, with each $\frac{1}{4}$ mi costing 75 ¢ = \$0.75. Thus, 10 times this distance is 10 times this price, or $10 \times \$0.75 = \7.50 .
The total price is then $\$2.25 + \$7.50 = \mathbf{\$9.75}$.
23. A total of 68 students are 7th graders, of which 40 are girls. The remaining $68 - 40 = 28$ are 7th-
grade boys. The rest of the 54 total boys are 8th graders, thus $54 - 28 = \mathbf{26}$ boys in the 8th
grade.

24. First aim for the largest number of thousands—use 7 from 2017 and 6 from 2016. Then aim for the largest number of hundreds using what is left, which must be a 2 and a 1, since we are not allowed to use the same digit twice for one place value. Then aim for the largest number of tens using what is left—that might seem like 1 and 2, but then we would have both 0's for the ones; the next best we can do is 0 and 2. That leaves 1 and 0 for the ones. Therefore:

$$7201 + 6120 = \mathbf{13\ 321}.$$

25. $1 = \frac{x}{12} + \frac{y}{36} = \frac{3x+y}{36}$, which implies $3x + y = 36$. Since $3x$ and 36 are both divisible by 3, then so must be y as the difference of two multiples of 3. The only positive integers less than 36 (must keep $x > 0$) that are multiples of 3 are $1 \times 3, 2 \times 3, 3 \times 3, \dots, 11 \times 3$. Thus, there are **11** such values.

$$\begin{aligned} 26. \quad 55 \times 59 - 53 \times 57 &= (57 - 2)(57 + 2) - (55 - 2)(55 + 2) \\ &= 57^2 - 2^2 - (55^2 - 2^2) \\ &= 57^2 - 55^2 \\ &= (57 + 55)(57 - 55) \\ &= 112 \times 2 = 224 = 15^2 - 1, \end{aligned}$$

so $x = \mathbf{15}$.

27. A consequence of the two given patterns is $1^3 + 2^3 + \dots + n^3 = (1 + 2 + \dots + n)^2 = s^2$. Now, $s = 1 + 2 + \dots + n = \frac{n(n+1)}{2}$. Here we have $n = 8$, so $s = \frac{8 \times 9}{2} = \mathbf{36}$.

28. The radius r of a circle inscribed in a triangle is equal to the area A enclosed by the triangle divided by the semiperimeter s of the triangle. We are given that circle Q has enclosed area $4\pi \text{ in}^2 = \pi r^2$, so $r = 2 \text{ in}$.

Let $X, Y,$ and Z be the points of tangency of circle Q with segments $AB, AC,$ and $BC,$ respectively. $BX = BZ = r = 2 \text{ in}$, and $AY = AX = AB - BX = 6 \text{ in} - 2 \text{ in} = 4 \text{ in}$. Let $d = CY = CZ$. With the right triangle, we have $(AB)^2 + (BC)^2 = (AC)^2$, so $(6 \text{ in})^2 + (2 \text{ in} + d)^2 = (4 \text{ in} + d)^2$. Therefore, $36 \text{ in}^2 + 4 \text{ in}^2 + 4d \text{ in} + d^2 = 16 \text{ in}^2 + 8d \text{ in} + d^2$, so $24 \text{ in}^2 = 4d \text{ in}$, and $d = 6 \text{ in}$. This means $AB = 6 \text{ in}$, $BC = 2 \text{ in} + 6 \text{ in} = 8 \text{ in}$, and $AC = 4 \text{ in} + 6 \text{ in} = 10 \text{ in}$. Thus, we have a 3-4-5 right triangle with scale factor 2 in. The area enclosed by the triangle is $A = \frac{1}{2} \times 6 \text{ in} \times 8 \text{ in} = \mathbf{24 \text{ in}^2}$.

29. The only ways to achieve 30 ¢ are:

3D All 3D must be H and all 4N must be T—only 1 way to do this;

2D 2N 2DH, 1DT, 2NH, 2NT— $C(3, 2) \times C(4, 2) = 3 \times 6 = 18$ ways to do this;

2D 1N 5P 2DH, 1DT, 1NH, 3NT— $C(3, 2) \times C(4, 1) = 3 \times 4 = 12$ ways to do this;

1D 4N 1DH, 2DT, 4NH— $C(3, 1) \times C(4, 4) = 3 \times 1 = 3$ ways to do this;

1D 3N 5P 1DH, 2DT, 3NH, 1NT— $C(3, 1) \times C(4, 3) = 3 \times 4 = 12$ ways to do this.

Total ways to achieve 30 ¢ is $1 + 18 + 12 + 3 + 12 = 46$; $2^{12} = 4096$ total options.

Therefore, $46/4096 = \mathbf{23/2048}$.

30. $a + b^2 + c^3 + d^4 + e^5 = 2$ requires either (1) two of the five terms to be 1 and the remainder be 0, or (2) three of the five terms have value 1, one term has value -1 , and the remaining term has value 0.

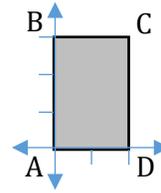

Case (1) has 3 subcases: (a) The two nonzero cases are chosen from a , c , and e . The two nonzero values must be 1 and the third value must be 0. There are 3 choices (a , c , and e) for which one is nonzero. (b) One of a , c , and e must be 1 and one of b and d must be $+1$ or -1 , with the rest being 0, which constitutes $3 \times 4 = 12$ choices. (c) Each of b and d must be $+1$ or -1 , with all other terms 0, which constitutes 4 choices. These 3 subcases add up to 19 possibilities for Case (1).

Case (2) has 2 subcases: (a) Each of b and d is $+1$ or -1 (contributing 4 options) and one of a , c , and e must be $+1$, one must be -1 , and one must be 0 (contributing 6 options), so 24 total possibilities. (b) One of b and d is $+1$ or -1 and the other is 0 (contributing 4 options), with two of a , c , and e being $+1$ and the other being -1 (contributing 3 options), so $4 \times 3 = 12$ choices. These 2 subcases add up to 36 possibilities for Case (2).

Combining the 2 cases yields $19 + 36 = 55$ total possibilities.

2017 Chapter Competition Target Round

1. The area enclosed by the rectangle is the product of the width times height.
The width is 2 units – 0 units = 2 units and height is 3 units – 0 units = 3 units, so the area is 2 units \times 3 units = **6 units²**.

2.

$$0.5^3 = 0.125$$

$$0.3^3 = 0.027$$

$$\frac{3^5}{5^3} = 1.944$$

$$\begin{aligned} 0.5 \times 0.3 \\ = 0.150 \end{aligned}$$

$$\begin{aligned} 0.3 \div 0.5 \\ = 0.600 \end{aligned}$$

The greatest absolute difference occurs with the greatest value minus the least value, which is $1.944 - 0.027 = \mathbf{1.917}$.

3. Let $a = \#$ adult tickets sold and $s = \#$ student tickets sold. We are to find the value of a , given:
 $a + s = 139$;

$\$13.50a + \$8.50s = \$1576.50$, which can be divided through by $\$$ to remove the $\$$ signs.

Therefore,

$$\begin{aligned} 1576.5 &= 13.5a + 8.5s \\ &= (5 + 8.5)a + 8.5s \\ &= 5a + 8.5a + 8.5s \\ &= 5a + 8.5(a + s) \\ &= 5a + 8.5(139) \\ &= 5a + 1181.5. \end{aligned}$$

Therefore, $5a = 1576.5 - 1181.5 = 395$, so $a = 395/5 = \mathbf{79}$.

4. There must be at least two 2's in order for 2 to be the mode. There cannot be more than two 2's, though, because that would make the median of four values be 2, which contradicts the given information. To have the median be greater than 2, the other two values must both be greater than 2. Therefore, in increasing order the four values must be 2; 2; a ; b . It is the value of b that we are to find. For the median to be 4, we must have $(2 + a)/2 = 4$, so $2 + a = 8$ and $a = 6$. For the mean of all four values to be 5, we must have $(2 + 2 + 6 + b)/4 = 5$, so $10 + b = 20$ and $b = \mathbf{10}$.

5. Pay attention to units, especially for given information versus for final results. It helps to put all units into the calculation and manipulate them algebraically (just like variables) in order to keep them straight and compare with the units you ultimately need:

$$4000 \text{ bill} \times \frac{0.9 \text{ oz}}{25 \text{ bill}} \times \frac{1 \text{ lb}}{16 \text{ oz}} = 4000 \times \frac{0.9}{400} \text{ lb} = 10 \times 0.9 \text{ lb} = \mathbf{9 \text{ lb}}$$

$$6. \quad c = \frac{a+b}{2}.$$

$$d = \frac{b+c}{2} = \frac{b + \frac{a+b}{2}}{2} = \frac{a+3b}{4}.$$

$$6 = \frac{c+d}{2} = \frac{\frac{a+b}{2} + \frac{a+3b}{4}}{2} = \frac{3a+5b}{8}.$$

Therefore, $48 = 3a + 5b$.

Clearly $(a; b) = (16; 0)$ satisfies this equation but $b > 0$ is required in the statement of the problem. Other integer solutions can be obtained by successively subtracting 5 from a and adding 3 to b [the coefficients of b and a , respectively, in $48 = 3a + 5b$]:

$(a; b) = (11; 3)$, which satisfies the last remaining criterion $a > b$. The next possibility is $(a; b) = (6; 6)$, which fails that criterion. Therefore, the only integer solution satisfying all the criteria is $(a; b) = (11; 3)$, so $a = \mathbf{11}$.

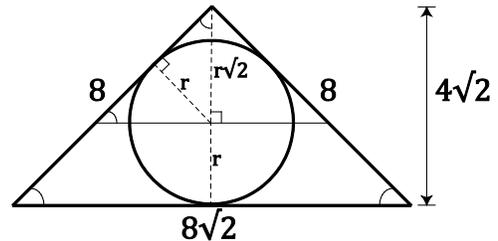

7. Jack must go down $3/5$ of the hill while Jill goes up $2/5$ of the hill. Jack must go a distance that is $1/5$ of the hill greater than Jill. Since the hill is 1260 ft, Jack must travel $(1260/5)$ ft = 252 ft more than Jill, and this occurs in 2 min = 120 s time (converting to seconds since the result is to be in feet per second). Therefore, Jack must be going faster than Jill by $\frac{252 \text{ ft}}{120 \text{ s}} = \mathbf{2.1}$ ft/s.
8. We want the probability that at least two of the ten students draw the same chip, which is the same as 1 minus the complementary probability, namely that no repeat selections are made. There are always 25 chips to draw from. For the second student, there are 24 chips to choose that do not match the selection of the previous student. For the third student, there are 23 chips to choose that do not match the selection of either of the previous two students. This process continues until the tenth student, for whom there are 16 chips to choose that do not match the selection of any of the previous nine students. Therefore, the probability of having no duplicate is $24 \times 23 \times 22 \times 21 \times 20 \times 19 \times 18 \times 17 \times 16 / 25^9 \approx 0.1244$, and the probability of having at least one duplicate is approximately $1 - 0.1244 = 0.8756$, which rounds to the nearest hundredth as **0.88**. (Note: If you have a factorial button on your calculator, calculating the numerator as $\frac{24!}{15!}$ will be a little easier and less prone to error.)

2017 Chapter Competition Team Round

- The first statement requires the numbers to be in the sequence 1, 4, 7, 10, 13, 16, 19, 22, The second statement requires the value to be greater than 1, so 1 is rejected and 4 is the first Lagado prime.
The next candidate is 7, which is not divisible by 4, so 7 is the second Lagado prime.
The next candidate is 10, which is not divisible by 4 or 7, so 10 is the third Lagado prime.
The next candidate is 13, which is not divisible by 4, 7, or 10, so 13 is the fourth Lagado prime.
The next candidate is 16, which is divisible by 4 (the first Lagado prime), so it is not a Lagado prime.
The next candidate is 19, which is not divisible by 4, 7, 10, or 13, so **19** is the fifth Lagado prime.

- The radius of a circle inscribed in a triangle is the area enclosed by the triangle divided by the semiperimeter of the triangle. The area enclosed by the triangle is $\frac{1}{2} \times 8 \text{ in} \times 8 \text{ in} = 32 \text{ in}^2$. For the semiperimeter, we need to know the length of the hypotenuse, which is $8\sqrt{2} \text{ in}$. Therefore, the semiperimeter is $(8 \text{ in} + 8 \text{ in} + 8\sqrt{2} \text{ in})/2 = (8 + 4\sqrt{2}) \text{ in}$, and the radius of the inscribed circle is $\frac{32 \text{ in}^2}{(8+4\sqrt{2}) \text{ in}} = 8 \text{ in} \times \frac{2-\sqrt{2}}{(2-\sqrt{2})(2+\sqrt{2})} = 8 \text{ in} \times \frac{2-\sqrt{2}}{4-2} = 4 \text{ in} \times (2 - \sqrt{2}) = 4(2 - \sqrt{2}) \text{ in}$. The area enclosed by a circle of such radius is $\pi[4(2 - \sqrt{2}) \text{ in}]^2 = 16(6 - 4\sqrt{2})\pi \text{ in}^2 = 17.248 \dots \text{ in}^2$. The shaded area is, therefore, $32 \text{ in}^2 - 17.248 \dots \text{ in}^2 = 14.752 \dots \text{ in}^2$, which rounds to the nearest hundredth of a square inch as **14.75 in²**.

Note: the radius of the circle can also be found using similar triangles. From the figure, we can see that $r + r\sqrt{2} = 4\sqrt{2}$. Solving for r , we will find the radius is $r = 8 - 4\sqrt{2}$ inches.

- To partition 15 into two positive integers with neither of them exceeding 10, we can have 10 + 5, 9 + 6, and 8 + 7. There are 4 card ranks (10, jack, queen, king) that have value 10 and 1 rank for each of the other values. Each rank has 4 choices based on suit. Therefore, there are 16 cards with value 10 and 4 cards for each of the values 5, 6, 7, 8, and 9. Thus, 10 + 5 has 16×4 options, 9 + 6 has 4×4 options, and 8 + 7 has 4×4 options, for a total of $(16 + 4 + 4)4 = 24 \times 4 = \mathbf{96}$ total options.
- Adding all positive integers from 1 through n constitutes an arithmetic series whose sum is given by $n(n + 1)/2$, which equals $[(n + \frac{1}{2})^2 - \frac{1}{4}]/2$. [This is based on completion of a square.] If we multiply this by 2 we get $\frac{1}{4}$ less than a square (though not a "perfect" square), so let's multiply by another factor of 4 (so now a total factor of 8) to get a subtraction of 1: $4(n + \frac{1}{2})^2 - 1 = (2n + 1)^2 - 1$, which is indeed 1 less than a perfect square. Therefore, the desired factor is **8**.
- Since $AP:PB = 2:3$, P is $\frac{2}{2+3} = \frac{2}{5}$ of the way from A to B. To get from A to B requires moving $13 - (-7) = 20$ in the horizontal direction and $-11 - 4 = -15$ in the vertical direction; $2/5$ of that movement is $20 \times 2/5 = 4 \times 2 = 8$ horizontally and $-15 \times 2/5 = -3 \times 2 = -6$ vertically. Therefore, P has horizontal coordinate $-7 + 8 = 1$ and vertical coordinate $4 + (-6) = -2$. The product of these two components is $1(-2) = \mathbf{-2}$.

6. Six consecutive whole numbers have the form $n, n + 1, n + 2, n + 3, n + 4,$ and $n + 5$, the sum of which is $6n + 15 = 3(2n + 5)$, where n is a non-negative integer, so 3 explicitly divides this value for all non-negative integers n . Now, how about $2n + 5$? Well, $2n + 5$ is 5 for $n = 0$ and 7 for $n = 1$, which have only 1 as a common factor. Therefore, the greatest positive integer guaranteed to divide $6n + 15$ is **3**.
7. The least-valued sequence of 4 consecutive positive integers is 1, 2, 3, 4. The greatest-valued sequence with all values less than 200 is 196, 197, 198, 199. Therefore, there are 196 total sequences to consider as candidates. To have an integer n divisible by 2, $n + 1$ divisible by 3, $n + 2$ divisible by 4, and $n + 3$ divisible by 5 requires having n leave a remainder of 0, 2, 2, and 2 when divided by 2, 3, 4, and 5, respectively. Clearly 2 satisfies the criteria for dividing by 3, 4, and 5; when 2 is divided by 2, it leaves a remainder of 0, so $n = 2$ satisfies all four divisibility criteria. The next greater number that does so is the least common multiple of the divisors 2, 3, 4, and 5, which is $3 \times 4 \times 5 = 60$. Thus, the next values that work are 62, 122, and 182. (The next one, 242, is above the maximum allowed, 196.) Therefore, we have 4 desired values out of 196 candidates, so the probability is $4/196 = 1/49$.
8. In a 30° - 60° - 90° triangle the longer leg is $\frac{\sqrt{3}}{2}$ times as long as the hypotenuse. The hypotenuse constitutes a side of one square and the longer leg a side of a neighboring square. Therefore, each side of square B is $\frac{\sqrt{3}}{2}$ times as long as each side of square A. The area enclosed by similar polygons is proportional to the square of the length of corresponding sides, so the area enclosed by square B is $\frac{3}{4}$ the area enclosed by square A. Likewise, the area enclosed by square C is $\frac{3}{4}$ the area enclosed by square B, which is then $(\frac{3}{4})^2 = 9/16$ (still more than $1/2$) the area of A. Likewise, the area enclosed by square D is $\frac{3}{4}$ the area enclosed by square C, which is then $(\frac{3}{4})^3 = 27/64$ the area enclosed by square A. This is the first one that has less than $1/2$ the area enclosed by square A, so **D** is the answer.
9. For two greater digits to have a sum that is a prime number, the sum must be odd ($1 + 1 = 2$ is an even prime sum of two digits, but almost certainly we will have a larger value, in which case the sum must be odd). For the sum to be odd, one digit must be even and the other digit odd. For the number with such digits to be prime, the even digit must be in the 10s place and the odd digit in the 1s place. Let's start with the greatest possibility—the 80s. The largest prime number in the 80s is 89, and $8 + 9 = 17$, which is prime, so **89** works.
10. For $n^2 + 55$ to be a perfect square, it must be equivalent to a form:
 $(n + m)^2 = n^2 + 2mn + m^2$ with m a positive integer. Therefore, 55 must be of the form $2n + 1, 4n + 4, 6n + 9, 8n + 16, 10n + 25,$ or $12n + 36$ (any larger value yielding $n < 1$). Expressions with both coefficients even cannot yield the odd value 55, so let's consider those with an odd constant term:
 $2n + 1 = 55$ works for $n = 27$;
 $6n + 9 = 55$ has n failing to be an integer;
 $10n + 25 = 55$ works for $n = 3$.
 The sum of the working values is $27 + 3 = 30$.

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

National Competition Sponsor

FOUNDING SPONSORS: National Society of Professional Engineers, National Council of Teachers of Mathematics and CNA Foundation

Copyright MATHCOUNTS, Inc. 2017. All rights reserved.

1. _____ inches If the total area enclosed by the seven congruent squares shown is 112 in^2 , what is the perimeter of the outer polygon?

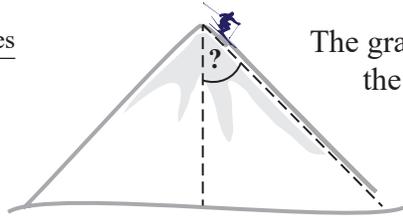

2. _____ Sasha added all but one of the first ten positive integers together. Her sum is a square number. Which integer did Sasha not include?

3. _____ If $\frac{x+1}{x} = 2$, what is the value of $\frac{x^2+1}{x^2}$?

4. \$ _____ For every \$50 worth of supplies Bill buys at a local hardware store, he receives a \$5 discount. If Bill bought \$846 worth of supplies from this store, what was the cost after the discounts were applied?

5. _____ Ayasha, Beshkno, and Chenoa were all born after 2000. Each of them was born in a year after 2000 that is divisible by exactly one of the prime numbers 2, 3 or 5. Each of these primes is a divisor of one of the birth years. What is the least possible sum of their birth years?

6. _____ degrees

The grade of a ski slope is the ratio of the vertical drop to the horizontal distance. What is the measure of the angle between the ski slope and the vertical, as shown, of a ski slope whose grade is 100%?

7. _____ percent

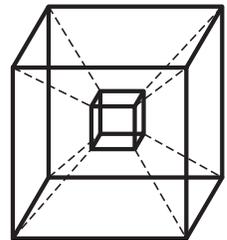

Jeff has been collecting string and has wound it into a sphere with a diameter of 1.2 meters. He has collected enough additional string to increase the diameter of the sphere by 0.2 meters. What is the percent increase in the radius of the sphere? Express your answer as a decimal to the nearest tenth.

8. _____ baskets

Allie plays basketball with her friends and makes 10 baskets. If each basket is worth either 2 or 3 points, and Allie scores a total of 26 points, how many baskets worth 3 points did she make?

9. _____ cm^3

A small cube is built inside a large cube as shown. The edge length of the large cube is four times the edge length of the small cube. If the small cube has volume 5 cm^3 , what is the volume of the space inside the large cube surrounding the small cube?

10. _____

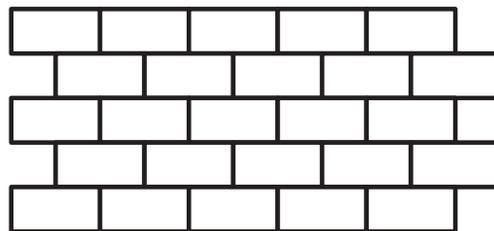

Andre can complete $\frac{5}{6}$ of a job in $\frac{3}{4}$ of the time that it takes Michael to do the whole job. What is the ratio of the rate at which Andre works to the rate at which Michael works? Express your answer as a common fraction.

11. _____ grains Eleven boastful bees are all lined up in a row. Each bee, after the first one, brags that it collected one more than twice as many grains of pollen as the bee in front of it. If the first bee has 100 grains of pollen, how many grains did the last bee collect?

12. _____ The mean of a list of nine numbers is 17, and the modes are a , b and c . If $a + 4$, $1 + b$ and $c - 8$ are distinct numbers in the list, and none of them are modes of the list, then what is the value of $3(a + b + c)$?

13. _____ in² The perimeter of a rectangle is 40 inches and each diagonal of the rectangle is 18 inches long. What is the area of this rectangle?

14. _____ ways The figure shows five rows, each containing five bricks. In how many ways can Mario choose five bricks, one in each row, so that any two bricks chosen in adjacent rows are adjacent?

15. _____ What is the least positive base-10 integer that can be written as a 4-digit number in base 3 and as a 3-digit number in base 4?

16. _____ If x and y are integers such that $(x - 3)^2 + (y + 4)^2 = 25$, what is the greatest possible value of $x^2 + y^2$?

17. _____ A positive integer q is the product of a prime number and a perfect square. Additionally, q is the product of a different prime number and a perfect cube. What is the least possible value of q ?

18. _____ If $\frac{3}{2-x} + \frac{2}{y+3} = 1$ and $\frac{2}{2-x} + \frac{8}{y+3} = 2$, what is the value of x ?

19. _____ A pole of radius 1 inch and height h inches is perpendicular to the ground. A snake is coiled around the pole in a spiral pattern, making a 60-degree angle with the ground. If the snake is 9π inches long and reaches from the ground to the top of the pole, then h can be written in the form $a\pi\sqrt{b}$, where a is a rational number and b is a positive integer that is not divisible by the square of any prime. What is the value of $a + b$? Express your answer as a common fraction.

20. _____ The median of the five numbers $2^{(3^4)}$, $2^{(4^3)}$, $3^{(2^4)}$, $4^{(3^3)}$ and $4^{(2^3)}$ is equal to p^k for some prime number p and some positive integer k . What is the value of $p + k$?

26. _____ A triangle in the coordinate plane has vertices at $(-4, 0)$, $(6, 0)$ and $(0, 5)$. The line $y = \frac{5}{4}x + c$, where c is a positive number, divides the triangle into a trapezoid and a smaller triangle whose areas, respectively, are in the ratio 5:4. What is the value of c ? Express your answer as a common fraction.

27. _____ ways In how many ways can 20 identical coins be given to 4 distinct people so that each person gets at least 2 coins?

28. _____ What is the sum of all values of x that satisfy the equation $\frac{x^{x-3}}{x} = \frac{x}{x^{\frac{4}{x}}}$?

29. _____ Lines AB and DC are parallel, and transversals AC and BD intersect at a point X between the two lines so that $\frac{AX}{CX} = \frac{5}{7}$. Points P and Q lie on segments AB and DC, respectively. The segment PQ intersects transversals BD and AC at points M and N, respectively, so that $PM = MN = NQ$. What is the ratio $\frac{AP}{BP}$? Express your answer as a common fraction.

30. _____ Suppose that a is a number such that the system of equations

$$\begin{aligned} |2x| - y &= 5 \\ x - |2y + 2| &= a \end{aligned}$$

has an odd number of distinct solutions. What is the product of all possible values of a ?

Forms of Answers

The following list explains acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$

Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}$, $1\frac{1}{2}$

Problem: What is the sum of the lengths of the radius and the circumference of a circle with diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$

Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}$, $\frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}$, $\frac{3}{\pi}$, $\frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}$, $\frac{1}{3}$, 3.5, 2:1

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is the value of $\sqrt{15} \times \sqrt{5}$? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c both are zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent unless otherwise specified. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not perform any intermediate rounding (other than the “rounding” a calculator does) when calculating solutions. All rounding should be done at the end of the computation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3

Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole number answers should be expressed in their whole number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

7. _____ units²

The figure shows right triangle ABC with side lengths 5, 12 and 13. Squares are drawn on each side, and segments DE, FG and HI are drawn between vertices of the squares as shown. What is the area of hexagon DEFGHI?

8. _____ units

An M-shaped curve is created by graphing the parabola $y = x^2$ in the coordinate plane, and then reflecting the part of the parabola that is above the line $y = 1$ across the line $y = 1$. There is a horizontal line that intersects the M-shaped curve at four points A, B, C, and D so that $AB = BC = CD$. What is the distance AB? Express your answer as a common fraction in simplest radical form.

■ State Competition ■
Team Round
Problems 1–10

School _____
Chapter _____
Team _____, Captain
Members _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ The product of three consecutive integers is 157,410. What is their sum?
2. _____ kg Lorie wants to create a coffee blend that has regular coffee mixed with premium coffee in a ratio of 4:1. She starts with 100 kg of blend in which the ratio of regular to premium coffee is 3:2. How many kilograms of regular coffee does she need to add to get her desired 4:1 ratio?
3. _____ triples How many ordered triples of integers (x, y, z) satisfy $x^2 + y^2 + z^2 < 3$?
4. _____ Triangle PQR has vertices P(12, 10), Q(1, 3) and R(4, 9). An altitude of triangle PQR lies on a line that passes through point P and is perpendicular to QR. What is the y -intercept of that line?
5. _____ If a, b, c and d are nonnegative integers such that $\frac{a!b!}{c!d!} = 420$, what is the least possible value of $a + b + c + d$?

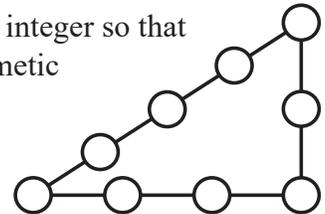

6. _____ ways In Dualia, citizens pay for goods using only one-dollar bills, two-dollar bills and four-dollar bills. How many ways are there for a citizen to pay for an antique abacus that costs 2017 dollars using one or more of these three denominations?

7. _____ degrees

Triangle ABC, shown here, is isosceles with $AC = BC$. P lies on side BC so that the segment AP bisects angle BAC. D is located outside triangle ABC on ray BC. Q is on side AB so that triangle DQB is similar to triangle APB. R lies on side AB so that the segment DR bisects angle QDB. If the angle bisectors AP and DR intersect at a right angle, as shown, what is the degree measure of angle ABC? Express your answer as a common fraction.

8. _____ Each circle in the figure is to contain a distinct positive integer so that the numbers on each edge of the triangle form an arithmetic sequence in either increasing or decreasing order. Let x represent the greatest integer in the completed figure. What is the least possible value of x ?

9. _____ feet Eddie and Missy are swimming laps in parallel lanes of a swimming pool at different constant speeds. They start simultaneously at opposite ends of the pool. They first pass each other when Eddie has swum 72 feet. Both turn back when they reach the opposite ends, and they next pass each other when Eddie is 40 feet from Missy's starting point. What is the length of a lap?

10. _____ units² In right triangle ABC, $AB = 5$, $BC = 12$ and $AC = 13$. P lies on side AC so that ray BP bisects angle ABC. Q and R lie on side BC so that $BQ = QR = RC$. Segments AQ and AR intersect segment BP at X and Y, respectively. What is the area of quadrilateral QRYX? Express your answer as a common fraction.

Copyright MATHCOUNTS, Inc. 2017. All rights reserved.

1. _____ If 60% of the students in a class are boys, what is the ratio of girls to boys?
Express your answer as a common fraction.

2. _____ In the figure, six of the seven congruent inner circles are tangent to the outer circle, to the central circle and to two other adjacent circles. What fraction of the largest circle's area is gray? Express your answer as a common fraction.

3. _____ What is the sum of all values of x such that the parabola $y = \frac{2}{3}x^2 + 7x + 14$ passes through the point $(x, \frac{32}{3})$? Express your answer as a common fraction.

4. _____ If the 6-digit number $82N281$ is equal to 909^2 , what digit does N represent?

5. _____ (numbers) How many 4-digit numbers are there in base 5?

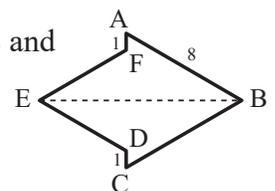

6. _____ (m^3) The surface area of a cube is $54 m^2$. What is its volume, in cubic meters?

7. _____ (dollars) Alton's bank will transfer money from his account to Justin's account at another bank but, as a fee, will deduct 10% of the amount of money transferred. To the nearest dollar, how much must Alton transfer so that Justin receives \$3000?

8. _____ What is the value of $\frac{2018!}{2016! + 2017!}$?

9. _____ (people) Of 1000 people surveyed, each person owned a cat, a dog or both. One-third of the 630 people who owned a cat also owned a dog. How many of the people surveyed owned a dog?

10. _____ (units) The polygon shown is composed of equilateral triangles ABC and DEF . If $AB = 8$ units and $FA = CD = 1$ unit, what is BE , in units? Express your answer in simplest radical form.

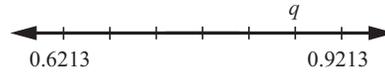

11. _____ What is the units digit of $4^{2017} - 3^{2017}$?

12. _____ What integer is equivalent to $(\frac{1}{2})^{-3}$?

13. _____ If $(a^{\sqrt{a}})^2 = 256$, what is the value of a ?

14. _____ What is the greatest negative integer solution to the absolute value inequality $\left| \frac{2x-7}{5} \right| > 4$?

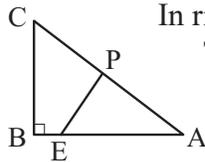

15. _____ A portion of a number line is divided into six equal parts as shown. What is the value of q ? Express your answer as a decimal to the nearest ten-thousandth.

16. _____ (combinations) A milkshake is made by blending three of five flavors: chocolate, vanilla, strawberry, cherry and peach. How many different combinations of three distinct flavors are possible?

17. _____ What value of n makes the equation $n^{n-1} + (n-1)^n = 145$ true?

18. _____ (units) In right triangle ABC, shown here, BA = 8 units and BC = 6 units. The perpendicular bisector of side AC intersects side AB at E. What is the length of segment AE, in units? Express your answer as a common fraction.

19. _____ What is the least common multiple of 6, 10 and 14?

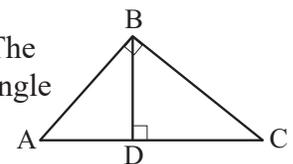

20. _____ (degrees) The interior angle measures in an octagon form an arithmetic sequence. The largest angle measures 156 degrees. What is the degree measure of the smallest interior angle?

21. _____ What is the greatest integer x for which $(x^2)! \leq (x!)^2$?

22. _____ What is the sum of the numerical coefficients of the expansion of $(2x + 2y)^5$?

23. _____ (years) The mean age of three students is 20 years. All three of the students are at least 18 years old. What is the greatest possible age of the oldest student, in years?

24. _____ (units) Right triangle ABC, shown here, has sides of integer length. The length of altitude BD is 12 units. What is the perimeter of triangle ABC, in units?

25. _____ If $\frac{1}{6}$ of 400 equals $\frac{5}{6}$ of x , what is the value of x ?

26. _____ (integers) $C(19, k)$ denotes the number of combinations of k items chosen from a group of 19 items. For how many integers k from 0 to 19, inclusive, is $C(19, k)$ divisible by 19?

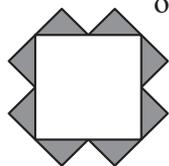

27. _____ The mean of six evenly spaced numbers is 2017. What is the sum of the mean and the median of the six numbers?

28. _____ A certain island has 14 towns. Each pair of towns is connected by a unique road, labeled with a positive integer. The road labels are consecutive positive integers beginning with 1. What is the greatest number used to label a road on the island?

29. _____ When $\sqrt{0.005}$ is written as a decimal, what is the hundredths digit?

30. _____ If $\frac{1}{16}$ of 2^{40} equals 4^k , what is the value of k ?

31. _____ The figure shows two gray rectangles and a white square overlapping. The sides of each rectangle intersect the four midpoints of the square's sides, and the vertices of the square intersect the midpoints of two sides of each rectangle, as shown. What is the ratio of the combined area of the gray regions to the area of the square? Express your answer as a common fraction.

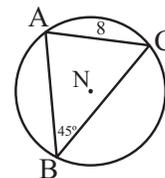

32. _____ What is the least value of z for which $z!$ is a multiple of 50?

33. _____ Given that y varies inversely with x , and $y = 13$ when $x = 57$, what is the value of y when $x = 19.5$?

34. _____ Let a, b, c and d be distinct nonnegative integers such that $a^2 - b^2 = c^2 - d^2$. What is the least possible value of $a + b$?

35. _____ (units²) Triangle ABC is inscribed in circle N as shown. If $\angle ABC$ has measure 45 degrees and $AC = 8$ units, what is the area of circle N , in square units? Express your answer in terms of π .

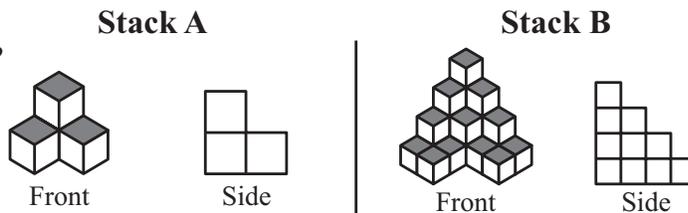

36. _____ What is the value of $(37)(33) - (39)(31)$?

37. _____ If January 1st is on a Monday in a non-leap year, on what day of the week is December 11th in the same year?
38. _____ What is the greatest integer n for which 2^n divides $(10!)(9!)(8!)(7!)(6!)(5!)(4!)(3!)(2!)(1!)$?
39. _____ What is the value of $\frac{1^3 + 2^3 + 3^3 + 4^3 + 5^3 + 6^3}{1 + 2 + 3 + 4 + 5 + 6}$?
40. _____ If $f(n) = \frac{1}{n^2 + n}$, what is the value of $f(1) + f(2) + f(3) + f(4) + f(5) + f(6) + f(7) + f(8) + f(9) + f(10)$? Express your answer as a common fraction.
41. _____ A circle of radius $2\sqrt{2}$ units has center $(0, 0)$. A chord from $(2, 2)$ to $(2, -2)$ divides the circle into two regions. The area of the larger region can be expressed as $a\pi + b$ units². What is the value of ab ?
42. _____ Seven positive numbers form an arithmetic sequence, and their reciprocals form a geometric sequence. If the third term of the arithmetic sequence is 12, what is the greatest possible value of the seventh term?
43. _____ (units) What is the distance, in units, between the points $(3, -5, 7)$ and $(1, -2, 1)$ in three-dimensional space?
44. _____ The integers 1 to 9 are randomly placed into the nine squares of a 3×3 array, one integer per square. What is the probability that the squares containing 1 and 2 share a side or a vertex with each other? Express your answer as a common fraction.
45. _____ If AB and BA are different two-digit numbers with the digits reversed and $AB - BA = 36$, what is the least possible value of the two-digit number AB ?
46. _____ (cm) Two circles, each with radius 6 cm, intersect at A and B such that the segment connecting their centers is divided into three congruent segments by the circles. What is the length, of the common chord AB , in centimeters? Express your answer in simplest radical form.
47. _____ Positive integers w, x, y and z exist such that $\frac{x}{y} = \frac{2w}{z}$ and $\frac{x}{z} = \frac{2y}{w}$. What is the value of $\frac{x}{y}$?

48. _____ What is the sum of all m for which the value of $\frac{2}{m + \frac{3}{m+4}}$ is undefined?

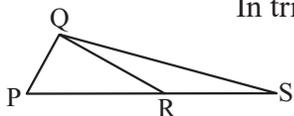

49. _____ What is the value of $\left(1 + \frac{3}{4}\right)\left(1 + \frac{3}{5}\right)\left(1 + \frac{3}{6}\right)\left(1 + \frac{3}{7}\right)$?

50. _____ (in³) In the figure shown, the cubes in stack A have edge length 2 inches, and the cubes in stack B have edge length 1 inch. What is the absolute difference between the volumes of the

51. _____ (people) Three million people paid to watch a movie the weekend the DVD was released. Some paid \$6 to rent the movie, and the rest paid \$15 to buy it. The total payments made were 22.5 million dollars. How many people bought the movie?

52. _____ In triangle PQS, shown here, $\angle PQR$ is a right angle, $PR = 2PQ$ and $QR = SR$. What is the degree measure of $\angle RQS$?

53. _____ What is the sum of the values of s for which $\frac{5}{s} = \frac{s}{35}$?

54. _____ For positive number p , the product $40p$ expressed as a decimal has a nonzero hundredths digit. What is the least possible value of p ? Express your answer as a common fraction.

55. _____ If n and m are numbers such that $n(n + m) = 6$ and $m(n + m) = 18$, what is the value of nm ? Express your answer as a common fraction.

56. _____ (numbers) How many seven-digit numbers have seven distinct nonzero digits that appear in increasing order from left to right?

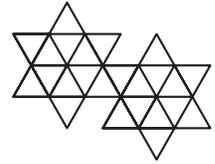

57. _____ What is the least possible value of a^{bc} where a , b and c each represent a different number chosen from the set $\{2, 3, 4\}$?

58. _____ What is the remainder when 38 dozen is divided by 7?

59. _____ (percent) A discount card offers \$10 off any purchase totaling \$100 to \$199.99 or \$25 off any purchase totaling \$200 or more. What is the maximum percent discount that can be obtained using this card? Express your answer to the nearest tenth.

60. _____ A line with slope $\frac{1}{3}$ passing through $(-3, 1)$ intersects a second line with slope $-\frac{2}{3}$ at $(6, a)$. What is the y -coordinate of the y -intercept of the second line?

61. _____ (triangles) How many triangles of any size are in the figure shown here?

62. _____ The number 65,432 is a *countdown* number because each successive digit is one less than its predecessor. What is the sum of all 5-digit *countdown* numbers?

63. _____ Let $(x^x)^{5x} = x^{x^5}$ for $x > 1$. If the value of x , in simplest radical form, is $\sqrt[a]{b}$, what is the value of $a + b$?

64. _____ If $5x + 2 = 4.003$, what is the value of $20x + 7$? Express your answer as a decimal to the nearest thousandth.

65. _____ (mL) The dosage for an antibiotic is 30 mg per kilogram of body weight. Every gram of antibiotic is dissolved in 10 mL of sterile water. In one dose, how many milliliters of the antibiotic solution should be administered to a child weighing 24 kg? Express your answer as a decimal to the nearest tenth.

66. _____ (cm) The length of a 12 cm segment is increased by 50%. The length of the resulting segment is then increased by 50%. After two additional increases, each by 50% of the resulting length, what is the length of the final segment, in centimeters? Express your answer as a common fraction.

67. _____ A sphere is inscribed in a cube. Let P be the ratio of the volume of the sphere to that of the cube, and let Q be the ratio of the surface area of the sphere to that of the cube. What is the value of $\frac{P}{Q}$?

68. _____ (ordered pairs) How many ordered pairs of positive integers (a, b) are there such that $ab = 1200$ and $a - b$ is an odd positive integer?

69. _____ Two single-digit positive integers have a product of 72. What is their sum?

70. _____ What is the absolute difference between the mean and median of the three 9-digit numbers 981,457,623 and 981,457,625 and 981,457,622? Express your answer as a common fraction.

71. (April) _____ Maggie, the goat, gave birth to three kids on March 21. Abigail, the goat, gave birth to twins on April 5. On what date in April will the mean age of all five kid goats be 30 days old?

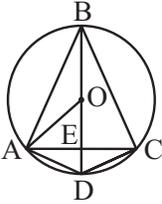

72. _____ What digit does A represent in the equation $1A \times 491 = AA3A$?

73. _____ If $f(x) = x^2 - 2x - 1$, what is the minimum value of $f(|x|)$?

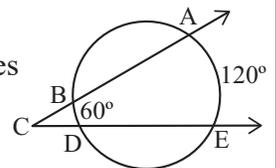

74. _____ In the sequence 1, 1, 2, 3, 5, ... each term after the second term is the sum of the previous two terms. The new sequence 1, 1, -2, 3, 5, ... is created by negating every third term of the original sequence. What is the sum of the first ten terms of this new sequence?

75. _____ After four tests, Lexa has a mean score of 88. What score does she need on the fifth test to raise her mean score to 90?

76. _____ Isosceles triangle ABC has a base of length $5x - 8$ and legs of length $6x - 5$. What is the least possible integer value for x ?

77. _____ (units²)  Kite ABCD is inscribed in circle O. A radius and segments of the two diagonals of the kite form triangle OAE, as shown, with $OE = 6$ units, $AE = 8$ units and $OA = 10$ units. What is the area of the kite, in square units?

78. _____ (degrees) In the figure, arc AE measures 120 degrees and arc BD measures 60 degrees. What is the degree measure of $\angle C$?

79. _____ What is the sum of the infinite sequence $\frac{3}{2}, \frac{3}{4}, \frac{3}{8}, \frac{3}{16}, \dots$, where each term after the first is half of the previous term?

80. _____ (years old) If three less than the product of 13 and Kris' current age equals the sum of three times his age 3 years from now and six times his age 6 years from now, how many years old will Kris be six years from now?

MATHCOUNTS®

2017 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2017 MATHCOUNTS® State Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

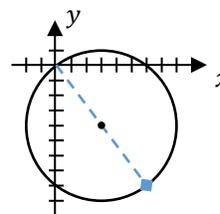

2017 State Competition Sprint Round

1. The 7 congruent squares enclose a total area of 112 in^2 . Therefore, each square encloses $112 \text{ in}^2 / 7 = 16 \text{ in}^2$, each edge having length the square root of that 16 in^2 for a length of 4 inches. Of the 7 squares, 5 are contributing 2 edges to the overall perimeter and 2 are contributing 3 edges. This means the perimeter of the whole figure is composed of $5 \times 2 + 2 \times 3 = 16$ edges, each of length 4 inches. Therefore, the total perimeter is $16 \times 4 \text{ in} = \mathbf{64}$ inches.
2. The sum of the first 10 positive integers is $10 \times 11 / 2 = 55$. The only perfect square from $55 - 10$ to $55 - 1$ is 49, so the missing number is $55 - 49 = \mathbf{6}$.
3. $2 = \frac{x+1}{x}$, so $2x = x + 1$ and $x = 1$. Therefore, $\frac{x^2+1}{x^2} = \frac{1^2+1}{1^2} = \mathbf{2}$.
4. Bill has earned $\left\lfloor \frac{\$846}{\$50} \right\rfloor = 16$ discounts, each worth \$5. The total discounts are $16 \times \$5 = \80 . The final cost of the supplies is $\$846 - \$80 = \mathbf{\$766}$.
5. For integers greater than 2000, the least divisible by 3 is 2001, by 2 is 2002, and by 5 is 2005. These three values sum to $\mathbf{6008}$.
6. Since $100\% = 1 = 1/1$, the horizontal distance and vertical drop are equal, thereby corresponding to a right isosceles triangle, for which the angle is $\mathbf{45^\circ}$.
7. Because the diameter of the sphere increases by 0.2 m from 1.2 m, the values for the radius are half that: an increase by 0.1 m from 0.6 m. The relative increase is the amount of increase divided by the starting value, which expressed as a percentage is $\frac{0.1 \text{ m}}{0.6 \text{ m}} \times 100\% = \frac{100}{6}\% = 16.666 \dots\%$, which rounds to the nearest tenth of a percent as $\mathbf{16.7\%}$.
8. As a minimum, 10 baskets are worth $10 \times 2 \text{ pt} = 20 \text{ pt}$. However, she got $26 \text{ pt} - 20 \text{ pt} = 6 \text{ pt}$ more than that. The "better" baskets are each worth $3 \text{ pt} - 2 \text{ pt} = 1 \text{ pt}$ extra. Therefore, the number of "better" baskets is $\frac{6 \text{ pt}}{1 \text{ pt}/\text{bsk}} = \mathbf{6}$ bsk.
9. Volume is proportional to the cube of length. The outer cube has edges 4 times as long as the inner cube, so the outer cube encloses a volume $4^3 = 64$ times as much volume enclosed by the inner cube, that is, $64 \times 5 \text{ cm}^3 = 320 \text{ cm}^3$. To get the volume of the "gap", we must subtract the volume enclosed by the inner cube: $320 \text{ cm}^3 - 5 \text{ cm}^3 = \mathbf{315 \text{ cm}^3}$.
10. The rate in this problem is the number of jobs completed divided by the time to complete them. Let t be the amount of time Michael takes to do one job, so Michael's rate is $1 \text{ job}/t$. Andre's rate is $\frac{(5/6) \text{ job}}{(3/4)t} = \frac{5}{6} \times \frac{4}{3} \frac{\text{job}}{t} = \frac{20}{18} \frac{\text{job}}{t} = \frac{10}{9} \frac{\text{job}}{t}$, which is $\frac{10}{9}$ times Michael's rate, in the desired form of a common fraction.

11. Let b_i be the number of grains collected by bee number i . Then $b_2 = 2b_1 + 1$, $b_3 = 2b_2 + 1 = 4b_1 + 3$, $b_4 = 2b_3 + 1 = 8b_1 + 7$, and so on. We see that the coefficient of b_1 goes up by a factor of 2 each time and the added constant always stays 1 less than the coefficient of b_1 . We can generalize this into a formula $b_i = 2^{i-1}b_1 + 2^{i-1} - 1$. Therefore, $b_{11} = 2^{10}b_1 + 2^{10} - 1$. If you do not know $2^{10} = 1024$ (which is actually good to know, not just for MATHCOUNTS but because random access memory (RAM) in a computer is often expressed in terms of this relationship), it can be evaluated as $2^{10} = (2^2)^5 = 4^5 = (4 \times 4) \times (4 \times 4) \times 4 = 16 \times 16 \times 4 = 256 \times 4 = 1024$. Therefore, the number of grains collected by the last bee is $1024 \times 100 + 1023 = 102,400 + 1,023 = \mathbf{103,423}$ grains.
12. There are 9 items with 3 modes, and 3 items do not have modal values. Therefore, at most 6 items have modal values, meaning the frequency of each mode is at most 2. Because there are 3 items given that are definitely not modes, the frequency of a mode must be at least 2. Putting these two statements together results in the modes have frequency 2 and other values have frequency 1. Therefore, a , b , and c each occur twice, and $a + 4$, $1 + b$, and $c - 8$ each occur once, making the mean:

$$17 = (2a + 2b + 2c + (a + 4) + (1 + b) + (c - 8))/9 = (3a + 3b + 3c - 3)/9.$$
Now, we want $3a + 3b + 3c$, which is part of the above expression and can be extracted by:
 $9 \times 17 = 3a + 3b + 3c - 3$ and $3a + 3b + 3c = 9 \times 17 + 3 = 153 + 3 = \mathbf{156}$.
13. Let b be the base length of the rectangle and h be the height of the rectangle. We need to find the area bh enclosed by the rectangle. We are given the perimeter $2(b + h) = 40$ in and the length of the diagonal $\sqrt{b^2 + h^2} = 18$ inches. Thus, the semiperimeter is $b + h = 20$ in and the square of the diagonal is $b^2 + h^2 = 324$ in². Squaring the semiperimeter equation yields $b^2 + 2bh + h^2 = 400$ in², which is very similar to the square-of-the-diagonal equation but with a vital extra piece. Taking the square-of-the-semiperimeter equation minus the square-of-the-diagonal equation yields $2bh = 400$ in² - 324 in² = 76 in², and the area is half of this, so $bh = \mathbf{38}$ in². Note that there is no need to find b and h individually to be able to determine their product.
14. Let's work our way across the top row of bricks from left to right. In essence, this involves powers of the binomial $(1 + 1)$, counting the left 1 for a lower-left brick and the right 1 for a lower-right brick; the issue is that not all paths are possible because the wall has ends. For the leftmost brick, the next row down has only a right brick. There are 3 rows below that, so nominally, $(1 + 1)^3 = 8$ options, except LLL and LLR cannot be done: thus, 6 legal paths. For the second brick, with 4 rows below it, there are nominally $(1 + 1)^4 = 16$ options, except LLLL and LLLR cannot be done: thus, 14 legal paths. For the third brick, there are the same number of nominal paths as the previous brick, 16, but this time all of them can be done: thus, 16 legal paths. For the fourth brick, there are again 16 nominal paths, but RRRR cannot be done: thus, 15 legal paths. For the rightmost brick, there are again 16 nominal paths, but this time LRRR, RLRR, RLLL, RLLR, RRRL, and RRRR cannot be done: thus, 10 legal paths. Adding the result of each of these cases yields $6 + 14 + 16 + 15 + 10 = \mathbf{61}$ legal paths.
15. The least positive 4-digit value in base 3 is $1000_3 = 3^3 = 27_{10}$; the least positive 3-digit value in base 4 is $100_4 = 4^2 = 16_{10}$. The least value satisfying both is the greater of the two, namely $\mathbf{27}$. That decimal value is equal to 1000_3 and 123_4 , confirming satisfaction of the stated criteria.

16. $(x - 3)^2 + (y + 4)^2 = 25$ is the equation of a circle centered at the point $(x, y) = (3, -4)$ with radius $\sqrt{25} = 5$. Wanting the maximum value of $x^2 + y^2$ is equivalent to wanting the square of the distance of the farthest point from the origin. Since the origin, $(0, 0)$ is on the circle, the opposite end of the diameter through the origin is the desired point. The diameter is twice the radius, or 10, so the distance of the desired point from the origin is 10, the square of which is **100**. The coordinates of the desired point need not be determined, but the point is at $(x, y) = (6, -8)$.

17. The two least primes are 2 and 3, so q has the form $2^a 3^b$ for some positive integers a and b . The specification that q is the product of a prime and a power in two different ways indicates: $q = 2 \times 2^{a-1} \times 3^b$ and $q = 3 \times 2^a \times 3^{b-1}$, where one of $2^{a-1} \times 3^b$ and $2^a \times 3^{b-1}$ is a perfect square and the other is a perfect cube. To be a perfect square, both of the exponents must be even (divisible by 2); to be a perfect cube, both of the exponents must be divisible by 3. If $2^{a-1} \times 3^b$ is to be the perfect square and $2^a \times 3^{b-1}$ the perfect cube, then a needs to be odd and divisible by 3, and b needs to be even and leave a remainder upon division by 3: The least positive integers satisfying these properties are $a = 3$ and $b = 4$. Similarly, if we reverse the role of the perfect square and perfect cube, we get $a = 4$ and $b = 3$. To obtain the least q , we want the lesser exponent on the greater base, so $a = 4$ and $b = 3$, which yields $q = 2^4 \times 3^3 = 2 \times 6^3 = 2 \times 216 = \mathbf{432}$.

18. Dividing through the second equation by 2, to make both equations equal to 1, yields:

$$\frac{1}{2-x} + \frac{4}{y+3} = 1 = \frac{3}{2-x} + \frac{2}{y+3}.$$

Multiplying through the left and right sides by $(2 - x)(y + 3)$ yields:

$$3(y + 3) + 2(2 - x) = 1(y + 3) + 4(2 - x), \text{ which simplifies to:}$$

$$2(y + 3) = 2(2 - x), \text{ so } y + 3 = 2 - x \text{ and all the denominators match in the original}$$

equations. Therefore, replacing $y + 3$ with $2 - x$ in the first original equation yields

$$5/(2 - x) = 1, \text{ so } 5 = 2 - x \text{ and } x = -3. \text{ Substituting this and } y = -x - 1 = 2 \text{ back into the original equations checks out fine with no divisions by 0.}$$

19. Imagining the pole to be like a rolled-up sheet of paper, make a vertical slice down the pole and unroll it into a flat sheet. The width of the sheet is the circumference of the original pole, which is 2π in, because the radius is 1 inches. The layout of the snake on this sheet forms a 30° - 60° - 90° triangle, with the short leg being the circumference of the pole. For one wind around the pole, the snake goes up vertically $\sqrt{3}$ times as far and “uses up” 2 times as much snake. Therefore, 4π in of snake reaches a height of $2\sqrt{3}\pi$ inches. Since the snake is 9π in long in total, we can set up the ratio $\frac{9\pi}{4\pi} = \frac{h}{2\sqrt{3}\pi}$. Therefore, the total height is $\left(\frac{9}{4}\right)(2\sqrt{3}\pi \text{ inches}) = \frac{9}{2}\sqrt{3}\pi$ inches, so $a = 9/2$ and $b = 3$, and $a + b = \mathbf{15/2}$.
20. Using $4 = 2^2$ and evaluating the exponents simplifies the numbers to be 2^{81} , 2^{64} , 3^{16} , 2^{54} , and 2^{16} . Now, $2^{16} < 3^{16} < 4^{16} = (2^2)^{16} = 2^{32}$. Putting the values in increasing numeric order, we have: 2^{16} , 3^{16} , 2^{54} , 2^{64} , 2^{81} . The median is 2^{54} , and the sum of the prime base and the exponent is $2 + 54 = \mathbf{56}$.

21. Two cases must be considered: first the digits 0 through 4, and second the set of 5 subcases where the least digit is any of 1 through 5 (and greatest digit is 1 through 9). The reason for this split is that in the first case the leftmost digit must not be 0 (because we are required to form 5-digit numbers), whereas in the other case any digit may be used in any position.
 Case 1 (01234): Any of the 4 nonzero digits may be used in the leftmost slot, and then the remaining 4 digits may fill the remaining slots in any order, resulting in $4 \times 4! = 4 \times 24 = 96$ values.
 Case 2 (12345, 23456, 34567, 45678, 56789): In each of the 5 subcases, all 5 digits may fill slots in any order, for $5! = 120$ values per subcase. With 5 subcases, there are $5 \times 120 = 600$ values.
 Combining the two cases yields $96 + 600 = \mathbf{696}$ distinct values.
22. The coin and walls correspond to a circle inscribed in a triangle. The radius of a circle inscribed in a triangle is the area of the triangle divided by its semiperimeter. The triangle is a right triangle so its enclosed area is half the product of the leg lengths:
 $(1.5 \text{ inches})(2.0 \text{ inches})/2 = 1.5 \text{ in}^2$. The semiperimeter is
 $(1.5 \text{ inches} + 2.0 \text{ inches} + 2.5 \text{ inches})/2 = 3 \text{ inches}$. Therefore, the radius of the inscribed circle is $(1.5 \text{ in}^2)/(3.0 \text{ inches}) = 0.5 \text{ inch}$. However, we are to find the diameter, which is double the radius, so $2 \times 0.5 \text{ inch} = \mathbf{1 \text{ inch}}$
23. Let A be the digit for the thousands place and B the digit for the hundreds place. (Note that juxtaposition of these letters with each other or with numerals is merely for concatenation of digits to form numerals and is never intended in this problem to indicate implied multiplication.) The number we are interested in is AB28. Dividing 28 by 16 yields a remainder of 12 and dividing 100 by 16 yields a remainder of 4. Therefore, 128 plus any multiple of 400 is divisible by 16, which means B must be odd. That yields 25 options—unnecessarily many, so let's look at the reverse value, 82BA. Dividing 8200 by 16 yields a remainder of 8, so dividing BA by 16 must also yield a remainder of 8, which yields only 6 options for ba : 08; 24; 40; 56; 72; 88. Remember that B must be odd, so only 56 and 72 are candidates. Indeed, **6528** is divisible by 16, but 2728 is not.
24. The radius of a circle inscribed in a triangle is given by the quotient of the area enclosed by the triangle divided by the semiperimeter of the triangle. In this case, we know the length of each side and the triangle is not a right triangle, so let's use Heron's formula to find the area:
 $A = \sqrt{s(s-a)(s-b)(s-c)}$, where a , b , and c are the lengths of the three sides, and s is the semiperimeter, $(a + b + c)/2$. But we need to divide area, A , by semiperimeter, s , so let's do that as variables before substituting numbers—the desired radius is $\sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$.
 $s = (9 + 13 + 14)/2 = 18$. Therefore, the desired radius is $\sqrt{9 \times 5 \times 4 / 18} = \sqrt{\mathbf{10}}$.
25. Filling in two more boxes shows the first box to the right of the #5 box is #20. This means the first layer for the #5 box has $20 - 5 = 15$ boxes. For the next layer each corner box will trigger 3 new boxes (for example, the upper right corner box will trigger a new box above, a new one to the right, and a new corner box), for a net increase of 2 boxes; all other boxes will trigger one new box for no net change. Since there are 4 corners, that means each layer will add 8 boxes more than the previous layer. The first layer adds 15 boxes, so the second through sixth layers will add $23 + 31 + 39 + 47 + 55$ boxes. This is an arithmetic series with sum
 $(23 + 55) \times 5 / 2 = 195$, which is the count to add to #20 as the first-layer box. Therefore, the desired box has number $20 + 195 = \mathbf{215}$.

26. The line $\frac{5}{4}x + c$ is parallel to the left edge of the triangle. Therefore, when this line cuts the given triangle, the new triangle is similar to the original triangle. The area of the new triangle is to be $4/(4 + 5) = 4/9$ of the original triangle, which means the sides need to be cut down to $\sqrt{4/9} = 2/3$ of the original triangle. The original bottom edge has length 10, so the new bottom edge must have length $20/3$ and have right end at $x = 6$, so the left end must be at $x = -2/3$. Thus, the line must pass through $(x, y) = (-\frac{2}{3}, 0)$, so $0 = (\frac{5}{4})(-\frac{2}{3}) + c = -\frac{5}{6} + c$, and $c = \frac{5}{6}$.

27. Give 8 of the coins split 2 each among the 4 people to satisfy the restriction. This means there are 12 identical coins to distribute among arbitrarily among 4 people. There are $C(12 + 4 - 1, 12) = C(15, 3) = (15 \times 14 \times 13)/(1 \times 2 \times 3) = 455$ distinct distributions.

28. To avoid division by 0, we must disregard 0 as a possible solution.

First cross-multiply: $x^2 = x^{x-3+4/x}$.

There are in general four cases:

1. The base is 1.
2. The base is -1 and the exponents are even.
3. The base is 0 and the exponents are nonnegative. (We have already rejected this, though.)
4. The exponents are equal.

With case 1, 1 is indeed a solution.

With case 2, the exponent on the left is 2 and on the right is 0, both of which are even.

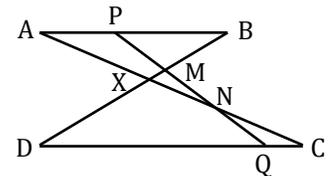

Therefore, -1 is a solution.

With case 4, $2 = x - 3 + 4/x$, so $0 = x^2 - 5x + 4 = (x - 4)(x - 1)$, making 1 and 4 solutions.

The solution 1 is a repeat (cases 1 and 4) and will be counted only once.

The sum is $-1 + 1 + 4 = 4$.

29. The description of the figure is a little hard to keep straight, so let's draw a diagram. For the sake of convenience I put D at the origin and A 3 units up (3 chosen because PQ is split into 3 congruent pieces—ratios are important, not magnitudes, so pick easy-to-work-with magnitudes; also, horizontal shearing has no impact on the result, so choose simplest values). $AB:CD = AX:CX = 5:7$, so let AB have length 5 and CD length 7. Since the y-component of Q and P is 0 and 3, respectively, to make the sub-segments congruent, the y-component of N and M must be 1 and 2, respectively.

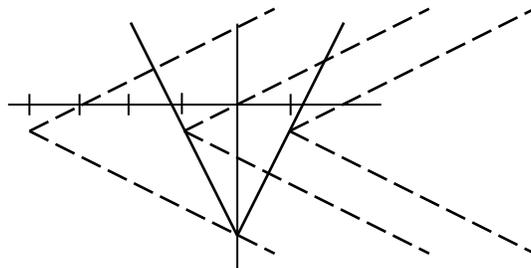

The line through AC has equation $y = 3 - \frac{3}{7}x$, and the line through DB has equation $y = \frac{3}{5}x$.

$1 = 3 - \frac{3}{7}x$ for point N, so the x-component of N is $14/3$; $2 = \frac{3}{5}x$ for point M, so the x-component of M is $10/3$. Going from N to M decreased the x-component by $4/3$; going from M to P will decrease the x-component by another $4/3$, so the x-component of P is $10/3 - 4/3 = 2$ and AP has length 2 and PB has length $5 - 2 = 3$. Therefore, the ratio $AB:BP = 2/3$.

30. The first equation can be rewritten as $y = |2x| - 5$, which is V-shaped with axis of symmetry along the y -axis and vertex at $(0, -5)$ and the second equation as $x = |2y + 2| + a$, which has a V shape opening to the right, axis of symmetry at $y = -1$ and vertex at $(a, -1)$. There are 3 values of a (3 positions of the horizontal V) for which there is an odd number of solutions (x, y) :

1. 1 solution when the vertex touches the right side of the vertical V, which is at $(2, -1)$ and $a = 2$.
2. 3 solutions when the vertex touches the left side of the vertical V, which is at $(-2, -1)$ and $a = -2$.
3. 3 solutions when the vertex of the vertical V touches the bottom side of the horizontal V, which is at $(0, -5)$ and $a = -8$.

Therefore, the product of these 3 values of a is $2(-2)(-8) = \mathbf{32}$.

2017 State Competition Target Round

1. You might or might not recognize $p^3 + q^3 + r^3 + 3(p+q)(q+r)(p+r) = (p+q+r)^3$. If you do, the answer is simply $(2+4+5)^3 = 11^3 = \mathbf{1331}$. If you do not (and you should not feel badly for not recognizing this), more plugging and grinding is required but it is very straightforward:
 $2^3 + 4^3 + 5^3 + 3(2+4)(4+5)(2+5) = 8 + 64 + 125 + 3(6)(9)(7) = 197 + 1134 = \mathbf{1331}$.

2. After 7 days the two dogs have finished $\frac{7 \text{ days}}{10 \text{ days/bag}} = \frac{7}{10}$ bag. The remaining $\frac{3}{10}$ bag takes Nipper 9 days to finish, so Nipper eats at the rate of $\frac{\frac{3}{10} \text{ bag}}{9 \text{ days}} = \frac{1}{30} \frac{\text{bag}}{\text{days}}$, thus requiring 30 days to finish a bag by himself. Therefore, in 7 days, Nipper would have eaten $7 \text{ days} \times \frac{1 \text{ bag}}{30 \text{ days}} = \frac{7}{30}$ bag by himself. In the same 7 days, the two dogs together ate $\frac{7}{10}$ bag. Therefore, Biter ate $\frac{7}{10} \text{ bag} - \frac{7}{30} \text{ bag} = \frac{21-7}{30} \text{ bag} = \frac{14}{30} \text{ bag}$, which is 2 times as much as Nipper ate (determining that factor of 2 is easier to determine without reducing $14/30$ to $7/15$ —reducing is critical for final answers but not at all for intermediate calculations). The amount of time a bag of dog food would last is inversely proportional to the amount of food eaten per day. Therefore, the number of days a bag would last Biter is $\mathbf{1/2}$ of the number of days for Nipper.

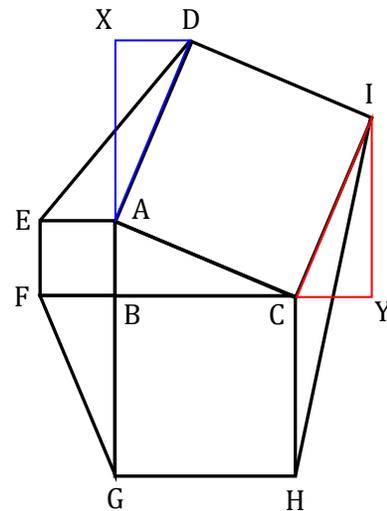

3. Passing exactly one test means to pass one test and fail the other, so the probability is given by:
 $P(\text{PS, FM}) + P(\text{FS, PM}) = \frac{3}{4} \left(1 - \frac{4}{5}\right) + \left(1 - \frac{3}{4}\right) \frac{1}{3} = \frac{3}{20} + \frac{1}{12} = \frac{9+5}{60} = \frac{14}{60} = \frac{7}{30}$.

4. The sum of the contents of all 16 cells includes 8 copies of each of $a, b, c,$ and d . For example, for the a 's the cells with a are those in the a row and those in the a column (being careful not to double-count the cell where the a row and column meet), so $(a+a) + (a+b) + (a+c) + (a+d) + (b+a) + (c+a) + (d+a)$ contains 8 copies of a being added. Therefore, the sum of all the cells is $8a + 8b + 8c + 8d = 8a + 8c + 8(b+d)$. Now, $a+a = 2a = n+10$, so $8a = 4n+40$; $c+c = 2c = n+6$ so $8c = 4n+24$; $b+d = n+3$ so $8(b+d) = 8n+24$. Therefore the sum of all the cells is $8a + 8c + 8(b+d) = 4n+40 + 4n+24 + 8n+24 = 16n+88$, so $k = \mathbf{88}$.

5. The mean of the 5 values 5, 8, 10, 16 and n is $\frac{n+5+8+10+16}{5} = \frac{1}{5}n + \frac{39}{5}$. The median is 8 if $n < 8$; 10 if $n > 10$; n if $8 \leq n \leq 10$. For the median to equal the mean, we, therefore, have three cases to consider:
 1. $n < 8$: $8 = \frac{1}{5}n + \frac{39}{5}$ means that $8 - \frac{39}{5} = \frac{1}{5}n \rightarrow \frac{1}{5} = \frac{1}{5}n$ so, $n = 1$.
 2. $8 \leq n \leq 10$: $n = \frac{1}{5}n + \frac{39}{5}$ means that $\frac{4}{5}n = \frac{39}{5}$, so $n = \frac{39}{4}$.
 3. $10 < n$: $10 = \frac{1}{5}n + \frac{39}{5}$ means that $10 - \frac{39}{5} = \frac{1}{5}n \rightarrow \frac{11}{5} = \frac{1}{5}n$ so, $n = 11$.
 All of these values satisfy the constraints on n . The sum of these three values is $1 + \frac{39}{4} + 11 = \frac{48+39}{4} = \frac{\mathbf{87}}{4}$.

6. The area enclosed by a trapezoid is the product of the height times the average of the base lengths. Therefore, $A = 12 \left(\frac{7.4 + x + 15.6 - x}{2} \right) = 6 \times 23 = \mathbf{138}$ units².

7. ABFE is a square of side length 5, so encloses area of 5^2 .
 BCHG is a square of side length 12, so encloses area of 12^2 .
 ACID is a square of side length 13, so encloses area of 13^2 .
 ABC is a right triangle enclosing area of $\frac{1}{2}(5 \times 12) = 30$.
 Triangle FBG is congruent to $\triangle ABC$, so encloses area of 30.
 Let side EA be the base of $\triangle EAD$, and it has length 5.
 Triangle DXA, which is congruent to $\triangle ABC$, has been included to show that the perpendicular height of $\triangle EAD$ is 12, so the area enclosed by $\triangle EAD$ is also 30.
 Let side HC be the base of $\triangle HCI$, and it has length 12.
 Triangle CYI, which is also congruent to $\triangle ABC$, has been included to show that the perpendicular height of $\triangle HCI$ is 5, so the area enclosed by HCI is also 30.
 Therefore, the area enclosed by the hexagon is:
 $5^2 + 12^2 + 13^2 + 4 \times 30 = 2 \times 13^2 + 120 = \mathbf{458}$ units².

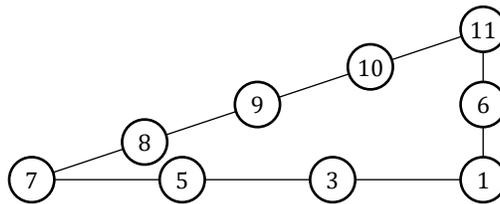

8. For $|x| \leq 1$, $y = x^2$; for $|x| \geq 1$, the reflection about $y = 1$ is given by $y = 2 - x^2$. Therefore, for a given value of y in the range $0 < y < 1$, we have four satisfying values of x : $-\sqrt{2 - y}$, $-\sqrt{y}$, \sqrt{y} , and $\sqrt{2 - y}$. For these to be equidistant, $\sqrt{2 - y}$ has to be as much greater than \sqrt{y} as \sqrt{y} is greater than $-\sqrt{y}$. Thus, $\sqrt{2 - y}$ must be $2\sqrt{y}$ greater than \sqrt{y} , so $\sqrt{2 - y} = 3\sqrt{y}$. Squaring both sides yields $2 - y = 9y$, $10y = 2$, and $y = \frac{1}{5}$. The separation between two consecutive intersections is $2\sqrt{y} = 2\sqrt{1/5} = \frac{2\sqrt{5}}{5}$ as a common fraction in simplest radical form.

2017 State Competition Team Round

1. The product of the consecutive integers has the form $(n - 1)(n)(n + 1) = n^3 - n$, and the sum is $3n$. The value of n will be slightly larger than the cube root of the value of the product. Now, $\sqrt[3]{157,410}$ is approximately 53.994, so let's round up to $n = 54$ and check it out. Indeed $53 \times 54 \times 55 = 157,410$ and the desired sum is $3n = 3 \times 54 = \mathbf{162}$.
2. The starting amounts are $\frac{3}{3+2}(100 \text{ kg}) = 60 \text{ kg}$ of regular and $100 \text{ kg} - 60 \text{ kg} = 40 \text{ kg}$ of premium. We want to keep the same amount of premium and add regular until there is $4/1 = 4$ times as much regular as there is premium. Therefore, a total of $4 \times 40 \text{ kg} = 160 \text{ kg}$ of regular is needed, so $160 \text{ kg} - 60 \text{ kg} = \mathbf{100 \text{ kg}}$ of regular needs to be added.
3. None of the coordinates is permitted to have a magnitude of 2 or more. Neither is it permitted for all three coordinates to have magnitude 1. This leaves three permitted cases:
 1. 3 coordinates with value 0 and 0 with magnitude 1: There is only 1 option: $(0, 0, 0)$.
 2. 2 coordinates with value 0 and 1 with magnitude 1: The basic form is $(0, 0, \pm 1)$, which is 2 options. However, the ± 1 can be placed in any of the 3 coordinate positions, which multiplies the number of options by 3 to make 6 options for this case.
 3. 1 coordinate with value 0 and 2 with magnitude 1: The basic form is $(0, \pm 1, \pm 1)$, which is 4 options. However, the 0 can be placed in any of the 3 coordinate positions, which multiplies the number of options by 3 to make 12 options for this case.The total number of options for points is $1 + 6 + 12 = \mathbf{19}$.
4. The slope of QR is $\frac{9-3}{4-1} = \frac{6}{3} = 2$. A line perpendicular to QR must have a slope that is the negative reciprocal of the slope of QR, thus $-\frac{1}{2}$. To go through P, the line must satisfy $(-\frac{1}{2})12 + b = 10$, and b is the quantity we seek the value of. $-6 + b = 10$, so $b = \mathbf{16}$.
5. For convenience let's work with $a \geq b$ and $c \geq d$. Since 420 is divisible by 7, a needs to be at least 7. With $a = 7$, $a! = 5040$ and $5040/420 = 12$, so $\frac{c!d!}{b!} = 12$. Now, 12 can be expressed as $6 \times 2 = \frac{3!2!}{0!}$ (remembering that non-negative integers are specified, and $0! = 1$ —not just $1!$ equals 1) and $\frac{2^4}{2} = \frac{4!0!}{2!}$. The former case has $b + c + d = 5$, which is less than the latter case with $b + c + d = 6$, so the least sum is $7 + 5 = \mathbf{12}$.
6. The 2017th dollar must be paid with a \$1 bill, so we can look at how to account for the other \$2016. Let f be the number of \$4 bills, t the number of \$2 bills, and o the number of \$1 bills. Then $4f + 2t + o = 2016$, where f , t , and o are non-negative integers. Therefore, $0 \leq f \leq 504$, the upper value being when there are no \$2 nor \$1 bills. When there are f \$4 bills, t must satisfy $0 \leq t \leq \frac{2016 - 4f}{2} = 1008 - 2f$, thus, $1009 - 2f$ choices, with the rest being \$1 bills. So, starting with $f = 504$ and decrementing by 1s to 0 yields the sequence of count of options for t : 1; 3; 5; ...; 1007; 1009. This is the sequence of the first 505 positive odd integers, which has sum $505^2 = \mathbf{255,025}$.

7. Let $m\angle BAC = m\angle ABC = x$. Since segment AP bisects $\angle BAC$, we know that $m\angle BAP = m\angle CAP = \frac{1}{2}x$. Also, since $\triangle ABP \sim \triangle DBQ$, we have $m\angle ABC = m\angle ABP = m\angle QBD = x$ and $m\angle BAP = m\angle BDQ = \frac{1}{2}x$. Similarly, since segment DR bisects $\angle BDQ$, we have $m\angle BDR = m\angle QDR = \frac{1}{4}x$. By theorem, the sum of the angles of a triangle must be 180° . So, $m\angle BPA = m\angle BQD = 180^\circ - (x + \frac{1}{2}x) = 180^\circ - \frac{3}{2}x$ and $m\angle DRB = 180^\circ - (x + \frac{1}{4}x) = 180^\circ - \frac{5}{4}x$. Now, let E be the intersection of bisectors AP and DR. Again, by theorem, the sum of the angles of a quadrilateral must be 360° . We know that $m\angle BPE = m\angle BPA = 180^\circ - \frac{3}{2}x$, $m\angle ABP = m\angle RBP = x$ and $m\angle PER = 90^\circ$, and $m\angle DRB = m\angle ERB = 360^\circ - (180^\circ - \frac{3}{2}x + x + 90^\circ) = 90^\circ + \frac{1}{2}x$. We now have two equations for $m\angle DRB$, which must equal each other. Therefore, $180^\circ - \frac{5}{4}x = 90^\circ + \frac{1}{2}x$. Solving for x , which is the degree measure of $\angle ABC$, we get $90^\circ = \frac{7}{4}x \rightarrow x = 90^\circ \times \frac{4}{7} = \frac{360}{7}$ degrees.

8. Every other term in an arithmetic sequence must have the same parity (oddness or evenness) since term with value a is followed by $a + d$ and then $a + 2d$ —when two terms differ by an even number, they must have the same parity. Therefore, the following terms must have the same parity: the lower right corner, the upper right corner, the middle on the top row, the left corner, and the other two in the bottom row because of the opposing lower corner. That means at least 6 distinct values with the same parity, i.e., at least 6 odd values (the largest having to be at least 11) or at least 6 even values (the largest having to be at least 12). Let's be optimistic and try the smaller case first with the 6 smallest positive odd integers 1, 3, 5, 7, 9, and 11 along with 3 positive even integers less than 11 (with 5 to choose from). The bottom row must be all odds, as well as the upper right corner and the middle of the top row; the middle of the right row and the other two values on the top row must be even. Sure enough, **11** works:

9. Let L be the length of the pool. At the first passing, Eddie has gone 72 ft while Missy has gone $L - 72$ ft. At the next passing Eddie has turned around at the end of his first lap (where Missy started) and gone 40 ft extra, while Missy will be the same 40 ft short of a full round trip; thus, Eddie has gone $L + 40$ ft and Missy has gone $2L - 40$ ft. Since each is moving at a constant rate, the ratio of the second distance to the first distance is the same for each: $\frac{L+40 \text{ ft}}{72 \text{ ft}} = \frac{2L-40 \text{ ft}}{L-72 \text{ ft}}$. Cross-multiplying yields $L^2 - 32L \text{ ft} - 2880 \text{ ft}^2 = 144L \text{ ft} - 2880 \text{ ft}^2$, reducing to $0 = L^2 - 176L \text{ ft} = L(L - 176 \text{ ft})$. Thus, either $L = 0$, which is absurd, or $L = \mathbf{176}$ ft, the latter being the only viable option.

10. Place the triangle on the xy -plane with BC on the x -axis and AB on the y -axis. Then point Q is at $(4, 0)$ and P is at $(8, 0)$. Since point A is at $(0, 5)$, the lines AQ and AR are given by equations $y = 5 - \frac{5}{4}x$ and $y = 5 - \frac{5}{8}x$, respectively. Since BP bisects the right angle at the origin, the line BP is given by $y = x$. Point X is at the intersection of $y = x$ and $y = 5 - \frac{5}{4}x$, which occurs at $(\frac{20}{9}, \frac{20}{9})$; similarly, point Y is at the intersection of $y = x$ and $y = 5 - \frac{5}{8}x$, which occurs at $(\frac{40}{13}, \frac{40}{13})$. Thus, the coordinates of quadrilateral QRYX are:

$$Q(4, 0) \qquad 4 \times 0 - 0 \times 8 = 0$$

$$R(8, 0) \qquad 8 \times \frac{40}{13} - 0 \times \frac{40}{13} = \frac{320}{13}$$

$$Y\left(\frac{40}{13}, \frac{40}{13}\right) \qquad \frac{40}{13} \times \frac{40}{13} - \frac{40}{13} \times \frac{40}{13} = 0$$

$$X\left(\frac{20}{9}, \frac{20}{9}\right) \qquad \frac{20}{9} \times 0 - \frac{20}{9} \times 4 = -\frac{80}{9}$$

We can use the surveyor's algorithm, commonly called the shoelace method in MATHCOUNTS, to find the enclosing area. This algorithm requires repeating the first point in the list at the end, which is why Q appears twice above. The text boxes to the right of the points show the determinant calculation for each pair of consecutive points. The enclosed area is one-half the absolute value of the sum of the determinants, so $\frac{|0 + \frac{320}{13} + 0 - \frac{80}{9}|}{2} = \frac{920}{117}$.

2017

■ **National Competition** ■
Sprint Round
Problems 1–30

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ gallons The gauge on an oil tank indicated that the tank was two-sevenths full. After 3200 gallons were added to the tank the gauge indicated that the tank was six-sevenths full. How many gallons of oil will the tank hold when full?

2. _____ What is the maximum possible absolute difference between a two-digit integer and the two-digit integer resulting when the digits are reversed?

3. _____ percent At Salisbury Central School, 60% of the students are 7th graders, and the rest are 8th graders. Half of the 7th graders ride a bus to school, 20% of the remaining 7th graders arrive by car, and the rest walk to school. A quarter of the 8th graders ride a bus to school, a third of the remaining 8th graders arrive by car, and the rest walk to school. What percent of Salisbury Central School students walk to school?

4. _____ units² Rectangle WXYZ, shown here, consists of eight squares. If the white square is a 1×1 unit square, what is the area of rectangle WXYZ?

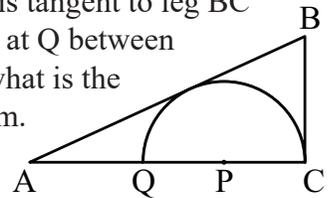

5. _____ What is the slope of a line perpendicular to the line given by the equation $\frac{x-8}{y+4} = \frac{6}{5}$? Express your answer as a common fraction

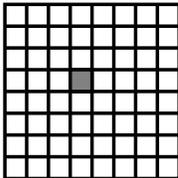

6. _____ terms In the sequence 121, 1221, 12221, ... the n th number consists of n copies of the digit 2, surrounded by two 1s. How many of the first 2017 terms in the sequence are divisible by 3?
7. _____ For what value of x is $|-x + |x| + 1|$ equal to 9?
8. _____ base 8 Computing in base 8, a certain two-digit base-8 number N is added to five times the sum of its digits. The sum has the same digits as N but in reverse order. What is N in base 8?
9. _____ integers The median of a list of positive integers is 3, and the mean of the list is less than 2.1. What is the fewest number of integers possible in the list?
10. _____ squares How many perfect squares are divisors of the product $1! \cdot 2! \cdot 3! \cdot 4! \cdot 5! \cdot 6! \cdot 7!$?

11. _____ If x and y are nonzero real numbers such that $mx + ny = u$, $nx - my = v$ and $u^2 + v^2 = x^2 + y^2$, what is the value of $m^2 + n^2$?

12. _____ gallons Zeno's tank holds 24 gallons of water. Zeno starts filling the tank, but when it is halfway full he decides to start draining water out. Once half of the water that he added is drained, he decides to add back half of the water that he just drained. He then drains half of the water that he just added, and continues alternately adding or draining half of the previous quantity of water. After 100 cycles of adding and draining water, how many gallons of water are in the tank? Express your answer to the nearest whole number.

13. _____ units In right triangle ABC with right angle at vertex C , a semicircle is constructed, as shown, with center P on leg AC , so that the semicircle is tangent to leg BC at C , tangent to the hypotenuse AB , and intersects leg AC at Q between A and C . The ratio of AQ to QC is $2:3$. If $BC = 12$, then what is the value of AC ? Express your answer in simplest radical form.

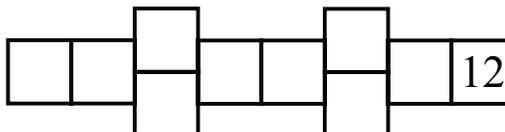

14. _____  Philippa stands on the shaded square of the 8-by-8 checkerboard shown. She moves to one of the four adjacent squares sharing an edge with her starting square, with each of the four squares equally likely to be chosen. She then makes two more moves to adjacent squares in the same way. Given any square S , let $P(S)$ be the probability that Philippa lands on that square after her third move. What is the greatest possible value of $P(S)$? Express your answer as a common fraction.

15. _____ If n is a positive integer and D is a digit such that $\frac{n}{814} = 0.\overline{D75}$, what is the value of n ?

16. _____ students A college dorm houses math majors and chemistry majors. There is at least one student in each major and no students are majoring in both. Students live in single or double rooms. If four-fifths of the math majors are roommates with six-sevenths of the chemistry majors, what is the least possible number of students living in the dorm?
17. _____ cm The sum of twelve times the numerical value of the total length, in centimeters, of the edges of a cube and the numerical value of its volume, in cubic centimeters, is equal to four times the numerical value of the total surface area, in square centimeters. What is the length of its space diagonal? Express your answer in simplest radical form.
18. _____ The diagonals of parallelogram ABCD intersect at E. Point F is the midpoint of segment BE and H is the midpoint of segment CE. What is the ratio of the area of quadrilateral AFHD to the area of the parallelogram? Express your answer as a common fraction.
19. _____ Sam creates a six-digit positive integer by writing the digit 7 in the hundred-thousands place, and then tossing a fair coin five times. If the coin comes up heads, he writes a 7 for the next digit; if the coin comes up tails, he writes a 0 for the next digit. What is the probability that Sam's number is divisible by 77? Express your answer as a common fraction.
20. _____ What is the sum of the positive integers less than 1000 that are multiples of 7 but not multiples of 2?

21. _____ Suppose f is a quadratic function defined by $f(x) = ax^2 + bx + c$ for some numbers a , b and c . If $g(x) = x - 2$ and $f(g(x)) = 2x^2 - 5x + 19$ for all values of x , what is the value of $a + b + c$?

22. _____ ways How many ways are there to fill in each empty square in the diagram below with a positive integer so that no integer appears more than once in the diagram, and every integer in the diagram is less than each integer to its right?

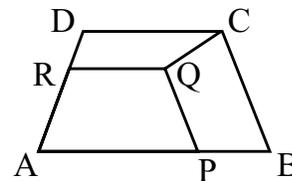

23. _____ cm^2 What is the total surface area of the largest regular tetrahedron that can be inscribed inside of a cube of edge length 1 cm? Express your answer in simplest radical form.

24. _____ Penny flips three fair coins into a box with two compartments. Each compartment is equally likely to receive each of the coins. What is the probability that either of the compartments has at least two coins that landed heads? Express your answer as a common fraction.

25. _____ units Triangle ABC has side lengths 9, 10 and 13, with D the midpoint of side BC. What is the length of segment AD?

26. _____ In a pile of 25 tiles, each tile has one of the letters A through E and one of the integers from 1 through 5. Each possible combination of a letter and a number appears on exactly one of the tiles. Jessica selects three tiles at random, without replacement, from the pile. What is the probability that each of the three tiles Jessica chooses has a letter or a number in common with at least one of the other chosen tiles? Express your answer as a common fraction.

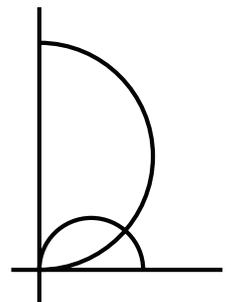

27. _____ units² In isosceles trapezoid ABCD, shown here, sides AB and DC are parallel, AB = 10 and CD = 8. Trapezoids APQR and BCQP are both similar to trapezoid ABCD. What is the area of trapezoid ABCD? Express your answer in simplest radical form.

28. _____ What is the value of $2\sqrt{1.75 + \sqrt{3}} - (1.75 + \sqrt{3})$? Express your answer as a decimal to the nearest hundredth.

29. _____ inches A 36-inch rope is cut into three pieces. One piece is five inches longer than another, and one piece is twice as long as another. What is the sum of the possible lengths of the longest piece? Express your answer as a decimal to the nearest tenth.

30. _____ units In the figure shown, two lines intersect at a right angle, and two semicircles are drawn so that each semicircle has its diameter on one line and is tangent to the other line. The larger semicircle has radius 1. The smaller semicircle intersects the larger semicircle, dividing the larger semicircular arc in the ratio 1:5. What is the radius of the smaller semicircle? Express your answer in simplest radical form.

1. _____ Let x , y and z be consecutive integers such that $x < y < z$. If $(x + y)(x + z) = 9900$, what is the value of x ?

2. _____ percent This year, the city coed softball league has 15% more participants than it had last year. There are 8% more male participants and 20% more female participants than last year. What percent of the league's participants are female this year? Express your answer to the nearest whole number.

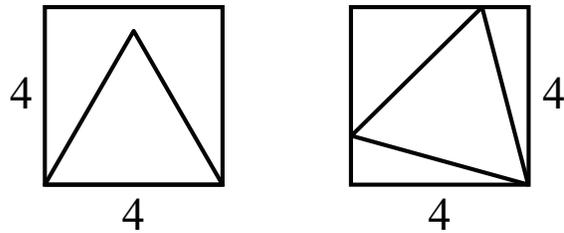

3. ways There are a hundred competitors at the National Debating Contest, two from each of the 50 states. In how many ways can five finalists be chosen if no state may have more than one finalist?

4. degrees Rays AC and AE intersect circle O at B and D, respectively. Segment DE is a diameter of circle O and $AB = \frac{1}{2} DE$. If the measure of $\angle BAD$ is 24 degrees, what is the degree measure of $\angle COE$?

5. _____ A set of five distinct prime numbers has a mean of 10 and a median of 7. What is the greatest possible number in this set?

6. _____ Two congruent squares with side length 4 have equilateral triangles constructed in them as shown. In one square, one side of the equilateral triangle is a side of the square. In the other square, the equilateral triangle has one vertex at a vertex of the square and its other two vertices are on the sides of the square. The absolute difference of the areas of the two triangles can be expressed in simplest radical form as $a\sqrt{b} + c$. What is the value of $a + b + c$?

7. _____ The graph of the equation $\frac{xy - y}{2x - y + 2} = a$, where a is a positive number, intersects the line $y = x$ at two points that are a distance of exactly 6 units apart. What is the value of a ? Express your answer in simplest radical form.

8. _____ crypto-
codes A certain cryptocode must contain one letter from the set $\{X, K, M, Z\}$ and three distinct letters from the set $\{W, X, Y, Z\}$. The four letters can be arranged in any order, and since X and Z are in both sets, these letters may each appear twice in an arrangement. How many cryptocodes are possible?

1. prime numbers For how many two-digit prime numbers p does swapping the digits of p produce a prime number greater than p ?
2. lines There are infinitely many lines that are perpendicular to the line $y = \frac{3}{2}x + 9$ and intersect it in the interior of the second quadrant of the coordinate plane. How many of these lines have integer y -intercepts?
3. _____ Madison writes a one-digit positive integer, a two-digit positive integer, and a three-digit positive integer with the digits 1 through 6, using each digit exactly once. The product of the three positive integers is 20,400. What is the sum of the three positive integers?
4. _____ A strip of uniform width is cut from three sides of a square. The area of the remaining rectangle is $\frac{3}{8}$ of the area of the original square. What is the ratio of the width of the uniform strip to the side length of the original square? Express your answer as a common fraction.
5. mi/h Bebe used three forms of transportation to get from Portland to Anchorage. She traveled 150 miles by train. She traveled 80 miles by bus at an average speed that was 10 mi/h less than that of the train. She traveled 1500 miles by plane at an average speed that was 10 times that of the train. If these three portions of the trip took a total of 8 hours, what was the average speed of the bus?

6. _____ ways In a game, eight hexagons are arranged as shown. Starting at hexagon 1, a path to hexagon 8 is created by moving to an adjacent hexagon whose value is greater than the preceding hexagon. Two hexagons are considered adjacent if they share a side. How many ways are there to get from hexagon 1 to hexagon 8?

7. _____ After their final practice, three math teams celebrated by ordering hot dogs and potato patties. The Thales team ordered ten of each and paid \$63.00. The Euclid team ordered five potato patties and twelve hot dogs for \$46.55. The total price the Archimedes team paid was a whole number of dollars, and this number was a palindrome. What is the least number that palindrome could have been?
8. _____ The sum of the reciprocals of four different positive integers is 1.9. What is the sum of the four integers?
9. _____ meters Two leopard seals, Snap and Snarl, start 210 meters apart. They swim toward each other at a constant speed of 10 km/h each. Gilly, a gentoo penguin, starts at Snap and swims back and forth between the seals continually until the two seals meet. When going from Snap to Snarl, Gilly swims at 15 km/h, but when going from Snarl to Snap, Gilly swims at 20 km/h. What is the total distance that Gilly swims before the seals meet?
10. _____ ways Jay has seven different cars that he is leaving to his three daughters and two sons. The Maserati must go to a daughter, and the Bentley must go to a son. Each heir is to receive at least one and no more than two cars. How many ways can the cars be distributed?

Luke Robitaille Named National Champion at 2017 Raytheon MATHCOUNTS National Competition

When he realized he had won the title of 2017 National Champion and the \$20,000 Donald G. Weinert College Scholarship, Luke Robitaille jumped up from his seat at the Countdown Round desk and simply could not hide his excitement.

For the audience—many of whom had watched Luke come in second as a sixth grader the year before—the excitement was infectious. As Luke laughed and bounded off the stage to hug his fellow Mathletes and family, the mood at the Countdown Round was equally exuberant.

Later, when talking to reporters during interviews, Luke's excitement turned to the future. After talking about the final question (he initially thought his answer was wrong), his incredible speed (he did not realize he had answered many questions in 1-2 seconds total), and the moment he felt most nervous (when he was down 2-3 in the final match-up), Luke pondered a new goal that was suddenly within his reach...He said he hoped to win again in 2018 and become the first person ever to become a two-time MATHCOUNTS National Champion.

Above: National Champion Luke Robitaille at the moment he won. Left: Robitaille with Pam Erickson, Chair of the MATHCOUNTS Board of Directors and Vice President of Corporate Citizenship at Raytheon, and Lou DiGioia, MATHCOUNTS Executive Director.

Whether or not he accomplishes the feat that no Mathlete in 34 years of national competitions has been able to manage, Luke already has made MATHCOUNTS history. He won this year after coming in second the previous year—an achievement he shares with only three other National Champions: Po-Ru Loh (1999), Bobby Shen (2009) and Kevin Liu (2015). And Luke is the *first* Mathlete to do this as a sixth and seventh grader.

Luke, a home-schooled seventh grader from Euless, Texas, received \$24,500 in college scholarships—the maximum amount a national competitor can win at the national level. Having a National Champion also win in the Written and Team Competitions is rare; Luke is only the fourth Mathlete in MATHCOUNTS history to sweep the three competitions. After buzzing in, Robitaille took just 0.9 seconds to answer the winning question:

In a barn, 100 chicks sit peacefully in a circle. Suddenly, each chick randomly pecks the chick immediately to its left or right. What is the expected number of un-pecked chicks? (Answer: 25)

Luke was one of 224 Mathletes from across the nation to compete at the 2017 Raytheon MATHCOUNTS National Competition on May 14–15 at the Hilton Orlando Lake Buena Vista Hotel in Florida. National competitors represented all 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands, the Department of Defense and State Department.

From left: Countdown Round competitors Kevin Li (back), William Wang (front), Andrew Cai (front), Jack Albright (back), Geoffrey Wu and Luke Robitaille.

National competitors represented all 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands, the Department of Defense and State Department.

The 2017 National Competition began with three rounds of written tests on Sunday, May 14, requiring students to work both individually and with their four-person state teams. On Monday, May 15, the 12 students with the highest scores on the Written Competition advanced to the Countdown Round, a thrilling contest with one-on-one match-ups. Countdown Round participants have a maximum of just

45 seconds to answer each question.

Rankings for the Countdown Round were determined by the students' scores on the previous day's Written Competition. The four individuals with the highest written scores—who received a bye in the first round of the Countdown Round—were Luke Robitaille; Written Competition Runner-Up Geoffrey Wu, an eighth grader from Naperville, Ill.; Andrew Cai, a seventh grader from Sugar Land, Texas; and William Wang, an eighth grader from Princeton, N.J.

The two Countdown Round Semifinalists were William Wang and Jack Albright, a seventh grader from Los Altos, Calif., who entered the Countdown Round as the tenth seed and advanced through three match-ups. The Countdown Round Runner-Up was Andrew Cai, who, like his teammate Luke, was a returning national competitor this year. Andrew was a Countdown Round Quarterfinalist at the 2016 National Competition as a sixth grader.

After winning the title of 2017 National Champion, Luke was featured in [The New York Times](#) and also appeared on [Live! with Kelly and Ryan](#), where he competed against hosts Kelly Ripa and Ryan Seacrest in a math competition.

2017 NATIONAL COMPETITION WINNERS

NATIONAL CHAMPION:

Luke Robitaille, TX

- \$20,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

COUNTDOWN ROUND RUNNER-UP:

Andrew Cai, TX

- \$7,500 Scholarship

COUNTDOWN ROUND SEMIFINALISTS:

William Wang, NJ

Jack Albright, CA

- \$3,000 Scholarship each

WRITTEN COMPETITION

CHAMPION: Luke Robitaille, TX

- \$2,500 Scholarship

1ST PLACE TEAM: Texas

Andrew Cai, Luke Robitaille,
Justin Xiao, Jeremy Zhou

- \$2,000 Scholarship each
- Trip to U.S. Space Camp

WRITTEN COMPETITION

RUNNER-UP: Geoffrey Wu, IL

COUNTDOWN ROUND QUARTERFINALISTS:

Geoffrey Wu, IL
Reagan Choi, MI
Alex Xu, MI
Jeremy Zhou, TX

COUNTDOWN ROUND PARTICIPANTS:

Brian Liu, NJ
Holden Watson, GA
Kevin Li, CA
Andrew Huang, PA

2ND PLACE TEAM: New Jersey

3RD PLACE TEAM: California

Texas Wins Team Competition for Second Year in a Row

The team from Texas won First Place for a second year in a row—and the sixth time in MATHCOUNTS history. Team members Andrew Cai, Luke Robitaille, eighth grader Justin Xiao from Austin and eighth grader Jeremy Zhou from Sugar Land each won a \$2,000 scholarship and a trip to U.S. Space Camp. The Texas coach, Isil Nal, also led the team to a first-place finish at last year's National Competition.

From left: Pam Erickson, Coach Isil Nal, Jeremy Zhou, Justin Xiao, Luke Robitaille, Andrew Cai and Dr. Jagadeesh Pamulapati, Director of the Laboratories Office, Office of the Assistant Secretary of Defense for Research and Engineering.

The New Jersey Team won Second Place, with team members Kevin Cong, a seventh grader from Basking Ridge; Brian Liu, an eighth grader from Holmdel; William Wang; and Daniel Xia, a seventh-grader from Basking Ridge. The team from California won Third Place, with team members Jack Albright; Andrew Gu, a seventh grader from Ladera Ranch; David Hu, an eighth grader from San Jose; and Kevin Li, an eighth grader from Pleasanton.

MATHCOUNTS Congratulates the 2017 National Competitors

MATHCOUNTS congratulates all 224 national competitors. Advancing to the national level is a remarkable achievement, and every Mathlete who participated this year should be incredibly proud of his or her success. Links to competition results, photographs and the archived ESPN webcast are available at the [MATHCOUNTS website](#). All national competitors are listed below, with the following special recognitions.

“The Ladder Challenge” by QUAD SQUAD Wins First Place at 2017 Math Video Challenge Finals

A video about three sisters who get stuck in a video game took top prize at the 2017 Math Video Challenge. The student filmmakers, all seventh graders from the Ron Clark Academy in Georgia, each received a \$1,000 college scholarship. Sydney Dinkins of Atlanta, Kamyah Hugee of Covington, Jalelah Johnson and Keaton Tsepas Bucciero, both of Atlanta, were led by team advisor Junior Bernadin and co-advisor Dr. Valerie Camille Jones.

From left: Kodi Verhalen, Team Advisor Junior Bernadin, Keaton Tsepas Bucciero, Kamyah Hugee, Sydney Dinkins, Jalelah Johnson, Matt Larson and Pam Erickson.

In “[The Ladder Challenge](#),” Keaton decides to trick his three sisters who always sneak into his room by trapping them in a video game. Simone, Sidney and Sierra have to work together to play their way out of the game...and they use their math skills to do it! The video showed two solutions to problem #50 from the 2016-2017 MATHCOUNTS School Handbook:

When leaned against a vertical structure, a straight ladder can be used safely if its top is no more than 4 feet above the base of the structure for every foot that the bottom of the ladder is away from the base. How high can a 22-foot ladder safely reach up a vertical structure? Express your answer as a decimal to the nearest tenth.

QUAD SQUAD was one of four teams selected to advance to the 2017 Math Video Challenge Finals, which took place on Monday, May 15 at the Hilton Orlando Lake Buena Vista Hotel in Florida. Sixteen students presented their videos to the 224 Competition Series national competitors at the event, who then voted to determine the winning video. “The Ladder Challenge,” as well as more than 1,000 original student-created math videos, can be viewed at the [Math Video Challenge website](#).

2017 MATH VIDEO CHALLENGE WINNERS

FIRST PLACE:

“The Ladder Challenge”
by QUAD SQUAD

Sydney Dinkins, GA
Kamyah Hugee, GA
Jalelah Johnson, GA
Keaton Tsepas Bucciero, GA
▪ \$1,000 Scholarship each

FINALIST:

“A Goldfish Fanta-sea”
by Fintastic Four

Nicole Augusta, CA
Riley Blaugrund, CA
Skylar Higgins, CA
Sophia Summerell, CA

FINALIST:

“Fighting a Zombie Apocalypse”
by MATHCOUNTS Army

Sashank Ganapathiraju, NC
Pranav Kosuri, NC
Srijan Oduru, NC
Havish Shirumalla, NC

FINALIST:

“Math vs. Robbers”
by Real Cops, Real Math

Jackie Carter, VA
Cara Peacock, VA
Lauren Schenack, VA
Alyssa Sklar, VA

In “The Ladder Challenge,” three sisters use their math skills to escape a video game in which their brother has trapped them.

Summer Session for Competition Math Course Opens June 5th

MATHCOUNTS, Art of Problem Solving and the University of Oklahoma will offer a summer session of Competition Math for Middle School again this year. This on-line course for coaches features exclusive content and strategies from experts at Art of Problem Solving and MATHCOUNTS, and is led by Dr. Stacey Reeder of the University of Oklahoma.

Hundreds of MATHCOUNTS coaches and math teachers have taken Competition Math since it was created in 2015.

The course is designed to be a resource for both new coaches and returning coaches looking to take their coaching to the next level. This year's summer session will run June 5–August 7, 2017.

More information is available at mathcounts.ou.edu and enrollment in the course costs \$199. All participants who successfully complete the course this summer will receive one graduate credit from the University of Oklahoma, which can be used in most districts for professional development credit. Educators interested in taking this course should register online by June 5, 2017.

Kaylee de Soto Wins 2017 MATHCOUNTS Alumni Scholarship

Kaylee de Soto of Pinecrest, Fla. won this year's \$3,000 MATHCOUNTS Alumni Scholarship. After her time as a Chapter and State Competitor from 2011–2013, Kaylee led her high school's Mu Alpha Theta club and volunteered as a MATHCOUNTS coach for two schools. She will attend the Massachusetts Institute of Technology in the fall and plans to major in physics and mathematics.

Kaylee described her time as a coach as life-changing and humbling. While reflecting after one of her teams finished in the top-10 at the chapter level, Kaylee said she realized her life "had truly come full circle...I can graduate knowing that my legacy and passions will continue through those students who I had the honor of training and see blossom before my eyes." Kaylee spoke during the Awards Banquet at the National Competition, where she advised Mathletes to keep an open mind about their passions and academic pursuits.

The application for the 2018 MATHCOUNTS Alumni Scholarship will be available in the fall at www.mathcounts.org/scholarship.

MATHCOUNTS®

2018
■ School Competition ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ The average of Jerrold's vocabulary quizzes is 88.75. What is Jerrold's quiz average expressed to the nearest whole number?

2. _____ What is the value of $2^5 - 5 \times 6$?

3. \$ _____ A particular store sells items for only \$1, \$3 and \$5 and charges no sales tax. If Georgia buys nine \$1 items, seven \$3 items and three \$5 items from this store, what is the total amount she will be charged?

4. _____ °F Water boils at 212 °F and freezes at 32 °F. What is the difference between the boiling point and freezing point of water?

Boiling Point
212 °F

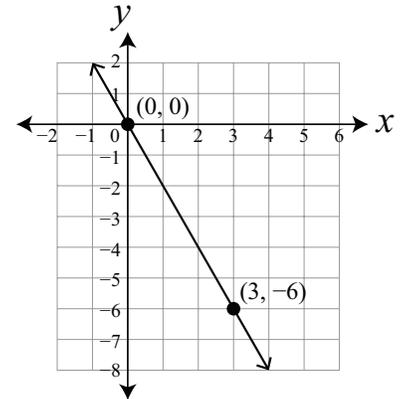

Freezing Point
32 °F

5. _____ If the first five terms of an arithmetic sequence are 26, 16, 6, -4, -14, what is the sixth term of this sequence?

6. _____ If $\frac{2^{12}}{2^n} = 2^3$, what is the value of n ?

7. _____ What is the slope of the line containing the points $(0, 0)$ and $(3, -6)$ as shown?

8. _____ The least common multiple of 15 and 20 is k . What is the least common multiple of 12 and k ?

9. _____ pounds When Allen Iverson and Shaquille O'Neal faced off in the 2001 NBA Finals, O'Neal weighed exactly twice as much as Iverson, and their weights totaled 495 pounds. How many pounds did Iverson weigh?

10. _____ If $3x + 7 = 22$, what is the value of $\frac{1}{3x+11}$. Express your answer as a common fraction.

11. _____ The table shows the results of Jake's last twenty times at bat. Based on this data, what is the probability that Jake hits a double on his next time at bat? Express your answer as a decimal to the nearest tenth.

Batting Results

| Result | Number |
|----------|--------|
| Home Run | 3 |
| Triple | 1 |
| Double | 2 |
| Single | 8 |
| Walk | 3 |
| Out | 3 |

12. _____ percent A square pen that is surrounded by a fence is divided into two rectangular regions by adding a new fence that connects the midpoints of two opposite sides. By what percent has the total length of fencing been increased?

13. _____ What is the sum of the greatest common factor of 4 and 18 and the least common multiple of 4 and 18?

14. _____ years Claire's three sons, from oldest to youngest, are Evan, Joel and Alex. The difference between the ages of Evan and Joel is the same as the difference between the ages of Joel and Alex. If the sum of the three ages is 39, how old is Joel?

15. $\frac{\text{mile}}{\text{marker}}$ Danica started her trip at mile marker 66 and ended her trip at mile marker 194. She drove at a constant speed the entire trip. Which mile marker had she reached by 75% of her trip?

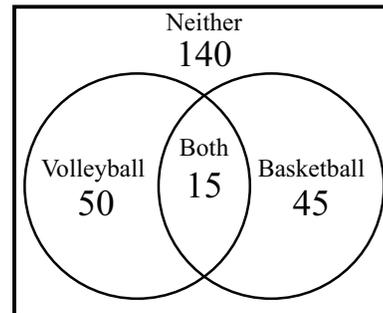

16. _____ What is the value of $(20 + 12)^2 - (20 - 12)^2$?

17. _____ visitors The table shows the number of visitors over a 4-week period to a new website. What was the average number of visitors to the site per week?

Website Visitors

| Week | Visitors |
|------|----------|
| 1 | 1028 |
| 2 | 1100 |
| 3 | 1060 |
| 4 | 1056 |

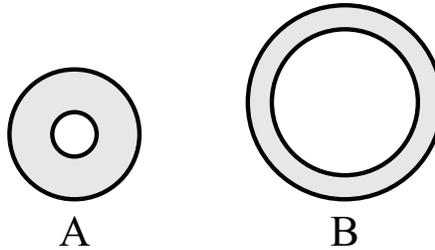

18. _____ percent The Venn diagram shows the number of students at Ramanujan Middle School who play both volleyball and basketball, the number who play one of these sports but not the other, and the number who play neither of these sports. All students at the school are represented in the diagram. What percent of the students at the school play basketball?

19. _____ Josie selected a number n . She divided n by 2 and then subtracted $\frac{1}{2}$ from the result. She took half of that result and then subtracted $\frac{1}{2}$ to get the final result of 10. What is the value of n ?

20. _____ times Scott repeatedly rolls a pair of standard six-sided dice and keeps track of the sum of the two numbers rolled each time. So far he has not rolled any sum twice. What is the maximum possible number of times he has thrown the dice?

21. _____ cm An *annulus* is a ring bounded by two concentric circles. In the figure, annulus A has an inner circle of radius 2 cm and an outer circle of radius 6 cm. Annulus B has an outer circle of radius 9 cm. If annulus B has area equal to that of annulus A, what is the radius of the inner circle of annulus B?

22. _____ Let $Q = \{1.7, 1.1, 1.4, 2.1, 2.3, s\}$. What is the absolute difference between the greatest and least possible values of the median of set Q ? Express your answer as a decimal to the nearest hundredth.
23. _____ tickets A bag contains 25 tickets, each colored either red or yellow. Red tickets are worth \$0.50, and yellow tickets are worth \$5.00. If the expected value of a ticket drawn at random from this bag is \$3.20, how many of the tickets are red?
24. _____ If a and b are integers such that $a^2 - b^2 = 100$, what is the greatest possible value of a ?
25. _____ cents In cents, what is the least total amount that cannot be obtained by using a combination of fewer than eight coins from a collection of pennies, nickels, dimes and quarters?

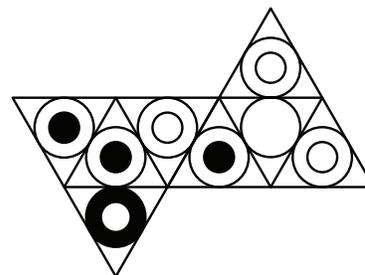

26. fourth powers How many of the first one thousand perfect fourth powers have either 1 or 6 as their units digit?

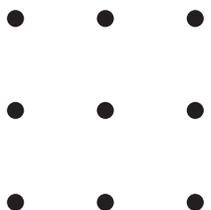

27. _____ Seven jars hold a total of 250 candies. They are lined up left to right from fullest to emptiest. The left-most jar has 72 candies, and the right-most jar has 13. No two jars hold the same number of candies. What is the positive difference between the greatest number of candies that could be in the second jar from the left, and the least number of candies that could be in that jar?

28. _____ What is the greatest integer k such that 2^k is a factor of $67!$?

29. nets How many distinct tetrahedron nets, formed from four connected equilateral triangles, can be cut from the figure shown?

30. triangles  The rows and columns of lattice points in a three-by-three square array are evenly spaced one unit apart. How many distinct triangles with at least one side of length $\sqrt{2}$ units can be drawn using three lattice points for the vertices?

MATHCOUNTS®

Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

5. _____ Three dogs arrived at the dog park at three different times, with their three owners, using three different leash colors. The Dalmatian was next to arrive after the Schnauzer. The dog with the red leash is owned by the 7th grader. The Poodle was not the first to arrive. The Schnauzer does not use a green leash. If the 6th grader owns the Dalmatian, then the Poodle's leash is blue. The 8th grader arrived first. What is the product of the grade levels of the student who arrived second, the student who owns the Poodle and the student who uses the green leash?

6. _____ Three circles are inscribed in a rectangle of width w and height h as shown. Two of the circles are congruent and are each tangent to two adjacent sides of the rectangle and to each other. The other circle is larger and is tangent to three sides of the rectangle and to the two smaller circles. What the ratio of h to w ? Express your answer as a decimal to the nearest hundredth.

1. _____ If $a \odot b = a^2 + ab + b^2$, what is the value of $(3 \odot 4) - 12$?

2. _____ Sammi has a sheet of stamps containing 4 rows of stamps, with 8 stamps in each row. Sammi wants to separate all of the stamps by tearing the sheet in as few tears as possible. So, after she makes one tear, she puts the two pieces of the sheet on top of each other before making the next tear. What is the fewest number of tears she can use to get all the stamps separated?

3. _____
$$\begin{array}{r} \text{ONE} \\ + \text{ONE} \\ \hline \text{TWO} \end{array}$$
 In the addition problem shown, each letter represents a different digit between 1 and 9, inclusive. If E and T represent 6 and 5, respectively, what digit does N represent?

4. _____ fluffy friends

All the kittens in a certain litter, which includes Billy and Peaches, are either fluffy or sleek and are friends with one another. Billy, a fluffy kitten, has 7 more fluffy kitten friends than sleek kitten friends. How many more fluffy friends than sleek friends does sleek kitten Peaches have?

5. _____ pounds

Marcia wants to estimate the total weight of the sand in her sandbox. She has a drinking glass whose interior is a cylinder with diameter 2 inches and height 4 inches; the glass weighs 4.1 ounces when empty. After she fills the glass with sand, the weight of the glass is 14.8 ounces. If the sandbox is a rectangle measuring 6 feet by 4 feet, and the average depth of the sand is 6 inches, what is the total weight of the sand in the sandbox? Express your answer as a whole number to the nearest hundred. (1 foot = 12 inches; 1 pound = 16 ounces.)

6. _____ There are three integer values of x that make the equation $x^3 + 6x^2 + 11x + 6 = 0$ true. What is the least of these values?

7. _____ A dorm dining hall has three tables. Currently one student is seated at one table, two are seated at another and three are seated at the remaining table. Each student who enters the dining hall picks a table to join with probability proportional to the number of students already seated at the table. Terri enters the dining hall and sits at a table. Ursula then enters the dining hall and sits at a table. What is the probability that there is now a table at which at least four students are seated? Express your answer as a common fraction.

8. _____ A list of numbers of the form $\frac{x}{2}$, for positive integers x , has a sum of 7. What is maximum product of the list of numbers? Express your answer as a common fraction.

9. _____ The figure on the left is a portion of a standard multiplication table that contains the products of all pairs of positive integers. The figure on the right is a contiguous 2-by-2 section of the standard multiplication table, with some digits replaced with question marks. What is the sum of the four numbers in this section?

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ What integer is closest in value to 2017.7012?

2. _____ minutes How many minutes past 2 o'clock is the time displayed on the clock shown here?

3. \$ _____ Rufus has \$835 in his checking account. After he pays \$415 for his portion of the rent and \$220 for his portion of the utilities, how much does Rufus have left in his checking account?

4. _____ On the number line shown, p is halfway between 0 and 8. What is the value of p ?

5. \$ _____ What is the total cost of 2 large bowls priced \$14 each and 14 small jars priced \$2 each?

6. _____ The sum of an integer n and four is equal to the difference of ten and two. What is the value of n ?

7. _____ apples The ratio of apples to pears in Celia's basket is 3:5. If there are 20 pears, how many apples are there in Celia's basket?

8. _____ If $462 = 7 \times 11 \times p$, what is the value of p ?

9. _____ What is the value of $\frac{1}{0.25} - 2$?

10. _____ The arithmetic mean of 9, 11, 13, x and 7 is 10. What is the value of x ?

11. _____ If p and q are real numbers and $3(p + 4) + 4(p + 11) = 7(p + q)$, what is the value of q ?

12. _____ in^3 A box of Yummy Number Crunch is a rectangular prism with height 10 inches, width 8 inches and depth 3 inches. What is the volume of the box?

13. _____ If $\frac{z}{16} = \frac{4}{z}$, what is the positive integer value of z ?

14. _____ cents Meredith buys a bag containing eight apples for \$3.50. When she gets home, she realizes one of the apples is rotten, so she throws it away. What is the actual cost for each non-rotten apple, in cents?

15. _____ By switching two of the digits of the number 123,456, Rodrigo obtains a new number that is 1980 more than the original. What is the product of the two digits Rodrigo switched?

16. _____ degrees In triangle ABC, $m\angle A = 35$ degrees and $m\angle B = 95$ degrees. What is the measure of $\angle C$?

17. _____ amounts Dak has a quarter, a dime, a nickel and a penny. How many different amounts can be obtained by using one or more of the coins in Dak's collection?

18. _____ The sum of two numbers is 14, and their difference is 4. What is their product?

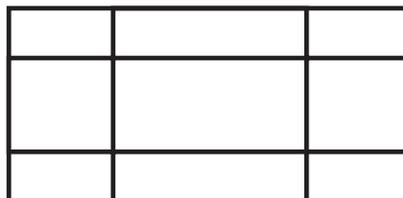

19. _____ What is the value of $16^2 - 15^2$?

20. _____ The arithmetic mean of a and b is 6.2, the mean of b and c is 7.3 and the mean of a and c is 4.5. What is the value of $a + b + c$?

21. _____ What is the greatest integer value of x for which $3^x < 100$?

22. _____ Which digit should replace A in the units place of the number 987,654,32A so that the number is divisible by 6?

23. _____ rectangles How many rectangles of any size are in the figure shown?

24. _____ In the equation shown, if p and q are positive integers and p is odd, what is the value of the sum $p + q$?

$$\frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \cdot \frac{7}{8} \cdot \frac{9}{10} \cdot \frac{11}{12} \cdot \frac{13}{14} \cdot \frac{15}{16} \cdot \frac{17}{18} \cdot \frac{19}{20} = \frac{p}{2^q}$$

25. \$ _____ Three employees split a bonus valued at some number of dollars. Arman first receives \$10 more than one third of the total amount. Bernardo then receives \$3 more than one half of what was left. Carson receives the remaining \$25. What is the total dollar value of the bonus?

26. _____ A line is tangent to a circle at the point $(2, 5)$. A parallel line is tangent to the circle at $(8, 13)$. What is the common slope of the two lines? Express your answer as a common fraction.
27. _____ For a particular list of four distinct integers the mean, median and range have the same value. If the least integer in the list is 10, what is the greatest value for an integer in the list?
28. _____ units^2 In circle P, chords AB and CD intersect at E so that $AD = AE = 3$, $ED = 4$ and $BC = 5$. What is the area of triangle BCE? Express your answer as a common fraction in simplest radical form.
29. _____ There are two values of x such that $\frac{|x-2018|}{|x-2019|} = \frac{1}{6}$. What is the absolute difference between these two values of x ? Express your answer as a common fraction.
30. _____ Six standard six-sided dice are rolled, and the sum S is calculated. What is the probability that $S \times (42 - S) < 297$? Express your answer as a common fraction.

This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ ways How many of the ways that 27 cents can be made using quarters, dimes, nickels and pennies use an odd number of coins?

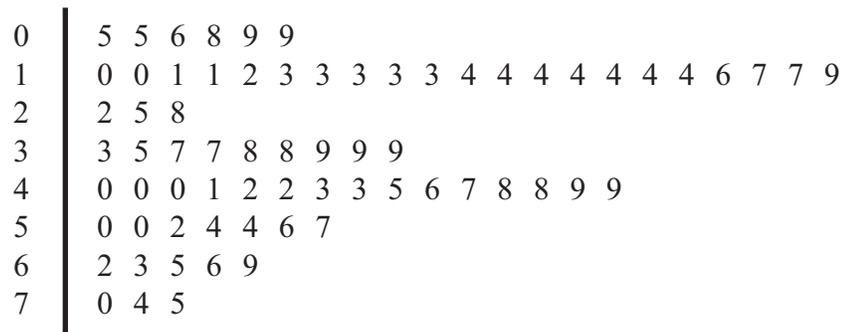

2. _____ degrees The degree measures of the angles of a hexagon are $x + 10$, $2x + 80$, $3x - 60$, $4x + 40$, $5x - 10$, and $6x - 33$. What is the degree measure of the largest angle of the hexagon?

3. _____ When a different positive integers from 11 to 21, inclusive, is placed in each of the circles in the figure shown, the sum of the three numbers on each segment is the same. What is the greatest possible value of that sum?

4. _____ If a , b , c , d and k are positive integers and $(ax + by)(cx + dy) = 7x^2 + 9kxy + 5y^2$ for all numbers x and y , what is the value of k ?

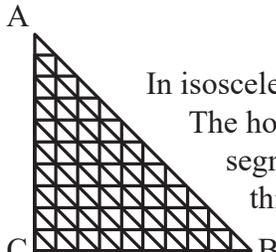

5. \$ At a middle school play, tickets for children under 10 years old cost half as much as tickets for seniors 60 and over, which in turn cost half as much as tickets for people from age 10 to age 59, inclusive. The stem-and-leaf plot below shows the ages of people who paid to attend the play. The total ticket sales for the play were \$544.50. What was the cost in dollars of a ticket for a child under the age of 10?

6. _____ Let $f(x) = \frac{x-3a}{x-2b}$ for constants a and b . If $f(5) = 0$ and $f(3)$ is undefined, what is the value of $f\left(\frac{1}{3}\right)$? Express your answer as a common fraction.

7. _____ For a computer code, nine numbers are grouped into three sets of three numbers, with one number in each set designated as a key. The nine numbers are 2, 3, 5, 7, 11, 13, 17, 19 and 29. If they must be used according to the eight rules, what is the product of the three numbers in the set that does not contain 2 or 3?

| Computer Code Rules | |
|--|---|
| 2 and 3 must be keys. | 13 must be with 11 or 19. |
| 5 and 7 must be in the same set; neither is a key. | 7 cannot be in a set with 17 as a key. |
| 13, 17 and 29 must be in different sets. | 13 cannot be in a set with 2 as a key. |
| 11 and 19 must be in different sets. | 19 cannot be in a set with 29 as a key. |

8. _____ triangles
- 
- In isosceles right triangle ABC, shown here, $AC = BC = 10$ units. The horizontal segments are spaced 1 unit apart, as are the vertical segments. Including triangle ABC, how many of the triangles in this figure are isosceles right triangles?

9. \$ _____ Noah is combining gummy bears and jelly beans in equal parts to create a mixture that he will sell. The bears cost him \$20 for 8 pounds, while the beans cost \$14 for 4 pounds. He wants his cost to be 40% of his selling price. At what price per pound should he sell the mixture?

10. _____ permuta-
tions How many five-letter permutations can be made from the letters in the word ADDITION?

1. _____ What is the sum of the integers from 1 to 100, inclusive?
2. _____ If $f(x) = 3x + 4$ and $g(x) = 2x - 4$, what is $f(g(-8))$?
3. _____ (points) If two distinct circles and an ellipse are drawn, what is the maximum possible number of points at which at least two of the three curves intersect?
4. _____ (minutes) Mikhail can type 80 words in one minute. At this rate, how many minutes will it take for Mikhail to type 320 words?
5. _____ (games) A total of 32 softball teams play in a single-elimination tournament, meaning the losers of each round are eliminated and the winners of each round are matched up against each other in the next round, until one champion remains. How many total games are played in the tournament?
6. _____ Valerie is exactly as much taller than Philip as Philip is taller than Janelle. If Valerie is 5 feet 6 inches tall, Philip is 4 feet 10 inches tall, and Janelle is 4 feet x inches tall, what is the value of x ?
7. _____ What is the greatest five-digit multiple of 5 with five distinct odd digits?
8. _____ What is the mean of the six numbers shown? Express your answer as a decimal to the nearest hundredth.

| | | |
|--------|--------|--------|
| 632.14 | 632.12 | 632.13 |
| 632.15 | 632.16 | 632.14 |
9. _____ Peter counts backwards by 3s starting with 100. What is the average of the first five numbers that Peter counts?
10. _____ If $(2^x)^{\frac{1}{2}} = 16$, what is the value of x ?
11. _____ (dollars) A prize of \$900 is to be shared in the ratio of 2:1:1 among three awardees. How many dollars are in the smallest share?
12. _____ (tickets) As a fund raiser, a booster club sells \$10 raffle tickets for a chance to win a free vacation. If the cost to print any number of raffle tickets is \$25, what is the minimum number of raffle tickets that must be sold to raise \$2500?

13. _____ What is the product of the number that is 8 more than 16 and the number that is 12 less than 5?

14. _____ The figure shown is made of ten unit squares. If the figure has area m units² and perimeter n units, what is the value of $m + n$?

15. _____ (home runs) In 2001, Barry led the league with 73 home runs. Alex finished fourth with 52. Sammy and Luis finished second and third, respectively. Sammy hit seven more home runs than Luis. If these four players hit a total of 246 home runs in 2001, how many home runs did Sammy hit that year?

16. _____ What is the least integer for which $3x - 7 > 24$?

17. _____ (hours) In a single week, how many hours pass between 10 p.m. on Monday and 7 a.m. on Wednesday?

18. _____ (eggs) A grocer sells her organic eggs in full containers of 6 or 7 eggs. What is the greatest number of eggs you cannot buy from her?

19. _____ Harry tosses 2 fair coins. What is the probability that at least one coin lands heads up? Express your answer as a common fraction.

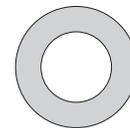

20. _____ (students) A class contains 40 students wearing gloves, scarves, hats or some combination of these. If 30 students are wearing gloves or scarves but not hats and 28 are wearing scarves or hats but not gloves, what is the absolute difference between the number of students wearing gloves and the number of students wearing hats?

21. _____ What is the value of the sum $1^2 + 3 + 4^3 + 6$?

22. _____ What value of n makes the equation $2^5 \times 4^2 = 8^n$ true?

23. _____ A 20-sided die with sides labeled with the letters A through T is rolled. What is the probability the letter facing up is a vowel? Express your answer as a common fraction.

24. _____ (ft²) The two concentric circles shown have radii of 2 feet and 5 feet. In square feet, what is the area of the shaded region between the circles? Express your answer in terms of π .

25. _____ What positive value r satisfies the equation $r = \frac{2}{1+r}$?

26. _____ What is the sum of the coefficients in the polynomial $x^4 + 4x^3 + 6x^2 + 4x + 1$?

27. _____ (dollars) Connie, Nate and Eli each want to buy a sundae. But Connie is 4 dollars short, Nate is 3 dollars short, and Eli is 1 dollar short. Combined, they have exactly enough money to buy one sundae. How many dollars does one sundae cost?

28. _____ What is the positive difference between the sum and product of 17 and 29?

29. _____ (seconds) Water comes out of a hose at a rate of 3 gallons per minute. Using this hose, how many seconds will it take to fill a bucket with 4 gallons of water?

30. _____ (units²) What is the area of a triangle with vertices at (1, 8), (9, 2) and (1, 2)?

31. _____ (dollars) Samantha bought a blouse and a skirt for \$70. The blouse cost \$20 more than the skirt. What was the cost of the blouse, in dollars?

32. _____ (units) The area of a rectangle is 40 units². If the length of the rectangle is 12 units, what is the width, in units? Express your answer as a common fraction.

33. _____ (degrees) The degree measure of the vertex angle of an isosceles triangle is twice the measure of each base angle. What is the degree measure of a base angle?

34. _____ Two standard six-sided dice are tossed. What is the probability that both the numbers shown are prime? Express your answer as a common fraction.

35. _____ What is the greatest integer solution of the inequality $|3x - 5| \leq 12$?

36. _____ What number lies at the midpoint of the segment on the number line given by $|2x + 3| \leq 5$? Express your answer as a common fraction.

37. _____ (unit cubes) A $3\text{-cm} \times 3\text{-cm} \times 3\text{-cm}$ cube is painted blue on all sides. The cube is then cut into unit cubes of edge length 1 cm. How many of the unit cubes have no paint on any side?
38. _____ (dollars) Harry made a one-time deposit of \$2000 for the use of a couch. When he returned the couch five years later, he was refunded \$1000. How many dollars per year did he pay for the use of the couch?
39. _____ If $3x - 7 = 3 + 2y$, what is the value of $9x - 6y$?
40. _____ What is the value of $(4.2 \times 10^{15}) \div (8.4 \times 10^{11})$? Express your answer as a whole number.
41. _____ (miles) Brice rides his bike at a constant speed of 8 mi/h for 15 minutes, then speeds up and rides at a constant speed of 10 mi/h for 30 minutes. During these 45 minutes, how many miles did he travel?
42. _____ (chickens) John has a barnyard containing only goats and chickens. The chickens each have 1 head and 2 legs. The goats each have 1 head and 4 legs. If there are 11 heads and 30 legs in the barnyard, how many chickens are in the barnyard?
43. _____ (buses) A school bus can transport as many as 50 students. What is the minimum number of school buses needed to transport 425 students on a field trip?
44. _____ A math class has 13 girls and 7 boys. If one girl is added to the class, what fraction of the class is now girls? Express your answer as a common fraction.
45. _____ What is the sum of the greatest common factor and least common multiple of the set $\{1, 2, 3, 4, 5\}$?
46. _____ The product of three consecutive odd integers is 315. What is the least of the integers?
47. _____ If $x + 3y = 1$, $2x + 5z = 11$ and $x + y - z = -4$, what is the value of $x + y + z$?

48. _____ (blue marbles) In a bag with 40 marbles, one-fourth are blue. How many blue marbles must be added to this bag so that half the marbles in the bag are blue?
49. _____ (degrees) The degree measures of a pair of complementary angles are in the ratio 1:5. What is the degree measure of the larger angle?
50. _____ (dollars) Joni's stock increased by 20% in the last year. It is now worth \$5 more than a year ago. What was the stock's value a year ago, in dollars?
51. _____ (words) Alex and Thomas take part in a rap battle. Alex raps for 90 seconds at an average word rate of 140 words per minute. Thomas has 75 seconds to respond. How many words does Thomas need to average per minute in his response to match Alex's word count?
52. _____ If $a \& b = a^2 + b^2$, what is the units digit of $((((1 \& 2) \& 3) \& 4) \& 5)$?
53. _____ (in³) A cylinder is filled with water to a depth of 6 inches. More water is added, increasing the depth of the water to 7.5 inches. If the original volume of water was 36 in³, what is the volume, in cubic inches, after more water is added?
54. _____ (degrees) What is the degree measure of an exterior angle of a regular nine-sided polygon?
55. _____ (servings) One serving of hot chocolate requires 2 tablespoons of cocoa, 1 tablespoon of sugar and 1 cup of milk. Milton has 2 cups of cocoa, $\frac{1}{2}$ cup of sugar and 1 gallon of milk. What is the greatest number of servings of hot chocolate Milton can make, given that 16 tablespoons = 1 cup and 16 cups = 1 gallon?
56. _____ A rectangle with non-congruent adjacent sides and a square share a side of length 6. The perimeter of the rectangle is 40. What is the ratio of the area of the square to the area of the rectangle. Express your answer as a common fraction.
57. _____ Eva's average score for seven algebra quizzes is 90, with the highest possible score on any quiz being 100. Eva scored 92 on each of five quizzes. Based on this, what is the lowest score she could have earned on any one of her quizzes?

58. _____ The product of 3 consecutive positive integers is divisible by $6!$. What is the least possible average of the 3 numbers?
59. _____ If $\{a, b, c, d, e\}$ is an increasing arithmetic sequence of five prime numbers, what is the least possible value of $|a - b|$?
60. _____ (percent) Of the 80% of the students in a geography class who earned a passing grade, 20% earned an A. What percent of the students in the entire class earned an A?
61. _____ The circumference of a circle with area π^2 can be expressed as $2\pi^b$. What is the value of b ? Express your answer as a common fraction.
62. _____ Dan rolls four standard six-sided dice. What is the probability that the product of the four numbers rolled is prime? Express your answer as a common fraction.
63. _____ (percent) Clara is in a rush, so she only gets sunscreen on 70% of her body and bug spray on 80%. What is the least possible percent of Clara's body that is protected by both? Express your answer as a whole number.
64. _____ (hours) The number of bacteria A present after t hours is given by $A(t) = 45.5 \times 8^{\frac{t}{12}}$. How many hours does it take for the number of bacteria present to double?
65. _____ (prime numbers) How many two-digit prime numbers are also prime numbers when the digits of the number are reversed?
66. _____ (cm) An equilateral triangle and a regular octagon share a side. If the triangle has a perimeter of 24 cm, what is the perimeter of the octagon, in centimeters?
67. _____ What number is $\frac{5}{6}$ of the way from -57 to 27 ?
68. _____ A standard 52-card deck contains four aces. If two cards are drawn randomly without replacement, what is the probability that they are both aces? Express your answer as a common fraction.
69. _____ (m/s) Jenny takes 90 steps per minute. If each step is 80 cm, what is Jenny's speed in meters per second? Express your answer as a decimal to the nearest tenth.

70. _____ What is the sum of the 11th and the 44th digits to the right of the decimal point in the decimal representation of $\frac{1}{7}$?
71. _____ (shots) In a basketball game, Jeff scored a total of 36 points. Of the shots he made, 20% were worth three points each, 40% were worth two points each and 40% were worth one point each. How many shots worth one point did Jeff make?
72. _____ (sides) The sum of the interior angle measures of a convex polygon is 900 degrees. How many sides does the polygon have?
73. _____ (zeros) How many trailing zeros are there in the decimal representation of $25!$?
74. _____ When Shirley goes bowling, the probability that she gets at least one strike during any given game is $\frac{1}{5}$, and distinct games are independent from one another. If Shirley plays three games, what is the probability that she gets at least one strike? Express your answer as a common fraction.
75. _____ What is the value of ${}_4C_0 + {}_4C_1 - {}_4C_2 + {}_4C_3 + {}_4C_4$?
76. _____ Marcus randomly selects a positive composite number less than 100 that has an odd number of positive factors. What is the probability that his number is also less than 50? Express your answer as a common fraction.
77. _____ (sides) A convex polygon has 35 diagonals. How many sides does it have?
78. _____ If two distinct letters are randomly chosen from the English alphabet of 26 letters, what is the probability that both are in the set $\{A, E, I, O, U\}$? Express your answer as a common fraction.
79. _____ (dollars) A \$270,000 prize is to be divided in the ratio of 5:3:1. What is the largest portion in dollars?
80. _____ What is the positive square root of 4×3^6 ?

MATHCOUNTS®

2018 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2018 MATHCOUNTS® Chapter Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2018 Chapter Competition Sprint Round

1. The next integer down from 2017.7012 is 2017, which is 0.7012 below; the next integer up is 2018, which is 0.2988 above. The latter is the lesser difference, so **2018** is the closest.
2. The minute hand (the longer hand) is pointing directly at the 7. Each increment of a number on the face corresponds to 5 minutes for the minute hand. Therefore, the clock is 7×5 minutes = **35** minutes after the hour.
3. Start with \$835;
subtract \$415 for rent,
leaving \$420;
subtract \$220 for utilities,
leaving **\$200**.
4. The halfway point occurs at the average of the two endpoints, which are at 0 and 8, so $p = (0 + 8)/2 = 4$.
5. $2 \times \$14$ and $14 \times \$2$ both equal $\$2 \times 14 = \28 . Since we have this cost twice, the total is $2 \times \$28 = \mathbf{\$56}$.
6. $n + 4 = 10 - 2 = 8$. Therefore, $n = 8 - 4 = 4$.
7. a for apples and p for pears: $a/p = 3/5 = a/20$, so $a = 20 \times 3/5 = 4 \times 3 = \mathbf{12}$ apples.
8. $462 = 7 \times 11 \times p$, so $p = (462/11)/7 = 42/7 = \mathbf{6}$.
9. $1/0.25 - 2 = 1/(1/4) - 2 = 4 - 2 = \mathbf{2}$.
10. There are 5 values, so the arithmetic mean is the sum of all the values then divided by 5:
 $10 = (9 + 11 + 13 + x + 7)/5 = (40 + x)/5$, so $40 + x = 5 \times 10 = 50$.
Therefore, $x = 50 - 40 = \mathbf{10}$.
11. $3(p + 4) + 4(p + 11) = 7(p + q)$;
 $3p + 12 + 4p + 44 = 7p + 7q$;
 $7p + 56 = 7p + 7q$;
 $56 = 7q$;
 $q = \mathbf{8}$.
12. $V = hwd = 10 \text{ inches} \times 8 \text{ inches} \times 3 \text{ inches} = (10 \times 8 \times 3) = \mathbf{240 \text{ in}^3}$.
13. $\frac{z}{16} = \frac{4}{z}$. Multiply both sides by $16z$:
 $z^2 = 64$, so $z = \pm 8$.
We are directed to take the positive value, so $z = \mathbf{8}$.

14. She has $8 - 1 = 7$ non-rotten apples costing \$3.50.
Therefore, each non-rotten apple cost $\$3.50/7 = \$0.50 = \mathbf{50}$ cents.
15. $123,456 + 1980 = 125,436$, which has swapped the 3 and the 5.
 $3 \times 5 = \mathbf{15}$.
16. The sum of the measures of the three angles of a triangle is always 180 degrees. Two of the angles are 35 degrees and 95 degrees, totaling 130 degrees, so the remaining angle must have measure $180 \text{ degrees} - 130 \text{ degrees} = \mathbf{50}$ degrees.
17. The values of the 25¢, 10¢, 5¢ and 1¢ are separated enough that duplicated sums cannot occur. In any possible mix of the coins, the quarter can be included or excluded (2 options), likewise for the dime (2 options), the nickel (2 options), and the penny (2 options). Each of these 4 inclusion-exclusion cases is independent of the others, so there are $2 \times 2 \times 2 \times 2 = 16$ possible mixes of coins; however, one of these, excluding all 4 coins, does not meet the criterion that at least one coin must be used. Therefore, there are **15** possible amounts.
18. $x + y = 14$ and $x - y = 4$.
The sum of these two equations is $2x = 18$, so $x = 9$.
Thus, $9 + y = 14$, so $y = 5$.
Therefore, $xy = 9 \times 5 = \mathbf{45}$.
19. $x^2 - y^2 = (x + y)(x - y)$. Let $x = 16$ and $y = 15$.
Therefore, $16^2 - 15^2 = (16 + 15)(16 - 15) = 31 \times 1 = \mathbf{31}$.
20. The mean of x and y is $\frac{x+y}{2}$. Therefore,
 $\frac{a+b}{2} = 6.2$;
 $\frac{b+c}{2} = 7.3$;
 $\frac{a+c}{2} = 4.5$.
We see that each of $a/2$, $b/2$ and $c/2$ occurs twice in these three equations, so if we add the three equations together, we will get the desired $a + b + c$.
Therefore, $a + b + c = 6.2 + 7.3 + 4.5 = \mathbf{18}$.
21. If you know the first few powers of 3, this question is very easy and fast. For those who do not know that many powers of 3, we have $3^2 = 9$; $9^2 = 81$ and $9^2 = (3^2)^2 = 3^4$, so $3^4 = 81$. We are still below 100 but not by much. The next power of 3 is 243, which is too big.
Therefore, the largest integer exponent is **4**.
22. A number is divisible by 6 if and only if it is divisible by 2 and by 3. To be divisible by 2, the units digit must be even, so A must be 0, 2, 4, 6 or 8. To be divisible by 3, the sum of all the digits in the number must be divisible by 3, so $9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + A = 44 + A$ needs to be 45, 48 or 51 to be divisible by 3 and have A be a digit. That means A must be 1, 4 or 7. The only value that satisfies both divisibility requirements is **4**.

23. We can make rectangles 1 column wide, in which case we have 3 choices, 2 columns wide, in which case we have 2 choices (#1 with #2 or #2 with #3), or all 3 columns wide, with only 1 choice. Thus, we have $3 + 2 + 1 = 6$ choices for arranging columns to make rectangles. The 3 rows work the same way as the 3 columns, so there are 6 choices for arranging rows. The manipulation of rows is independent of the manipulation of columns (for each of the 6 row choices, we have 6 column choices), making a total of $6 \times 6 = 36$ rectangles. More generally, if you have r rows, there will be T_r choices of row arrangements, where T_r is the r th triangular number, $r(r + 1)/2$. Likewise, with c columns, there will be T_c choices of column arrangements, for a total of $T_r T_c$ rectangles. In this problem, $T_3 T_3 = 6 \times 6$.

24. The denominator of each of the 10 factors in $\frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \cdot \frac{7}{8} \cdot \frac{9}{10} \cdot \frac{11}{12} \cdot \frac{13}{14} \cdot \frac{15}{16} \cdot \frac{17}{18} \cdot \frac{19}{20}$ is even and, therefore, has a factor of 2. Let's pull out the 10 factors of 2 in the denominators to yield: $\frac{1}{2^{10}} \cdot \frac{1 \cdot 3 \cdot 5 \cdot 7 \cdot 9 \cdot 11 \cdot 13 \cdot 15 \cdot 17 \cdot 19}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10}$, with both the numerator and denominator having factors 1, 3, 5, 7, and 9 that can be cancelled out, leaving $\frac{1}{2^{10}} \cdot \frac{11 \cdot 13 \cdot 15 \cdot 17 \cdot 19}{2 \cdot 4 \cdot 6 \cdot 8 \cdot 10}$. Again each of the 5 factors in the denominator of the fraction on the right is even and has a factor of 2 that can be pulled out, so let's remove them from the right fraction and give them to the denominator or the left fraction, now making 15 factors of 2 there: $\frac{1}{2^{15}} \cdot \frac{11 \cdot 13 \cdot 15 \cdot 17 \cdot 19}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}$. Now, the factors of 3 and 5 together in the denominator on the right cancel with the 15 in the numerator, leaving $\frac{1}{2^{15}} \cdot \frac{11 \cdot 13 \cdot 17 \cdot 19}{1 \cdot 2 \cdot 4}$. The denominator on the right is now $8 = 2^3$, so we have 3 more factors of 2 to move to the 15 already in the denominator on the left, yielding $\frac{1}{2^{18}} \cdot 11 \cdot 13 \cdot 17 \cdot 19 = \frac{11 \cdot 13 \cdot 17 \cdot 19}{2^{18}}$. Now we have some arithmetic to do and this is Sprint Round—only the biological calculator above your shoulders, with assistance of pencil and paper, allowed. There are several ways to do this efficiently, and different people may well have different preferences. One way is to rearrange: $11 \cdot 13 \cdot 17 \cdot 19 = (13 \cdot 17)(11 \cdot 19) = [(15 + 2)(15 - 2)][(15 + 4)(15 - 4)]$
 $= (15^2 - 2^2)(15^2 - 4^2) = (15^2)^2 - (4 + 16)15^2 + (4 \times 16)$
 $= 15^2(15^2 - 20) + 64 = 225 \times 205 + 64 = (215 + 10)(215 - 10) + 64$
 $= 215^2 - 10^2 + 64.$

Now we need to square an integer 215 ending in 5. Break off that 5 and call the rest of the number n , so here $n = 21$. The square of such a number can be calculated is the number of 100s being $n(n + 1)$ and the attaching 25 for the tens and units digits:

$21(21 + 1) = 21 \times 22 = 21 \times 2 \times 11 = 42 \times 11 = 462$, using the multiply by 11 trick.

Therefore, $215^2 = 46\,225$, so we need $46,225 - 100 + 64 = 46,125 + 64 = 46,189$, to which we need to add the exponent 18 that 2 was raised to: $46,189 + 18 = 46,207$.

25. Let t be the total bonus amount; A be Arman's portion, B be Bernardo's portion, and C be Carson's portion.

$$A = \frac{1}{3}t + \$10.$$

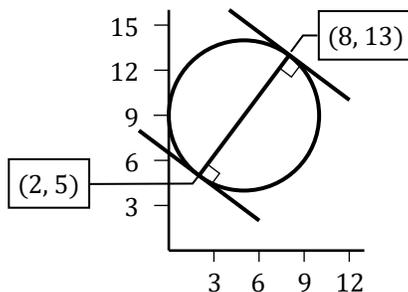

$$B = \frac{1}{2}(t - A) + \$3 = \frac{1}{2}\left[t - \left(\frac{1}{3}t + \$10\right)\right] + \$3 = \frac{1}{3}t - \$2.$$

$$C = \$25.$$

$$t = A + B + C = \frac{1}{3}t + \$10 + \frac{1}{3}t - \$2 + \$25 = \frac{2}{3}t + \$33,$$

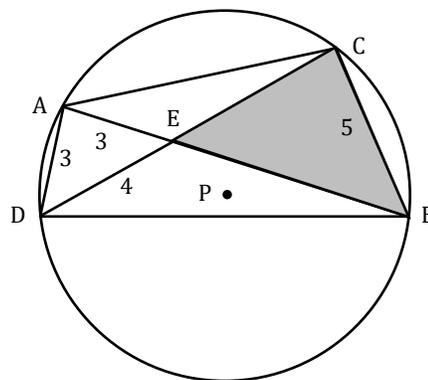

$$\text{so } \frac{1}{3}t = \$33 \text{ and } t = \$99.$$

26. A tangent line to a circle is always perpendicular to the radius connecting the center of the circle to the point of tangency. We have two distinct tangent lines with the same slope, meaning the circle is between the two tangent lines. Each corresponding radius must be perpendicular to its tangent line and have slope equal to the negative reciprocal of the two tangent lines. The two radii are distinct, have the same slope, and coincide at the center of the circle, which means the two radii combined form a diameter of the circle. We know the two endpoints of the diameter, so we can determine its slope: $(13 - 5)/(8 - 2) = 8/6 = 4/3$. The two tangents lines are perpendicular to this diameter and have slope equal to the negative reciprocal of the diameter's slope, thus $-3/4$.

27. Let the four values be $10 \leq a \leq b \leq c$. The mean is $\frac{10+a+b+c}{4}$. The median is $\frac{a+b}{2}$. The range is $c - 10$. The mean being equal to the median implies $\frac{10+c}{4} = \frac{a+b}{4}$, so $10 + c = a + b$. The median being equal to the range implies $a + b = 2(c - 10) = 2c - 20$. Therefore, $10 + c = 2c - 20$, so $c = 30$.

28. Most MATHCOUNTS students are familiar with the intersecting chords theorem. The basis of the proof for that theorem is that triangles ADE and CBE are similar. The scale factor of similarity in this case is that segment $BC = 5$ and corresponding segment $AD = 3$, so the linear dimensions of CBE are $5/3$ times the corresponding linear dimensions of ADE, and the area of CBE is $(5/3)^2 = 25/9$ times the area of ADE. We can find the area of ADE by Heron's formula since we know the lengths of all three sides: 3, 3 and 4. The semi-perimeter is $(3 + 3 + 4)/2 = 5$, so the area of ADE is given by:

$\sqrt{5(5 - 3)(5 - 3)(5 - 4)} = \sqrt{20} = 2\sqrt{5}$. The area CBE is $25/9$ times this, or $\frac{50\sqrt{5}}{9}$ units².

$$29. \frac{1}{6} = \left| \frac{x-2018}{x-2019} \right| = \left| 1 + \frac{1}{x-2019} \right|.$$

The absolute value introduces two cases:

$$\text{Case 1: } 1 + \frac{1}{x-2019} = \frac{1}{6}, \text{ so } \frac{1}{x-2019} = \frac{1}{6} - 1 = -\frac{5}{6} \text{ and } x - 2019 = -\frac{6}{5}.$$

Therefore, $x = 2019 - \frac{6}{5}$. (I am leaving it in this form for reasons to be seen shortly.)

$$\text{Case 2: } 1 + \frac{1}{x-2019} = -\frac{1}{6}, \text{ so } \frac{1}{x-2019} = -\frac{1}{6} - 1 = -\frac{7}{6} \text{ and } x - 2019 = -\frac{6}{7}.$$

Therefore, $x = 2019 - \frac{6}{7}$.

Combining cases: We want $\left| \left(2019 - \frac{6}{5} \right) - \left(2019 - \frac{6}{7} \right) \right| = \left| \frac{6}{7} - \frac{6}{5} \right|$ since the 2019's cancel each other.

$$\left| \frac{6}{7} - \frac{6}{5} \right| = \left| \frac{6 \times 5 - 6 \times 7}{7 \times 5} \right| = \left| -\frac{12}{35} \right| = \frac{12}{35}.$$

30. Each die can independently show any integer from 1 to 6, so the sum S can range from 6 (all 1s) to 36 (all 6s).

For $S = 36$, $S(42 - S) = 36 \times 6 = 216$ uses all 6s with probability $\frac{6!}{6!} \left(\frac{1}{6}\right)^6 = 1 \left(\frac{1}{6}\right)^6$.

For $S = 35$, $S(42 - S) = 35 \times 7 = 245$ uses five 6s and one 5 with probability $\frac{6!}{5!1!} \left(\frac{1}{6}\right)^6 = 6 \left(\frac{1}{6}\right)^6$.

For $S = 34$, $S(42 - S) = 34 \times 8 = 272$ uses *either* five 6s and one 4 with probability $6 \left(\frac{1}{6}\right)^6$ or four 6s and two 5s with probability $\frac{6!}{4!2!} \left(\frac{1}{6}\right)^6 = 15 \left(\frac{1}{6}\right)^6$.

For $S = 33$, $S(42 - S) = 33 \times 9 = 297$ does not qualify.

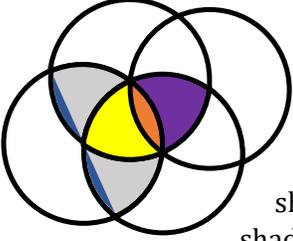

Remember, commutativity of multiplication applies and the reverse cases apply, such as 6×36 for $S = 6$. The same probability applies for $S = 6, 7$ and 8 as for $S = 36, 35$ and 34 , respectively, so we need to double the sum of the first three case sets. Therefore, the total probability is

$$2(1 + 6 + 6 + 15) \left(\frac{1}{6}\right)^6 = 56 \left(\frac{1}{6}\right)^6 = 7 \times 2^3 \left(\frac{1}{6}\right)^3 \left(\frac{1}{6}\right)^3 = 7 \left(\frac{1}{3}\right)^3 \left(\frac{1}{6}\right)^3 = \frac{7}{18^3} = \frac{7}{5832}.$$

2018 Chapter Competition Target Round

1. First we must remember that 1 hour = 60 minutes.
The starting time is at 11:43 a.m., and 17 minutes after that, we reach 60 minutes after 11:00 a.m., which is 12:00 noon.
From noon to 2:34 p.m. is 2 hours + 34 minutes = 2×60 minutes + 34 minutes = 120 minutes + 34 minutes = 154 minutes.
The total time is the sum of the morning time, 17 minutes, and the afternoon time, 154 minutes, which is **171** minutes.
2. We can factor the quadratic $2x^2 + 5x - 12$ into $(x + 4)(2x - 3)$. Substituting and solving the quadratic equation yields $(x + 4)(2x - 3) = 0$, so $x + 4 = 0$ and $x = -4$, or $2x - 3 = 0$ and $x = \frac{3}{2}$. Now, let $m = -4$ and $n = \frac{3}{2}$. Substituting into the expression $(m - 1)(n - 1)$, we get $(-4 - 1)\left(\frac{3}{2} - 1\right) = (-5)\left(\frac{1}{2}\right) = -\frac{5}{2}$.
3. Determine x given: $x > y$; $x + y = 35$; $x = 2y - 4$.
 $y = 35 - x$ and $x = 2y - 4$ imply that $x = 2(35 - x) - 4 = 70 - 2x - 4 = 66 - 2x$, so $3x = 66$. Therefore, $x = \mathbf{22}$.
4. There are $4!/(2! \times 2!) = 6$ distinct arrangements of the 4 values into the 2 pairs. The division by $2!$ twice in this count is based on $a + b = b + a$, yielding a duplicate outcome, and likewise for $c + d = d + c$. These 6 arrangements are:
 $((1+2), (3+4)) = (3, 7)$;
 $((1+3), (2+4)) = (4, 6)$;
 $((1+4), (2+3)) = (5, 5)$;
 $((2+3), (1+4)) = (5, 5)$;
 $((2+4), (1+3)) = (6, 4)$;
 $((3+4), (1+2)) = (7, 3)$.
We see that $(5, 5)$ is duplicated, so there are only 5 distinct cases at this level. Thus, we are looking at evaluating 3^7 , 4^6 , 5^5 , 6^4 , and 7^3 . There is a theorem relating x^y and y^x for $e < x < y$, where e is a special irrational number (like π) with value 2.718...: $y^x < x^y$. We want the maximum power out of these 5 choices. We know from the theorem that $3^7 > 7^3$ and $4^6 > 6^4$, so we are down to 3 powers to evaluate: $3^7 = 2187$, $4^6 = 4096$, and $5^5 = 3125$, the greatest of which is **4096**.
5. Let a and b be the number of laps that Aiden and Bryce, respectively, make when they meet again at the starting line. Because the requisite meeting place is at the starting line, that involves a whole number of laps for each, thus making both a and b to be integers. The times involved are $44a$ seconds and $40b$ seconds, which must be equal to be a meeting.
Now, $44a$ seconds = $40b$ seconds, and manipulating algebraically yields $b/a = 44/40 = 11/10$, which cannot be reduced further. Therefore, Bryce takes 11 laps while Aiden takes 10 laps, corresponding to 10×44 seconds = 11×40 seconds = **440** seconds.

6. The movie lasts 2 hours + 18 minutes = 2×60 minutes + 18 minutes = 120 minutes + 18 minutes = 138 minutes. An ad is shown at the very beginning and then after each 10 minutes of movie, thus at 0, and after 10 minutes, 20 minutes, ..., 130 minutes of movie, which is a total of 14 ads. Each ad takes 30 seconds, which is $(1/2)$ minute, so 14 of them last $14 \times (1/2)$ minutes = 7 minutes. Therefore, the total watching time is 138 minutes + 7 minutes = 145 minutes, of which 7 minutes is advertising, making the fraction of time spent watching ads equal to $7 \text{ minutes} / (145 \text{ minutes}) = (7/145) \times 100\% \approx \mathbf{4.8\%}$.

7.  The original figure involved finding the area of what is shaded here with blue, gray, and purple. Because all of the circles are congruent, there are various corresponding regions. The purple region is congruent to the yellow region. The two blue regions joined flat side to flat side is congruent to the orange region. If we move the purple shading to the yellow shading and the two blue shadings to the orange shading, so that we assess only the gray, yellow, and orange shading, we see that we have a semicircle made up of half of one of the four congruent circles. Therefore, the area of the shaded region is $\frac{1}{2}\pi r^2 = \frac{1}{2}\pi(2 \text{ cm})^2 = \mathbf{2\pi \text{ cm}^2}$.

8. In order to have $3 - \sqrt{\frac{4-x}{2}}$ to be meaningful at all in the context of real numbers, the radicand, $(4 - x)/2$, must not be negative, so $x \leq 4$. We must also keep the radical at most 3, so the radicand must be at most $3^2 = 9$; therefore, $4 - x \leq 18$, that is, $x \geq -14$. Therefore, we wish to add the integers from -14 through $+4$. This is a simple arithmetic series to add using the standard formula; one might also note that 1 through 4 cancel out -1 through -4 , so add -14 through -5 ; as yet another option, adding 1 through n , or the negative thereof, is the simplest of the arithmetic series formulas and separately do -14 through -1 and 1 through 4. I prefer the last option:
 -14 through -1 is the negative of 1 through 14: $-(14 \times 15/2) = -7 \times 15 = -105$, and 1 through 4 is easily found to be 10, so $-105 + 10 = \mathbf{-95}$.

2018 Chapter Competition Team Round

1. Let Q represent a quarter, D a dime, N a nickel, and P a penny. The absence of a letter in an expression indicate no corresponding coin is present; for coins that are present, a subscript applied to a letter for a coin indicates how many of that coin type is there. Let's start with as big a coin as possible and gradually break it down to smaller-valued coins:

Q_1P_2 : 3 coins, which is odd. ✓

$D_2N_1P_2$: 5 coins, which is odd. ✓

D_2P_7 : 9 coins, which is odd. ✓

Replacing one D with any of two N, or one N and five P, or ten P in either of the preceding two cases adds an odd number of coins, making the odd count go to even, so none of those work. Those are all the cases that have a Q or D, so all that is left are N and P cases. Start with replacing Q in the first case with 5N, an increase of 4 coins, so the odd case that worked at the beginning works with this replacement:

N_5P_2 : 7 coins, which is odd. ✓

Now we successively replace one N at a time with five P, increasing the odd count by 4 each time, resulting in a new odd count:

N_4P_7 : 11 coins, which is odd; ✓

N_3P_{12} : 15 coins, which is odd; ✓

N_2P_{17} : 19 coins, which is odd; ✓

N_1P_{22} : 23 coins, which is odd; ✓

P_{27} : 27 coins, which is odd. ✓

Counting the check marks, there are **9** ways.

2. The sum of the measures of all 6 interior angles of a hexagon is $(6 - 2)180$ degrees = 720 degrees. Therefore, 720 degrees = $x + 10$ degrees + $2x + 80$ degrees + $3x - 60$ degrees + $4x + 40$ degrees + $5x - 10$ degrees + $6x - 33$ degrees = $21x + 27$ degrees, and 693 degrees = $21x$, so $x = 33$ degrees. That results in the following angles:

$$33 \text{ degrees} + 10 \text{ degrees} = 43 \text{ degrees};$$

$$2 \times 33 \text{ degrees} + 80 \text{ degrees} = 146 \text{ degrees};$$

$$3 \times 33 \text{ degrees} - 60 \text{ degrees} = 39 \text{ degrees};$$

$$4 \times 33 \text{ degrees} + 40 \text{ degrees} = 172 \text{ degrees};$$

$$5 \times 33 \text{ degrees} - 10 \text{ degrees} = 155 \text{ degrees};$$

$$6 \times 33 \text{ degrees} - 33 \text{ degrees} = 165 \text{ degrees}.$$

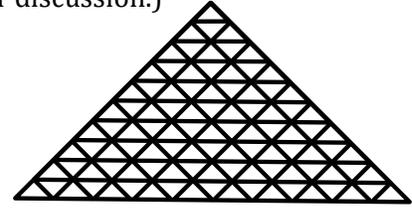

The largest of the values is **172** degrees.

3. To get the greatest possible sum, we need to put the largest value, 21, in the circle used every time, the center circle. On any branch the sum of the two outer circles must match the sum of the least and greatest remaining numbers after removing the 21, thus $11 + 20 = 31$. The maximum possible sum per the specified criteria is, therefore, $21 + 31 = 52$.

4. $(ax + by)(cx + dy) = acx^2 + (ad + bc)xy + bdy^2 = 7x^2 + 9kxy + 5y^2$.
 Therefore, $ac = 7$, so $a = 1$ and $c = 7$, or $a = 7$ and $c = 1$;
 similarly, $bd = 5$, so $b = 1$ and $d = 5$, or $b = 5$ and $d = 1$.
 We must take each of the two possible pairings of a and c and combine with each of the two pairings of b and d to see how we can get $ad + bc$ to be a multiple of 9. The options are:
 $1 \times 5 + 1 \times 7 = 12$ —not a multiple of 9;
 $7 \times 5 + 1 \times 1 = 36$ —a multiple of 9;
 $1 \times 1 + 5 \times 7 = 36$ —a multiple of 9;
 $7 \times 1 + 5 \times 1 = 12$ —not a multiple of 9.
 There are two cases that work, both with value 36, so $9k = 36$ and $k = 4$.
5. Let c be the cost of the child ticket; then the cost of a senior ticket is double that, or $2c$, and regular ticket is doubled yet again, or $4c$. There are 6 child tickets, 8 senior tickets, and 55 regular tickets. The total price is $\$544.50 = 6c + 8 \times 2c + 55 \times 4c = 242c$; therefore, $c = \$544.50/242 = \mathbf{\$2.25}$.
6. For a fraction to have value 0, the numerator must be 0; thus, the numerator must be $x - 5$ (the numerator being x minus something and it must be 0 for $x = 5$, so the something must be 5, regardless whether it is called $3a$ or anything else—no need to calculate a or $3a$.) Likewise, being undefined at $x = 3$ means the denominator is 0 at $x = 3$ so the denominator is $x - 3$.
 Therefore, $f(x) = \frac{x-5}{x-3} = 1 - \frac{2}{x-3}$, and $f\left(\frac{1}{3}\right) = 1 - \frac{2}{\frac{1}{3}-3} = 1 - 2\left(-\frac{3}{8}\right) = 1 + \frac{3}{4} = \frac{7}{4}$.
7. We know that 2 and 3 are keys, and there is a third, as yet unknown key. Because we want the product of all three elements in the set that contains neither 2 nor 3, that unknown key must be determined.
 5 and 7 go in the same set, but neither is a key, so those two values go with one of the three keys, and that key is the only thing that is unknown for that set.
 Because 13, 17, and 29 must be in different sets, one of them must be the key in the set with 5 and 7.
 Now, 13 must be with 11 or 19, which cannot be the case if it is with 5 and 7, so we are down to 17 and 29 for consideration.
 7 cannot be in a set with 17 as a key, and we are dealing with the set with 5 and 7, so 17 cannot be the key, so the only value left for the key is 29.
 Our set appears to be $\{29, 5, 7\}$. A quick check of the other rules yields no contradiction. The desired answer is the product $29 \times 5 \times 7 = \mathbf{1015}$.

8. (Note: I have re-oriented the figure from the problem for easier discussion.)

We need to treat the triangles oriented \triangle differently from how we treat triangles oriented ∇ (sorry, but you will need to pretend these are right triangles)—we will see why shortly.

There is 1 unit \triangle in the top row, 2 in the second row, 3 in the third row, ..., and 10 in the tenth (bottom) row. Thus, there are $1 + 2 + 3 + \dots + 10 = T_{10}$ unit \triangle in total, where T_k is the k th triangular number, $C_{k+1,2} = \frac{(k+1)k}{2}$. The top two rows together comprise a single “2×2” triangle oriented as \triangle . Go one row down (second and third rows) and there are 2 more. Each time we go down a row, there is 1 more than the previous row, and we can go down to the ninth-tenth row pair, which has 9. Therefore, there are $1 + 2 + 3 + \dots + 9 = T_9$ such “2×2” \triangle . We can keep making the component triangle bigger by 1 more row at a time, and this pattern continues: count of T_8 for “3×3” \triangle , T_7 for “4×4”, ..., until finally $T_1 = 1$ for “10×10” when we consider the whole given triangle as a component triangle. This yields a total of count of \triangle of any size of $T_1 + T_2 + T_3 + \dots + T_{10} = C_{12,3} = 12 \times 11 \times 10 / 6 = 220$. (This is a basic property of Pascal’s triangle—the sum of the top n 1’s $[C_{k,0}]$ in the leftmost diagonal is the n th positive integer n $[C_{n,1}]$, the sum of the first n positive integers $[C_{k,1}]$ in the next diagonal is the n th triangular number $(n + 1)n/2 = C_{n+1,2}$, the sum of the first n triangular numbers $[C_{k+1,2}]$ in the next diagonal is the n th tetrahedral number $(n + 2)(n + 1)n/3! = C_{n+2,3}$, and so on.)

Now we have to deal with the triangles oriented ∇ . Such a triangle does not occur until the second row, and there is 1; each successive row (of which there are 8) adds 1 more unit ∇ , so we have $1 + 2 + 3 + \dots + 9 = T_9$ unit ∇ . The “2×2” ∇ start in row 3 but the bottommost one starts in row 9 (occupying rows 9 and 10), so there only 7 rows with such component triangles yielding a total of T_7 of them—note that we have skipped T_8 . This skipping pattern continues: T_5 “3×3”, T_3 “4×4”, and T_1 “5×5”. There is no farther to go—the reason being that the one “5×5” has its top in row 6 and its bottom in row 10 (the last row), so there is no room at the bottom to grow a larger ∇ . Thus, the total number of ∇ is $T_1 + T_3 + T_5 + T_7 + T_9$. There is a simple, but not so trivial to remember, formula to evaluate such an expression, plus a different formula must be used if the total number of rows is odd. Instead let’s just crunch through the numbers: $\frac{2 \times 1}{2} + \frac{4 \times 3}{2} + \frac{6 \times 5}{2} + \frac{8 \times 7}{2} + \frac{10 \times 9}{2} = 1 + 6 + 15 + 28 + 45 = 95$.

Combining the two orientations of triangles, we have a total of $220 + 95 = 315$.

There is a straightforward overall formula that handles the general case for the total rather simply, even though the ∇ portion is messy: $\left\lfloor \frac{n(n+2)(2n+1)}{8} \right\rfloor$. The outer “brackets” are *not* ordinary rectangular brackets (notice the inward horizontal extensions at the bottom but not the top) but constitute the symbol for the floor operator (also known as the greatest integer function). Note that when n is even the numerator is divisible by 8, so no issue; however, when n is odd the numerator is odd and not divisible by 8. However, if you round the quotient *down* (in the negative direction) to an integer, the result always works—whether odd or even. Without this rounding trick, the formula for the odd n case would look quite different.

9. To make one pound of equal mix, there needs to be one-half pound gummy bears and one-half pound of jelly beans. Gummy bears cost \$20 for 8 pounds, so $\$20 / (8 \text{ lb}) = \$2.50/\text{lb}$, and one-

half pound would cost \$1.25. Jelly beans cost \$14 for four pounds, so $\$14/(4 \text{ lb}) = \$3.50/\text{lb}$, and one-half pound would cost \$1.75. The total cost to make one pound of the mix is $\$1.25 + \$1.75 = \$3.00$, which is to be $2/5$ (that is, $40\% = 40/100$) of the selling price, so the selling price needs to be $\$3.00 \times 5/2 = \mathbf{\$7.50}$.

10. There are three cases:

Case 1. Both Ds and both Is are used, with 1 of the other 4 letters: With each of two letters used twice and one used once, that yields $\frac{5!}{2!2!1!} = 30$ arrangements. Now for the letter on its own, there are 4 choices (A, T, O, N). Combining those two features yields $30 \times 4 = 120$ options.

Case 2. Both Ds are used but not both Is, or both Is are used but not both Ds: With one letter used twice and each of three letters used once, that yields $\frac{5!}{2!1!1!1!} = 60$ arrangements. It could be either the D or the I that is doubled, providing a factor of 2, and we can choose any 3 of the 5 distinct remaining letters, for another factor of $\frac{5!}{3!2!} = 10$. Combining these three factors yields $60 \times 2 \times 10 = 1200$ options.

Case 3. There is at most one D and at most one I used: There are 6 distinct letters of which any 5 are to be chosen, yielding $\frac{6!}{(6-5)!} = 720$ options.

Total: These three cases yield a total count of $120 + 1200 + 720 = \mathbf{2040}$ permutations.

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ If $x \nabla y$ is defined as $(x + 1)(y - 1)$, what is $4 \nabla 3$?

2. _____ integers How many integers are equal to their own cube?

3. _____ Four consecutive odd integers sum to 256. What is the least of the four integers?

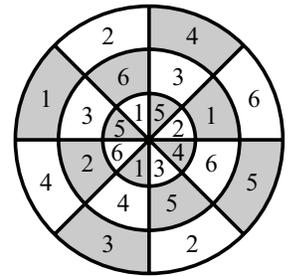

4. _____ units The area of a square is, numerically, 5 times its perimeter. What is the greatest possible length of a side of the square?

5. _____ If $f(x) = x + 2$, $g(x) = x^2 - 3$ and $h(x) = x - 5$, what is the value of $f(g(h(10)))$?

6. _____ baskets Steph is playing basketball with his brother. He scores 29 points on 12 successful baskets. Each basket was worth either 2 or 3 points. How many baskets worth 3 points did Steph make?

7. _____ chips Alexandra plays poker with seven friends. Each of the eight players starts with 60 chips, but players take chips from one another as play progresses. The goal of the game is to win all of the chips. A player drops out of the game if she loses all her chips to other players in the game. After five players have dropped out of the game, what is the average number of chips each of the remaining players has?

8. _____ Setzer throws a dart that lands within one of the 24 numbered regions on the dartboard shown, and then rolls a standard six-sided die. What is the probability that the number of the region his dart hits is the same as the number he rolls on the die? Express your answer as a common fraction.

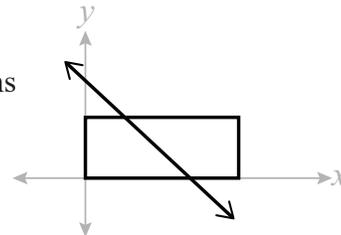

9. _____ The product $33 \times 34 \times 57 \times 65$ is divisible by the square of a prime number p . What is the value of p ?

10. _____ An ordinary 3-by-3 magic square contains every positive integer from 1 through 9, with one integer per cell, such that the sums of the numbers in each row, each column and each diagonal are the same. When the ordinary magic square shown is completed, what is the sum of all the possible values of x ?

| | | |
|--|-----|---------|
| | x | |
| | 5 | |
| | | $x + 1$ |

11. _____

The line $x + y = 5$ intersects a rectangle with vertices at $(0, 0)$, $(0, 3)$, $(8, 0)$ and $(8, 3)$, dividing it into two regions as shown. What is the ratio of the area of the smaller region to the area of the larger region? Express your answer as a common fraction.

12. _____

If a runner who runs at a constant speed of p miles per hour runs a mile in exactly p minutes, what is the integer closest to the value of p ?

13. _____

The three-digit numbers C99, A6A, BC7 and B91 form an arithmetic sequence in this order. What is the value of $A^2 + B^2 + C^2$?

14. _____

Let $x \star y = x^2 + xy$. If a and b are positive integers such that $a \star b = 9$ and $b \star a = 72$, what is the value of $\frac{a}{b}$? Express your answer as a common fraction.

15. _____ mi/h

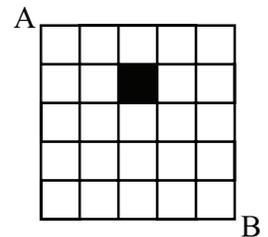

The team had an easy trip to the MATHCOUNTS contest, but a detour on the way home made the return trip take twice as long. If the new route home (including the detour) was 50% longer than the original trip, and the average speed returning was 10 mi/h slower, what was the average speed of the team going to the contest?

16. _____ The orbital period of a planet is the time it takes to make one revolution around its sun. In a distant solar system, the giant planet Flion makes 5 orbits of its sun in the time it takes its planetary neighbor Reffurn to make 2 orbits. Flion makes 19 orbits of its sun in the time it takes the comet Hathov to make 3 orbits. What is the ratio of Hathov's orbital period to Reffurn's orbital period? Express your answer as a common fraction.

17. _____ points In eight games this season, Kelly's basketball team scored 22, 30, 33, 44, 50, 55, 61 and 66 points, respectively. They exactly tripled their opponent's score three times and exactly doubled their opponent's score three times. They lost two games by 4 points each. How many points did their opponents score altogether?

18. _____ A 100-digit positive integer is divisible by 72. What is the greatest possible value of the sum of the number's digits?

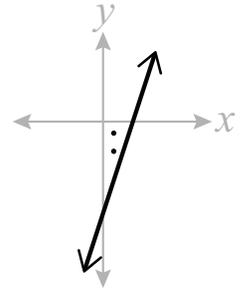

19. _____ ways In the figure, each segment between two adjacent vertices has length 1 unit. How many ways are there to go from A to B along a sequence of 10 segments without touching a side or vertex of the shaded square?

20. _____ What is the sum of all the integer values of x for which $|3x - 3| < 13$?

21. _____ points

The right triangle bounded by the x - and y -axes and the line $3x - y = 6$ contains 2 lattice points in its interior. How many lattice points will be contained in the interior of the triangle bounded by the x - and y -axes and the line $3x - y = 24$?

22. _____

The base four representation of $p = 3 + \frac{0}{4} + \frac{2}{4^2} + \frac{1}{4^3}$ is $p = 3.021_4$. In base eight, $p = 3.AB_8$. What is the value of $A + B$?

23. _____

Bryan visits a carnival booth where Carl shows him 10 boxes. Exactly one of the boxes contains a gold coin; the other boxes are empty. Bryan randomly takes one of the boxes, but he doesn't open it. Carl then opens five other boxes that he knows are empty and shows Bryan that they are empty. Carl then tells Bryan he can either keep his initially chosen box or return it and choose one of the remaining closed boxes instead. If Bryan chooses to return his box and choose another one instead, what is the probability Bryan will choose the box with the gold coin? Express your answer as a common fraction.

24. _____

Ivory writes down three two-digit numbers, each with units digit 7. The tens digit of the product of these three numbers is 5. What is the tens digit of the sum of the three numbers?

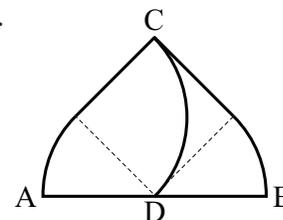

25. _____

What is the probability that three randomly drawn real numbers between 0 and 1 have a sum less than 1? Express your answer as a common fraction.

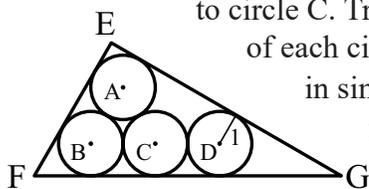

26. _____ Kevin writes a sequence of numbers starting with 1, and repeatedly adding 1 until a multiple of 2 is reached. He then repeatedly adds 2 to this value until a multiple of 3 is reached, then adds 3 until he gets a multiple of 4, and so on. The first four terms are 1, 2, 4, 6. What will be the last term Kevin writes down before he adds 2000 for the first time?

27. _____ Oliver rolls three fair standard six-sided dice. What is the probability that there is at least one pair of dice whose top faces sum to 6? Express your answer as a common fraction.

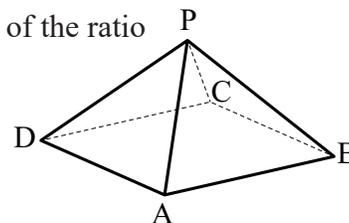

28. _____ percent A figure shown is bounded by segment AB and paths BC and CA, and is formed by seamlessly joining two 45-degree sectors of a circle of radius 1 unit along two sides of a unit square that has C and D as opposite vertices. A quarter-circular arc of radius 1 unit is drawn from C to D. What is the percent probability that a random point chosen on arc CD forms an acute triangle with points A and B? Express your answer to the nearest tenth.

29. _____ Congruent, non-overlapping circles A, B, C and D are positioned in a plane, such that A, B and C are mutually tangent to each other, and circle D is tangent to circle C. Triangle EFG circumscribes the four circles as shown. If the radius of each circle is 1 meter, then the length of side FG can be expressed in simplest radical form as $a + b\sqrt{c}$ meters, where a , b and c are integers. What is the value of $a + b + c$?

30. _____ In right pyramid PABCD, ABCD is a square with sides of length 2 and the distance from P to the center of square ABCD is 1. A plane intersects the pyramid at A and intersects edges PB, PC and PD at points B', C' and D', respectively. If $\frac{B'B}{PB} = \frac{1}{4}$ and $\frac{D'D}{PD} = \frac{1}{5}$, what is the value of the ratio $\frac{C'C}{PC}$? Express your answer as a common fraction.

Forms of Answers

The following list explains acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Judges will score competition answers in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lbs 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not share a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N \frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}$, $1 \frac{1}{2}$
Problem: What is the sum of the lengths of the radius and the circumference of a circle with diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$
Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1 \frac{2}{3}$ *Unacceptable:* $1 \frac{8}{12}$, $\frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Simplified, Acceptable Forms: $\frac{7}{2}$, $\frac{3}{\pi}$, $\frac{4-\pi}{6}$ *Unacceptable:* $3 \frac{1}{2}$, $\frac{1}{3}$, 3.5, 2:1

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is the value of $\sqrt{15} \times \sqrt{5}$? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c both are zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent unless otherwise specified. Examples:

Acceptable: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not perform any intermediate rounding (other than the “rounding” a calculator does) when calculating solutions. All rounding should be done at the end of the computation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3
Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole number answers should be expressed in their whole number form.

Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. \$ _____ Chris needs to move 500 kg of furniture 5000 km from San Francisco to Washington D.C. One moving company charges a \$500 fixed cost for any move in addition to \$0.30 per kilometer traveled and \$0.40 per kilogram carried. A different moving company charges no fixed cost, but charges \$0.50 per kilometer traveled and \$0.30 per kilogram carried. How many dollars can Chris save by choosing the less expensive moving company?

2. _____ percent Matt, the donut quality inspector, randomly tastes five donuts out of 10 dozen. If one or more donuts tastes burnt or is under cooked, then the whole batch has to be discarded. Given that there are exactly four unacceptable donuts in a batch of 10 dozen, what is the probability that Matt rejects the batch? Express your answer to the nearest whole percent.

MATHCOUNTS®

2018 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2018 MATHCOUNTS® State Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

with the MATHCOUNTS community.*

2018 State Competition Sprint Round

1. $4 \nabla 3 = (4 + 1)(3 - 1) = 5 \times 2 = \mathbf{10}$.
2. $x = x^3$ so $0 = x^3 - x = (x^2 - 1)x = (x + 1)(x - 1)x$, which has solutions $-1, +1$, and 0 for a total count of **3** integers.
3. Find x such that $256 = x + (x + 2) + (x + 4) + (x + 6) = 4x + 12$, so $4x = 244$. This results in $x = 61$, which is required to be odd, and we verify readily. Therefore, $x = \mathbf{61}$.
4. The area enclosed by square of side s is s^2 ; the perimeter of such a square is $4s$. Therefore, $s^2 = 5(4s) = 20s$ and $0 = s^2 - 20s = s(s - 20)$. Thus, s must be 0 or 20 . A square with side 0 would be degenerate (just a point) and the question asks for the greatest possible value anyway, so we go with an answer of **20** units.
5. $f(g(h(10))) = f(g(10 - 5)) = f(g(5)) = f(5^2 - 3) = f(22) = 22 + 2 = \mathbf{24}$.
6. At least 2 points are scored for each basket, which means at least 24 points for the 12 baskets made. Baskets might be worth 1 extra point each. Since a total of 29 points were scored, we need to account for $29 - 24 = 5$ extra points, which means **5** baskets worth 3 points.
7. The same number of chips stay in play throughout the game. There are 8 people (Alexandra and 7 others) who start, making $8 \times 60 = 480$ chips, and 3 players left after 5 players drop out. The average number of chips for each of the 3 remaining people is $480/3 = \mathbf{160}$ chips.
8. Regardless the probability of any particular value with the dart, the probability of the die rolling on that particular value is $\frac{1}{6}$. (To demonstrate this in case you do not believe it, let p_i be the probability of the dart hitting value i ; the probability of the die rolling an i is $\frac{1}{6}$. Therefore, the probability for both the dart and die hitting i , as independent events, is the product $\frac{1}{6}p_i$. Add the products for all possible values of i and factor out the common $\frac{1}{6}$ to obtain $\frac{1}{6}(p_1 + p_2 + p_3 + p_4 + p_5 + p_6)$. The sum of the probabilities in the parentheses must be 1, since the dart hits some value, so the result is indeed $\frac{1}{6}$.)
9. $33 \times 34 \times 57 \times 65 = (3 \times 11) \times (2 \times 17) \times (3 \times 19) \times (5 \times 13)$ is the prime factorization. Each prime, except 3, occurs once, and 3 occurs twice to be the only perfect square, thus **3**.
10. The sum of the elements in each row, column, and diagonal of a 3×3 magic square must be $\frac{1+2+3+4+5+6+7+8+9}{3} = \frac{9 \times 10}{2 \times 3} = 15$. For the center column to sum to 15 the bottom box must be $10 - x$. Then for the bottom row to sum to 15, the left box must be 4 . Then for the bottom-left to top-right diagonal to sum to 15, the top right box must be 6 . Then for the right column to sum to 15, the middle right box must be $8 - x$. For the top row to sum to 15, the left box must be $9 - x$. Lastly, for the left column to sum to 15, the middle box must be $x + 2$. Now we see three sets of 3 consecutive values: $x, x + 1, x + 2$; $4, 5, 6$; and $8 - x, 9 - x, 10 - x$. Either one of the unknown sets must evaluate to $1, 2, 3$ and the other to $7, 8, 9$; x is the least value in its set. Therefore, x can be either 1 or 7 , the sum of which is **8**.

| | | |
|---------|----------|---------|
| $9 - x$ | x | 6 |
| $x + 2$ | 5 | $8 - x$ |
| 4 | $10 - x$ | $x + 1$ |

11. The two sections of the rectangle are trapezoids. The line intersects the rectangle at the top where $y = 3$, so $x = 5 - 3 = 2$, and at the bottom where $y = 0$, so $x = 5 - 0 = 5$. The average of the base lengths of the left trapezoid is $(2 + 5)/2 = 7/2$, and the rectangle has width 8, so the average of the base lengths of the right trapezoid is $8 - \frac{7}{2} = 9/2$. Using the height to find the actual area of the trapezoids is unneeded since it will cancel out in the ratio, so only the average base lengths are needed. The smaller is $7/2$ and the larger is $9/2$, so the ratio of the smaller to the larger has the 2s in the denominator cancel, leaving **7/9**.
12. Distance equals the product of rate and time: distance is 1 mi, rate is p mi/h, and time is p minutes. Therefore, $1 \text{ mi} = p \frac{\text{mi}}{\text{h}} \times p \text{ min} = p^2 \text{ mi} \cdot \frac{\text{min}}{\text{h}}$. Now, $1 \text{ h} = 60 \text{ min}$, so $\frac{\text{min}}{\text{h}} = \frac{1}{60}$. Therefore, $1 \text{ mi} = (p^2/60) \text{ mi}$. The "mi" cancel, and we are left with $p^2 = 60$. Since $7^2 = 49$ and $8^2 = 64$, p must be between 7 and 8, and 60 looks closer to 64 than to 49, it appears 8 is the correct answer. We can double check with $7.5^2 = 7(7 + 1) + 0.25 = 56.25 < 60$, so, yes, the correct answer is **8**.
13. An arithmetic sequence involves a common difference, which may be either positive or negative, between consecutive terms. Having a negative difference means the terms are decreasing, so the last two must satisfy $BC7 \geq B91$, which necessitates $C = 9$ and yields a common difference of -6 . That means the first term must be 12 greater than the third term and the $B97 + 12$ must end in 09, but the first term ends in 99. A contradiction results, so the common difference must be positive. The difference in the last pair of values, $B91 - BC7$ must be in the range 4 (for $C = 8$) to 84 (for $C = 0$) and end in 4. The difference between the last and first terms is 3 times the common difference, which is in the range 12 to 252, ending in 2 and divisible by 3; that difference is $B91 - C99$, which ends in 92. The choices satisfying the range constraint are 92 and 192, of which only 192 is divisible by 3. Thus, the common difference is $192/3 = 64$, making the third term 64 less than the fourth term, that is, $B91 - 64 = B27 = BC7$, so $C = 2$. That makes the first term be 299 and successive terms being 363, 427, and 491, which is consistent with the given information, with $A = 3$, $B = 4$, and $C = 2$. Therefore, $A^2 + B^2 + C^2 = 9 + 16 + 4 = \mathbf{29}$.
14. $x \star y = x^2 + xy = x(x + y)$. Therefore, $9 = a \star b = a(a + b)$, and $72 = b \star a = b(b + a) = b(a + b)$. Now, $(a + b) \neq 0$ since the products are not 0, so we may divide by an expression containing $(a + b)$ as a factor. Dividing the upper equation by the lower equation yields:

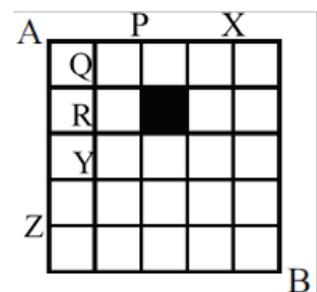

$$\frac{\mathbf{1}}{\mathbf{8}} = \frac{a(a + b)}{b(a + b)} = \frac{a}{b}$$
15. Let d be the distance to the contest and t be the time to travel to the contest. Then the average speed going to the contest is d/t , which I will call v (for the magnitude of the velocity). Returning home involves a distance 50 % greater than going, so $(1 + 0.5)d = 1.5d$ and a time twice as long as going, so $2t$, making the average return speed $\frac{1.5d}{2t} = \frac{1.5}{2} \frac{d}{t} = \frac{3}{4}v$, which is given to be 10 mi/h less than v . Therefore, $\frac{3}{4}v = v - 10 \text{ mi/h}$ and $10 \text{ mi/h} = v - \frac{3}{4}v = v/4$, so $v = 4 \times 10 \text{ mi/h} = \mathbf{40 \text{ mi/h}}$.

16. Let T represent the time of one orbit, called the orbital period, and apply a subscript F when applied to Flion, H when applied to Hathov, and R when applied to Reflurn. Then, we want T_H/T_R , so let's express T_H in terms of T_F and T_F in terms of T_R , since we are given the relationship between Flion and each of Hathov and Reflurn:

$$5T_F = 2T_R, \text{ so } T_F = \frac{2}{5}T_R, \text{ and } 19T_F = 3T_H, \text{ so } T_H = \frac{19}{3}T_F = \frac{19}{3}\left(\frac{2}{5}T_R\right) = \frac{38}{15}T_R, \text{ so } T_H/T_R = \frac{38}{15}.$$

17. Three times they tripled the opponents' score, so their scores must be divisible by 3; there are three such scores (30, 33, 66), so they must be those scores, meaning the opponents' scores in those games were 10, 11, and 22, respectively. For three of the remaining five scores, the team doubled their opponents' scores, so their scores must be divisible by 2; there are three such scores (22, 44, 50), meaning the opponents' scores in those games were 11, 22, and 25, respectively. The two remaining scores (55 and 61) fell short of the opponents by 4, so the opponents' scores for those two games were 59 and 65. The sum of the eight scores of the opponents is, therefore, $10 + 11 + 22 + 11 + 22 + 25 + 59 + 65 = 225$ points.
18. For an integer to be divisible by 72, the three least significant digits taken together as an integer must be divisible by 8 and the sum of all the digits must be divisible by 9. The largest sum that one can obtain from 100 digits is when all digits are 9, yielding a sum of 900. However, the last three digits taken as an integer, 999, is not divisible by 8. Thus, we must decrease at least one of the digits below 9, making the sum below 900. The next largest potential value sum (requiring that sum to be divisible by 9) is 891. If we find a way to achieve a sum of 891 while having divisibility of the last three digits together by 8, then we are done. The greatest three-digit multiple of 8 is 992, which has 20 as the sum of its digits, yielding a decrease of 7, 2 short of what we need to decrease. That can be remedied by decreasing the thousands digit from 9 to 7. Constructing the 100-digit number as 96 copies of 9 followed by the last 4 digits being 7992 yields a value whose digits sum to 891, which is divisible by 9, and the last 3 digits as the integer 992 that is divisible by 8. Therefore, the greatest possible sum of the digits is **891**.

19. The point B is 5 segments to the right and 5 segments down from A, so the shortest possible path sequence involves 10 segments, which is the length specified for allowed sequences. In order to achieve such, backtracking (moving back to the left or back up) is impossible. Due to constraints on avoiding the shaded box, if a path goes through P it must proceed to X; similarly if a path goes through Q or R it must proceed to Y. That means every path must go through exactly one of X, Y, or Z. The number of paths going from A to B

through X is the product of the number of paths from A to X times the number of paths from X to B, and similarly through Y and through Z. The number of available paths that involves moving d steps down (D) and r steps right (R) is the number of arrangements (combinations) of the Ds and Rs, given by ${}_{d+r}C_d = {}_{d+r}C_r$.

From A to X: $d = 0$ and $r = 4$; from X to B: $d = 5$ and $r = 1$. ${}_4C_0 = 1$ and ${}_6C_1 = 6$.

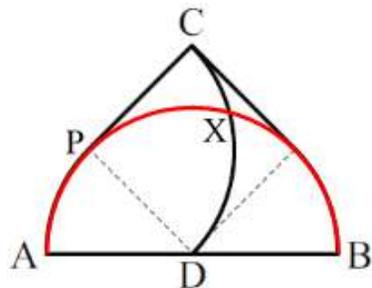

From A to Y: $d = 3$ and $r = 1$; from Y to B: $d = 2$ and $r = 4$. ${}_4C_1 = 4$ and ${}_6C_2 = 15$.

From A to Z: $d = 4$ and $r = 0$; from Z to B: $d = 1$ and $r = 5$. ${}_4C_0 = 1$ and ${}_6C_1 = 6$.

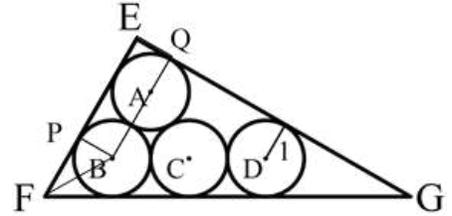

Therefore, the total number of valid paths results in $1 \times 6 + 4 \times 15 + 1 \times 6 = 72$ ways to get from A to B.

20. $|3x - 3| < 13$ is equivalent to $-13 < 3x - 3 < 13$, which is equivalent to $-\frac{13}{3} < x - 1 < \frac{13}{3}$.
Therefore, $-\frac{10}{3} = -3\frac{1}{3} < x < \frac{16}{3} = 5\frac{1}{3}$. The integers satisfying those constraints are $-3, -2, \dots, 3, 4, 5$. When we add these, the -3 through -1 cancel out the 1 through 3 , leaving only 4 and 5 , so the answer is $4 + 5 = 9$.
21. The lattice points must satisfy $3x - 24 < y < 0$, equivalent to $3x - 23 \leq y \leq -1$ for x an integer from 1 through 7 . For $x = 1$, y must be an integer from -1 through -20 , for a total of 20 choices. As we increment x by 1 , the minimum value of y increases by 3 , decreasing the number of choices by 3 . This continues through $x = 7$, where y must be one of two choices, -1 or -2 . The total count of qualifying lattice points is the sum of an arithmetic series $20, 17, 14, 11, 8, 5, 2$, which has a total of 7 terms (one for each of the 7 values of x). The sum of an arithmetic series is the product of the number of terms times the average of the first and last terms, thus there are $7 \times (20 + 2)/2 = 7 \times 11 = 77$ points.
22. A and B are in the fractional part of the value, so we need not concern ourselves with the integer part. The fractional part, based on the base 4 expression, is given by:
 $\frac{0}{4^1} + \frac{2}{4^2} + \frac{1}{4^3} = \frac{1}{8} + \frac{1}{64} = \frac{1}{8^1} + \frac{1}{8^2} = \frac{A}{8^1} + \frac{B}{8^2}$. Therefore, $A = B = 1$, so $A + B = 2$.
23. This is a variant of the Monty Hall problem. When Bryan firsts picks a box, the probability of him picking the one with the coin is $1/10$ and of not picking the one with the coin is $9/10$. After 5 boxes are removed, there are 5 left. In the $1/10$ case, Bryan had the good box and a change would have 0 probability of yielding the good box. In the $9/10$ case, Bryan does not have the good box, and the coin is equally likely to be in any one of the other 4 boxes, thus probability $1/4$ to change to the good box. Thus, the probability of changing to the good box is $\frac{1}{10} \times 0 + \frac{9}{10} \times \frac{1}{4} = \frac{9}{40}$.
24. The three numbers can be represented as $10a + 7$, $10b + 7$, and $10c + 7$, where a , b , and c are integers in the range between 1 and 9 , inclusive. When we add these numbers together we obtain: $10a + 10b + 10c + 21 = 10(a + b + c + 2) + 1$. The 1 tells us the units digit of the sum, and the $a + b + c + 2$ corresponds to the tens digit of the sum—however, $a + b + c + 2$ might exceed 9 , in which case we need to take only the units digit of the latter sum.
Now, the product of the three given numbers is obtained as follows:
The product of the three 7 s contributes 343 . Taking each of the three terms containing the factor 10 in succession and multiplying by the 7 s in the other two terms contributes $490a + 490b + 490c = 10(49(a + b + c))$. The other contributions to the product will involve at least two factors of 10 , yielding 100 times some integer, thus ending in 00 and not affecting the tens digit of the product. Thus, the product is $100x + 10(49(a + b + c)) + 343$. Let's reduce some clutter here. The last (rightmost) two digits of an integer can be obtained as a pair by dividing the integer by 100 to yield an integer quotient that we throw away and a remainder that is the result we want (modulo 100 arithmetic). The $100x$ goes to 0 and disappears, 490 goes to 90 , so the second term goes to $10(9(a + b + c))$ and 343 goes to 43 . Thus, what we care about from the product is $10(9(a + b + c)) + 43 = 10(9(a + b + c) + 4) + 3$, so that the product has units digit 3 and tens digit given by the units digit of $9(a + b + c) + 4$. We are told this tens digit is 5 ; therefore, $9(a + b + c)$ ends in 1 . For 9 times an integer to end in 1 , the integer must end in 9 . So, now we know $a + b + c$ ends in 9 , but, remember, we need 2 more than that, which yields a desired digit value of 1 .

25. Selecting three real numbers x , y , and z , each in the range 0 to 1 (and it does not matter whether we include versus exclude 0, and likewise for 1) is like constructing a unit cube with one vertex at the origin, one edge along the x -axis out to 1, an adjacent edge along the y -axis out to 1, and another adjacent edge along the z -axis going out to 1. The criterion $x + y + z < 1$ corresponds to being at a point on the origin side of the plane $x + y + z = 1$, which plane cuts through the unit cube. The region in question is summarized as: $x > 0$; $y > 0$; $z > 0$; $x + y + z < 1$, describing the interior of a tetrahedron with vertices $(0, 0, 0)$, $(1, 0, 0)$, $(0, 1, 0)$, $(0, 0, 1)$. More specifically this is a pyramid whose base is an isosceles right triangle with legs of length 1, and the pyramid height is 1. The volume of a pyramid is $1/3$ times the base area. The base area is $(1/2) \times 1 \times 1 = 1/2$, so the volume is $(1/3)(1/2)(1) = 1/6$. The volume of the unit cube, which is $1^3 = 1$ is the volume of the whole sample space. Therefore, the probability of a random position in the cube being within the desired pyramid is $\frac{1/6}{1} = \frac{1}{6}$.
26. The pattern goes in pairs. The first value of each pair is n^2 and the second value is $n^2 + n = n(n + 1)$, where n is the pair number starting with 1. (To get the next value, add $n + 1$ to obtain $(n + 1)^2$, which is indeed the first element of the next pair.) The first time to add 2000 is going from the second value of pair 1999 to the first value of pair 2000. Thus, the element to which the first time 2000 is added is $1999(2000) = \mathbf{3,998,000}$.
27. The total number of possible outcomes is $6^3 = 216$. For the desired outcomes, we have a variety of cases to deal with. All three dice show the same value: $(3, 3, 3)$, with 1 way for that to occur. Two dice show the same value and the third die shows a different value: $(1, 1, 5)$; $(2, 2, 4)$; $(3, 3, 1)$; $(3, 3, 2)$; $(3, 3, 4)$; $(3, 3, 5)$; $(3, 3, 6)$; $(4, 4, 2)$; $(5, 5, 1)$, each with 3 ways to occur (which of the three dice is the different one). All three dice have different values: $(1, 5, 2)$; $(1, 5, 3)$; $(1, 5, 4)$; $(1, 5, 6)$; $(2, 4, 1)$; $(2, 4, 3)$; $(2, 4, 5)$; $(2, 4, 6)$, each with 6 ways to occur. This yields a total count of desired outcomes is $1 \times 1 + 9 \times 3 + 8 \times 6 = 76$. The probability of the ratio of count of desired outcomes to count of total outcomes: $\frac{76}{216} = \frac{19}{54}$.
28. Let P be the leftmost vertex of the unit square. Then arc \widehat{AP} is a circular arc of measure 45° centered at D . At D the triangle ADB would be so obtuse that it is degenerate. Moving up the arc toward C makes the triangle less and less obtuse. At some point on the arc the triangle becomes right, and above that toward C the triangle will be acute. Thus, we need to find the point X on \widehat{CD} such that $\angle AXB$ is right and determine the ratio of the measure of arc \widehat{CX} to the measure of the arc \widehat{CD} . Now, segment AB is a diameter of circle D , and a triangle inscribed in a circle such that one side of the triangle is a diameter of the circle has a right angle at the vertex opposite the diameter; arc \widehat{AP} is a portion of circle D , and the upper semicircle of D containing points A and B is colored red. Therefore, X must be on circle D ; from the information we are given, we know that arc \widehat{CD} is part of a circle centered at P . Therefore, X is at an intersection of circles D and P . Now segments PX and PD are radii of circle P , and segments DP and DX are radii of circle D . Therefore, segments DX , XP , and PD are congruent and form an equilateral triangle. Therefore, $\angle DPX$ and arc \widehat{XD} have measure 60° . $\angle DPC$ (a right angle) and arc \widehat{CD} have measure 90° . Thus, the measure of arc \widehat{CX} is $90^\circ - 60^\circ = 30^\circ$, and the fraction of the arc forming an acute triangle is $30^\circ/90^\circ = \frac{1}{3} = 33\frac{1}{3}\%$, which rounds to the nearest tenth of a percent as **33.3** percent.

29. The segments AB, BC, and CA form an equilateral triangle, so $\angle ABC$ has measure 60° . Segment AB is parallel to segment EF and segment BC is parallel to segment FG, so $\angle EFG$ is congruent to $\angle ABC$, which has measure 60° . Because C is on segment BD, $\angle ACD$ is supplementary to $\angle ACB$, so $\angle ACD$ has measure $180^\circ - 60^\circ = 120^\circ$. Segments CA and CD are congruent, so triangle ACD is isosceles and base angle $\angle ADC$ has measure that is half the supplement of $\angle ACD$, thus $60^\circ/2 = 30^\circ$. Segment BD is parallel to segment FG and segment AD is parallel to segment EG, so $\angle ADC$ and $\angle EGF$ are congruent with measure 30° . Therefore, triangle GFE is a 30° - 60° - 90° triangle and the length of hypotenuse FG is double the length of short leg FE. The length of FE is the sum of the lengths of FP and PE. Segments PE and BQ are congruent, with the length of the latter being the diameter of circle A plus the radius of circle B, thus a total of 3 meters. Triangle FBP is a 30° - 60° - 90° triangle, so long leg FP is $\sqrt{3}$ times as long as short leg BP, which is $\sqrt{3} \times 1 \text{ meter} = \sqrt{3}$ meters. Therefore, segment FE has length $(3 + \sqrt{3})$ meters, and FG is double that for $(6 + 2\sqrt{3})$ meters. The problem requests $6 + 2 + 3 = 11$.

30. Let's set up a 3-dimensional coordinate system to ease our calculations. A plane can be expressed in the form $ax + by + cz = d$. If we pick the origin to be a point the plane passes through, the calculations are slightly simplified because in such a setup, $d = 0$. The plane goes through the vertex A, and a vertex is often a great place to put the origin, so let's choose $A = (0; 0; 0)$. Let's pick B along the x -axis, and it is given as distance 2 from A, so $B = (2; 0; 0)$. Let's pick D along the y -axis, and it is given as distance 2 from A, so $D = (0; 2; 0)$. Then $C = (2; 2; 0)$. The figure is stated to be a right pyramid: the centroid of the square base is then at the midpoint of segment AC, which is also the midpoint of segment BD, so $(1; 1; 0)$; P is distance 1 up, so at $(1; 1; 1)$.
- B' is $1/4$ of the way from B to P, so $B' = (2; 0; 0) + \frac{1}{4}[(1; 1; 1) - (2; 0; 0)] = (\frac{7}{4}; \frac{1}{4}; \frac{1}{4})$.
- D' is $1/5$ of the way from D to P, so $D' = (0; 2; 0) + \frac{1}{5}[(1; 1; 1) - (0; 2; 0)] = (\frac{1}{5}; \frac{9}{5}; \frac{1}{5})$.
- The equation of the given plane must be of the form $ax + by + cz = 0$ for A to be on the plane. However, multiplying the equation through by nonzero k yields an equally valid solution, so there are only two independent parameters among a , b , and c . Because the given plane is clearly not parallel to any of the coordinate planes (xy , xz , yz), we may choose any the three coefficients to be fixed at 1, so let's choose $c = 1$. Thus, the given plane must satisfy the equation $ax + by + z = 0$ for some a and b . For B' to be on the plane, we must satisfy: $\frac{7}{4}a + \frac{1}{4}b + \frac{1}{4} = 0$, which can be simplified to $7a + b = -1$. Similarly, for D' to be on the plane, we must satisfy: $\frac{1}{5}a + \frac{9}{5}b + \frac{1}{5} = 0$, which can be simplified to $a + 9b = -1$. Multiplying the first of these equations by 9 and subtracting the second equation yields: $62a = -8$, so $a = -\frac{4}{31}$;
- $b = -1 - 7a = -1 + \frac{28}{31} = -\frac{3}{31}$. The point C' to be on segment PC must have a coordinate of the form $(2 - z; 2 - z; z)$ for some y satisfying $0 < z < 1$. (This has been set up for z to be the answer to the problem, as the fraction of the distance from C to P as where C' is.) Therefore, $0 = -\frac{4}{31}(2 - z) - \frac{3}{31}(2 - z) + z = -\frac{14}{31} + \frac{38}{31}z$, so $z = \frac{14}{38} = \frac{7}{19}$.

2018 State Competition Target Round

1. Company 1: $\$500 + 5000 \text{ km} \times \$0.30 \frac{1}{\text{km}} + 500 \text{ kg} \times \$0.40 \frac{1}{\text{kg}} = \$500 + \$1500 + \$200 = \$2200$.

Company 2: $\$0 + 5000 \text{ km} \times \$0.50 \frac{1}{\text{km}} + 500 \text{ kg} \times \$0.30 \frac{1}{\text{kg}} = \$2500 + \$150 = \2650 .

Subtracting the greater amount minus the lesser amount yields $\$2650 - \$2200 = \mathbf{\$450}$.

2. The count 10 dozen means $10 \times 12 = 120$ donuts. There are $\binom{120}{5}$ combinations of donuts sampled, which is $\frac{120!}{5! 115!}$. For acceptance, 0 of the 4 bad ones and 5 of the 116 good ones must

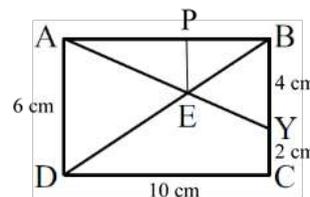

be in a sample, allowing for a total number of combinations of $\binom{4}{0} \binom{116}{5} = \frac{4!}{0! 4!} \times \frac{116!}{5! 111!} =$

$$\frac{\frac{116!}{5! 111!}}{\frac{120!}{5! 115!}} = \frac{116 \times 115 \times 114 \times 113 \times 112}{120 \times 119 \times 118 \times 117 \times 116} = \frac{115 \times 114 \times 113 \times 112}{120 \times 119 \times 118 \times 117} \approx 0.8416, \text{ which rounds to } 84\%.$$

Therefore, the probability of rejection is 100% minus this value, or **16%**.

3. There is a gain of $\$8 - \$3 = \$5$ for each bigon sold. With \$400 upfront costs to make up for at \$5 per bigon, to break even, she must sell $\$400/\$5 = \mathbf{80}$ bigons.

4. Draw PE perpendicular to AP, as shown. Then triangle APE is a right triangle, and it is the hypotenuse AE that we wish to determine. Triangles AED and YEB are similar (Angle-Angle-Angle) with a scaling ratio of 6 cm to 4 cm, or 3:2. Therefore, the distance of E from the left side of the rectangle is $\frac{3}{5}(10 \text{ cm}) = 6 \text{ cm}$, which is also the length of AP.

Triangles APE and ABY are similar (Angle-Angle-Angle) with a scaling ratio of 6 cm to 10 cm, or 3:5. Therefore the length of PE is $\frac{3}{5}$ of the length of BY, so $\frac{3}{5}(4 \text{ cm}) = \frac{12}{5} \text{ cm}$. We can now apply the Pythagorean Theorem to legs of $\frac{12}{5} \text{ cm}$ and $6 \text{ cm} = \frac{30}{5} \text{ cm}$. We have

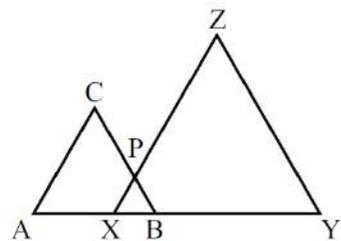

$$\sqrt{\left(\frac{12}{5}\right)^2 + \left(\frac{30}{5}\right)^2} \text{ cm} = \sqrt{\frac{1044}{25}} \text{ cm} = \frac{6\sqrt{29}}{5} \text{ cm}.$$

5. We need to add all the individual scores and divide by the total count of scores. Many scores are held by multiple competitors, and the histogram tells us how many individuals earned each score value, so we must multiply each score value by the corresponding number of students to obtain the sum of all the individual scores. Therefore, the mean score is:

$$\frac{2 \times 0 + 4 \times 2 + 11 \times 4 + 13 \times 6 + 12 \times 8 + 7 \times 10 + 0 \times 12 + 1 \times 14}{2 + 4 + 11 + 13 + 12 + 7 + 0 + 1} = \frac{0 + 8 + 44 + 78 + 96 + 70 + 0 + 14}{50} = \frac{310}{50} = \mathbf{6.2}.$$

6. Whenever a line of slope 1 bisects an angle formed by two lines intersecting, the product of the slopes of the two lines is 1, except when one is horizontal and the other vertical—in other words, the two slopes are reciprocals of each other. Therefore, $n = 1/m$, so:
 $2\sqrt{65} = m + n = m + \frac{1}{m}$, and $m^2 - 2\sqrt{65}m + 1 = 0$. Now, since the constant coefficient divided by the leading coefficient is $1/1 = 1$, the product of the two roots of this equation is 1, so that they are reciprocal to each other. Thus, the solution to this quadratic equation is two roots, one of which (the greater) is m and the other (the lesser) is n . The roots to the quadratic equation are: $\frac{2\sqrt{65} \pm \sqrt{260-4}}{2} = \sqrt{65} \pm 8$, with m being the greater, $\sqrt{65}+8$, and n being the lesser, $\sqrt{65} - 8$. Subtracting the two yields $m - n = (\sqrt{65} + 8) - (\sqrt{65} - 8) = 8 + 8 = \mathbf{16}$.

7. Triangles ABC and XYZ are given to be equilateral, so $m\angle PXB = m\angle ZXY = 60^\circ$, and $m\angle PBX = m\angle CBA = 60^\circ$, making triangle XBP equilateral. The perimeter of the pentagon AYZPC is the perimeter of triangle ABC plus the perimeter of triangle XYZ minus the perimeter of triangle XPB (the last “minus” part to take away the inappropriate inclusion of XP and PB, as well as to correct for double counting XB. Therefore, the requested perimeter is $3 \times 3 \text{ cm} + 3 \times 5 \text{ cm} - 3 \times 1 \text{ cm} = \mathbf{21 \text{ cm}}$.

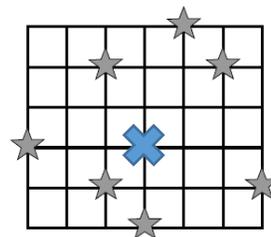

8. Let's let p be the number of pages in each book and f be the number of pages Varun read to finish the first book, with $21 \leq p \leq 999$ and $1 \leq f \leq 41$; that leaves $42 - f$ pages to start the second book.
 Therefore, Varun reads pages $p - f + 1$ through p from the first book and pages 1 through $42 - f$ from the second book. This makes two arithmetic series to evaluate and the results together: the sum of an arithmetic series is the product of the number of terms times the average of the first and last values in the series. The total for the two series is 2018. Therefore,
 $2018 = f \cdot \left(\frac{p-f+1+p}{2}\right) + (42 - f) \cdot \left(\frac{1+42-f}{2}\right)$. Multiplying through both sides by 2 yields:
 $4036 = f \cdot (2p - f + 1) + 42(43 - f) - f(43 - f) = f \cdot (2p - f + 1 - 42 - 43 + f) + 1806$.
 Thus, $2230 = f \cdot (2p - 84)$ and $1115 = f \cdot (p - 42)$, which means that f must be a divisor of $1115 = 5 \times 223$. (Note 223 is prime because it is not divisible by any of 2, 3, 5, 7, 11, or 13.)
 Thus, f must be one of 1, 5, 223, or 1115, but the last two possibilities are rejected because $f < 42$; also $p = \frac{1115}{f} + 42$, which must be less than 1000, so f cannot be 1. The only possibility is $f = 5$, which means $p = \frac{1115}{5} + 42 = 223 + 42 = \mathbf{265}$.

2018 State Competition Team Round

- The sum of the squares of the first ten positive integers is $1 + 4 + 9 + 16 + 25 + 36 + 49 + 64 + 81 + 100 = 385$. The arithmetic mean of these ten squares is $385/10 = \mathbf{38.5}$. If you know that $n(n + 1)(2n + 1)/6$ is the formula for the sum of the squares of the first n positive integers, you may note that finding the average of those squares requires dividing that sum by n to obtain $(n + 1)(2n + 1)/6$. In this case, $n = 10$, so we have $\frac{(10+1)(20+1)}{6} = 11 \times \frac{7}{2} = \mathbf{38.5}$.
- The name MATHCOUNTS has 7 constants (MTHCNTS—counting all occurrences, including repetitions) and 3 vowels (AOU). The probability of choosing a consonant for the first letter is $7/10$, leaving 6 consonants and 3 vowels for choosing the second letter. That makes the probability of choosing a consonant for the second letter $6/9 = 2/3$. The probability of two independent event occurring is the product of the two probabilities for the individual events: $\frac{7}{10} \times \frac{2}{3} = \frac{14}{30} = \frac{7}{15}$.
- Since $(n + 2)^2 - (n - 2)^2 = (n^2 + 4n + 4) - (n^2 - 4n + 4) = 8n$, $(m + 1)^2 - (m - 1)^2 = (m^2 + 2m + 1) - (m^2 - 2m + 1) = 4m$, and we are told that these two expressions are equal, we have $8n = 4m$. Dividing both sides by 4 yields $2n = m = an$, which means $a = \mathbf{2}$.

- When one wishes to minimize the sum of distances in along one dimension, the optimum position is at the median position. Here we have two dimensions, with each working independently of the other. There are 7 restaurants, so the fourth acts as the median. The blue cross marks the optimum position—the same horizontal coordinate as the fourth restaurant from left to right and the same vertical coordinate as the fourth restaurant from top to bottom. The cumulative horizontal distances as a number of kilometers is $3 + 1 + 1 + 0 + 1 + 2 + 3 = 11$; the cumulative vertical distances as a number of kilometers is $3 + 2 + 2 + 0 + 1 + 1 + 2 = 11$. The total distance of travel to go separately from the optimum point to each restaurant, is the sum of these two values, $11 \text{ km} + 11 \text{ km} = 22 \text{ km}$. The average distance to each restaurant is this sum divided by 7, thus $\frac{22}{7}$ km.

- Profit is the difference of the selling price minus the purchase price. The percentage profit is 100 percent times the ratio of this difference to the purchase price. The total selling price is $2 \times \$25,000 = \$50,000$. The given profit rates cannot be exact, because they would involve purchase prices involving fractions of cents, so we will round each to the nearest cent. The purchase price of car 1 is $\$25,000/(1 + 0.22) = \$20,491.80$, and the purchase price of car 2 is $\$25,000/(1 - 0.07) = \$26,881.72$, for a total purchase price of $\$47,373.52$. The profit is $\$50,000.00 - \$47,373.52 = \$2,626.48$, for a percentage profit of: $100\% \times (\$2,626.48/\$47,373.52) = 5.54419\dots$ percent. Which rounds to $\mathbf{5.54}$ percent.
- A sequence of n 6s forming the digits of an integer is equal to $\frac{2}{3} 10^n - \frac{2}{3}$. Thus, the numerator and the denominator of the 5 given fractions are $(A + \frac{2}{3}) 10^n - \frac{2}{3}$ and $(6 + \frac{2}{3}) 10^n - \frac{2}{3} + B - 6$, respectively, where n is an integer from 0 through 4 (and it will work for larger values of n as well). Because this ratio is the same for all n , the ratio of the two coefficients of 10^n must be the

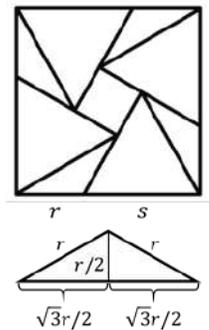

same as the ratio of the two constant terms, so that $\frac{A+\frac{2}{3}}{20/3} = \frac{2/3}{\frac{20-B}{3}}$. Multiplying through

numerator and denominator by 3 simplifies this to $\frac{3A+2}{20} = \frac{2}{20-3B}$. Flipping the two ratios yields

$$\frac{20}{3A+2} = \frac{20-3B}{2}, \text{ so } 20 - 3B = \frac{40}{3A+2}, 3B = 20 - \frac{40}{3A+2} = \frac{60A+40-40}{3A+2} = \frac{60A}{3A+2}. \text{ Therefore, } = \frac{20A}{3A+2}.$$

Both A and B are specified to be 1-digit integers, and B must not be 0 in order to avoid division by 0 in the fraction A/B, and that means A cannot be 0 either. If we try the integers 1 through 9 for A, we find an integer value results for B only for A being 1, 2, and 6, where B is 4, 5, and 6, respectively. The sum of these three values of A is $1 + 2 + 6 = 9$.

7. Let s be the desired length of a side of one of the equilateral triangles and r be the rest of the length 1 of a side of the unit square. Therefore, $r + s = 1$. The obtuse angle of the obtuse triangle is supplementary to the 60° angle of the equilateral triangle, thus 120° . The acute angle of the obtuse triangle at a vertex of the unit square is complementary to the 60° angle of the equilateral triangle, thus 30° . Therefore, the angles of the obtuse triangle measure $30^\circ, 30^\circ,$ and 120° . The base of the isosceles triangle matches a side s of the equilateral triangle. We can bisect the obtuse angle to form two congruent right (30 - 60 - 90) triangles, as shown, with hypotenuse r , short leg $r/2$, and long leg $\sqrt{3}r/2$. The base of the obtuse triangle is twice the length of this long leg, thus $\sqrt{3}r$. (Knowing and using the law of cosines can make this go faster.) Therefore, $s = \sqrt{3}r$, $r = s/\sqrt{3}$, and $1 = s + r = \left(1 + \frac{1}{\sqrt{3}}\right)s = \frac{\sqrt{3}+1}{\sqrt{3}}s$, making $s = \frac{\sqrt{3}}{\sqrt{3}+1} = \frac{\sqrt{3}}{\sqrt{3}+1} \frac{\sqrt{3}-1}{\sqrt{3}-1} = \frac{3-\sqrt{3}}{2} \approx 0.634$ units.

8. There are $\frac{25!}{4! 21!} = \frac{25 \times 24 \times 23 \times 22}{4 \times 3 \times 2} = 12,650$ sets of 4-card draws out of 25 cards. There are two cases satisfying the criteria:
- (1) Three cards of the same number, each with different color; the fourth card must be a different number to have two numbers involved, and it must be the same color as one of the first three cards to keep a total of three colors. Any of the 5 numbers may be the triplet number and they may have any 3 of 5 colors, so $\frac{5!}{3! 2!} = 10$ color arrangements, for a total of $5 \times 10 = 50$ possible sets of triplet numbers. For each such set, there are 4 numbers and 3 colors that may be used to achieve the specified criteria, thus $50 \times 4 \times 3 = 600$ arrangements with a triplet number and three colors.
- (2) Two cards of one number and two cards of another number. For four cards to have three colors, two of the cards must be the same color and they must have different numbers. The options for the two numbers out of 5 choices are $\frac{5!}{2! 3!} = 10$ and likewise, independently, 10 for the colors of the first two cards, so $10 \times 10 = 100$ options for the first two cards. The two cards of the second number have 2 choices for one card matching one of the already chosen colors and 3 choices for the other card to match one of the other 3 colors, making $100 \times 2 \times 3 = 600$ arrangements with two doublet numbers and three colors.
- Therefore, there are a total of $600 + 600 = 1200$ desirable sets of 4 cards out of a possible 12 650 possible sets of 4 cards, which makes a probability of $\frac{1200}{12,650} = \frac{24}{253}$.

9. The volume of a frustum is given by $\frac{h}{3}(B + \sqrt{Bb} + b)$, where h is the height of the frustum and B and b are the areas of the two end bases. The bottom base is a square of side 10 m, so area $(10 \text{ m})^2 = 100 \text{ m}^2$ and the top base is a square whose diagonal is 10 m, so area of half the square of the diagonal for 50 m^2 . The height $h = 60 \text{ m}$. Thus, the volume of the frustum is: $20 \text{ m} (100 \text{ m}^2 + \sqrt{100 \text{ m}^2 \times 50 \text{ m}^2} + 50 \text{ m}^2) = 3000 \text{ m}^3 + 1000\sqrt{2} \text{ m}^3$. The volume of the pyramid is given by $\frac{H}{3}b$, where H is the height of the pyramid (not the same as h for the frustum), and b is the area of the base, which is the same as for the top base of the frustum, $10 \text{ m} \times 50 \text{ m}^2/3 = \frac{500}{3} \text{ m}^3$. The sum of the two parts is: $(3000 + 1000\sqrt{2} + \frac{500}{3}) \text{ m}^3 = 4580.88 \dots \text{ m}^3$, which rounds to the requested nearest 10 m^3 as **4580** m^3 .

10. There are three cases:

$$a_4 = 4^2 - a_1 - a_2 - a_3;$$

$$a_5 = 5^2 - a_2 - a_3 - a_4 = 5^2 - 4^2 + a_1;$$

$$a_6 = 6^2 - a_3 - a_4 - a_5 = 6^2 - 5^2 + a_2;$$

$$a_7 = 7^2 - a_4 - a_5 - a_6 = 7^2 - 6^2 + a_3;$$

$$a_8 = 8^2 - a_5 - a_6 - a_7 = 8^2 - 7^2 + 4^2 - a_1 - a_2 - a_3 = 8^2 - 7^2 + a_4;$$

$$a_9 = 9^2 - a_6 - a_7 - a_8 = 9^2 - 8^2 + 5^2 - 4^2 + a_1 = 9^2 - 8^2 + a_5;$$

We have a pattern going for $k \geq 5$: $a_k = k^2 - (k-1)^2 + a_{k-4}$. We want to know about a_{99} .

$$\begin{aligned} a_{99} &= 99^2 - 98^2 + a_{95} = 99^2 - 98^2 + 95^2 - 94^2 + a_{91} = \dots \\ &= (99^2 - 98^2) + (95^2 - 94^2) + (91^2 - 90^2) + \dots + (7^2 - 6^2) + a_3 \\ &= 197 + 189 + 181 + \dots + 13 + a_3 \\ &= 24 \times \frac{(197 + 13)}{2} + a_3 = 2520 + a_3. \end{aligned}$$

Going from the second line to the third line is based on $k^2 - (k-1)^2 = 2k - 1$; going from the third line to the fourth line is based on recognizing all but the last term on the third line being an arithmetic series of 24 terms with common difference 8.

To maximize this expression, all that is left to do is to maximize a_3 . The only initializations $a_1; a_2; a_3$ that satisfy the criteria that all terms are positive integers and the terms are in strictly increasing order are:

1; 2; 3 yields 4th term 10 (but fails with 5th term 10);

1; 2; 4 yields 4th term 9;

1; 2; 5 yields 4th term 8;

1; 2; 6 yields 4th term 7;

1; 3; 4 yields 4th term 8;

1; 3; 5 yields 4th term 7;

1; 4; 5 yields 4th term 6;

2; 3; 4 yields 4th term 7;

2; 3; 5 yields 4th term 6.

The maximum value for a_3 is 6. Therefore, the maximum value for a_{99} is $2520 + 6 = \mathbf{2526}$.

CERTIFIED

Change the Equation has recognized MATHCOUNTS as having one of the nation's most effective STEM learning programs, listing the Math Video Challenge as an Accomplished Program in STEMworks.

The National Association of Secondary School Principals has placed all three MATHCOUNTS programs on the NASSP Advisory List of National Contests and Activities for 2017-2018.

HOW TO USE THIS SCHOOL HANDBOOK

If You're a New Coach

Welcome! We're so glad you're a coach this year.
Check out the **Guide for New Coaches**
starting on the next page.

If You're a Returning Coach

Welcome back! Thank you for coaching again.
Get the **2018-2018 Handbook Materials**
starting on page 8.

GUIDE FOR NEW COACHES

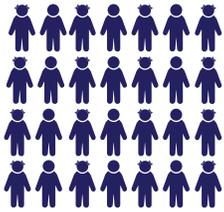

Welcome to the **MATHCOUNTS® Competition Series!** Thank you so much for serving as a coach this year. Your work truly does make a difference in the lives of the students you mentor. We've created this Guide for New Coaches to help you get acquainted with the Competition Series and understand your role as a coach in this program.

If you have questions at any point during the program year, please feel free to contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

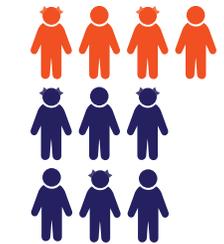

THE MATHCOUNTS COMPETITION SERIES IN A NUTSHELL

The **MATHCOUNTS Competition Series** is a national program that provides students the opportunity to compete in live, in-person math contests against and alongside their peers. Created in 1983, it is the longest-running MATHCOUNTS program and is open to all sixth-, seventh- and eighth-grade students.

HOW DOES IT WORK? The Competition Series has 4 levels of competition—school, chapter, state and national. Here's what a typical program year looks like.

Schools register in the fall and work with students during the year. Coaches administer the **School Competition, usually in January.** Any number of students from your school can participate in your team meetings and compete in the School Competition. MATHCOUNTS provides the School Competition to coaches in November. Many coaches use this to determine which student(s) will advance to the Chapter Competition.

Between 1 and 10 students from each school advance to the local **Chapter Competition, which takes place in February.** Each school can send a team of 4 students plus up to 6 individual competitors. All chapter competitors—whether they are team members or individuals—participate in the individual rounds of the competition; then just the 4 team members participate in the team round. Schools also can opt to send just a few individual competitors, rather than forming a full team. Over 500 Chapter Competitions take place across the country.

Top students from each Chapter Competition advance to their **State Competition, which takes place in March.** Your school's registration fees cover your students as far as they get in the Competition Series. If your students make it to one of the 56 State Competitions, no additional fees are required.

Top 4 individual competitors from each State Competition receive an all-expenses-paid trip to the **National Competition, which takes place in May.** These 224 students combine to form 4-person state teams, while also competing individually for the title of National Champion.

WHAT DOES THE TEST LOOK LIKE? Every MATHCOUNTS competition consists of 4 rounds—Sprint, Target, Team and Countdown Round. Altogether the rounds are designed to take about 3 hours to complete. Here's what each round looks like.

Sprint Round

40 minutes
30 problems total
no calculators used
focus on speed and accuracy

Target Round

Approx. 30 minutes
8 problems total
calculators used
focus on problem-solving and mathematical reasoning

The problems are given to students in 4 pairs. Students have 6 minutes to complete each pair.

Team Round

20 minutes
10 problems total
calculators used
focus on problem-solving and collaboration

Only the 4 students on a school's team can take this round officially.

Countdown Round

Maximum of 45 seconds per problem
no calculators used
focus on speed and accuracy

Students with highest scores on Sprint and Target Rounds compete head-to-head. This round is optional at the school, chapter and state level.

HOW DO I GET MY STUDENTS READY FOR THESE COMPETITIONS? What specifically you do to prepare your students will depend on your schedule as well as your students' schedules and needs. But in general, working through lots of different MATHCOUNTS problems and completing practice competitions is the best way to prepare to compete. Each year MATHCOUNTS provides the *School Handbook* to all coaches, plus lots of additional free resources online.

The next sections of this Guide for New Coaches will explain the layout of the *MATHCOUNTS School Handbook* and other resources, plus give you tips on structuring your team meetings and preparation schedule.

THE ROLE OF THE COMPETITION COACH

Your role as the coach is such an important one, but that doesn't mean you need to know everything, be a math expert or treat coaching like a full-time job. Every MATHCOUNTS coach has a different coaching style and you'll find the style that works best for you and your students. But in general **every good MATHCOUNTS coach must do the following.**

- Schedule and run an adequate number of practices for participating students.
- Help motivate and encourage students throughout the program year.
- Select the 1-10 student(s) who will represent the school at the Chapter Competition in February.
- Take students to the Chapter Competition or make arrangements with parents and volunteers to get them there.

You don't need to know how to solve every MATHCOUNTS problem to be an effective coach. In fact, many coaches have told us that they themselves improved in mathematics through coaching. Chances are, you'll learn with and alongside your students throughout the program year.

You don't need to spend your own money to be an effective coach. You can prepare your students using solely the free resources and this handbook. We give coaches numerous detailed resources and recognition materials so you can guide your Mathletes® to success even if you're new to teaching, coaching or competition math, and even if you use only the free resources MATHCOUNTS provides all competition coaches.

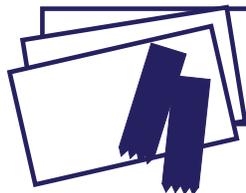

MAKING THE MOST OF YOUR RESOURCES

As the coach of a registered competition school, you already have received what we at MATHCOUNTS call the **School Competition Kit**. Your kit includes the following materials for coaches.

2017-2018 MATHCOUNTS School Handbook

The most important resource included in the School Competition Kit. Includes 250 problems.

Student Recognition Ribbons and Certificates

10 participation certificates and 1 ribbon for each registered chapter competitor.

You'll also get access to electronic resources. The following resources are available to coaches online at www.mathcounts.org/coaches. This section of the MATHCOUNTS website is restricted to coaches and you already should have received an email with login instructions. *If you have not received this email, please contact us at info@mathcounts.org to make sure we have your correct email address.*

Official 2018 MATHCOUNTS School Competition

Released in November 2017
Includes all 4 test rounds and the answer key

2017 MATHCOUNTS School, Chapter + State Competitions

Released by mid-April 2018
Each level includes all 4 test rounds and the answer key

MATHCOUNTS Problem of the Week

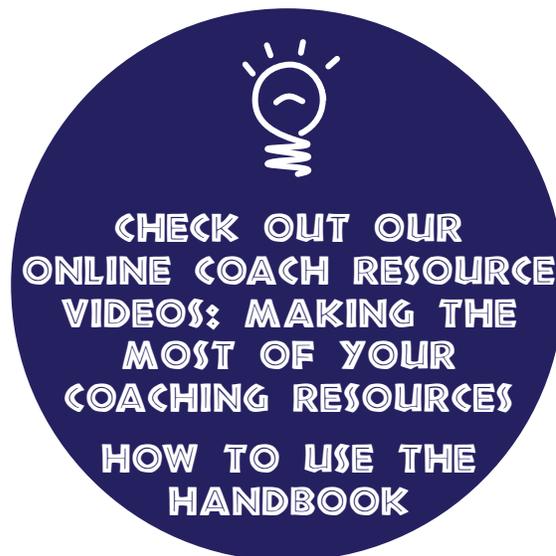

Released each Monday
Each multi-step problem relates to a timely event

You can use the **2018 MATHCOUNTS School Competition** to choose the students who will represent your school at the Chapter Competition. Sometimes coaches already know which students will attend the Chapter Competition. If you do not need the School Competition to determine your chapter competitors, then we recommend using it as an additional practice resource for your students.

The **2017-2018 MATHCOUNTS School Handbook** will be your primary resource for the Competition Series this year. It is designed to help your students prepare for each of the 4 rounds of the test, plus build critical thinking and problem-solving skills. This section of the Guide for New Coaches will focus on how to use this resource effectively for your team.

WHAT'S IN THE HANDBOOK? There is a lot included in the *School Handbook*, and you can find a full table of contents on pg. 8 of this book, but below are the sections that you'll use the most when coaching your students.

- **Handbook Problems:** 250 math problems divided into Warm-Ups, Workouts and Stretches. These problems in-

crease in difficulty as the students progress through the book. (pg. 11)

- **Solutions to Handbook Problems:** complete step-by-step explanations for how each problem can be solved. These detailed explanations are only available to registered coaches. (pg. 56)
- **Answers to Handbook Problems:** key available to the general public. Your students can access this key, but not the full solutions to the problems. (pg. 49)
- **Problem Index + Common Core State Standards Mapping:** catalog of all handbook problems organized by topic, difficulty rating and mapping to Common Core State Standards. (pg. 53)

There are 3 types of handbook problems to prepare students for each of the rounds of the competition. You'll want to have your students practice all of these types of problems.

|--|---|--|
| <p style="text-align: center;">Warm-Ups</p> <p>14 Warm-Ups in handbook 10 questions per Warm-Up no calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Warm-Ups prepare students particularly for the Sprint and Countdown Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Workouts</p> <p>8 Workouts in handbook 10 questions per Workout calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Workouts prepare students particularly for the Target and Team Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Stretches</p> <p>3 Stretches in handbook Number of questions and use of calculators vary by Stretch</p> <p style="text-align: center;"><i>Each Stretch covers a particular math topic that could be covered in any round. These help prepare students for all 4 rounds.</i></p> <div style="text-align: center;">  </div> |
|--|---|--|

IS THERE A SCHEDULE I SHOULD FOLLOW FOR THE YEAR? On average coaches meet with their students for an hour once a week at the beginning of the year, and more often as the competitions approach. Practice sessions may be held before school, during lunch, after school, on weekends or at other times, coordinating with your school's schedule and avoiding conflicts with other activities.

Designing a schedule for your practices will help ensure you're able to cover more problems and prepare your students for competitions. We've designed the *School Handbook* with this in mind. Below is a suggested schedule for the program year that mixes in Warm-Ups, Workouts and Stretches from the *School Handbook*, plus free practice competitions from last year. This schedule allows your students to tackle more difficult problems as the School and Chapter Competition approach.

| | | | |
|---|---|--|---|
| <p>Mid-August – September 2017</p> <p>Warm-Ups 1, 2 + 3 Workouts 1 + 2</p> | <p>October 2017</p> <p>Warm-Ups 4, 5 + 6 Workout 3 Probability Stretch</p> | <p>November 2017</p> <p>Warm-Ups 7 + 8 Workouts 4 + 5 Patterns Stretch</p> | <p>December 2017</p> <p>Warm-Ups 9, 10 + 11 Workout 6 Travel Stretch</p> |
| <p>January 2018</p> <p>Warm-Ups 12, 13 + 14 Workouts 7 + 8 <i>2018 MATHCOUNTS School Competition</i> <i>Select chapter competitors (optional at this time)</i></p> | | <p>February 2018</p> <p>Practice Competition: 2017 School Competition Practice Competition: 2017 Chapter Competition <i>Select chapter competitors (required by this time)</i> <i>2018 MATHCOUNTS Chapter Competition</i></p> | |

You'll notice that in January or February you'll need to select the 1-10 student(s) who will represent your school at the Chapter Competition. This must be done before the start of your local Chapter Competition. You'll submit the names of your chapter competitors either online at www.mathcounts.org/coaches or directly to your local Chapter Coordinator.

It's possible you and your students will meet more frequently than once a week and need additional resources. If that happens, don't worry! You and your Mathletes can work together using the **Interactive MATHCOUNTS Platform**, powered by NextThought. This free online platform contains numerous *MATHCOUNTS School Handbooks* and past competitions, not to mention lots of features that make it easy for students to collaborate with each other and track their progress. You and your Mathletes can sign up for free at mathcounts.nextthought.com.

And remember, just because you and your students will meet once a week doesn't mean your students can only prepare for MATHCOUNTS one day per week. Many coaches assign "homework" during the week so they can keep their students engaged in problem solving outside of team practices. Here's one example of what a 2-week span of practices in the middle of the program year could look like.

| Monday | Tuesday | Wednesday (Weekly Team Practice) | Thursday | Friday |
|---|--|--|---|--|
| -Students continue to work individually on Workout 4, due Wednesday | -Students continue to work on Workout 4 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 4 -Coach gives Warm-Up 7 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 5 as individual work, due Wednesday | -Students continue to work individually on Workout 5 |
| -Students continue to work individually on Workout 5, due Wednesday | -Students continue to work on Workout 5 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 5 -Coach gives Warm-Up 8 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 6 as group work, due Wednesday | -Students work together on Workout 6 using online Interactive Platform |

WHAT SHOULD MY TEAM PRACTICES LOOK LIKE? Obviously every school, coach and group of students is different, and after a few practices you'll likely find out what works and what doesn't for your students. Here are some suggestions from veteran coaches about what makes for a productive practice.

- Encourage discussion of the problems so that students learn from each other
- Encourage a variety of methods for solving problems
- Have students write math problems for each other to solve
- Use the **Problem of the Week** (posted online every Monday)
- Practice working in groups to develop teamwork (and to prepare for the Team Round)
- Practice oral presentations to reinforce understanding

On the following page is a sample agenda for a 1-hour practice session. There are many ways you can structure math team meetings and you will likely come up with an agenda that works better for you and your group. It also is probably a good idea to vary the structure of your meetings as the program year progresses.

MATHCOUNTS Team Practice Sample Agenda – 1 Hour

Review Problem of the Week (20 minutes)

- Have 1 student come to the board to show how s/he solved the first part of the problem.
- Discuss as a group other strategies to solve the problem (and help if student answers incorrectly).
- Have students divide into groups of 4 to discuss the solutions to the remaining parts of the problem.
- Have 2 groups share answers and explain their solutions.

Timed Practice with Warm-Up (15 minutes)

- Have students put away all calculators and have one student pass out Warm-Ups (face-down).
- Give students 12 minutes to complete as much of the Warm-Up as they can.
- After 12 minutes is up, have students hold up pencils and stop working.

Play Game to Review Warm-Up Answers (25 minutes)

- Have students divide into 5 groups (size will depend on number of students in meeting).
- Choose a group at random to start and then rotate clockwise to give each group a turn to answer a question. When it is a group's turn, ask the group one question from the Warm-Up.
- Have the group members consult their completed Warm-Ups and work with each other for a maximum of 45 seconds to choose the group's official answer.
- Award 2 points for a correct answer on questions 1-3, 3 points for questions 4-7 and 5 points for questions 8-10. The group gets 0 points if they answer incorrectly or do not answer in 45 seconds.
- Have all students check their Warm-Up answers as they play.
- Go over solutions to select Warm-Up problems that many students on the team got wrong.

OK I'M READY TO START. HOW DO I GET STUDENTS TO JOIN? Here are some tips given to us from successful competition coaches and club leaders for getting students involved in the program at the beginning of the year.

- Ask Mathletes who have participated in the past to talk to other students about participating.
- Ask teachers, parent volunteers and counselors to help you recruit.
- Reach parents through school newsletters, PTA meetings or Back-to-School-Night presentations.
- Advertise around your school by:
 1. posting intriguing math questions (specific to your school) and referring students to the first meeting for answers.
 2. designing a bulletin board or display case with your MATHCOUNTS poster (included in your School Competition Kit) and/or photos and awards from past years.
 3. attending meetings of other extracurricular clubs (such as honor society) so you can invite their members to participate.
 4. adding information about the MATHCOUNTS team to your school's website.
 5. making a presentation at the first pep rally or student assembly.

Good luck in the competition! If you have any questions during the year, please contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

Practice Competitions for MATHCOUNTS, Vol. I & II

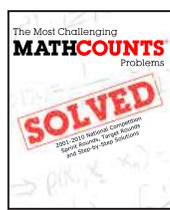

Practice books written by repeat national-level coach Josh Frost. Each volume includes 4 complete mock-competitions plus solutions.

www.mathcounts.org/store

Most Challenging MATHCOUNTS Problems Solved

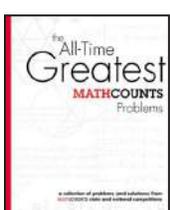

Advanced level practice book with 10 years of national-level Sprint Rounds, plus detailed step-by-step solutions to each problem.

www.mathcounts.org/store

All Time Greatest MATHCOUNTS Problems

A collection of some of the most creative, interesting and challenging MATHCOUNTS competition problems.

www.mathcounts.org/store

Interactive MATHCOUNTS Platform

Online platform of past and current handbook and competition problems. Interactive features make collaboration easy and fun!

mathcounts.nextthought.com

MATHCOUNTS Trainer App

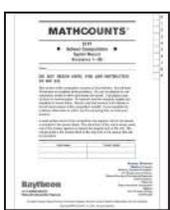

Train your Mathletes with this fun app, featuring real-time leaderboards and lots of past MATHCOUNTS problems.

aops.com/mathcounts_trainer or download at the App Store

Past Competitions

Last year's School, Chapter and State competitions are free online! Other years' competitions can be purchased.

www.mathcounts.org/pastcompetitions
www.mathcounts.org/store

Problem of the Week

A new, multi-step problem every week! Each problem focuses on a particular set of math skills and coincides with a timely event, holiday or season. Get the problem at the beginning of the week and the step-by-step solution the following week.

www.mathcounts.org/potw

MATHCOUNTS Minis

A fun monthly video series featuring Richard Rusczyk from Art of Problem Solving. Each video looks at a particular math skill and walks through how to solve different MATHCOUNTS problems using creative problem-solving strategies.

CRITICAL 2017-2018 DATES

2017

Aug. 15 –
Dec. 15

Submit your school's registration to participate in the Competition Series and receive this year's School Competition Kit, which includes a hard copy of the *2017-2018 MATHCOUNTS School Handbook*. Kits are shipped on an ongoing basis between mid-August and December 31.

The fastest way to register is online at www.mathcounts.org/compreg. You also can download the MATHCOUNTS Competition Series Registration form and mail or email it with payment to:

MATHCOUNTS Foundation – Competition Series Registrations
1420 King Street, Alexandria, VA 22314
Email: reg@mathcounts.org

To add students to your school's registration, log in at www.mathcounts.org/coaches to access the Dashboard. **Questions?** Call the MATHCOUNTS national office at (703) 299-9006 or email us at info@mathcounts.org.

Nov. 1

The 2018 School Competition will be available online. All registered coaches can log in at www.mathcounts.org/coaches to download the competition.

Nov. 3
(postmark)

Deadline to register for the Competition Series at reduced registration rates (\$30 per student, \$300 for full registration of 10 students). After November 3, registration rates will be \$35 per student, \$350 for full registration.

Dec. 15
(postmark)

Competition Series Registration Deadline

In some circumstances, late registrations might be accepted at the discretion of MATHCOUNTS and the local coordinator. *Late fees will apply. Register on-time to ensure your students' participation.*

2018

Early Jan.

If you have not been contacted with details about your upcoming competition, call your local or state coordinator. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

Late Jan.

If you have not received your School Competition Kit, contact the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

Feb. 1-28

Chapter Competitions

March 1 –
Apr. 1

State Competitions

May 13-14

2018 Raytheon MATHCOUNTS National Competition in Washington, DC

THIS YEAR'S HANDBOOK PROBLEMS

**You and your students might notice something special
about some of the problems in this year's
Warm-Ups and Workouts...**

Throughout this handbook are names—first and/or last—of people who donated to the MATHCOUNTS Foundation's Giving Tuesday campaign last year to help us cover half the cost of registering for the Competition Series for Mathletes from low-income schools. These donors help make this program possible for students across the country, so we decided it was fitting to include them in the primary preparation resource for participants in this program.

**To all of our 2016 Giving Tuesday Donors
(whether or not you chose to be featured in this handbook)**

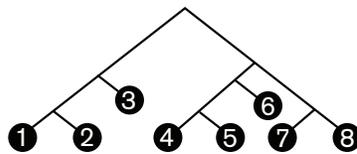

THANK YOU!

Probability Stretch

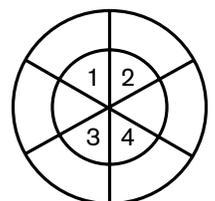

- _____ % Petra randomly selects a card from a standard deck of 52 playing cards. What is the percent probability that the card shows a red number greater than 6? Express your answer to the nearest hundredth.
- _____ Max has eight identical cups. Each cup contains a different combination of nickels, dimes and quarters, each totaling 45 cents. Max randomly selects a cup. What is the probability that the cup he selects contains at least three dimes? Express your answer as a common fraction.
- _____ A bag contains five chips numbered 2 through 6. Danya draws chips from the bag one at a time and sets them aside. After each draw, she totals the numbers on all the chips she has already drawn. What is the probability that at any point in this process her total will equal 10? Express your answer as a decimal to the nearest tenth.
- _____ A drawer contains five socks: two green and three blue. What is the probability that two socks pulled out of the drawer at random will match? Express your answer as a common fraction.
- _____ A penny, a nickel and a dime are flipped. What is the probability that at least two coins land heads up and one of them is the nickel? Express your answer as a common fraction.
- _____ % When the circuit containing blinking lights A and B is turned on, lights A and B blink together. Then A blinks once every 5 seconds and B blinks once every 11 seconds. Lindsey looks at the two lights just in time to see A blink alone. What is the percent probability that the next light to blink will be A blinking alone?
- _____ % What is the percent probability that a randomly selected multiple of 3 less than or equal to 3000 is also a multiple of 5?

- _____ Starting at the top and selecting paths randomly as you move downward, what is the probability of ending at an odd number? Express your answer as a common fraction.

- _____ A five-digit number is made by randomly ordering the digits 1, 2, 3, 4 and 5. What is the probability that this number is divisible by 4? Express your answer as a common fraction.

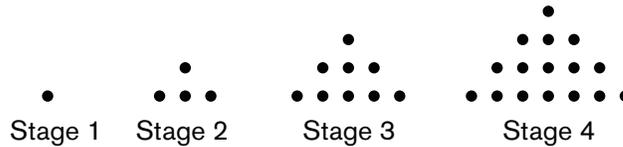

- _____ Pierre throws darts that land randomly in the dartboard shown here. The dartboard is a circle of radius 2 units, with an inner circle of radius 1 unit. Both circles are divided into six congruent sectors. What is the probability that a dart Pierre throws will land in one of the four inner numbered sectors? Express your answer as a decimal to the nearest hundredth.

Patterns Stretch

11. _____ dots The first four stages of a dot pattern are shown. How many more dots are in the figure at Stage 47 than in the figure at Stage 27?

12. _____ The first three terms of a sequence are 1, 2 and 3. Each subsequent term is the sum of the three previous terms. What is the 11th term of this sequence?
13. _____ What is the sum of the terms in the arithmetic series $2 + 5 + 8 + 11 + 14 + \dots + 89 + 92$?
14. _____ Three consecutive terms in an arithmetic sequence are x , $2x + 11$ and $4x - 3$. What is the constant difference between consecutive terms in this sequence?
15. _____ What is the sum of the terms in the geometric series $1 + 4 + 16 + \dots + 1024$?
16. _____ What is the sum of the first 51 consecutive odd positive integers?
17. _____ What is the sum of the terms in the infinite series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \dots$?
18. _____ What is the sum of the terms in the infinite series $1 + \frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \frac{1}{256} + \dots$? Express your answer as a common fraction.
19. _____ Let $f(x) = 2x + 3$ and $f^2(x) = f(f(x)) = f(2x + 3) = 2(2x + 3) + 3 = 4x + 9$. If $f^5(x) = ax + b$, what is the value of $a + b$?
20. _____ degrees The degree measures of the interior angles of a quadrilateral form a geometric sequence whose terms have integer values and are all integer multiples of the first term. What is the largest possible degree measure of an angle in this quadrilateral?

Travel Stretch

$$\text{speed} = \frac{\text{distance}}{\text{time}}$$

$$\text{distance} = \text{speed} \times \text{time}$$

$$\text{time} = \frac{\text{distance}}{\text{speed}}$$

21. _____ mi/h Jack and Jill travel up a hill at a speed of 2 mi/h. They travel back down the hill at a speed of 4 mi/h. What is their average speed for the entire trip? Express your answer as a mixed number.

22. _____ : _____ p.m. At 2:20 p.m., Jack is at the top of the hill and starts walking down at the exact same time that Jill, who is at the bottom of the hill, starts walking up. If they maintain the same uphill and downhill speeds from the previous problem, and the distance from the bottom to the top of the hill is 1.5 miles, at what time will Jack and Jill meet?

23. _____ yards When Jack and Jill meet, as described in the previous problem, how many yards will they be from the bottom of the hill?

24. _____ minutes Alysha's average speed when walking from home to the market is 5 mi/h, and it takes her 21 minutes longer than when she drives to the market. If Alysha drives to the market, along the same route, at an average speed that is eight times her average walking speed, how many minutes does it take her to drive from home to the market?

25. _____ miles Based on problem 24, how many miles does Alysha travel to get from home to the market?

26. _____ minutes
- 
- Jana begins jogging along a path and, 5 minutes later, Zhao begins riding his bicycle along the same path, which has a length of 2 miles. Zhao rides his bicycle at a speed of 10 mi/h, and Jana's jogging speed is 6 mi/h. If they both begin at one end of the path and end at the other, how many minutes after Zhao reaches the end of the path will Jana reach the end of the path?

27. _____ minutes Based on problem 26, how many minutes after Zhao begins riding will he catch up with Jana? Express your answer as a mixed number.

28. _____ miles Again, based on problem 26, how many miles will Jana have traveled when Zhao catches up with her? Express your answer as a mixed number.

29. _____ mi/h
- 
- Ansel left the dock in his motorboat, traveled 10 miles, and then returned to the dock along the same route. On the return trip, Ansel was traveling against the current of the river, and his average speed relative to the water was 20 mi/h. If the round-trip took Ansel 64 minutes, what is the speed of the river's current?

30. _____ Based on problem 29, what fraction of Ansel's total travel time was spent traveling upstream? Express your answer as a common fraction.

Warm-Up 1

31. _____ What is the value of $5 - 5 \times 5 + 5 \div 5$?
32. _____ diagonals How many diagonals are in a convex heptagon?
33. _____ What is the first year after 2018 that is a palindrome?
34. _____ A standard 52-card deck of playing cards includes four aces. What is the probability that two cards selected randomly, without replacement, will both be aces? Express your answer as a common fraction.
35. _____ What is the value of $\sqrt{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 10}$? Express your answer in simplest radical form.
36. _____ °F The temperature dropped from 13°F to -5°F . How many degrees Fahrenheit is the absolute value of the change in temperature?
37. _____ What is the value of $1 \times 2 + 3 \div 6 \times 5 - 4$? Express your answer as a common fraction.
38. _____ If $x \textcircled{R} y$ is defined as $x^2 - y^2$, what is the value of $3 \textcircled{R} (2 \textcircled{R} 1)$?
39. _____ If the digits 7, 8, 2, 3 and 0 are used, each exactly once, to form a three-digit positive integer and a two-digit positive integer that differ by exactly 288, what is the sum of the three-digit integer and the two-digit integer?
40. _____ degrees In rectangle ABCD, point P lies on side BC and point Q lies in the interior of the rectangle so that triangle APQ is equilateral. If the measure of angle PAB is 17 degrees, what is the measure of angle QPC?

Warm-Up 2

41. _____ balls Kim is knitting a baby blanket that requires 750 meters of yarn. There are 180 meters of yarn in each ball. How many balls of yarn must Kim buy to ensure she has enough yarn to complete her blanket?
42. _____ years
old On Chris' birthday in 1992, he was half the age of his brother Joseph. On Chris' birthday in 1998, he was two-thirds the age of Joseph. How old will Chris be on his birthday in 2018?
43. _____ degrees On a standard 12-hour clock, the minute hand moves continuously, at a constant rate, making one full revolution every hour, and the hour hand moves similarly, making one full revolution every 12 hours. What is the measure of the smaller of the two angles between the minute hand and the hour hand, in degrees, when the clock reads 5:42?
44. _____ What is the value of the expression $12 \times 37 + 12 \times 7 + 12 \times 6$?
45. _____ factors How many distinct positive factors does 2018 have?
46. _____ Two fair six-sided dice, with sides numbered 1 through 6, are rolled. What is the probability that the values on the two top faces add to at least 9? Express your answer as a common fraction.
47. _____ If the graph of the equation $y = mx + b$ is a line passing through the points (6, 13) and (10, 31), what is the value of m ? Express your answer as a common fraction.
48. _____ Dewey buys soda in 12-ounce cans that cost \$1.00 each. Peppar buys soda in 20-ounce bottles that cost \$1.25 each. If Dewey and Peppar buy the same volume of soda in one week, then Peppar pays $P\%$ less than Dewey. What is the value of P ?
49. _____ logs Gerald Scheetz is building a log cabin. If each log is 9 inches in diameter, how many logs must be stacked on top of one another to create a wall that has a height of 12 feet?
50. _____ units² A square with area 8 units² is inscribed in a circle. What is the area of the circle? Express your answer in terms of π .

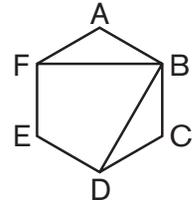

Warm-Up 3

51. _____ If y is a number such that $y^2 = (y + 2018)^2$, what is the value of y ?
52. _____ $\frac{\text{years}}{\text{old}}$ Maura is 5 years younger than her sister Cara. Seven years ago, Maura was half as old as her sister. How old is Maura now?
53. _____ A dartboard consists of three concentric circles with radii 10, 5 and 1, respectively, measured in inches. The area between the largest and middle circles is colored green, the area between the middle and smallest circles is colored yellow, and the area within the smallest circle, the bull's-eye, is colored red. If a thrown dart is guaranteed to hit the board, but its position on the board is uniformly random, what is the probability that it lands in the yellow portion of the board? Express your answer as a common fraction.
54. _____ $\frac{\text{days}}$ The 1990 and 2018 calendars are identical in the number of days in each month and the day of the week on which each day of each month occurs. In fact, the calendar repeats in these ways every 28 years until the year 2100. How many days are there in the 28 years preceding 2018?
55. _____ $\frac{\text{cm}}$ A right triangle has legs with lengths of 5 cm and 10 cm. What is the length of the altitude drawn to the hypotenuse of this triangle? Express your answer in simplest radical form.
56. _____ Min Zhang wrote down all of the two-digit multiples of 5. What is the probability that one of these numbers, chosen at random, has exactly two distinct primes that are factors? Express your answer as a common fraction.
57. _____ Given a set of numbers with median m , the median of all the numbers less than m is called the *lower quartile*. The median of all the numbers greater than m is called the *upper quartile*. The absolute difference between the lower and upper quartiles is called the *interquartile range*. What is the interquartile range for the numbers in the stem-and-leaf plot shown?
- | | | | | | | |
|---|---|---|---|---|---|---|
| 0 | 2 | 4 | 6 | 8 | 9 | |
| 1 | 1 | 1 | 3 | 8 | 9 | 9 |
| 2 | 0 | 4 | 6 | 8 | | |
| 3 | 0 | 3 | 5 | 7 | 7 | |
| 4 | 1 | 5 | 7 | 7 | | |
58. _____
- | | | | | | |
|----|----|----|----|----|----|
| 1 | 2 | 3 | 4 | 5 | 6 |
| 7 | 8 | 9 | 10 | 11 | 12 |
| 13 | 14 | 15 | 16 | 17 | 18 |
| 19 | 20 | 21 | 22 | 23 | 24 |
| 25 | 26 | 27 | 28 | 29 | 30 |
| 31 | 32 | 33 | 34 | 35 | 36 |
- Positive integers 1 to 36 are written in rows in a six-by-six array as shown. Each prime number is crossed off, as well as all the numbers in the diagonal extending up and to the right from that prime. For example, 11 is prime and is crossed off along with the 6 above and to the right. What is the sum of the remaining values after all the primes and associated diagonals have been eliminated?
59. _____ What is the value of $1,000,000! \div 999,999!$?
60. _____ $\frac{\text{inches}}$ A cubic yard of topsoil is to be spread evenly in the garden at Prove It! Math Academy. The garden measures 10 feet by 8 feet. How many inches deep will the topsoil be? Express your answer as a mixed number.

Warm-Up 4

61. _____ Diagonals FB and BD are drawn in regular hexagon ABCDEF. What is the ratio of the sum of the areas of triangles ABF and BCD to the area of quadrilateral BDEF? Express your answer as a common fraction.

62. _____ What is the value of $\frac{11! - (9+1)(9!)}{8(7!)}$?

63. _____ times David's optometrist sold him a bottle of eyeglass cleaner containing 30 mL of glass-cleaning solution. Assuming there are 20 drops per milliliter, and assuming proper cleaning requires 3 drops of glass cleaner on each side of each lens, what is the maximum number of times David can properly clean his glasses before he must buy a new bottle of eyeglass cleaner?

64. _____ combinations The lunch-ordering app for Pete's Pizza Parlor requires you to choose two distinct meats from among pepperoni, Canadian bacon and sausage; or choose two distinct vegetables from among mushrooms, onions, green peppers and black olives; or choose one meat and one vegetable from among the same choices. How many different pizza combinations are possible using the lunch-ordering app?

65. _____ pounds Kathy Beckhardt weighs four of her sheep at the fair. She can weigh two of them at a time on the big scale. Sheep A and sheep B have an average weight of 150 pounds, sheep B and sheep C have an average weight of 127 pounds, and sheep C and sheep D have an average weight of 168 pounds. What is the average weight of sheep A and sheep D?

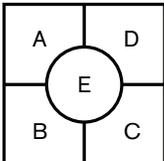

66. _____ meters In circle O, the lengths of chords AB and BC are equal and $m\angle ABC = 90$ degrees. Given that circle O has a radius of 3 meters, what is the length of arc ABC? Express your answer in terms of π .

67. _____ tiles How many 4-inch square tiles are needed to cover a wall that measures 6 feet by 8 feet?

68. _____ What is the units digit of $2^{2017} \times 7^{2017}$?

69. _____ integers How many integers between 100 and 1000 contain no digits other than 3, 4 or 5?

70. _____ paths

The square shown is divided into five cells. How many paths can be drawn that start at any cell, move only to adjacent cells and visit each of the five cells exactly once?

Warm-Up 5

71. _____ paper clips A pencil and 5 paper clips weigh the same as 2 erasers. A pencil weighs the same as 29 paper clips. How many paper clips weigh the same as an eraser?

72. _____ points What is the maximum number of points of intersection of a right triangle with a square, assuming no side of the triangle is collinear with any side of the square?

73. _____ If $p(x) = ax^2 + bx + c$ is a quadratic polynomial satisfying $p(0) = 4$, $p(1) = 15$, $p(2) = 36$, what is the value of the product abc ?

74. _____ units A certain sphere has a volume that is numerically equal to three times its surface area. What is the radius of this sphere?

75. _____ candles A layered candle is made with 5 colors, shown here as candle A. How many different candles can be made using the same 5 colors, with BLUE as the middle layer, shown as candle B, and with no color next to a color that it touched in candle A?

| A | B |
|--------|------|
| BLUE | |
| GREEN | |
| RED | BLUE |
| ORANGE | |
| YELLOW | |

76. _____ Suppose Luke spins the pointer on a fair 3-color spinner twice. What is the probability that the pointer lands on the same color twice? Express your answer as a common fraction.

77. _____ shots Kevin is playing basketball and up to now made $\frac{1}{3}$ of his attempted shots. If he makes his next 5 shots, he will improve his shooting percent to 50%. How many shots has Kevin attempted up to now, when he has a $\frac{1}{3}$ success rate?

78. _____ base eight What is 110011_2 when rewritten in base eight?

79. _____ points If the point $(8, 9)$ is the center of a circle of radius 10 units, at how many points does the circle intersect the coordinate axes?

80. _____ If $x + \frac{1}{y} = \frac{1}{5}$ and $y + \frac{1}{x} = 20$, what is the value of the product xy ?

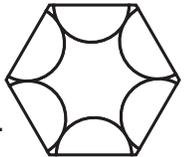

Warm-Up 6

81. _____ If $3x + 5 = 13$, what is the value of the expression $(3x + 2)(3x + 3)(3x + 4)$?
82. _____ units² What is the maximum area of a rectangle with a diagonal of length 16 units?
83. _____ pairs How many pairs of numbers (a, b) satisfy rules I and II shown here?
I. $a = 0$ or $b = -1$ or $b = 1$
II. $a = -1$ or $a = 1$ or $b = 0$
84. _____ If each letter in the sum $A.BC + D.EF$ represents a different nonzero digit, what is the least possible value of the sum? Express your answer as a decimal to the nearest hundredth.
85. _____ ways In the hardware store, Matt goes to the fastener aisle, which has wood screws, sheet metal screws, hex bolts, carriage bolts and lag bolts. How many ways can he choose 10 fasteners if he needs at least one of each kind?
86. _____ A family farm is equally divided among three heirs: Jim, Jan and John. John's share of the farm is then equally divided among his three heirs: Peter, Paul and Patricia. Paul decides to sell his share of the farm, and then later the family decides to sell the remainder of the farm all at once. What portion of the proceeds from the most recent sale should Jim receive? Express your answer as a common fraction.
87. _____ Olivia Justynski earned scores of 82, 86 and 92 on her first three tests. What score does she need on her fourth test to achieve an average score of 90 on the four tests?
88. _____ hours For each child, Kiddie Day Care charges \$330 per month for preschool and \$5.50 per hour for each hour of after-school care. If Cody's cost was \$770 for his son's child care last month, how many hours did his son spend in after-school care?
89. _____ When three consecutive positive integers are multiplied, the product is 16 times the sum of the three integers. What is the difference of the product minus the sum?
90. _____ The lift force on an airplane during flight is directly proportional to the surface area of the wing. Orville builds a model airplane and goes outside to play. Orville's little brother, Wilbur, builds a mini replica of Orville's plane that is half as long in every linear dimension. What is the ratio of the lift force on Wilbur's plane to that on Orville's plane? Express your answer as a common fraction.

Warm-Up 7

91. _____ What whole number n makes $\frac{6}{78} < \frac{1}{n} < \frac{5}{55}$ true?
92. _____ In 2016 the Flying Turtles finished their baseball season with a record of 95 wins and 67 losses. The Dolphins finished the season with 84 wins and 78 losses. The Flying Turtles and Dolphins played each other 19 times during the season. If the Flying Turtles had F wins against teams other than the Dolphins, and the Dolphins had D wins against teams other than the Flying Turtles, what is the value of $F + D$?
93. _____ units A point D is placed on the segment with endpoints $(0, 8)$ and $(8, 0)$, and a point E is placed on the segment with endpoints $(-3, 0)$ and $(0, -2)$. What is the shortest possible distance between D and E ? Express your answer in simplest radical form.
94. _____ terms In the arithmetic sequence $1, 3, 5, 7, 9, 11, \dots$, how many terms appear after the term 315 but before the term 639?
95. _____ Allen Zhang rolls two fair 6-sided dice with faces numbered 1 through 6. What is the probability that the sum of his two rolls has an odd number of positive integer divisors? Express your answer as a common fraction.
96. _____ Six semicircles, each of radius r , are constructed inside a regular hexagon of side length s , one on each side, so that each semicircle is tangent to two others. What is the ratio of r to s ? Express your answer in simplest radical form.

97. _____ Gaylon starts writing down dates from January 1, 2018 onward as follows: 01012018, 01022018, 01032018, etc. What is the 2018th digit Gaylon writes down?
98. _____ lightning bolts Zeus threw, on average, 12 lightning bolts per day in the month of March. During the first week in April, he averaged 15 lightning bolts per day. How many lightning bolts does Zeus need to throw per day on average for the rest of April to maintain a 12-bolt-per-day average over March and April? Express your answer to the nearest integer.
99. _____ For what positive value of x is the equation $9^{2x^2 - 6} = 27^{x^2 - 1}$ true?
100. _____ times The decibel is a unit used to describe the loudness of a sound. For every 20-decibel increase, a sound gets 10 times as loud. Normal conversation is about 60 decibels, and a loud rock concert is about 120 decibels. How many times as loud is a rock concert compared to normal conversation?

Warm-Up 8

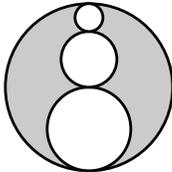

101. _____ Pamela Wickham writes a sequence of four consecutive integers on a sheet of paper. The sum of three of these integers is 206. What is the other integer?

102. _____ seconds Benjamin starts walking up on an escalator that moves down one flight of stairs every 20 seconds. Benjamin takes 10 seconds to walk up a single flight of stairs on the adjacent stationary staircase. Assuming Benjamin walks at the same speed on the escalator and stairs, how many seconds does it take him to walk up two flights on this escalator?

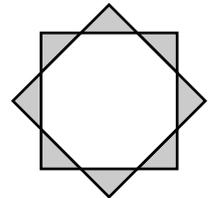

103. _____ divisors Let $K = 168 \times 900 = 151,200$. How many positive integer divisors does K have?

104. _____ Emma Kerwin creates a custom six-sided die by randomly choosing six different integers between 1 and 7, inclusive, to paint on the sides of a blank cube. What is the probability that the faces of her die sum to 24? Express your answer as a common fraction.

105. \$ _____ The owners of two food carts calculate their weekly profits for three weeks. The medians and the highest weekly profit values are the same for the two carts. The mean weekly profit of Cart A is \$27 more than that of Cart B. What is the absolute difference between the lowest weekly profit values of Cart A and Cart B?

106. _____  Each of the circles in the figure is tangent to exactly two others. The centers of all four lie on a line. If the diameters of the three inner circles are in a ratio of 1:2:3, what fraction of the largest circle is shaded? Express your answer as a common fraction.

107. _____ Two congruent squares overlap to form a regular octagon as shown. What is the ratio of the shaded area to the area of the regular octagon? Express your answer in simplest radical form.

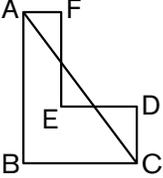

108. _____ hours It takes Avi one half-hour longer to make a basket than it takes Markus. After 28 hours, Markus has made one more basket than Avi has made. How many hours does it take Avi to make one basket?

109. _____ Suppose N is a positive integer such that $N - 1$ is even, $N - 2$ is divisible by 3, $N - 3$ is divisible by 5, and $N - 5$ is divisible by 7. What is the least possible value of N ?

110. _____ What fraction of the positive integer factors of 1000^3 are perfect squares? Express your answer as a common fraction.

Warm-Up 9

111. _____ Sola's lucky numbers are 7 and 11. So he decides his lucky common fraction, f , will be formed by the repeating decimal $f = \overline{0.711}$. What is the value of f as a common fraction?
112. _____ Suppose m is the line given by the equation $6x - 3y = 7$, and suppose n is the line perpendicular to m and passing through the point $(6, 2)$. If k is the line of slope 5 and y -intercept 1, what is the x -coordinate of the intersection of n and k ? Express your answer as a common fraction.
113. _____ In hexagon ABCDEF, shown here, adjacent sides are perpendicular. If $AB = 8$, $BC = 6$, $CD = 3$ and $DE = 4$, what fraction of the segment AC lies inside of the hexagon? Express your answer as a common fraction.
- 
114. _____ $\frac{\text{times}}{\text{stronger}}$ The Richter scale is used to describe the strength of an earthquake. An increase of 1 point on the Richter scale represents a tenfold increase in the strength of an earthquake. How many times stronger is an earthquake rated 7.5 on the Richter scale compared to an earthquake rated 5? Express your answer in simplest radical form.
115. _____ The third term of a geometric sequence of integers is 45. The seventh term of the sequence is 3645. What is the least possible sum of the first five terms of the sequence?
116. _____ words In a new version of Scrabble, a sequence of letters is considered a word if the first and last letters are consonants and every letter in between is a vowel. In this game, how many four-letter words can be formed using each of the letters M, A, T, H, R, U, L, E and S no more than once?
117. _____ mi/h Rebecca and Susan live at opposite ends of a 2-mile-long street. At 8:00 a.m., Rebecca starts jogging from her house toward Susan's end of the street. At 8:06 a.m., Susan starts jogging from her apartment toward Rebecca's end of the street. They pass each other at exactly 8:13 a.m. If Rebecca and Susan jog at the same constant speed, what is this speed, in miles per hour?
118. _____ units^2 We define a *Heronian triangle* to be a triangle with three integer side lengths and integer area. What is the least possible positive area of a Heronian triangle whose longest side has a length of 17 units?
119. _____ For each of the first eight prime numbers, Brian Edwards writes down all the number's positive factors. What is the sum of all the numbers Brian writes down?
120. _____ If $\sqrt{x} - \sqrt{y} = 10$ and $\sqrt{x} + \sqrt{y} = 14$, what is the value of $x + y$?

Warm-Up 10

121. _____ What is the greatest prime factor of $(1!)! \times (2!)! \times (3!)! \times (4!)!$?

122. _____ minutes The table shows how long it takes Anita's fully discharged cell phone battery to fully charge using three methods. When her phone battery fully discharged, Anita charged the phone for half an hour using the wall charger, and now she will continue charging it for 1 hour using her computer. How many minutes are required to fully charge the phone battery using the portable charger, if the phone is not used during or between chargings?

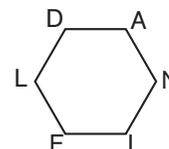

| Method | Hours <small>(to fully charge)</small> |
|------------------|---|
| Wall Charger | 1.5 |
| Computer | 3 |
| Portable Charger | 5 |

123. _____ In equilateral triangle ABC , M is the midpoint of side AB . If CMN is also an equilateral triangle, what fraction of the area of triangle $\triangle ABC$ lies inside of $\triangle CMN$? Express your answer as a common fraction.

124. _____ What is the greatest prime factor of $3^7 - 27$?

125. _____ ways In how many ways can eight differently colored balls, including one red, one green and one yellow, be ordered left to right so that the green ball is to the right of the red ball (not necessarily adjacent) and the yellow ball is to the right of the green ball (not necessarily adjacent)?

126. _____ units Sides DL and AN in a regular hexagon $DANIEL$, shown here, are extended until they intersect at a point F . If the sides of the hexagon have length 6 units, what is the length of segment FE ? Express your answer as a radical in simplest form.

127. _____ baskets Annette, Mary and Lynn team up to pick apples. Annette can pick 4 baskets of apples per hour, and Mary can pick 5 baskets of apples per hour. Annette, Mary and Lynn work together to pick 6 baskets of apples in half an hour. How many baskets of apples can Lynn pick by herself in 3 hours?

128. _____ Kayla Straub starts with a pile of 15 stones. She divides the pile into two new piles and finds the product of the numbers of stones in the two new piles. Kayla then divides one of the existing piles into two new piles. She finds the product of the numbers of stones in the two new piles and adds it to the previous product. Kayla continues this process, each time adding the product of the numbers of stones in the two new piles to the previous total, until she has 15 piles with one stone each. What is the greatest possible ending total?

129. _____ A sphere is inscribed in a cube. What is the ratio of the volume of the cube to that of the sphere? Express your answer as a common fraction in terms of π .

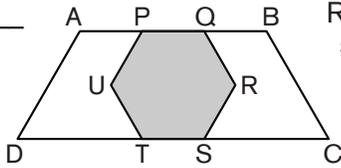

130. _____ Let $\#x$ represent the greatest even integer less than x . If $20 < x < 30$, what is the maximum possible value of $\#(5x) - \#(4x)$?

Warm-Up 11

131. _____ points If two distinct ellipses and a square are drawn, what is the maximum possible number of points at which at least two of the three planar figures intersect?

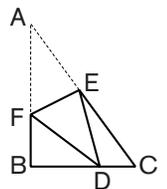

132. _____ Isosceles triangles ABC and DEF have six interior angles altogether, but these six angles have only three different measures among them. If the sum of these three different measures is 156 degrees, and both triangles have at least one angle of measure m degrees, what is the value of m ?

133. _____  Regular hexagon PQRSTU lies inside of trapezoid ABCD, as shown, so that vertices P and Q trisect the base AB, S and T lie on the base CD, and sides PU and QR are parallel to sides AD and BC, respectively. The shaded area is what fraction of the area of trapezoid ABCD? Express your answer as a common fraction.

134. _____ integers How many positive integers in the set of numbers from 1 to 1000, inclusive, are multiples of 2, 3 and 5 but not 8?

135. _____ In the sum $ABCD + EFGH$, each letter represents a digit selected independently at random from the set $\{1, 2, 3, 4\}$. What is the probability that the sum of the two four-digit numbers contains the digit 5 at least once? Express your answer as a common fraction.

136. _____ cm^2 In right triangle ABC, with $AB = 44$ cm and $BC = 33$ cm, point D lies on side BC so that $BD:DC = 2:1$. If vertex A is folded onto point D to create quadrilateral BCEF, as shown, what is the area of triangle CDE?

137. _____ passes After the first eight games of the football season, Jason Doan had completed 70% of his passes. During the ninth game, he completed 49 of his 50 passes, raising his season pass completion rate to 74%. How many total passes did he throw during the first nine games?

138. _____ The mean of seven distinct positive integers is 20. What is the difference between the greatest and least possible medians of the seven integers?

139. _____ integers How many two-digit positive integers have a units digit that is equal to the product of its two digits?

140. _____ Colleen Kipfstuhl rolls a standard fair six-sided die. If she rolls a number with an odd number of positive integer divisors, she steps 1 meter to her right. Otherwise, she steps 1 meter to her left. After four rolls of the die, what is the probability Colleen ends up right where she started? Express your answer as a common fraction.

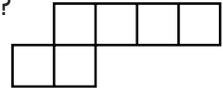

Warm-Up 12

141. _____ What is the absolute difference between the sum of the multiples of 2, from 1 to 100, inclusive, and the sum of the multiples of 3, from 1 to 100, inclusive?
142. _____ If $p(x)$ is a cubic polynomial with $p(0) = 4$, $p(1) = 10$, $p(-1) = 2$ and $p(2) = 26$, what is the value of $p(3)$?
143. _____ inches What is the greatest possible perimeter of an obtuse triangle, each of whose side lengths is a whole number of inches less than or equal to 100?
144. _____ fist bumps After playing a math game, each member of the MATHCOUNTS national office staff gives a fist bump to every coworker. If 25 members of the national office staff participate as described, how many total fist bumps occur?
145. _____ students Several students were trying out for a class play. When asked which roles they were willing to play, 12 of them were willing to play the knight, 15 were willing to play the princess and 6 were willing to play the sorcerer. Of these students, 8 were willing to play either the knight or the princess, 5 were willing to play the knight or the sorcerer, and 4 were willing to play the princess or the sorcerer. Exactly 3 of these students were willing to play any of the roles. How many students were willing to play the sorcerer but no other role?
146. _____ ways Frankie the frog stands at the number 0 on a number line and wants to hop to the number 8. He can hop 1, 2 or 3 units forward in a single jump. How many different ways are there for Frankie to reach the number 8?
147. _____ The median and the mean of the five integers 10, 12, 26, x , x are equal. What is the sum of all possible values of x ?
148. _____ ordered pairs How many ordered pairs of prime numbers (a, b) are there such that $a + b = 100$?
149. _____ cm What is the perimeter of a right triangle with an area of 10 cm^2 and a hypotenuse of length 10 cm? Express your answer in simplest radical form.
150. _____ If $\frac{2}{x+1} + \frac{8}{y-3} = \frac{10}{3}$ and $\frac{4}{x+1} - \frac{2}{y-3} = \frac{2}{3}$, what is the value of $x + y$?

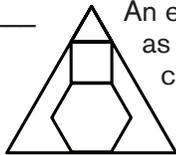

Warm-Up 13

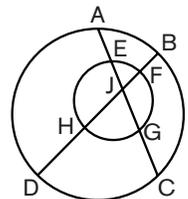

151. ordered triples How many ordered triples of integers (m, n, p) exist such that $mn = p$, $np = m$ and $mp = n$?
152. cm² What is the least possible area of a rectangle that can enclose an equilateral triangle with side length 6 cm? Express your answer in simplest radical form.
153. integers How many of the first 2018 positive integers are either perfect squares or perfect cubes?
154. assortments Alexander Clifton visits Sweet Dreams bakery, which sells three kinds of cookies. How many unique assortments of a dozen cookies can Alexander buy?
155. dimes Gabriel and Isabel each start with a pile of 20 coins consisting of nickels, dimes and quarters. After Gabriel gives Isabel 2 coins, and Isabel gives Gabriel 5 coins, Gabriel's pile is worth twice the value of Isabel's pile. If Gabriel and Isabel have the greatest possible combined value of coins, what is the least number of dimes Isabel could end up with?
156. _____ What is the smallest positive integer multiple of 130 that is divisible by 365?
157. hexominoes A *hexomino* is a planar figure formed by connecting six unit squares so that adjacent squares have a common side. One possible hexomino is shown. How many distinct hexominoes can be drawn that have exactly four squares in a row? Two hexominoes are distinct if one cannot be reflected or rotated to form the other hexomino.

158. _____ An equilateral triangle, a square and a regular hexagon with side length 6 are stacked as pictured. A larger equilateral triangle is then drawn around the stack of polygons, completely enclosing it. The area outside the polygon stack but inside the larger triangle can be expressed in the form $a + b\sqrt{c}$, where a , b and c are integers and $b\sqrt{c}$ is in simplest radical form. What is $a + b + c$?

159. assignments Abhi, Bryan, Meghna and Noreen are each assigned a different integer from 1 to 10, inclusive. Abhi's number is prime and Noreen's number is a perfect square. Bryan's number is half of the value assigned to another person, while Meghna's number is the sum of two other assigned values. The ordered quadruple $(2, 1, 5, 4)$ is one possible assignment. How many such assignments are there?

Warm-Up 14

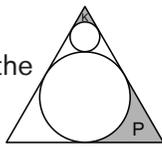

161. _____ If n is the product of three consecutive positive integers and $n = 22 \times 14 \times k$, what is the least possible value of k ?

162. _____

| | | | | |
|----|----|----|----|----|
| 23 | 12 | 1 | | 9 |
| 4 | 18 | 7 | 21 | |
| 10 | 24 | 13 | 2 | 16 |
| | 5 | 19 | 8 | 22 |
| 17 | | 25 | 14 | 3 |

A regular 5×5 magic square contains a permutation of the integers from 1 through 25, such that every row, every column, and the two main diagonals sum to the same value. What is the sum of the numbers missing from the magic square shown?

163. _____ Two circles are inscribed in an equilateral triangle as shown. What is the ratio of the areas of the shaded regions K to P? Express your answer as a common fraction.

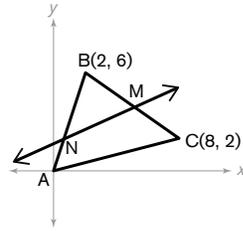

164. _____ What is the sum of the integers strictly between 1 and 100 that are multiples of neither 2 nor 3?

165. _____

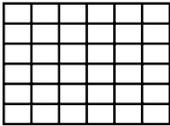

James and John take turns spinning the pointer of a fair spinner that is divided into three congruent sectors. The first player whose spin lands on the WIN sector is the winner of the game. If James goes first, what is the probability that he wins the game? Express your answer as a common fraction.

166. _____ units Triangle ABC has vertices at $(0, 0)$, $(2, 6)$ and $(8, 2)$. The line $x - 3y = -7$ intersects two sides of the triangle at points M and N, as shown. What is the length of segment MN? Express your answer as a common fraction in simplest radical form.

167. _____ bottles Edna enters a room with 1000 bottles lined up in a row left to right. One bottle contains a tasteless magic potion. All bottles to the left of the magic potion contain tasteless water. All bottles to the right of the magic potion contain a bitter poison. Edna can drink from no more than two bottles containing poison before becoming sick and being unable to drink anything else. She can take an unlimited number of drinks from any other bottle. What is the minimum number of bottles from which Edna may need to drink to ensure she can identify the bottle containing the magic potion no matter where it is in the lineup?

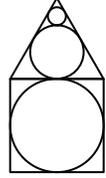

168. _____ silver rectangles

In origami, a *silver rectangle* is any rectangle such that the ratio of the length of the short side to the length of the long side is exactly $1:\sqrt{2}$. Each of the small rectangles in the figure shown is a silver rectangle. How many silver rectangles of any size can be found in the figure?

169. _____ laps Priya, Amanda and Du simultaneously begin jogging in the same direction from the same point on a circular track. Amanda's speed is the average of Priya's and Du's speeds. Du passes Priya for the first time at the moment when Du completes his fourth lap. How many laps has Amanda completed at the moment when she passes Priya for the first time?

170. _____

An equilateral triangle is stacked above a square as shown, with a circle inscribed inside the square and two stacked circles inscribed in the triangle so that they are tangent to each other. What is the ratio of the area of the smallest circle to the area of the largest circle? Express your answer as a common fraction.

Workout 1

171. _____ If three fair coins are simultaneously flipped, what is the probability that exactly two heads will be showing? Express your answer as a fraction in simplest form.
172. _____ m/s^2 An Euler Airline flight is getting ready to take off. Gary McDonald, the pilot, starts from rest at the edge of the runway. He needs to accelerate to a speed of 300 km/h in 30 seconds. Acceleration is defined as the change in speed per unit time. What is Gary's average acceleration, in meters per second per second, which is equivalent to meters per second squared, during takeoff? Express your answer as a decimal to the nearest tenth.
173. _____ pounds An object's weight on a planet is directly proportional to the mass of that planet and inversely proportional to the square of the radius of the planet. Jupiter is 318 times as massive as Earth and has a radius 11 times as large as that of Earth. If Gordon weighs 100 pounds on Earth, how many pounds would he weigh on Jupiter? Express your answer to the nearest whole number.
174. _____ $\frac{\text{million}}{\text{dollars}}$ The 1998 film *Armageddon* had a production budget of \$140 million. The domestic box office gross was about \$200 million, and the international box office gross was about \$350 million. The studio considers a film a financial success if the worldwide (domestic plus international) gross is at least double the sum of the production budget and the advertising budget. In millions of dollars, what was the greatest advertising budget the film could have had to be considered a financial success? Express your answer to the nearest whole number.
175. _____ days What is the mean number of days per month among all months in the year 2018? Express your answer as a decimal to the nearest tenth.
176. _____ If $A = x^2 - 2x + 6$ and $B = \frac{5x^2 - 1}{x + 3}$, what is $A + B$ if $x = -2$?
177. _____ cm What is the height of a cone with a volume of 1187.5 cm^3 and a base of diameter 18 cm? Express your answer to the nearest whole number.
178. _____ degrees What is the degree measure of each interior angle of a regular decagon?
179. \$ _____ Elliott's stock portfolio was valued at \$5000 on January 1. Its value decreased by 20% during January but then increased by 25% during February. What was the value of his stock portfolio at the end of February?
180. _____ hours How many hours are in the decade from January 1, 2011, through December 31, 2020?

Workout 2

181. _____ inches If a television screen with a length-to-height ratio of 16:9 has an area of 576 in^2 , what is its perimeter?
182. _____ miles Alex Zhu bikes between home and school every day. He uses the same route to go to and from school, but it takes him 20 minutes to bike to school and only 15 minutes to bike back. If his average biking pace for the whole round-trip is 7 minutes per mile, how many miles long is the trip from home to school? Express your answer as a decimal to the nearest tenth.
183. _____ m/s Bruce and Lawson are playing ice hockey. Bruce shoots the puck at the goal 40 meters directly in front of him at a speed of 50 m/s. If Lawson is standing exactly 30 meters to the left of Bruce, what is the minimum speed at which he must skate, to reach the goal when the puck does? Express your answer as a decimal to the nearest tenth.
184. \$ _____ In 2015 the average two-adult family in a particular town paid \$619 per month for groceries, excluding sales tax. If groceries in this town were subject to a 9% sales tax, how much sales tax was paid by the average two-adult family in one month?
185. \$ _____ Linda makes 6 cakes per hour. Sara makes 4 cakes per hour. If Linda gets paid \$11 less than Sara for each cake, how much in dollars should Sara be paid for each cake for Linda and Sara to earn the same amount each hour?
186. _____ yards In a golf long-drive competition, Jason Zuback hits his first five drives 394, 401, 387, 414 and 421 yards, respectively. How long must he hit his sixth drive to ensure that the mean of his six drives is at least 400 yards?
187. _____ km A pilot flying due east is forced to make a detour from her original route to avoid turbulent weather. The pilot turns 30 degrees north of east. After traveling some distance, she turns and rejoins her original route and is 1000 km away from where she took the detour. The turn back to her original route put her at a 45 degree angle to that route. How much farther did the pilot travel due to her detour? Express your answer to the nearest whole kilometer.
188. _____ What is 12% of $\frac{3}{4}$ of 1.8? Express your answer to the nearest thousandth.
189. _____ ways In how many different ways can four people be seated around a circular table so that no one ever has the same two neighbors more than once?
190. _____ fluid ounces A cylindrical container holds 20 fluid ounces. It has a radius of 3 inches and a height of 12 inches. How many fluid ounces will a similar container with a radius of 4.5 inches hold? Express your answer as a decimal to the nearest tenth.

Workout 3

191. _____ seats The number of seats per row in an auditorium increases from the front to the back. The first row has 15 seats, the second row has 2 more seats than the first row, the third row has 3 more seats than the second row, the fourth row has 2 more seats than the third row, the fifth row has 3 more seats than the fourth row. This pattern continues, with successive rows alternating between 2 more seats and then 3 more seats than the previous row. How many seats are in the auditorium if there are 30 rows total?
192. _____ degrees Three interior angles of a pentagon measure 110, 120 and 130 degrees, respectively. Of the two remaining interior angles, one is three times the measure of the other. What is the measure of the pentagon's smallest interior angle?
193. _____ Hisham Dimashkieh chooses four distinct positive integers a , b , c and d , each less than or equal to 10. He chooses the numbers so that a is prime, b is composite, c is a perfect square and d is a perfect cube. What is the greatest possible sum of the four numbers?
194. _____ If p , q and r are prime numbers such that $pq + r = 73$, what is the least possible value of $p + q + r$?
195. _____ % If Bella runs 40% as fast as Thomas and 35% as fast as Tam, what percent faster than Thomas is Tam? Express your answer to the nearest percent.
196. _____ % The probability that it will rain today is 50%. The probability that it will rain tomorrow is 40%. Assuming today and tomorrow's precipitation outcomes are independent from one another, what is the percent probability that it will rain on at least one of the two days? Express your answer as a whole number.
197. _____ ft² What is the area of a 60 degree sector of a circle with radius 30 feet? Express your answer in terms of π .
198. _____ kg One year, the U.S. government printed \$700 million worth of paper money every day, for 365 days. Half of the total value came from \$1 bills. If a new \$1 bill weighs exactly 1 gram, what was the weight, in kilograms, of all the \$1 bills printed that year?
199. _____ trees The number of bushels of apples, $B(n)$, that can be harvested from an acre of land is a function of n , the number of trees planted per acre, where $B(n) = 2025n - n^3$. How many trees planted per acre will produce the greatest harvest? Express your answer as a whole number.
200. _____ Three days ago, there were p cupcakes on the counter. Two days ago, exactly 20% of the cupcakes were eaten. Today, there are 30% fewer cupcakes than yesterday and half as many as there were three days ago. If a whole number of cupcakes were eaten every day, what is the least possible value of p ?

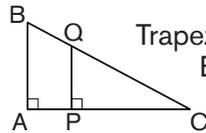

Workout 4

201. _____ The sum of the digits of a two-digit integer is 12. The integer is equal to 15 times its units digit. What is the integer?
202. _____ If $\frac{x^2 + 8x + 15}{x + 5} = 4.01$, then what is the value of x ? Express your answer as a decimal to the nearest hundredth.
203. _____ units² A triangle has three vertices given by coordinates (2, 2), (2, -6) and (-5, -9). What is the area of the triangle?
204. _____ In a regular octagon, the diagonals have three possible lengths —“short,” “medium,” and “long.” What is the ratio of the length of the medium diagonal to the long diagonal? Express your answer as a decimal to the nearest thousandth.
205. _____ % Not realizing that an 18% tip had already been added to the cost of a meal, Emalee added another 15% to the total bill. Given that there is no sales tax, what percent tip did Emalee actually pay? Express your answer as a percent to the nearest tenth.
206. _____ Penner has a deck of 40 cards composed of four suits (red, blue, green, and yellow) and cards numbered 1 through 10 in each suit. Tell secretly chooses a card. Penner then chooses the following 4 cards from the deck: Red-2, Blue-3, Green-5 and Yellow-7. For each card Penner chooses, Tell says “yes” if his secret card is of the same color or shares a common factor greater than 1 with Penner’s card. Otherwise Tell says “no.” Tell says “no,” “yes,” “no,” and “yes,” respectively, in response to Penner’s cards. With this information, what is the best possible probability Penner has of guessing Tell’s secret card? Express your answer as a common fraction.
207. _____ Henry Flannigan chooses a two-digit positive integer at random. What is the probability that the two digits have an absolute difference greater than 1? Express your answer as a common fraction.
208. _____ mi³ Ngorongoro Crater is shaped approximately like a cylinder that is 10 miles across and 2000 feet deep. How many cubic miles of water would it take to fill the crater? Express your answer to the nearest whole number.
209. _____ Mady distributes w candies evenly among 20 bags. The next day, she discovers 5 more empty bags and decides to redistribute the w candies evenly into all of the bags. On the third day, Mady finds 1 more bag and redistributes the w candies evenly again. There are 2 fewer candies on the third day in each of the bags than there were in the bags on the second day. What is the value of w ?
210. _____ If $f(x) = ax^2 + bx + c$, with $f(0) = 4$, $f(2) = 2$ and $f(4) - f(3) = 4$, what is the value of $f(1)$?

Workout 5

211. _____ units²

Trapezoid APQB lies inside of right triangle ABC, as shown. If $AP = 30$, $BQ = 34$ and $AB = 60$, what is the area of triangle ABC?

212. _____

There are five two-digit positive integers arranged in decreasing order. Each digit is unique. What is the absolute difference between the greatest possible range and the least possible range of such a set of integers?

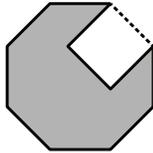

213. _____ ways

Six different donuts are lined up in a box. Six different cookies are lined up in another box. Mackenzie wants to alternate the donuts and cookies in one big long box. How many ways are there to arrange them?

214. _____ workers

For a certain crew of workers, it takes the n th worker exactly n hours to complete a certain job alone. What is the least number of workers needed to complete an identical job in under 20 minutes by working together?

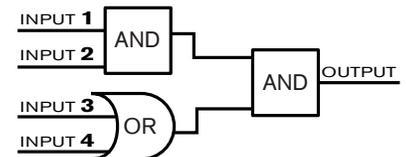

215. _____ cm²

A regular octagon has a perimeter of 64 cm. A square with one side along an edge of the octagon has been cut out of the octagon, as shown. What is the remaining area of the octagon? Express your answer in simplest radical form.

216. _____ inputs

The function machine shown here consists of three logic functions. A Boolean is a member of the set $\{0, 1\}$. For each function, the inputs are on the left and the output is on the right. The output of each function is a Boolean. The input of each function is a pair of Booleans. For the AND function, the output is 1 if and only if both inputs are 1. For the OR function, the output is 0 if and only if both inputs are 0. Among the 16 distinct sets of inputs that can be applied on the far left, how many will produce a 1 as the final output on the far right?

217. \$ _____

Joe, Bob and Randell split a restaurant bill that totaled \$80 before the tip. The group tipped 25%, Joe paid twice as much as Bob, and Randell paid the same amount as Joe. How much did Bob pay?

218. _____ pairs

How many pairs of positive integers a and b exist such that $a^2 - b^2 = 144$?

219. _____ cm³

A rectangular box measures 5 mm \times 10 mm \times 1 m. What is the volume of the box in cubic centimeters?

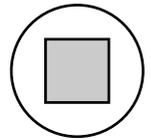

220. _____

A college has been trying to decrease the number of cars on campus and increase the number of bicycles. The price of a parking permit was tripled, and the number of cars on campus decreased 30%. Student tuition was decreased, and the number of bicycles on campus increased by 20%, producing a car to bicycle ratio of 1:3. What was the ratio of cars to bicycles before the changes occurred? Express your answer as a common fraction.

Workout 6

221. _____ in² The gasket shown consists of a circular disk with a square removed. The square and the disk have the same center. If each corner of the square is exactly 1 inch away from the boundary of the disk, and the midpoint of each side of the square is exactly 2 inches away from the boundary of the disk, what is the area of the top face of the gasket? Express your answer as a decimal to the nearest tenth.

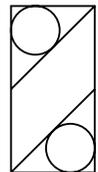

222. _____ % Jeffrey Pribble needs to buy 6 pairs of socks. The Sock Shop is running a limited time promotion: buy 3 pairs of socks and get 3 pairs at half off the regular price. What percent savings does Jeffrey get with the promotion compared to the regular price without the promotion?

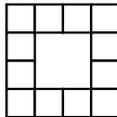

223. _____ What is the greatest possible absolute difference between the median and mean of a list of 10 positive integers that are at most 20? Express your answer as a decimal to the nearest tenth.

224. _____ tourists The tour from Ajim to the Mos Eisley Cantina can take at most 36 tourists. The price for the tour is \$520 per person until at least 15 people have signed up. After that, the price for each person, including the first 15, drops \$5 per additional tourist. If the total amount the tourists paid was \$12,740, how many tourists signed up?

225. _____ inches A rectangle has a width of 1 inch and a height 2 inches. There are two lines drawn, each connecting a vertex to the midpoint of the opposite side, and circles are inscribed in the triangles created, as shown. How far apart are the centers of the circles? Express your answer as a decimal to the nearest hundredth.

226. _____ rect-angles

How many rectangles of any size are in the figure shown?

227. _____ Let S be the set of all integers N such that both N and the number formed by reversing the digits of N are three-digit perfect squares. What is the sum of the integers in S ?

228. _____ feet A seesaw is in balance when the weight on one side of the fulcrum times its distance from the fulcrum is equal to the weight on the other side of the fulcrum times its distance from the fulcrum. Shandra weighs 96 pounds. Her little sister weighs 72 pounds. The seesaw at their playground has a beam with seats 14 feet apart. The position of the fulcrum can be adjusted as required. If each girl sits in her seat, how far should the fulcrum be from Shandra's seat to achieve perfect balance with her sister?

229. _____ Jennie Weiner has p pennies, n nickels, d dimes and q quarters with a total value of \$1.08. If the numbers p , n , d and q are distinct and positive, and the greatest common divisor of each pair of these numbers is 1, what is the least possible value of $p + n + d + q$?

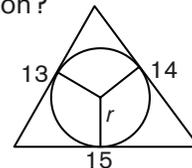

230. _____ ft² What is the total surface area of a right square pyramid with a height of 12 feet and a base with side length 10 feet?

Workout 7

231. \$ _____ Rahul Ilangovan can arrange his dad's collection of quarters as a rectangular array with 10 equal rows, 12 equal rows or 18 equal rows, using all the quarters in each arrangement. What is the least possible monetary value in dollars of the quarter collection?

232. _____ units What is the radius of the largest circle that can be inscribed in an acute triangle with sides 13, 14 and 15 units?

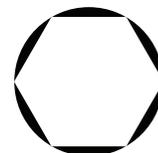

233. _____ Francisco is born at 1:00 a.m. on a Tuesday and gets married exactly 2^{18} hours later. On what day of the week does Francisco get married?

234. _____ Erica drew a 4 of hearts out of a standard 52-card deck, without replacement. If she draws a second card from the deck, what is the probability that her two cards will show consecutive numbers? Express your answer as a common fraction.

235. _____ A set S contains some, but not all, of the positive integers from 3 to 7. Some statements describing S are given below. The statement numbered n is true if the number n is in S and false if n is not in S . What is the product of the numbers that are in S ?

3. The sum of the numbers in S is odd.
4. The sum of the numbers in S is less than 15.
5. S contains exactly one composite number.
6. S contains exactly one prime number.
7. The product of the numbers in S is odd.

236. _____ m^2 The figure shows a regular hexagon of side length 12 meters inscribed in a circle. What is the total area of the shaded regions between the hexagon and the circle? Express your answer to the nearest whole number.

237. _____ Kendra starts at a positive integer k and counts up by 4s until she hits exactly 200. Mason starts at a positive integer m and counts up by 6s until he hits exactly 200. If it takes Kendra half as many steps to reach 200 as it takes Mason, what is the greatest possible value of $k - m$?

238. _____ The graph of the line $3x - 4y = 13$ is translated 2018 units to the right. What is the y -intercept of the translated line? Express your answer as a decimal to the nearest hundredth.

239. \$ _____ Ron works five days a week selling wallets in a booth at the mall. He earns a salary of \$215 per week plus 15% of his weekly sales. If he earned \$383.75 this week, what was the amount of his average daily sales for the week?

240. _____ inches A regular hexagon is inscribed in a circle. If the area of the hexagon is $216\sqrt{3}$ in², what is the circumference of the circle? Express your answer in terms of π .

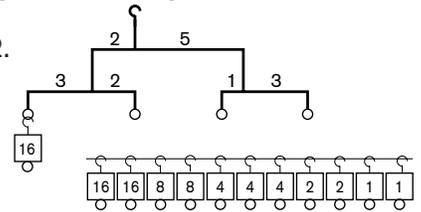

Workout 8

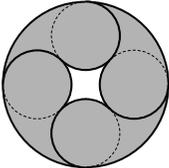

241. _____ Suppose that $A \& B = k \times A^m \times B^n$, where k , m and n are constants. Suppose that $5 \& 3 = 18$, $10 \& 3 = 72$ and $5 \& 6 = 36$. What is the value of $10 \& 6$?

242. combinations _____ How many different combinations of pennies, nickels, dimes and quarters are possible in the cup holder of Terry's car if he counts 15 coins total?

243. in³ _____ If the average length of the edges of a right rectangular prism is 13 inches, and the dimensions of the prism are distinct integers in geometric progression, what is the sum of the volumes of the distinct prisms that meet these criteria?

244. weights _____ In the mobile shown, a beam is *in balance* when the length l_L of the left arm of the beam times the total weight w_L hanging below the left arm of the beam is equal to the length l_R of the right arm of the beam times the total weight w_R hanging below the right arm of the beam. Every beam must be in balance for the mobile to be in balance. Decorative weights are available only in powers of 2. Multiple weights can be hung in a vertical chain, one below another. If the existing weight in the figure is not removed, what is the minimum number of weights that must be added to bring the mobile shown into balance?

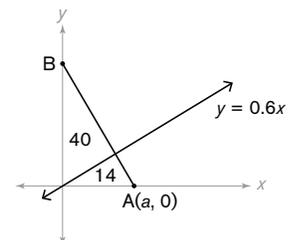

245. % _____  Four non-overlapping congruent circles are inscribed in a larger circle. Each small circle is shaded. Each region between two adjacent small circles and the enclosing large circle is also shaded. What percent of the figure is not shaded? Express your answer as a decimal to the nearest tenth of a percent.

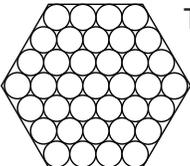

246. _____ Maxine secretly chooses a positive integer between 1 and 2018, inclusive. Martin wants to identify her number with a series of guesses. Each time Martin makes a guess, Maxine tells him whether his number is correct, too high or too low. With an appropriate strategy, Martin can always identify Maxine's number after at most n guesses. What is the least value of n for which Martin can correctly guess Maxine's number?

247. novels _____ Ms. Ault's reading list has novels by only three authors: Mark Twain, Ernest Hemingway and John Steinbeck. For a summer reading assignment, Austen Mazenko must pick one of the authors and read two of that author's novels on the list. If there are exactly 100 ways for Austen to pick two novels that satisfy this requirement, what is the greatest possible total number of novels on the reading list?

248. _____ What is the sum of all prime numbers p less than 60 such that there exists a right triangle whose side lengths are all integers and whose hypotenuse has length p ?

249. _____ A line segment AB from the positive x -axis to the positive y -axis cuts off a triangle of area 54 square units in the first quadrant of the coordinate plane. The line $y = 0.6x$ divides this triangle into two triangles of areas 40 units² and 14 units². If the point A has coordinates $(a, 0)$, what is the value of a ? Express your answer in simplest radical form.

250. % _____  The Solar Sunflower is made up of super-efficient circular solar panels within a hexagonal frame. Using a two-dimensional diagram of the Solar Sunflower, as shown, with a hexagonal frame with side length 10 meters, what percent of the hexagon is covered in solar discs? Express your answer to the nearest whole number.

OFFICIAL RULES + PROCEDURES

The following rules and procedures govern all MATHCOUNTS competitions. The MATHCOUNTS Foundation reserves the right to alter these rules and procedures at any time. **Coaches are responsible for being familiar with the rules and procedures outlined in this handbook.** Coaches should bring any difficulty in procedures or in student conduct to the immediate attention of the appropriate chapter, state or national official. Students violating any rules may be subject to immediate disqualification.

Any questions regarding the MATHCOUNTS Competition Series Official Rules + Procedures articulated in this handbook should be addressed to the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

REGISTRATION

The fastest and easiest way to register for the MATHCOUNTS Competition Series is online at www.mathcounts.org/compreg.

For your school to participate in the MATHCOUNTS Competition Series, a school representative is required to complete a registration form and pay the registration fees. A school representative can be a teacher, administrator or parent volunteer who has received expressed permission from his/her child's school administration to register. By completing the Competition Series Registration Form, the coach attests to the school administration's permission to register students for MATHCOUNTS.

School representatives can register online at www.mathcounts.org/compreg or download the Competition Series Registration Form and mail or email a scanned copy of it to the MATHCOUNTS national office. Refer to the Critical 2017-2018 Dates on pg. 10 of this handbook for contact information.

WHAT REGISTRATION COVERS: Registration in the Competition Series entitles a school to:

- 1) send 1-10 student(s)—depending on number registered—to the Chapter Competition. *Students can advance beyond the chapter level, but this is determined by their performance at the competition.*
- 2) receive the School Competition Kit, which includes the 2017-2018 MATHCOUNTS School Handbook, one recognition ribbon for each registered student, 10 student participation certificates and a catalog of additional coaching materials. *Mailings of School Competition Kits will occur on a rolling basis through December 31, 2017.*
- 3) receive online access to the 2018 School Competition, along with electronic versions of other competition materials at www.mathcounts.org/coaches. *Coaches will receive an email notification no later than November 1, 2017 when the 2018 School Competition is available online.*

Your state or chapter coordinator will be notified of your registration, and then you will be informed of the date and location of your Chapter Competition. **If you have not been contacted by mid-January with competition details, it is your responsibility to contact your local coordinator** to confirm that your registration has been properly routed and that your school's participation is expected. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

DEADLINES: The sooner your Registration Form is received, the sooner you will receive your preparation materials. To guarantee your school's participation, submit your registration by one of the following deadlines:

| | |
|---|---|
| <i>Early Bird Discount Deadline:</i> November 3, 2017 | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by November 3, 2017 |
| <i>Regular Registration Deadline:</i> December 15, 2017* | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by December 15, 2017 |

*Late Registrations may be accepted at the discretion of the MATHCOUNTS national office and your local coordinators, but are not guaranteed. If a school's late registration is accepted, an additional \$20 processing fee will be assessed.

REGISTRATION FEES: The cost of your school's registration depends on when your registration is postmarked/mailed/submitted online. The cost of your school's registration covers the students for the entire Competition Series; there are no additional registration fees to compete at the state or national level. Title I schools (as affirmed by a school's administration) receive a 50% discount off the total cost of their registration.

| | |
|--|--|
| <i>Early Bird Registrations</i> (by November 3, 2017) | \$30 per student \$120 for 1 team of 4 \$300 for 1 team of 4 + 6 individuals |
| <i>Regular Registrations</i> (by December 15, 2017) | \$35 per student \$140 for 1 team of 4 \$350 for 1 team of 4 + 6 individuals |
| <i>Late Registrations</i> (after December 15, 2017) | \$35 per student + \$20 late fee on entire order \$160 for 1 team of 4 \$370 for 1 team of 4 + 6 individuals |

CANCELLATION FEES: Registered schools that need to cancel their Competition Series registration must notify the MATHCOUNTS national office in writing via email or mail. Schools may request and receive a full refund minus a \$30 non-refundable cancellation fee to cover refund processing and the cost of materials shipped to the school. MATHCOUNTS will verify a school's non-participation with local coordinators and reserves the right to refuse a refund request. No cancellations or refund requests will be processed after February 1, 2018. *This fee does not apply to schools that reduce their number of registered students but remain registered with at least one student.*

ELIGIBILITY REQUIREMENTS

Eligibility requirements for the MATHCOUNTS Competition Series are different from other MATHCOUNTS programs. Eligibility for the National Math Club or the Math Video Challenge does not guarantee eligibility for the Competition Series.

WHO IS ELIGIBLE:

- U.S. students enrolled in the 6th, 7th or 8th grade can participate in MATHCOUNTS competitions.
- Schools that are the students' official school of record can register.
- Any type of school, of any size, can register—public, private, religious, charter, virtual or homeschools—but virtual and homeschools must fill out additional forms to participate (see pgs. 39-40).
- Schools in 50 U.S. states, District of Columbia, Guam, Puerto Rico and Virgin Islands can register.
- Overseas schools that are affiliated with the U.S. Departments of Defense and State can register.

WHO IS NOT ELIGIBLE:

- Students who are not full-time 6th, 7th or 8th graders cannot participate, even if they are taking middle school math classes.
- Academic centers, tutoring centers or enrichment programs that do not function as students' official school of record cannot register. *If it is unclear whether your educational institution is considered a school, please contact your local Department of Education for specific criteria governing your state.*
- Schools located outside of the U.S. states and territories listed on the previous page cannot register.
- Overseas schools not affiliated with the U.S. Departments of Defense or State cannot register.

NUMBER OF STUDENTS ALLOWED: A school can register a maximum of one team of four students and six individuals; these 1-10 student(s) will represent the school at the Chapter Competition. Any number of students can participate at the school level. Prior to the Chapter Competition, coaches must notify their chapter coordinator of which students will be team members and which students will compete as individuals.

NUMBER OF YEARS ALLOWED: Participation in MATHCOUNTS competitions is limited to 3 years for each student, but there is no limit to the number of years a student may participate in school-based coaching.

WHAT TEAM REGISTRATION MEANS: Members of a school team will participate in the Target, Sprint and Team Rounds. Members of a school team also will be eligible to qualify for the Countdown Round (where conducted). Team members will be eligible for team awards, individual awards and progression to the state and national levels based on their individual and/or team performance. It is recommended that your strongest four Mathletes form your school team. Teams of fewer than four will be allowed to compete; however, the team score will be computed by dividing the sum of the team members' scores by four (see pg. 43), meaning, teams of fewer than four students will be at a disadvantage. *Only one team (of up to four students) per school is eligible to compete.*

WHAT INDIVIDUAL REGISTRATION MEANS: Students registered as individuals will participate in the Target and Sprint Rounds, but not the Team Round. Individuals will be eligible to qualify for the Countdown Round (where conducted). Individuals also will be eligible for individual awards and progression to the state and national levels. A student registered as an "individual" may not help his/her school's team advance to the next level of competition. *Up to six students may be registered in addition to or in lieu of a school team.*

HOW STUDENTS ENROLLED PART-TIME AT TWO SCHOOLS PARTICIPATE: *A student may compete only for his/her official school of record.* A student's school of record is the student's base or main school. A student taking limited course work at a second school or educational center may not register or compete for that second school or center, even if the student is not competing for his/her school of record. MATHCOUNTS registration is not determined by where a student takes his or her math course. If there is any doubt about a student's school of record, the chapter or state coordinator must be contacted for a decision before registering.

HOW SMALL SCHOOLS PARTICIPATE: MATHCOUNTS does not distinguish between the sizes of schools for Competition Series registration and competition purposes. Every "brick-and-mortar" school will have the same registration allowance of up to one team of four students and/or up to six individuals. A school's participants may not combine with any other school's participants to form a team when registering or competing.

HOW HOMESCHOOLS PARTICIPATE: Homeschools and/or homeschool groups in compliance with the homeschool laws of the state in which they are located are eligible to participate in MATHCOUNTS competitions in accordance with all other rules. Homeschool coaches must complete the 2017-2018 Homeschool + Virtual School Participation Form, verifying that students from the homeschool or homeschool group are in the 6th, 7th or 8th grade and that each homeschool complies with applicable state laws. Forms can be downloaded at www.mathcounts.org/competition and must be submitted to the MATHCOUNTS national office in order for registrations to be processed.

HOW VIRTUAL SCHOOLS PARTICIPATE: Virtual schools that want to register must contact the MATHCOUNTS national office by December 8, 2017 for specific registration details. Any student registering as a virtual school student must compete in the MATHCOUNTS Chapter Competition assigned according to the student's home address. Additionally, virtual school coaches must complete the 2017-2018 Homeschool + Virtual School Participation Form, verifying that the students from the virtual school are in the 6th, 7th or 8th grade and that the virtual school complies with applicable state laws. Forms must be submitted to the national office in order for registrations to be processed; forms can be downloaded at www.mathcounts.org/competition.

WHAT IS DONE FOR SUBSTITUTIONS OF STUDENTS: Coaches determine which students will represent the school at the Chapter Competition. Coaches cannot substitute team members for the State Competition unless a student voluntarily releases his/her position on the school team. Additional requirements and documentation for substitutions (such as requiring parental release or requiring the substitution request be submitted in writing) are at the discretion of the State Coordinator. A student being added to a team need not be a student who was registered for the Chapter Competition as an individual. Coaches cannot make substitutions for students progressing to the State Competition as individuals. At all levels of competition, student substitutions are not permitted after on-site competition registration has been completed.

WHAT IS DONE FOR RELIGIOUS OBSERVANCES: A student who is unable to attend a competition due to religious observances may take the written portion of the competition up to one week in advance of the scheduled competition. In addition, all competitors from that student's school must take the Sprint and Target Rounds at the same earlier time. If the student who is unable to attend the competition due to a religious observance: (1) is a member of the school team, then the team must take the Team Round at the same earlier time; (2) is not part of the school team, then the team has the option of taking the Team Round during this advance testing or on the regularly scheduled day of the competition with the other school teams. The coordinator must be made aware of the team's decision before the advance testing takes place. Advance testing will be done at the discretion of the chapter and state coordinators. If advance testing is deemed possible, it will be conducted under proctored conditions. Students who qualify for an official Countdown Round but are unable to attend will automatically forfeit one place standing.

WHAT IS DONE FOR STUDENTS WITH SPECIAL NEEDS: Reasonable accommodations may be made to allow students with special needs to participate. However, many accommodations that are employed in a classroom or teaching environment cannot be implemented in the competition setting. Accommodations that are not permissible include, but are not limited to: granting a student extra time during any of the competition rounds or allowing a student to use a calculator for the Sprint or Countdown Rounds. A request for accommodation of special needs must be directed to chapter or state coordinators in writing at least three weeks in advance of the Chapter or State Competition. This written request should thoroughly explain a student's special need, as well as what the desired accommodation would entail. In conjunction with the MATHCOUNTS Foundation, coordinators will review the needs of the student and determine if any accommodations will be made. In making final determinations, the feasibility of accommodating these needs at the National Competition will be taken into consideration.

LEVELS OF COMPETITION

There are four levels in the MATHCOUNTS Competition Series: school, chapter (local), state and national. Competition questions are written for 6th, 7th and 8th graders. The competitions can be quite challenging, particularly for students who have not been coached using MATHCOUNTS materials. All competition materials are prepared by the national office.

SCHOOL COMPETITIONS (TYPICALLY HELD IN JANUARY 2018): After several months of coaching, schools registered for the Competition Series should administer the 2018 School Competition to all interested

students. The School Competition should be an aid to the coach in determining competitors for the Chapter Competition. *Selection of team and individual competitors is entirely at the discretion of the coach and does not need to be based solely on School Competition scores.* School Competition materials are sent to the coach of a school, and it may be used by the teachers and students only in association with that school's programs and activities. The current year's School Competition questions must remain confidential and may not be used in outside activities, such as tutoring sessions or enrichment programs with students from other schools. For updates or edits, please check www.mathcounts.org/coaches before administering the School Competition.

It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better math skills in all students, not just in those students who will be competing. Therefore, it is suggested that the coach postpone selection of competitors until just prior to the Chapter Competition.

CHAPTER COMPETITIONS (HELD FEB. 1–28, 2018): The Chapter Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be conducted. The chapter and state coordinators determine the date and location of the Chapter Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The winning team will advance to the State Competition. Additionally, the two highest-ranking competitors not on the winning team (who may be registered as individuals or as members of a team) will advance to the State Competition. This is a minimum of six advancing Mathletes (assuming the winning team has four members). Additional teams and/or individuals also may progress at the discretion of the state coordinator, but the policy for progression must be consistent for all chapters within a state.

STATE COMPETITIONS (HELD MAR. 1– APR. 1, 2018): The State Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be included. The state coordinator determines the date and location of the State Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The four highest-ranked Mathletes and the coach of the winning team from each State Competition will receive an all-expenses-paid trip to the National Competition.

2018 RAYTHEON MATHCOUNTS NATIONAL COMPETITION (HELD MAY 13–14 IN WASHINGTON, DC): The National Competition consists of the Sprint, Target, Team and Countdown Rounds (conducted officially). Expenses of the state team and coach to travel to the National Competition will be paid by MATHCOUNTS. The national program does not make provisions for the attendance of additional students or coaches. All national competitors will receive a plaque and other items in recognition of their achievements. Winning teams and individuals also will receive medals, trophies and college scholarships.

COMPETITION COMPONENTS

The four rounds of a MATHCOUNTS competition, each described below, are designed to be completed in approximately three hours:

TARGET ROUND (approximately 30 minutes): In this round eight problems are presented to competitors in four pairs (six minutes per pair). The multi-step problems featured in this round engage Mathletes in mathematical reasoning and problem-solving processes. *Problems assume the use of calculators.*

SPRINT ROUND (40 minutes): Consisting of 30 problems, this round tests accuracy, with the time period allowing only the most capable students to complete all of the problems. *Calculators are not permitted.*

TEAM ROUND (20 minutes): In this round, interaction among team members is permitted and encouraged as they work together to solve 10 problems. *Problems assume the use of calculators.*

Note: The order in which the written rounds (Target, Sprint and Team) are administered is at the discretion of the competition coordinator.

COUNTDOWN ROUND: A fast-paced oral competition for top-scoring individuals (based on scores on the Target and Sprint Rounds), this round allows pairs of Mathletes to compete against each other and the clock to solve problems. Calculators are not permitted.

At Chapter and State Competitions, a Countdown Round (1) may be conducted officially, (2) may be conducted unofficially (for fun) or (3) may be omitted. However, the use of an official Countdown Round must be consistent for all chapters within a state. In other words, *all* chapters within a state must use the round officially in order for *any* chapter within a state to use it officially. All students, whether registered as part of a school team or as individual competitors, are eligible to qualify for the Countdown Round.

An official Countdown Round determines an individual's final overall rank in the competition. If a Countdown Round is used officially, the official procedures as established by the MATHCOUNTS Foundation must be followed, as described below.*

- The top 25% of students, up to a maximum of 10, are selected to compete. These students are chosen based on their Individual Scores.
- The two lowest-ranked students are paired; a question is read and projected, and students are given 45 seconds to solve the problem. A student may buzz in at any time, and if s/he answers correctly, a point is scored. If a student answers incorrectly, the other student has the remainder of the 45 seconds to answer.
- Three total questions are read to the pair of students, one question at a time, and the student who scores the higher number of points (not necessarily 2 out of 3) progresses to the next round and challenges the next-higher-ranked student.
- If students are tied in their matchup after three questions (at 1-1 or 0-0), questions should continue to be read until one is successfully answered. The first student who answers an additional question correctly progresses to the next round.
- This procedure continues until the 4th-ranked Mathlete and his/her opponent compete. For the final four matchups, the first student to correctly answer three questions advances.
- The Countdown Round proceeds until a 1st place individual is identified. More details about Countdown Round procedures are included in the 2018 School Competition.

**Rules for the Countdown Round change for the National Competition.*

An unofficial Countdown Round does not determine an individual's final overall rank in the competition, but is done for practice or for fun. The official procedures do not have to be followed. Chapters and states choosing not to conduct the round officially must determine individual winners solely on the basis of students' scores in the Target and Sprint Rounds of the competition.

SCORING

MATHCOUNTS Competition Series scores do not conform to traditional grading scales. Coaches and students should view an Individual Score of 23 (out of a possible 46) as highly commendable.

INDIVIDUAL SCORE: calculated by taking the sum of the number of Sprint Round questions answered correctly and twice the number of Target Round questions answered correctly. There are 30 questions in the Sprint Round and eight questions in the Target Round, so the maximum possible Individual Score is $30 + 2(8) = 46$. If used officially, the Countdown Round yields final individual standings.

TEAM SCORE: calculated by dividing the sum of the team members' Individual Scores by four (even if the team has fewer than four members) and adding twice the number of Team Round questions answered correctly. The highest possible Individual Score is 46. Four students may compete on a team, and there are 10 questions in the Team Round. Therefore, the maximum possible Team Score is $((46 + 46 + 46 + 46) \div 4) + 2(10) = 66$.

TIEBREAKING ALGORITHM: used to determine team and individual ranks and to determine which individuals qualify for the Countdown Round. In general, questions in the Target, Sprint and Team Rounds increase in difficulty so that the most difficult questions occur near the end of each round. In a comparison of questions to break ties, generally those who correctly answer the more difficult questions receive the higher rank. The guidelines provided below are very general; competition officials receive more detailed procedures.

- Ties between individuals: the student with the higher Sprint Round score will receive the higher rank. If a tie remains after this comparison, specific groups of questions from the Target and Sprint Rounds are compared.
- Ties between teams: the team with the higher Team Round score, and then the higher sum of the team members' Sprint Round scores, receives the higher rank. If a tie remains after these comparisons, specific questions from the Team Round will be compared.

RESULTS DISTRIBUTION

Coaches should expect to receive the scores of their students, as well as a list of the top 25% of students and top 40% of teams, from their competition coordinators. In addition, single copies of the blank competition materials and answer keys may be distributed to coaches after all competitions at that level nationwide have been completed. Before distributing blank competition materials and answer keys, coordinators must wait for verification from the national office that all such competitions have been completed. Both the problems and answers from Chapter and State Competitions will be posted on the MATHCOUNTS website following the completion of all competitions at that level nationwide, replacing the previous year's posted tests.

Student competition papers and answers will not be viewed by or distributed to coaches, parents, students or other individuals. Students' competition papers become the confidential property of MATHCOUNTS.

ADDITIONAL RULES

All answers must be legible.

Pencils and paper will be provided for Mathletes by competition organizers. However, students may bring their own pencils, pens and erasers if they wish. They may not use their own scratch paper or graph paper.

Use of notes or other reference materials (including dictionaries and translation dictionaries) is prohibited.

Specific instructions stated in a given problem take precedence over any general rule or procedure.

Communication with coaches is prohibited during rounds but is permitted during breaks. All communication between guests and Mathletes is prohibited during competition rounds. Communication between teammates is permitted only during the Team Round.

Calculators are not permitted in the Sprint and Countdown Rounds, but they are permitted in the Target, Team and Tiebreaker (if needed) Rounds. When calculators are permitted, students may use any calculator (including programmable and graphing calculators) that does not contain a QWERTY (typewriter-like) keypad. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. Smart phones, laptops, tablets, iPods®, personal

digital assistants (PDAs) and any other “smart” devices are not considered to be calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.

Coaches are responsible for ensuring their students use acceptable calculators, and students are responsible for providing their own calculators. Coordinators are not responsible for providing Mathletes with calculators or batteries before or during MATHCOUNTS competitions. Coaches are strongly advised to bring backup calculators and spare batteries to the competition for their team members in case of a malfunctioning calculator or weak or dead batteries. Neither the MATHCOUNTS Foundation nor coordinators shall be responsible for the consequences of a calculator’s malfunctioning.

Pagers, cell phones, tablets, iPods® and other MP3 players should not be brought into the competition room. Failure to comply could result in dismissal from the competition.

Should there be a rule violation or suspicion of irregularities, the MATHCOUNTS coordinator or competition official has the obligation and authority to exercise his/her judgment regarding the situation and take appropriate action, which might include disqualification of the suspected student(s) from the competition.

FORMS OF ANSWERS

The following rules explain acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Competition answers will be scored in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lb 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not have a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}, 1\frac{1}{2}$
Problem: What is the sum of the lengths of the radius and the circumference of a circle of diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$
Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}, \frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Acceptable Simplified Forms: $\frac{7}{2}, \frac{3}{\pi}, \frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}, \frac{1}{3}, 3.5, 2:1$

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is $\sqrt{15} \times \sqrt{5}$ expressed in simplest radical form? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent, unless otherwise specified. Examples:

Acceptable Forms: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not do any intermediate rounding (other than the “rounding” a calculator performs) when calculating solutions. All rounding should be done at the end of the calculation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3
Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form. Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

COMPETITION COACH TOOLKIT

This is a collection of lists, formulas and terms that Mathletes frequently use to solve problems like those found in this handbook. There are many others we could have included, but we hope you find this collection useful.

| Fraction | Decimal | Percent |
|----------------|--------------|---------------|
| $\frac{1}{2}$ | 0.5 | 50 |
| $\frac{1}{3}$ | $0.\bar{3}$ | 33. $\bar{3}$ |
| $\frac{1}{4}$ | 0.25 | 25 |
| $\frac{1}{5}$ | 0.2 | 20 |
| $\frac{1}{6}$ | $0.1\bar{6}$ | 16. $\bar{6}$ |
| $\frac{1}{8}$ | 0.125 | 12.5 |
| $\frac{1}{9}$ | $0.\bar{1}$ | 11. $\bar{1}$ |
| $\frac{1}{10}$ | 0.1 | 10 |
| $\frac{1}{11}$ | 0.09 | 9.09 |
| $\frac{1}{12}$ | 0.083 | 8. $\bar{3}$ |

Common Arithmetic Series

$$1 + 2 + 3 + 4 + \dots + n = \frac{n(n+1)}{2}$$

$$1 + 3 + 5 + 7 + \dots + (2n-1) = n^2$$

$$2 + 4 + 6 + 8 + \dots + 2n = n^2 + n$$

Prime Numbers

| | |
|----|----|
| 2 | 43 |
| 3 | 47 |
| 5 | 53 |
| 7 | 59 |
| 11 | 61 |
| 13 | 67 |
| 17 | 71 |
| 19 | 73 |
| 23 | 79 |
| 29 | 83 |
| 31 | 89 |
| 37 | 97 |
| 41 | |

Combinations & Permutations

$${}^nC_r = \frac{n!}{r!(n-r)!} \quad {}^nP_r = \frac{n!}{(n-r)!}$$

| n | n^2 | n^3 |
|-----|-------|-------|
| 1 | 1 | 1 |
| 2 | 4 | 8 |
| 3 | 9 | 27 |
| 4 | 16 | 64 |
| 5 | 25 | 125 |
| 6 | 36 | 216 |
| 7 | 49 | 343 |
| 8 | 64 | 512 |
| 9 | 81 | 729 |
| 10 | 100 | 1000 |
| 11 | 121 | 1331 |
| 12 | 144 | 1728 |
| 13 | 169 | 2197 |
| 14 | 196 | 2744 |
| 15 | 225 | 3375 |

Geometric Mean

$$\frac{a}{x} = \frac{x}{b} \quad \text{and} \quad x = \sqrt{ab}$$

Divisibility Rules

- 2: units digit is 0, 2, 4, 6 or 8
- 3: sum of digits is divisible by 3
- 4: two-digit number formed by tens and units digits is divisible by 4
- 5: units digit is 0 or 5
- 6: number is divisible by both 2 and 3
- 8: three-digit number formed by hundreds, tens and units digits is divisible by 8
- 9: sum of digits is divisible by 9
- 10: units digit is 0

Equation of a Line

Standard Form

$$Ax + By = C$$

Slope-Intercept Form

$$y = mx + b$$

m = slope b = y -intercept

Point-Slope Form

$$y - y_1 = m(x - x_1)$$

m = slope (x_1, y_1) = point on the line

Distance Traveled

$$\text{Distance} = \text{Rate} \times \text{Time}$$

Quadratic Formula

For $ax^2 + bx + c = 0$, where $a \neq 0$,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Pythagorean Triples

| | | |
|-------------|-------------|--------------|
| (3, 4, 5) | (5, 12, 13) | (7, 24, 25) |
| (8, 15, 17) | (9, 40, 41) | (12, 35, 37) |

Difference of Squares

$$a^2 - b^2 = (a + b)(a - b)$$

Sum and Difference of Cubes

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

Circles

Circumference $2 \times \pi \times r = \pi \times d$ Area $\pi \times r^2$

For radius r

Arc Length $\frac{x}{360} \times 2 \times \pi \times r$ Sector Area $\frac{x}{360} \times \pi \times r^2$

For central angle of x degrees

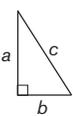

Given $A(x_1, y_1)$ and $B(x_2, y_2)$

Distance from A to B = $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

Midpoint of $\overline{AB} = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$

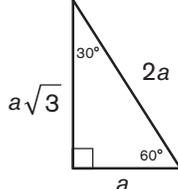

Slope of $\overline{AB} = \frac{y_2 - y_1}{x_2 - x_1}$

Pythagorean Theorem

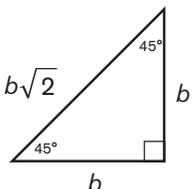

$a^2 + b^2 = c^2$

Special Right Triangles

30-60-90
Right Triangle

45-45-90
Right Triangle

| Area of Polygons | | |
|----------------------|--|-------------------------------------|
| Square | side length s | s^2 |
| Rectangle | length l , width w | $l \times w$ |
| Parallelogram | base b , height h | $b \times h$ |
| Trapezoid | bases b_1, b_2 , height h | $\frac{1}{2}(b_1 + b_2) \times h$ |
| Rhombus | diagonals d_1, d_2 | $\frac{1}{2} \times d_1 \times d_2$ |
| Triangle | base b , height h | $\frac{1}{2} \times b \times h$ |
| Triangle | semi-perimeter s , side lengths a, b, c | $\sqrt{s(s-a)(s-b)(s-c)}$ |
| Equilateral Triangle | side length s | $\frac{s^2\sqrt{3}}{4}$ |

Polygon Angles (n sides)

Sum of the interior angle measures:
 $180 \times (n - 2)$

Central angle measure of a regular polygon:
 $\frac{360}{n}$

Interior angle measure of a regular polygon:
 $\frac{180 \times (n - 2)}{n}$ or $180 - \frac{360}{n}$

| Solid | Dimensions | Surface Area | Volume |
|-------------------|-------------------------------------|--|--|
| Cube | side length s | $6 \times s^2$ | s^3 |
| Rectangular Prism | length l , width w , height h | $2 \times (l \times w + w \times h + l \times h)$ | $l \times w \times h$ |
| Circular Cylinder | base radius r , height h | $2 \times \pi \times r \times h + 2 \times \pi \times r^2$ | $\pi \times r^2 \times h$ |
| Circular Cone | base radius r , height h | $\pi \times r^2 + \pi \times r \times \sqrt{r^2 + h^2}$ | $\frac{1}{3} \times \pi \times r^2 \times h$ |
| Sphere | radius r | $4 \times \pi \times r^2$ | $\frac{4}{3} \times \pi \times r^3$ |
| Pyramid | base area B , height h | | $\frac{1}{3} \times B \times h$ |

Vocabulary & Terms

The following list is representative of terminology used in the problems but **should not** be viewed as all-inclusive. It is recommended that coaches review this list with their Mathletes.

| | | |
|--------------------------------------|-----------------------------------|--|
| absolute difference | geometric sequence | rate |
| absolute value | hemisphere | ratio |
| acute angle | image(s) of a point(s) | rational number |
| additive inverse (<i>opposite</i>) | (<i>under a transformation</i>) | ray |
| adjacent angles | improper fraction | real number |
| apex | infinite series | reciprocal (<i>multiplicative inverse</i>) |
| arithmetic mean | inscribe | reflection |
| arithmetic sequence | integer | regular polygon |
| base 10 | interior angle of a polygon | relatively prime |
| binary | intersection | revolution |
| bisect | inverse variation | right angle |
| box-and-whisker plot | irrational number | right polyhedron |
| center | isosceles | rotation |
| chord | lateral edge | scalene triangle |
| circumscribe | lateral surface area | scientific notation |
| coefficient | lattice point(s) | sector |
| collinear | LCM | segment of a circle |
| common divisor | median of a set of data | segment of a line |
| common factor | median of a triangle | semicircle |
| common fraction | mixed number | semiperimeter |
| complementary angles | mode(s) of a set of data | sequence |
| congruent | multiplicative inverse | set |
| convex | (<i>reciprocal</i>) | significant digits |
| coordinate plane/system | natural number | similar figures |
| coplanar | obtuse angle | slope |
| counting numbers | ordered pair | space diagonal |
| counting principle | origin | square root |
| diagonal of a polygon | palindrome | stem-and-leaf plot |
| diagonal of a polyhedron | parallel | supplementary angles |
| digit-sum | Pascal's Triangle | system of equations/inequalities |
| direct variation | percent increase/decrease | tangent figures |
| divisor | perpendicular | tangent line |
| domain of a function | planar | term |
| edge | polyhedron | transformation |
| equiangular | polynomial | translation |
| equidistant | prime factorization | triangular numbers |
| expected value | principal square root | trisect |
| exponent | proper divisor | twin primes |
| exterior angle of a polygon | proper factor | union |
| factor | proper fraction | unit fraction |
| finite | quadrant | variable |
| frequency distribution | quadrilateral | whole number |
| frustum | random | y-intercept |
| function | range of a data set | |
| GCF | range of a function | |

ANSWERS

In addition to the answer, we have provided a difficulty rating for each problem. Our scale is 1-7, with 7 being the most difficult. These are only approximations, and how difficult a problem is for a particular student will vary. Below is a general guide to the ratings:

Difficulty 1/2/3 - One concept; one- to two-step solution; appropriate for students just starting the middle school curriculum.

4/5 - One or two concepts; multistep solution; knowledge of some middle school topics is necessary.

6/7 - Multiple and/or advanced concepts; multistep solution; knowledge of advanced middle school topics and/or problem-solving strategies is necessary.

Probability Stretch

| Answer | Difficulty | Answer | Difficulty |
|----------|------------|----------|------------|
| 1. 15.38 | (2) | 6. 50 | (4) |
| 2. 1/4 | (3) | 7. 20 | (2) |
| 3. 0.2 | (4) | 8. 9/16 | (4) |
| 4. 2/5 | (3) | 9. 1/5 | (3) |
| 5. 3/8 | (3) | 10. 0.17 | (4) |

Patterns Stretch

| Answer | Difficulty | Answer | Difficulty |
|----------|------------|----------|------------|
| 11. 1480 | (4) | 16. 2601 | (3) |
| 12. 423 | (3) | 17. 2 | (4) |
| 13. 1457 | (3) | 18. 4/3 | (4) |
| 14. 36 | (4) | 19. 125 | (4) |
| 15. 1365 | (3) | 20. 243 | (5) |

Travel Stretch

| Answer | Difficulty | Answer | Difficulty |

| 84. | 3.81 | (2) | 89. | 315 (4) |
| 85. | 126 | (5) | 90. | $1/4$ (3) |

Warm-Up 7

| Answer | Difficulty | | | |
|--------|-------------|-----|------|------------------|
| 91. | 12 | (2) | 96. | $\sqrt{3}/4$ (5) |
| 92. | 160 | (4) | 97. | 9 (4) |
| 93. | $5\sqrt{2}$ | (5) | 98. | 11 (4) |
| 94. | 161 | (3) | 99. | 3 (4) |
| 95. | $7/36$ | (3) | 100. | 1000 (3) |

Warm-Up 8

| Answer | Difficulty | | | |
|--------|------------|-----|------|--------------------|
| 101. | 68 | (3) | 106. | $11/18$ (4) |
| 102. | 40 | (3) | 107. | $\sqrt{2} - 1$ (5) |
| 103. | 144 | (4) | 108. | 4 (5) |
| 104. | $1/7$ | (3) | 109. | 173 (5) |
| 105. | 81 | (3) | 110. | $1/4$ (5) |

Warm-Up 9

| Answer | Difficulty | | | |
|--------|----------------|-----|------|---------|
| 111. | $79/111$ | (2) | 116. | 180 (3) |
| 112. | $8/11$ | (5) | 117. | 6 (4) |
| 113. | $17/24$ | (5) | 118. | 36 (7) |
| 114. | $100\sqrt{10}$ | (4) | 119. | 85 (2) |
| 115. | 305 | (4) | 120. | 148 (4) |

Warm-Up 10

| Answer | Difficulty | | |
|--------------------|------------|----------------------|-----|
| 121. 23 | (3) | 126. $6\sqrt{7}$ | (6) |
| 122. 100 | (3) | 127. 9 | (4) |
| 123. $\frac{3}{8}$ | (5) | 128. 105 | (5) |
| 124. 5 | (3) | 129. $\frac{6}{\pi}$ | (6) |
| 125. 6720 | (5) | 130. 30 | (4) |

Warm-Up 11

| Answer | Difficulty | | |
|------------------------|------------|---------------------|-----|
| 131. 20 | (4) | 136. 132 | (6) |
| 132. 76 | (4) | 137. 350 | (4) |
| 133. $\frac{3}{8}$ | (5) | 138. 28 | (4) |
| 134. 25 | (4) | 139. 18 | (3) |
| 135. $\frac{175}{256}$ | (5) | 140. $\frac{8}{27}$ | (5) |

Warm-Up 12

| Answer | Difficulty | | |
|----------|------------|----------------------|-----|
| 141. 867 | (3) | 146. 81 | (5) |
| 142. 58 | (5) | 147. 58 | (4) |
| 143. 241 | (5) | 148. 12 | (3) |
| 144. 300 | (3) | 149. $10+2\sqrt{35}$ | (6) |
| 145. 0 | (3) | or $2\sqrt{35}+10$ | |
| | | 150. 8 | (5) |

Warm-Up 13

| Answer | Difficulty | | |
|-------------------|------------|-----------|-----|
| 151. 5 | (4) | 156. 9490 | (5) |
| 152. $18\sqrt{3}$ | (3) | 157. 13 | (4) |
| 153. 53 | (3) | 158. 105 | (5) |
| 154. 91 | (4) | 159. 17 | (5) |
| 155. 3 | (4) | 160. 25 | (4) |

Warm-Up 14

| Answer | Difficulty | | |
|--------------------|------------|------------------------|-----|
| 161. 30 | (4) | 166. $(11\sqrt{10})/8$ | (5) |
| 162. 52 | (2) | 167. 45 | (6) |
| 163. $\frac{1}{9}$ | (5) | 168. 140 | (4) |

MATHCOUNTS Problems Mapped to Common Core State Standards (CCSS)

Forty-two states, the District of Columbia, four territories and the Department of Defense Education Activity (DoDEA) have voluntarily adopted the Common Core State Standards (CCSS). As such, MATHCOUNTS considers it beneficial for teachers to see the connections between the *2017-2018 MATHCOUNTS School Handbook* problems and the CCSS. MATHCOUNTS not only has identified a general topic and assigned a difficulty level for each problem but also has provided a CCSS code in the Problem Index (pages 54-55). A complete list of the Common Core State Standards can be found at www.corestandards.org.

The CCSS for mathematics cover K-8 and high school courses. MATHCOUNTS problems are written to align with the NCTM Standards for Grades 6-8. As one would expect, there is great overlap between the two sets of standards. MATHCOUNTS also recognizes that in many school districts, algebra and geometry are taught in middle school, so some MATHCOUNTS problems also require skills taught in those courses.

In referring to the CCSS, the Problem Index code for each of the Standards for Mathematical Content for grades K-8 begins with the grade level. For the Standards for Mathematical Content for high school courses (such as algebra or geometry), each code begins with a letter to indicate the course name. The second part of each code indicates the domain within the grade level or course. Finally, the number of the individual standard within that domain follows. Here are two examples:

- *6.RP.3* → *Standard #3 in the Ratios and Proportional Relationships domain of grade 6*
- *G-SRT.6* → *Standard #6 in the Similarity, Right Triangles and Trigonometry domain of Geometry*

Some math concepts utilized in MATHCOUNTS problems are not specifically mentioned in the CCSS. Two examples are the Fundamental Counting Principle (FCP) and special right triangles. In cases like these, if a related standard could be identified, a code for that standard was used. For example, problems using the FCP were coded 7.SP.8, S-CP.8 or S-CP.9 depending on the context of the problem; SP → Statistics and Probability (the domain), S → Statistics and Probability (the course) and CP → Conditional Probability and the Rules of Probability. Problems based on special right triangles were given the code G-SRT.5 or G-SRT.6, explained above.

There are some MATHCOUNTS problems that either are based on math concepts outside the scope of the CCSS or based on concepts in the standards for grades K-5 but are obviously more difficult than a grade K-5 problem. When appropriate, these problems were given the code SMP for Standards for Mathematical Practice. The CCSS include the Standards for Mathematical Practice along with the Standards for Mathematical Content. The SMPs are (1) Make sense of problems and persevere in solving them; (2) Reason abstractly and quantitatively; (3) Construct viable arguments and critique the reasoning of others; (4) Model with mathematics; (5) Use appropriate tools strategically; (6) Attend to precision; (7) Look for and make use of structure and (8) Look for and express regularity in repeated reasoning.

PROBLEM INDEX

It is difficult to categorize many of the problems in the *MATHCOUNTS School Handbook*. It is very common for a MATHCOUNTS problem to straddle multiple categories and cover several concepts. This index is intended to be a helpful resource, but since each problem has been placed in exactly one category and mapped to exactly one Common Core State Standard (CCSS), the index is not perfect. In this index, the code **9 (3) 7.SP.3** refers to problem 9 with difficulty rating 3 mapped to CCSS 7.SP.3. For an explanation of the difficulty ratings refer to page 49. For an explanation of the CCSS codes refer to page 53.

OTHER MATHCOUNTS PROGRAMS

MATHCOUNTS was founded in 1983 as a way to provide new avenues of engagement in math for middle school students. MATHCOUNTS began solely as a competition, but has grown to include 3 unique but complementary programs: the **MATHCOUNTS Competition Series**, the **National Math Club** and the **Math Video Challenge**. Your school can participate in all 3 MATHCOUNTS programs!

The **National Math Club** is a free enrichment program that provides teachers and club leaders with resources to run a math club. The materials provided through the National Math Club are designed to engage students of all ability levels—not just the top students—and are a great supplement for classroom teaching. This program emphasizes collaboration and provides students with an enjoyable, pressure-free atmosphere in which they can learn math at their own pace.

Active clubs also can earn rewards by having a minimum number of club members participate (based on school/organization/group size). **There is no cost to sign up for the National Math Club**, and registration is open to schools, organizations and groups that consist of at least 4 students in 6th, 7th and/or 8th grade and have regular in-person meetings. More information can be found at www.mathcounts.org/club, and the 2017-2018 School Registration Form is included on the next page.

The **Math Video Challenge** is an innovative program that challenges students to work in teams of 4 to create a video explaining the solution to a MATHCOUNTS handbook problem and demonstrating its real-world application. This project-based activity builds math, communication and collaboration skills.

Students post their videos to the contest website, where the general public votes for the best videos. The 100 videos with the most votes advance to judging rounds, in which 20 semifinalists and, later, 4 finalists are selected. This year's finalists will present their videos to the students competing at the 2018 Raytheon MATHCOUNTS National Competition, and the 224 Mathletes will vote to determine the winner. Members of the winning team receive college scholarships. **Registration is completely free** and open to all 6th, 7th and 8th grade students. More information can be found at videochallenge.mathcounts.org.

! The fastest way to register is online at www.mathcounts.org/clubreg!

2017-2018 **SCHOOL** REGISTRATION FORM

This registration form is for U.S. middle schools only. To register a non-school group (such as a Girl Scout troop, Boys and Girls Club Chapter or math circle) for the National Math Club, please go to www.mathcounts.org/club to review eligibility requirements and register.

STEP 1 Tell Us About Your School

U.S. School with Students in Grades 6-8

One school can have multiple clubs, as long as each club has a different club leader.

School Name* _____

School Type (check one)* Public Charter Private Homeschool Virtual

Title I School? (check one)* Yes No

Overseas U.S. schools must provide additional information below:

My school is sponsored by the U.S. Department of: Defense (DoDDS) State

Country _____

Approximate Total Number of Students Participating in Club (Minimum 4)* _____

STEP 2 Tell Us About You

Club Leader First & Last Name* _____

Club Leader Email* _____

Club Leader Alternate Email* _____

Your email and alternate email address will not be made public or shared and will only be used by MATHCOUNTS.

Club Street Address* _____

City, State and ZIP Code* _____

I am a MATHCOUNTS alumnus/a. → Please tell us more information below!

When? (for example, 1999-02) _____ Where? (state/territory) _____

Which Program(s)? MATHCOUNTS Competition Series → Highest Level Reached: _____

The National Math Club (formerly MATHCOUNTS Club Program)

Math Video Challenge (formerly Reel Math Challenge)

STEP 3 Turn in Your Form

! **IMPORTANT!** *By submitting this form you attest your group consists of at least 4 U.S. students in grades 6-8 who meet in person regularly, and is therefore eligible to participate in the National Math Club. The club leader will receive an emailed confirmation once this registration has been processed.*

Mail or email a scanned copy of this completed form to:

Address: MATHCOUNTS Registration | 1420 King Street | Alexandria, VA 22314

Email: reg@mathcounts.org

2017-2018 ADDITIONAL STUDENTS REGISTRATION FORM

! The fastest way to add students to your school's registration is by logging in to your Coach Dashboard at www.mathcounts.org/coaches!

Step 1: Tell us about your school so we can find your original registration (please print legibly).

Coach Name _____ School Name _____
 Coach Email Address _____
 School Address _____ City, State ZIP _____

Step 2: Tell us how many students you are adding to your school's registration. Following the instructions below.

Please circle the number of additional students you will enter in the Chapter Competition and the associated cost below (depending on the date your registration is postmarked).

| # of Students You Are Adding | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|-------------|-------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| <i>Early Bird Rate</i> <small>(postmarked by Nov. 3, 2017)</small> | \$30 | \$60 | \$90 | \$120 | \$150 | \$180 | \$210 | \$240 | \$270 |
| <i>Regular Rate</i> <small>(postmarked by Dec. 15, 2017)</small> | \$35 | \$70 | \$105 | \$140 | \$175 | \$210 | \$245 | \$280 | \$315 |
| <i>Late Registration</i> <small>(postmarked after Dec. 15, 2017)</small> | \$55 | \$90 | \$125 | \$160 | \$195 | \$230 | \$265 | \$300 | \$335 |

My school qualifies for the **50% Title I discount**, so the Amount Due in Step 4 will be half the amount I circled above. Principal signature required below to verify Title I eligibility.
 Principal Name _____ Principal Signature _____

Step 3: Tell us what your school's FINAL registration should be (including all changes/additions).

| Total # of Registered Students | 1 <small>(1 individual)</small> | 2 <small>(2 ind)</small> | 3 <small>(3 ind)</small> | 4 <small>(1 team)</small> | 5 <small>(1 tm, 1 ind)</small> | 6 <small>(1 tm, 2 ind)</small> | 7 <small>(1 tm, 3 ind)</small> | 8 <small>(1 tm, 4 ind)</small> | 9 <small>(1 tm, 5 ind)</small> | 10 <small>(1 tm, 6 ind)</small> |
|--------------------------------|------------------------------------|-----------------------------|-----------------------------|------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|------------------------------------|
| | | | | | | | | | | |

Step 4: Almost done... just fill in payment information and turn in your form!

Amount Due \$ _____ Credit Card Check (payable to MATHCOUNTS Foundation) Money Order Purchase Order # _____ (must include copy of P.O.)
Do NOT include any credit card information on this form. Within 5 business days you will receive an email invoice enabling you to pay by credit card.

! **IMPORTANT!** By submitting this form you (1) agree to adhere to the rules of the MATHCOUNTS Competition Series; (2) attest you have the school administration's permission to register students for this program under this school's name; and (3) affirm the above named school is a U.S. school eligible for this program and not an academic or enrichment center. The coach will receive an emailed confirmation and receipt once this additional students registration has been processed.

ACKNOWLEDGMENTS

The MATHCOUNTS Foundation wishes to acknowledge the hard work and dedication of those volunteers instrumental in the development of this handbook: the question writers who develop the questions for the handbook and competitions, the judges who review the competition materials and serve as arbiters at the National Competition and the proofreaders who edit the questions selected for inclusion in the handbook and/or competitions.

2016-2017 QUESTION WRITING COMMITTEE

Chair: Rich Morrow, *Naalehu, HI*
Susan Holtzapple, *Los Altos, CA*
Nina Otterson, *Lakeville, CT*

2019
■ School Competition ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ integers How many integers between 98 and 122 are odd?

2. _____ degrees In triangle ABC, the measure of $\angle A$ is 40 degrees, and the measure of $\angle B$ is 80 degrees. What is the degree measure of $\angle C$?

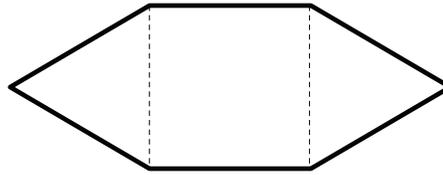

3. _____ students Ms. Rogers surveyed her class by asking, “What is your favorite Skattles candy color?” The graph shows the number of students who selected each Skattles candy color. What is the total number of students who chose red or orange as their favorite Skattles candy color?

4. _____ If $\frac{r}{s} = 22$ and the value of r is 242, what is the value of s ?

5. _____ When 12 is subtracted from a number n , the result is one-third of n . What is the value of n ?

6. _____ cm The equilateral hexagon shown is formed by joining two equilateral triangles and a square. If this hexagon has perimeter 420 cm, what is its side length?

7. _____

| | | |
|----|----|----|
| 10 | X | 12 |
| Y | 18 | Z |
| 24 | W | 26 |

The figure shows a 3-by-3 section of numbers from a monthly calendar that has five rows and seven columns. What is the value of $X + Y + Z + W$?

8. _____ If q is a rational number such that q divided by $\frac{7}{8}$ is $\frac{3}{5}$, what is the value of q ? Express your answer as a common fraction.

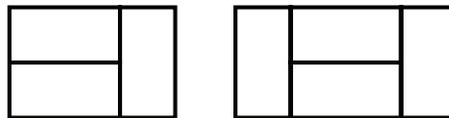

9. _____ Audra adds the numbers 2018 and 22, then multiplies the result by 2 and assigns this value to a . Beto multiplies the numbers 2018 and 2, then adds 22 to the result and assigns this value to b . What is the value of $a - b$?

10. _____ inches Alberto has four rectangular tiles. The dimensions of the tiles, in inches, are 2×3 , 3×5 , 1×4 and 4×6 . Alberto puts all four tiles together, without gaps or overlaps, to form a single square. What is the side length of the square?

11. _____ If $2x - 1 = 6$, what is the value of $4x^2 - 1$?

12. _____ If the operation \oplus is defined by $p \oplus q = \sqrt{p^2 + q^2}$, what is the value of $8 \oplus 6$?

13. _____ Flag A and Flag B are composed of a combined total of seven congruent rectangles as shown. What is the ratio of the perimeter of Flag A to the perimeter of Flag B? Express your answer as common fraction.

Flag A

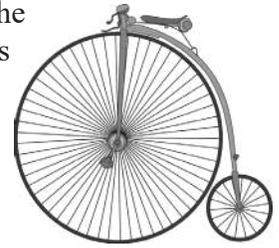

Flag B

14. _____ combinations Jenna's ice cream shop offers small and large ice cream cones, ten different ice cream flavors and nine different toppings. How many different combinations does Jenna sell with one cone, one ice cream flavor and **at most** one topping?

15. _____ pumpkins Each of the 100 pumpkins decorated by the art club at Squa Middle School was painted, carved or both. If 68 pumpkins were painted and 70 pumpkins were carved, how many pumpkins were painted and carved?

16. _____
 revo-
 lutions

A penny-farthing, like the one shown, is an old-fashioned bicycle from the Victorian era having wheels with different diameters. When the larger wheel makes 20 full revolutions, how many revolutions will the smaller wheel have made if the diameters of the two wheels are 54 inches and 18 inches?

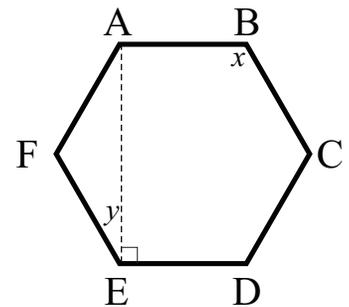

17. _____

Forrest is playing a four-player card game with his three grandchildren. His three grandchildren are all equally likely to win, but Forrest's experience and cunning make him twice as likely to win as each of his grandchildren. What is Forrest's probability of winning? Express your answer as a common fraction.

18. _____
 degrees

In regular hexagon ABCDEF, shown here, the degree measure of $\angle ABC$ is x and the degree measure of $\angle AEF$ is y . What is the value of $x + y$?

19. _____

Four tokens, numbered as shown, are face-down and shuffled. Kopavy randomly selects two different tokens. If the product of the numbers on his selected tokens is a negative odd number, then he wins a new bicycle. What is the probability that Kopavy will win a new bicycle? Express your answer as a common fraction.

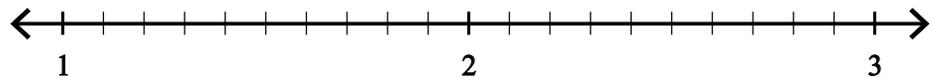

20. _____
 years

At Freddie's family reunion, none of her relatives was older than 99 years old and no two relatives were the same age. She found that she had exactly 13 relatives with 2-digit ages where the digits differed by exactly 3. What is the sum of the ages of these 13 relatives?

21. _____ Bernie played three rounds of golf, and the mean of his scores was 78. If his lowest score was 74. What is the greatest possible value of his highest score?

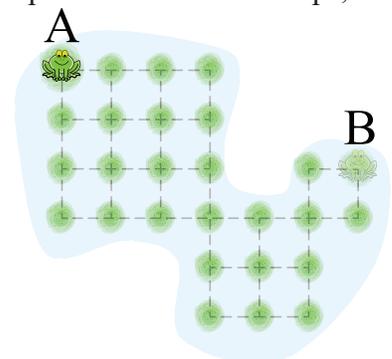

22. _____ If $(x + y)^3$ is expanded, what is the sum of the numerical coefficients?

23. _____ The number line from 1 to 3, shown here, has a scale of 0.1. If a and b represent two consecutive values on this number line, where $a < \sqrt{6} < b$, what is the value of a ? Express your answer as a decimal to the nearest tenth.

24. _____ years Currently, Lupe and Hector are 61 and 67 years old, respectively. They have two daughters and a grandson, who are 37, 31 and 7 years old, respectively. Lupe noted that their current ages are all prime numbers. During how many of the next 25 years will it also be true that their ages are all prime numbers?

25. _____ ways Kermey starts on the lily pad at location A and moves to the lily pad at location B with a series of hops, made only to adjacent lily pads while traveling along the dashed segments shown. If Kermey uses the fewest possible number of hops, how many ways are there for him to get from location A to location B?

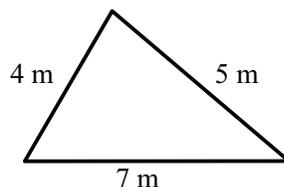

26. _____ cupcakes Mercedes bought some vanilla cupcakes and some chocolate cupcakes. If she eats one of the vanilla cupcakes, then $\frac{1}{7}$ of the remaining cupcakes will be vanilla. If Mercedes instead eats two of the chocolate cupcakes, then $\frac{1}{5}$ of the remaining cupcakes will be vanilla. How many cupcakes did Mercedes buy?

27. _____ What is the remainder when 2019^{2019} is divided by 2020?

28. _____ % Ted is taking a true-false test. He has a 90% chance of identifying the correct answer to each question. Unfortunately, there is a 25% chance that he will circle the opposite of his intended answer. What is the probability, expressed as a percent, that Ted circles the correct answer to any particular question on this test?

29. _____ cm^2 Frank's painting is on a large triangular canvas with side lengths 4 meters, 5 meters and 7 meters, as shown. He wants to create a frame such that its inner border is flush with each side of the canvas and every point on its outer border is a distance of exactly 2 cm from the closest point on the canvas. In square centimeters, what is the area of the frame? Express your answer to the nearest whole number.

30. _____ people Chloe charged for admission to her play on three different nights. Each night, a different number of people were in attendance, but remarkably, Chloe collected \$541 each night. If the admission charges for each child and each adult were \$9 and \$17, respectively, how many people in total came to the three showings?

MATHCOUNTS®

Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

5. _____ Three dogs arrived at the dog park at three different times, with their three owners, using three different leash colors. The Dalmatian was next to arrive after the Schnauzer. The dog with the red leash is owned by the 7th grader. The Poodle was not the first to arrive. The Schnauzer does not use a green leash. If the 6th grader owns the Dalmatian, then the Poodle's leash is blue. The 8th grader arrived first. What is the product of the grade levels of the student who arrived second, the student who owns the Poodle and the student who uses the green leash?

6. _____ Three circles are inscribed in a rectangle of width w and height h as shown. Two of the circles are congruent and are each tangent to two adjacent sides of the rectangle and to each other. The other circle is larger and is tangent to three sides of the rectangle and to the two smaller circles. What the ratio of h to w ? Express your answer as a decimal to the nearest hundredth.

1. tiles A classroom is 24 feet wide and 30 feet long. What is the fewest number of 2-foot by 3-foot rectangular tiles needed to completely to cover the floor?

2. cases Ellen found Misty’s favorite cat food at two stores. Purrina charges \$20 per case plus a single \$15 shipping fee. Meow Meow charges \$18 per case plus a single \$25 shipping fee. How many cases must Ellen buy if she wants the total cost to be the same at both stores?

3. polygons Keisha draws several polygons on a sheet of paper. Each of the ten words or phrases shown describes at least one of her polygons. What is the fewest possible number of polygons that Keisha drew?

- RECTANGLE ▪ ▪ OBTUSE TRIANGLE ▪ ▪ HEXAGON ▪ ▪ SQUARE ▪
- 16 VERTICES OR MORE ▪ ▪ VERTEX WITH 108° ANGLE ▪ ▪ 11 SIDES OR MORE ▪
- REGULAR POLYGON ▪ ▪ PARALLELOGRAM ▪ ▪ ISOSCELES TRIANGLE ▪

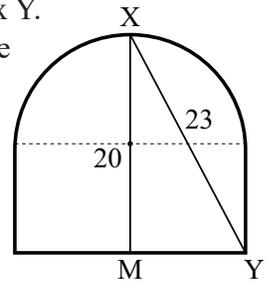

4. color-ings Liz wants to color each of the first 21 positive integers red or blue. She wants to do this in such a way that an integer and twice that integer are never the same color. How many distinct colorings of the first 21 positive integers fit this criterion?

5. In the magic square shown, the sums of the numbers in each row, each column and each diagonal are all equal. What is the value of D?

| | | |
|----|----|----|
| A | 48 | B |
| 42 | C | 50 |
| D | 44 | 45 |

6. _____ cm^3 Sally has ten pet termites, each of which eats 6 cm^3 of wood every 20 minutes. She has a wooden block measuring 10 cm by 10 cm by 15 cm. Sally places one termite on the block, then an hour later places a second termite on the block, then an hour later places a third termite on the block, and so on. She continues placing one additional termite on the wood every hour until all ten termites are on the wooden block. What volume of wood will the termites eat in the first 12 hours after the first termite is placed on the wooden block?

7. _____ in^2 The figure shown is composed of a semicircle and a rectangle. A segment from point X of the arc is drawn perpendicular to the base and intersecting the base at its midpoint M. Another segment is drawn from X to vertex Y. If $XM = 20$ inches and $XY = 23$ inches, what is the area of the figure? Express your answer to the nearest whole number.

8. _____ ways How many different ways are there to remove five letters from the word “CAROLINA” so that the remaining three letters are in alphabetical order?

9. _____ Jo’s American truck’s fuel economy of x miles per U.S. gallon is equivalent to Adelbert’s European car’s fuel economy of x liters per 100 km. Given that one U.S. gallon equals 3.785 liters, and one mile equals 1.609 km, what is the numerical value of x ? Express your answer as a decimal to the nearest hundredth.

10. _____ candies Irina ate some candies on Monday. On Tuesday, she ate twice as many candies as she did on Monday. On Wednesday, she ate a third as many candies as she did on Tuesday. On Thursday, she ate five more candies than she did on Wednesday. On Friday, she ate two fewer candies than she did on Thursday. If she ate the same number of candies on Friday as she did on Monday, how many did she eat on Tuesday?

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete®. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ The square root of n is 4. What is the value of n ?

2. _____ For the function graphed here, what is the integer value of y when $x = 2$?

3. _____

Jaden writes down the following six integers: 1, 10, 101, 1010, 10101, 101010. What is the sum of the six integers Jaden has written?

4. _____ What is the value of $8^2 - 6^2$?

5. _____ people

A survey of 100 people, each of whom owns a dog or a cat or both, showed that 63 own a dog and 58 own a cat. Based on these results, how many of the people surveyed own both a cat and a dog?

6. _____ apples

There are six apples in a bin, four bins in a bundle and two bundles in a crate. How many apples are in a crate?

7. _____ nickels

Dwight has nine coins consisting of only pennies and nickels. If the total value of the coins is 29 cents, how many nickels does Dwight have?

8. _____ heart-
beats

After a brisk workout, Felicia counts 32 heartbeats in 15 seconds. Based on this count, what is Felicia's expected number of heartbeats in one minute?

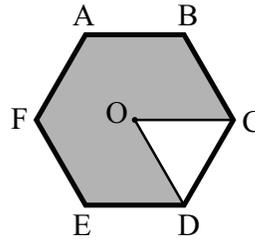

9. _____

What is the median of the first five prime numbers?

10. _____

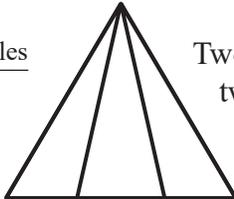

If 108 is 90% of x , what is the value of x ?

11. _____ Regular hexagon ABCDEF with center O is shown. What fraction of the area of hexagon ABCDEF is shaded? Express your answer as a common fraction.

12. _____ Two times a number divided by eight equals two. What was the original number?

13. _____ triangles

Two distinct segments are drawn inside a triangle from one vertex to two points on the opposite side as shown. What is the total number of triangles of any size in the resulting figure?

14. _____ mi/h The table shows the minimum and maximum speeds of four types of baseball pitches. What is the absolute difference between the minimum speed of a fastball and the maximum speed of a knuckleball?

BASEBALL PITCH SPEEDS (mi/h)

| Pitch | Min Speed | Max Speed |
|-------------|-----------|-----------|
| Fastball | 80 | 95 |
| Slider | 70 | 85 |
| Curve | 65 | 80 |
| Knuckleball | 55 | 70 |

15. _____ zeros Kris multiplies the first six positive prime numbers together. How many zeros follow the last non-zero digit of the product?

16. _____ mi/h Carmichael's favorite race car driver completes 10 laps in 10 minutes. If one lap is 2.5 miles long, what was the average speed of the driver, in miles per hour?

17. _____ The two solutions of the equation $x^2 + ax + 14 = 0$ are $x = 2$ and $x = 7$. What is the value of a ?

18. _____ Cal crosses out n randomly selected days from the seven consecutive days on her calendar, shown here. What is the minimum value of n that guarantees she crosses out three consecutive days?

| Sunday | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday |
|--------|--------|---------|-----------|----------|--------|----------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

19. _____ Let $p \ominus q = \sqrt{p^2 - q^2}$, and let $p \oplus q = \sqrt{p^2 + q^2}$. What is the value of $(3 \oplus 4) \oplus (20 \ominus 16)$?

20. _____ km/h Jones is chasing a car 800 meters ahead of him. He is on a horse moving at 50 km/h. If Jones catches up to the car in 4 minutes, how fast was the car moving?

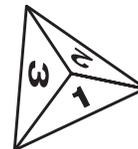

21. _____ After a hockey game, each member of the losing team shook hands with each member of the winning team. Afterwards, each member of the winning team gave a fist-bump to each of her teammates. Each team has 20 players. If n handshakes occurred and m fist-bumps occurred, what is the value of $n + m$?

22. _____ Diana has two fair spinners. The sectors of the first are numbered with the prime numbers less than 10. The sectors of the second are numbered with the positive perfect squares less than 40. On each of the spinners, all sectors have equal area. What is the probability that if both spinners are spun, the selected numbers on the two are not relatively prime? Express your answer as a common fraction.

23. _____ If A represents a digit such that the sum of the two-digit numbers $2A$, $3A$ and $4A$ is the three-digit number $10A$, what is the value of A ?

24. _____ A fair tetrahedral die, whose faces are numbered 1, 2, 3 and 4 is rolled three times. What is the probability that the sum of the numbers rolled is 7? Express your answer as a common fraction.

25. _____ cm A line bisecting the larger acute angle in a triangle with sides of length 33, 44 and 55 cm divides the opposite side into two segments. What is the length of the shorter segment of that side? Express your answer as a common fraction.

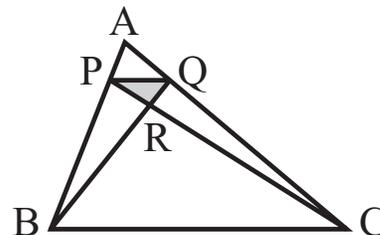

26. _____ ways In the grid shown, how many ways are there to spell the word “QUEUE” by moving one square at a time either horizontally or vertically, and provided squares may be revisited?

| | | | | |
|---|---|---|---|---|
| E | U | E | U | E |
| U | E | U | E | U |
| E | U | Q | U | E |
| U | E | U | E | U |
| E | U | E | U | E |

27. _____ mi/h The Millers went on a weekend outing 180 miles from their home. The average speed to their destination was 20 mi/h less than the average speed returning home. If the travel time for the entire trip was 7.5 hours, what was the Millers’ average speed to their destination?

28. _____ The least common multiple of the consecutive positive integers from 20 through k is greater than one billion. Assuming that $k > 20$, what is the least possible value of k ?

29. _____ In triangle ABC, shown here, P and Q lie on sides AB and AC, respectively, so that $\frac{AP}{AB} = \frac{AQ}{AC} = \frac{1}{5}$. Segments PC and QB intersect at R. What is the ratio of the area of triangle PQR to the area of triangle ABC? Express your answer as a common fraction.

30. _____ If a , b and c are positive integers such that $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} = \frac{6}{7}$, then what is $a + b + c$?

Problems 1 & 2

Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. \$ _____ Every week, Nora buys six oranges priced \$0.49 each. If the price of an orange increases from \$0.49 to \$0.69, how much will the cost of six oranges increase?

2. _____ Chris graphs the line $y = 3x + 7$ in the coordinate plane, while Sebastian graphs the line $y = ax + b$, for some numbers a and b . The x -intercept and y -intercept of Sebastian's line are double the x -intercept and y -intercept of Chris's line, respectively. What is the value of the sum $a + b$?

Team
Members _____, Captain

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ inches Dara creates three congruent isosceles triangles, each of which has two legs of length 7 inches and a base of length 5 inches. She joins these triangles together, gluing an entire side of one triangle to an entire side of another triangle, until she has used all three triangles to form a single polygon. What is the greatest possible perimeter of the polygon?

2. _____ For what value of n is the equation $5^{50} = n^n$ true?

3. _____ Lior brought two-thirds of his candy bar to school to share with two friends. Celine took one-fourth of the shared piece and Elliot took half of what was left. The final portion of that piece was split equally among Lior, Celine and Elliot. What fraction of Lior's original candy bar did Celine get? Express your answer as a common fraction.

4. _____ units² When a triangle with vertices at $(2, 0)$, $(10, 2)$ and $(6, 6)$ is rotated 360 degrees about the point $(0, -3)$, the sides and vertices of the triangle sweep out a region in the shape of an annulus (ring). What is the area of the annulus? Express your answer in terms of π .

5. _____ On Monday, Crystal drives from San Antonio to Dallas at a constant speed. On her return trip on Tuesday, she initially drives 10% faster than her Monday speed. However, during the last part of her trip, she runs into traffic and has to drive 30% slower than her Monday speed. As a result, her Tuesday trip takes exactly as long as her Monday trip. What fraction of the distance of her Tuesday trip does she travel at the faster speed? Express your answer as a common fraction.

6. _____

In the 6-by-6 grid shown, each square contains a different positive integer. Hiroshi placed coins on some squares in the grid. No square had more than one coin, and the total number of coins in each row and in each column is indicated by the row and column labels in **bold**. What is the sum of the numbers in the squares on which Hiroshi placed a coin?

7. _____

Shi Yin chooses four numbers at random, without replacement, from the set of integers from 1 to 10, inclusive. What is the probability that the product of these four numbers has units digit 0? Express your answer as a common fraction.

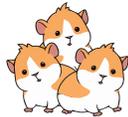

8. _____

Two congruent circles are inscribed in a 12×18 rectangle such that each circle is tangent to three of the four edges of the rectangle as shown. What is the probability that a randomly chosen point in the rectangle is in the shaded area? Express your answer as a decimal to the nearest hundredth.

9. _____

ways

Jane has six different hamsters for which she has two cages, one red and one blue. She wants to put three hamsters in the red cage and three in the blue cage, but two of the hamsters, Felix and Oscar, do not get along and cannot be in the same cage. In how many different ways can she choose which three hamsters to put in the red cage?

10. _____

Nala draws triangle ABC. She randomly chooses a real number a between 0 and 1. She then picks point P on \overline{AB} such that $\frac{PB}{PA} = a$. Point Q is chosen on \overline{AC} such that the area of triangle APQ is half the area of triangle ABC. What is the probability that $\frac{QC}{QA} \leq \frac{1}{4}$? Express your answer as a common fraction.

MATHCOUNTS®

2019 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2019 MATHCOUNTS® Chapter Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

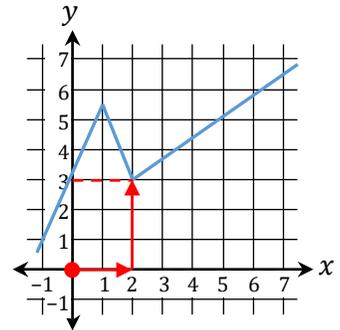

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2019 Chapter Sprint Round Solutions

1. For a nonnegative real number n , the square of the square root of n yields n . Since the square root of n is 4, n must be the square of 4, which is $4 \times 4 = \mathbf{16}$.

2. We start at the origin, where the two double-arrowed axis lines meet, and, since we want $x = 2$, we proceed horizontally to the right (toward the x) to where we see the 2. We then proceed vertically parallel to the axis marked y until we meet the blue function line, which we see to be 3 units above the x -axis. So the answer is **3**.

3. Line up the values vertically so that the units digit of all the values are in a column as in the figure with the problem and add the digits column by column:

$$\begin{array}{r}
 1 \\
 10 \\
 101 \\
 1\ 010 \\
 10\ 101 \\
 \underline{101\ 010} \\
 \mathbf{112\ 233}
 \end{array}$$

4. $8^2 - 6^2 = 64 - 36 = \mathbf{28}$.

5. With 63 people owning a dog, the remaining $100 - 63 = 37$ people must own just a cat, since all 100 people own a dog, a cat or both. However, 58 people own a cat, and only 37 cats have been accounted for. That means $58 - 37 = \mathbf{21}$ cats are owned by the people owning a dog also.

6. $6 \frac{\text{apples}}{\text{bin}} \times 4 \frac{\text{bins}}{\text{bundle}} \times 2 \frac{\text{bundles}}{\text{crate}} = \mathbf{48} \frac{\text{apples}}{\text{crate}}$.

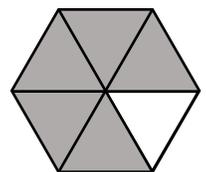

7. If all 9 coins were pennies, then they would have a value of 9¢. Because the total value is to be 29¢, we are 20¢ short. Each time we replace a penny by a nickel, the total value increases by 4¢. To make up that 20¢ by substituting nickels for pennies will require $\frac{20¢}{4¢} = 5$ such substitutions, thus ending up with **5** nickels.

8. There are 60 seconds in a minute, so $\frac{32 \text{ heartbeats}}{15 \text{ sec}} \times \frac{60 \text{ sec}}{1 \text{ min}} = \frac{32 \times 60 \text{ heartbeats}}{15 \text{ min}} = 32 \times 4 \frac{\text{heartbeats}}{\text{min}} = \mathbf{128} \frac{\text{heartbeats}}{\text{min}}$.

9. The first five prime numbers in increasing order are 2, 3, 5, 7, 11. The median value is the third prime, **5**.

10. $90\% = 9/10$, so $108 = \frac{9}{10}x$ and $x = \frac{10}{9} \times 108 = 10 \times \frac{108}{9} = 10 \times 12 = \mathbf{120}$.

11. A regular hexagon is composed of 6 congruent equilateral triangles as shown in the figure. The shaded region covers 5 of the 6 congruent triangles, so the shaded area is **5/6** of the hexagon's area.

12. $2 = \frac{2n}{8} = \frac{n}{4}$ so $n = 4 \times 2 = \mathbf{8}$.

13. Here we have three smaller triangles joined in a row such that each pair of adjacent triangles forms a triangle, with there being two such pairs (left with middle and middle with right) and all three taken together forming a single triangle. That means $3 + 2 + 1 = 6$ total triangles. Had n distinct line segments been drawn from the vertex to the base of the original triangle, partitioning the original triangle into $n + 1$ small triangles, the total number of triangles would have been the triangular number $T_{n+1} = (n + 1)(n + 2)/2$.
14. In the Fastball row under Min Speed we see the value 80 mi/h. In the Knuckleball row under Max Speed we see the value 70 mi/h. The absolute difference is $|80 - 70|$ mi/h = $|10|$ mi/h = **10** mi/h.
15. The first six positive prime numbers are 2, 3, 5, 7, 11 and 13. We do not need to determine the actual product, only how many zeros are at the right end of the integer—in other words how many factors of 10 are generated by the product. The only ways to get factors of 10 are by multiplying by a multiple of 10 and by multiplying by a multiple of 2 and by a multiple of 5. In the first six primes there are no multiples of 10, but there is one multiple of 2 and one multiple of 5, having one factor of 2 and one factor of 5, respectively, which combine to yield one factor of 10, so the number of 0s at the right end of the product is **1**.
16. $\frac{10 \text{ lap}}{10 \text{ min}} = 1 \frac{\text{lap}}{\text{min}} \times 2.5 \frac{\text{mi}}{\text{lap}} \times 60 \frac{\text{min}}{\text{h}} = 1 \times 2.5 \times 60 \frac{\text{mi}}{\text{hr}} = \mathbf{150} \frac{\text{mi}}{\text{h}}$.
17. The sum of the two solutions of the quadratic equation $Ax^2 + Bx + C = 0$ is given by $-B/A$ [and, as a side note, the product of the solutions is C/A]. Because the two solutions are given as 2 and 7, the sum of the two solutions is 9. Now, $A = 1$ and $B = a$, so $9 = -\frac{B}{A} = -\frac{a}{1} = -a$, so that $a = \mathbf{-9}$.
18. The way of selecting the most total days without selecting three consecutive days by starting at either end and alternately selecting two and skipping one. Thus, starting from the left, days 1, 2, 4, 5, and 7 are selected without three in a row anywhere. There are only two days left to choose, #3 and #6. Choosing either one makes at least three consecutive days. Thus, making 5 selections is not enough to guarantee three consecutive days but **6** is enough.
19. $(3 \oplus 4) \oplus (20 \ominus 16) = \sqrt{3^2 + 4^2} \oplus \sqrt{20^2 - 16^2} = 5 \oplus 12 = \sqrt{5^2 + 12^2} = \mathbf{13}$.
 The evaluations of the radicals can be done in any of several ways:
 Just crunch numbers: $\sqrt{3^2 + 4^2} = \sqrt{9 + 16} = \sqrt{25} = 5$; $\sqrt{20^2 - 16^2} = \sqrt{400 - 256} = \sqrt{144} = 12$;
 $\sqrt{5^2 + 12^2} = \sqrt{25 + 144} = \sqrt{169} = 13$.
 Recognize each square root except the last is re-squared, so $\sqrt{3^2 + 4^2 + 20^2 - 16^2} = \sqrt{9 + 16 + 400 - 256} = \sqrt{169} = 13$.
 Note Pythagorean triples: 3-4-5 scaled by 1 and 4 to 3-4-5 and 12-16-20, respectively; and lastly 5-12-13.
 The \oplus operation combines two legs to yield the hypotenuse.
 The \ominus operation combines the hypotenuse and one leg to yield the other leg.
20. Jones catches up 800 m in 4 min and, thus at a rate of: $\frac{800 \text{ m}}{4 \text{ min}} = 200 \frac{\text{m}}{\text{min}} \times \frac{1 \text{ km}}{1000 \text{ m}} \times \frac{60 \text{ min}}{1 \text{ h}} = 12 \frac{\text{km}}{\text{h}}$. Jones is going 50 km/h, so the car is going $50 - 12$ km/h = **38** km/h.

21. Each of 20 people on the winning team shook hands with each of 20 people on the losing team for a total of $n = 20 \times 20 = 400$ handshakes. Each of the 20 people on the winning team fist-bumped each of the other 19 teammates, but we are double counting because player A fist-bumping player B is the same action as player B fist-bumping A. So, there were $m = 20 \times 19/2 = 10 \times 19 = 190$ fist bumps.
 $n + m = 400 + 190 = \mathbf{590}$.

22. The sections of spinner 1 are the prime numbers less than 10: 2, 3, 5, 7. The sections of spinner 2 are the positive perfect squares less than 40: 1, 4, 9, 16, 25, 36.

The 2 on spinner 1 is not relatively prime to these values on spinner 2: 4, 16, and 36.

The 3 on spinner 1 is not relatively prime to these values on spinner 2: 9 and 36.

The 5 on spinner 1 is not relatively prime to these values on spinner 2: 25.

The 7 on spinner 1 is not relatively prime to these values on spinner 2: —.

There are, thus, 6 pairs that qualify; there are $4 \times 6 = 24$ total pairs.

The desired probability is, therefore, $6/24 = \mathbf{1/4}$.

23. The sum of the three values is $(20 + A) + (30 + A) + (40 + A) = 90 + 3A$, but we are told that their sum is $100 + A$. For $90 + 3A = 100 + A$, we must have $2A = 10$, so $A = \mathbf{5}$.

24. There are $4 \times 4 \times 4 = 64$ equally likely outcomes of rolling the die. The only ways to get a sum of 7 are:

rolling 4, 2 and 1 in any order, which can occur in $\frac{3!}{1! 1! 1!} = \frac{6}{1 \times 1 \times 1} = 6$ distinct, equally likely ways;

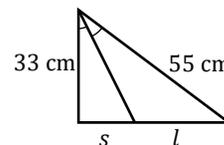

rolling 3,3 and 1 in any order, which can occur in $\frac{3!}{2! 1!} = \frac{6}{2 \times 1} = 3$ distinct, equally likely ways;

rolling 3, 2 and 2 in any order, which can occur in $\frac{3!}{1! 2!} = \frac{6}{1 \times 2} = 3$ distinct, equally likely ways.

Thus, the probability that the sum of the numbers rolled is 7 is $\frac{6+3+3}{64} = \frac{12}{64} = \frac{\mathbf{3}}{\mathbf{16}}$.

25. We are to determine s , given the information in the figure shown and $s + l = 44$ cm.

The reason for bisecting the angle formed by the 33 cm and 55 cm sides is that we are instructed to bisect the maximal acute angle. Now, a 33 cm-44 cm-55 cm triangle is a 3-4-5 right triangle with a scaling of 11 cm, so the angle opposite the 55 cm side is a right angle, not acute. The larger acute angle is then the angle opposite the next longest

side, which is the 44 cm side. We can use the triangle angle-bisector theorem, which says that $\frac{l}{s} = \frac{55 \text{ cm}}{33 \text{ cm}}$, so

$$\frac{l+s}{s} = \frac{55 \text{ cm} + 33 \text{ cm}}{33 \text{ cm}} = \frac{88}{33} = \frac{8}{3}. \text{ Because } l + s = 44 \text{ cm, we have } \frac{44 \text{ cm}}{s} = \frac{8}{3}, \text{ so } s = \frac{3 \times 44 \text{ cm}}{8} = \frac{3 \times 11}{2} \text{ cm} = \frac{\mathbf{33}}{\mathbf{2}} \text{ cm.}$$

26. The only Q is in the center square, so that is where we must start. From there, moving left, right, up, or down, gets us to a U, so that is 4 ways to make QU. Due to symmetry all four ways behave alike, so we can analyze just one choice for the U and multiply by 4. Regardless of which U we move to, three out of the four possible moves left, right, up, or down get us to an E to make QUE. We must be careful here, though, because not all 3 Es yield the same number of options for the next move:

(i) We see that 2 of the Es are interior on a diagonal, each of which leads to any of 4 Us. From any of these Us, we can move to any of 3 Es to make QUEUE.

(ii) But 1 of the Es is along an outer edge in the middle and leads to any of 3 Us. From any of these Us, we can move to any of 3 Es to make QUEUE.

Thus, we have a total of $4[(2 \times 4 \times 3) + (1 \times 3 \times 3)] = 4(24 + 9) = 4(33) = \mathbf{132}$ ways.

27. Here we have a problem relating the average speed over a whole trip to the average speed over each of several legs of equal length. The overall average is the harmonic mean of the speeds for each leg. For two legs with average speeds of v_1 and v_2 , respectively, the harmonic mean is $\frac{1}{\frac{1}{2}(\frac{1}{v_1} + \frac{1}{v_2})} = \frac{2v_1v_2}{v_1+v_2}$. Thus, we have the overall average speed being $v_a = \frac{2v_1v_2}{v_1+v_2}$. We are given the actual value for the difference between v_1 and v_2 , but for now let's simply say that $v_2 = v_1 + d$. For solving equations with lots of peculiar numbers and measurement units, it is often easier to solve in terms of general variables and substitute actual quantities once we express the variable to be solved in terms of the other variables. We have $v_a = \frac{2v_1v_2}{v_1+v_2}$, and $v_a = \frac{2v_1(v_1+d)}{2v_1+d}$, but we need to rearrange this to express v_1 in terms of v_a and d . Multiplying both sides by $2v_1 + d$ yields $v_a(2v_1 + d) = 2v_1(v_1 + d)$, which expands to $2v_av_1 + dv_a = 2v_1^2 + 2dv_1$. Rearranging this into conventional form for a quadratic equation in terms of v_1 yields $2v_1^2 + 2(d - v_a)v_1 - dv_a = 0$. Using the quadratic formula, we get $v_1 = \frac{-2(d-v_a) \pm \sqrt{[2(d-v_a)]^2 - 4(2)(-dv_a)}}{2 \times 2} = \frac{(v_a-d) \pm \sqrt{(v_a-d)^2 + 2dv_a}}{2}$. We know that the overall average speed is given by the total distance $2 \times 180 \text{ mi} = 360 \text{ mi}$ divided by the total time 7.5 h. So, we have $v_a = \frac{360 \text{ mi}}{7.5 \text{ h}} = \frac{3 \times 120 \text{ mi}}{3 \times 2.5 \text{ h}} = \frac{4 \times 120 \text{ mi}}{4 \times 2.5 \text{ h}} = \frac{480 \text{ mi}}{10 \text{ h}} = 48 \frac{\text{mi}}{\text{h}}$. We are given that $v_1 = v_2 - 20 \frac{\text{mi}}{\text{h}}$, so $d = 20 \frac{\text{mi}}{\text{h}}$ and $v_a - d = 48 \frac{\text{mi}}{\text{h}} - 20 \frac{\text{mi}}{\text{h}} = 28 \frac{\text{mi}}{\text{h}}$. Substituting into our quadratic formula yields:

$$v_1 = \frac{28 \frac{\text{mi}}{\text{h}} \pm \sqrt{(28 \frac{\text{mi}}{\text{h}})^2 + 2 \times 20 \frac{\text{mi}}{\text{h}} \times 48 \frac{\text{mi}}{\text{h}}}}{2} = 14 \frac{\text{mi}}{\text{h}} \pm \sqrt{196 \left(\frac{\text{mi}}{\text{h}}\right)^2 + 480 \left(\frac{\text{mi}}{\text{h}}\right)^2} = 14 \frac{\text{mi}}{\text{h}} \pm \sqrt{676} \frac{\text{mi}}{\text{h}} = (14 \pm 26) \frac{\text{mi}}{\text{h}}$$

This yields a choice of 40 mi/h or -12 mi/h, but a negative result does not make sense for this problem, so the answer must be $v_1 = 40 \text{ mi/h}$.

28. Start with 20 and work up, incorporating new factors that have not yet been covered. Now, we are dealing with numbers in the 20s (or less due to common factors)—let's just say an average of $25 = 10^2/2^2$. With 7 such factors, we would be at most about $(10^2/2^2)^7 = 10^{14}/2^{14} \approx \frac{10^{14}}{1.6 \times 10^4} \approx 6 \times 10^9$, so let's work 20 through 27 and see where we stand. [NOTE that *billion* refers to 10^9 .]

| | |
|---|--|
| 20 | $2^2 \times 5$; |
| 21 = 3 × 7, both new, so 20 × 21 | $2^2 \times 3 \times 5 \times 7$; |
| 22 = 2 × 11, with new 22 but old 2, so 20 × 21 × 11 | $2^2 \times 3 \times 5 \times 7 \times 11$; |
| 23 is a new prime, so 20 × 21 × 11 × 23 | $2^2 \times 3 \times 5 \times 7 \times 11 \times 23$; |
| 24 = 2 ³ × 3 with one new 2, two old 2's and old 3, so 20 × 21 × 22 × 23 | $2^3 \times 3 \times 5 \times 7 \times 11 \times 23$; |
| 25 = 5 ² with a new and an old 5, so 100 × 21 × 22 × 23 | $2^3 \times 3 \times 5^2 \times 7 \times 11 \times 23$; |
| 26 = 2 × 13 with a new 13 and an old 2, so 100 × 21 × 22 × 23 × 13 | $2^3 \times 3 \times 5^2 \times 7 \times 11 \times 13 \times 23$; |
| 27 = 3 ³ with two new and one old 3, so 100 × 21 × 22 × 23 × 117 | $2^3 \times 3^3 \times 5^2 \times 7 \times 11 \times 13 \times 23$; |

Pause: Let's assess where we are with $100 \times 21 \times 22 \times 23 \times 117$. The product of the first 4 factors is straightforward to do exactly with only mental power; for the rest an approximation is likely good enough. $21 \times 22 \times 23 = 22 \times (22^2 - 1^2) = 22^3 - 22 = 2^3 \times 11^3 - 22 = 8 \times 1331 - 22 = 10\,648 - 22 = 10\,626$. The 100 part tacks on two more 0's for 1 062 600, just over 10^6 ; 117 is only a little over 10^2 , for a total of a little over 10^8 . We need another factor of 10 or so to get there.

28 = 2² × 7, all of which is old, so nothing new to contribute;

29 is a prime, so new, and provides us with our needed factor of at least 10, making the answer **29**.

29. My favorite approach to this type of problem is somewhat unconventional—but only in the sense of combining properties of similarity and proportionality in such a way as to combine steps unconventionally, but quite validly, to reduce the count and complexity of steps, but all equivalent to a more traditional approach. The area of a triangle is $1/2$ times the base times the height. For the ratio of areas of two triangles the $1/2$ cancels out, leaving the product of the ratio of the bases time the ratio of the heights. Let's regard the base of $\triangle ABC$ to be segment BC and the base of $\triangle PQR$ to be segment PQ . It is very convenient they are parallel to one another. With $\frac{AP}{AB} = \frac{AQ}{AC} = \frac{1}{5}$, $\frac{PQ}{BC}$ must be the same $\frac{1}{5}$, so we know the ratio of the bases is $\frac{1}{5}$. Now we need to deal with the ratio of the heights of the two triangles, and this will be a 2-step process: first, the ratio of the height of PQ above BC to the height of A above BC , and, second, the ratio of the height of PQ above R to the height of PQ above BC . The product of these two will be the ratio of the height of PQ above R to the height of A above BC , which product is the ratio of the heights of the two triangles of concern. We use similarity to realize that the height of A above PQ is $\frac{1}{5}$ the height of A above BC , so the ratio of the height of PQ above BC to the height of A above BC is 1 minus the ratio $\frac{1}{5}$, which is $\frac{4}{5}$ as the answer to the first part. For the second part, we need to determine the horizontal distance from line BQ to line CP going horizontally at some height, and left-to-right will be regarded as a positive value and right-to-left as a negative value (a form of what is often referred to a displacement [physics] or directed distance [mathematics]). At the height of base PQ , we are going from Q to P , which is right-to-left, so negative. Since we care only about ratios and scaling, we can regard the distance as normalized to -1 . At the base BC , the point on BQ is B and the point on CP is C , with C to the right of B , so a positive distance that is 5 times the magnitude of the distance -1 from Q to P , with our given scaling. The magnitude of -1 is 1 , which multiplied by 5 is 5 . The two lines intersect at R so the distance from R to R is 0 . Now, 0 is $\frac{1}{6}$ of the way from -1 to 5 , so the height of R below PQ is $\frac{1}{6}$ the height of BC below PQ , which is $\frac{4}{5}$ the height of BC below A , making the height of $\triangle PQR$ equal to $\frac{4}{5} \times \frac{1}{6} = \frac{2}{15}$ the height of $\triangle ABC$. With a ratio of bases being $\frac{1}{5}$ and the ratio of heights being $\frac{2}{15}$, the ratio of the areas is $\frac{1}{5} \times \frac{2}{15} = \frac{2}{75}$.

[The explanation is long because there are some atypical details to discuss, but the calculations are short when you are used to the concept. It is very quick to see that the base of $\triangle RPQ$ is $1/5$ as wide as for $\triangle ABC$, and then the height of $\triangle RPQ$ is $\frac{1}{6} \times \frac{4}{5} = \frac{2}{15}$ that of $\triangle ABC$, so the ratio of the areas is $\frac{1}{5} \times \frac{2}{15} = \frac{2}{75}$.]

30. We can reorder the terms so that $a \leq b \leq c$. It must be that a must be 2 or 3 ; otherwise, a being 1 makes the sum of the three reciprocals greater than 1 , and the maximum sum for $a > 3$ is $\frac{3}{4} < \frac{6}{7}$. For the sum to have a denominator of 7 , at least one of a , b , and c must be a multiple of 7 , and it is not a since a is 2 or 3 ; neither can it be b since then c would also have to be at least 7 , and the sum of the reciprocals cannot reach the requisite $\frac{6}{7}$. Thus, with $a = 3$ and $c \geq 7$, then $\frac{1}{b} \geq \frac{6}{7} - \left(\frac{1}{3} + \frac{1}{c}\right) = \frac{8}{21}$, so $b \leq \frac{21}{8} < 3$, making $b < a$ (a contradiction of specified conditions) if $a = 3$. Thus, a must be 2 , making $\frac{1}{b} + \frac{1}{c} = \frac{6}{7} - \frac{1}{2} = \frac{5}{14}$. Therefore, $\frac{14}{5} < b \leq \frac{14}{3}$ (the first condition based on c being an arbitrarily large integer, making $1/c$ arbitrarily close to 0 , and the second condition based on $c \geq 7$ since c is a multiple of 7). Thus, b must be 3 or 4 . For $b = 3$, c would have to be $c = \frac{1}{\left(\frac{5}{14} - \frac{1}{3}\right)} = \frac{1}{\frac{1}{42}}$, which is the reciprocal of an integer and, therefore, suitable. For completeness (but not necessary in the competition), for $b = 4$, c would have to be $c = \frac{1}{\left(\frac{5}{14} - \frac{1}{4}\right)} = \frac{3}{28}$, which is not the reciprocal of an integer, so is not an acceptable answer. Therefore, we end up with: $a = 2, b = 3, c = 42; a + b + c = 2 + 3 + 42 = 47$.

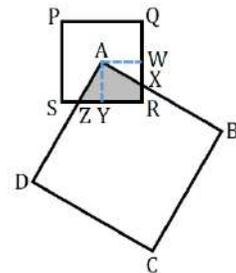

2019 Chapter Target Round Solutions

- The price increase of each orange is $\$0.69 - \$0.49 = \$0.20$. Therefore, the price increase of 6 oranges is $6 \times \$0.20 = \mathbf{\$1.20}$. [WARNING: That second decimal place is required for monetary amounts.]
- The y -intercept is determined by solving for y when $x = 0$. For Chris that is at $y = 7$, while for Sebastian that is $y = b$. For Sebastian's to be double Chris', $b = 2 \times 7 = 14$.
The x -intercept is determined by solving for x when $y = 0$. For Chris that is at $x = -7/3$ while for Sebastian that is $x = -b/a$. For Sebastian's to be double Chris', $-\frac{b}{a} = -\frac{14}{a} = 2\left(-\frac{7}{3}\right) = -\frac{14}{3}$, so $\frac{1}{a} = 1/3$ and $a = 3$.
Therefore, $a + b = 3 + 14 = \mathbf{17}$.

- In 12 min, the Cubes have gained $21 - 18 = 3$ points over the Bisectors, so the rate of gain is $\frac{3 \text{ points}}{12 \text{ min}} = \frac{1 \text{ point}}{4 \text{ min}}$, or 1 point every 4 minutes. The game lasts $2 \times 20 \text{ min} = 40 \text{ min}$. Therefore, the total gain of points by the Cubes over the Bisectors is $\frac{1 \text{ pt}}{4 \text{ min}} \times 40 \text{ min} = \mathbf{10 \text{ points}}$.

- Let point X be the point of intersection of the bisector of $\angle D$ and line AB , forming $\triangle ADX$, and point Z be the point of intersection of the two dashed lines, forming $\triangle BXZ$. We are given $m\angle XAD = 84^\circ$ and $m\angle ADX = 32^\circ/2 = 16^\circ$, so $m\angle DXA = 180^\circ - (84^\circ + 16^\circ) = 80^\circ$. $\angle DXB$ is the supplement of $\angle DXA$, and, thus, has a measure of 100° ; this is the same as $\angle BXZ$. We are given $m\angle ZDB = 32^\circ/2 = 16^\circ$. Therefore, for $\angle XZB$, which is the angle in question, $m\angle XZB = 180^\circ - (100^\circ + 16^\circ) = \mathbf{64^\circ}$.

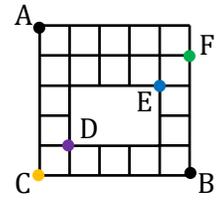

- As the figure shows, we can draw line segments \overline{AW} and \overline{AY} perpendicular to lines QR and RS , respectively. Because A is the center of square $PQRS$, W and Y are the midpoints of their respective sides of the square. Triangles AWX and AYZ are congruent. The shaded area is quadrilateral $AXRZ$. That area is equal to the sum of the areas of quadrilateral $AXRY$ and triangle AYZ . Since triangles AWX and AYZ are congruent, their areas are equal. Thus, the given shaded area is equal to the sum of the areas of quadrilateral $AXRY$ and triangle AWX , which is the same as the area of square $AWRY$ —a square that is similar to square $PQRS$, with linear scale factor of $\frac{1}{2}$. The ratio

of the area $AWRY$ to the area of $PQRS$ is the square of this linear scale factor, thus $\left(\frac{1}{2}\right)^2 = \frac{1}{4}$. Note that this answer does not depend in any way on the degree of rotation of the larger square about the center of the smaller square.

- Let the desired tens digit be d , the wrongly input tens digit be w , and the units digit be u . Then the desired number to square is $10d + u$ and the wrongly squared number is $10w + u$. The difference in their squares is $2340 = (10w + u)^2 - (10d + u)^2 = (100w^2 + 20wu + u^2) - (100d^2 + 20du + u^2) = 100(w^2 - d^2) + 20(w - d)u$. Dividing both sides by 20 yields: $117 = 5(w^2 - d^2) + (w - d)u = [5(w + d) + u](w - d)$. We are dealing with ten's digits d and w of 2-digit numbers, with $w > d$, so we must have $1 \leq d < w \leq 9$. Thus, $1 \leq w - d \leq 8$ and $w - d$ must divide $117 = 3^2 \times 13$, meaning that $w - d$ is 1 or 3. If $w - d = 1$, then $5(w + d) + u = 117$, but $w \leq 9$, $d \leq 8$, and $u \leq 9$, so $5(w + d) + u \leq 94$ and cannot be 117. Therefore, $w - d = 3$. Now we have $117 = [5(w + d) + u](3)$, so $5(w + d) + u = 39$, which means:
 $w + d = 6$ and $u = 9$, or $w + d = 7$ and $u = 4$. Since $w - d$ is odd (3), $w + d$ must likewise be odd. Thus, $w + d = 7$ and $u = 4$ holds. Now, we are to find $(10w + u) + (10d + u) = 10(w + d) + 2u = 10 \times 7 + 2 \times 4 = \mathbf{78}$.

7. In order to traverse from point A to point B, one must pass through exactly one of points C, D, E or F shown. There is some number of paths from A to each of the points C, D, E and F, and for each such path there is some number of paths from there to B. So, we can determine the product of those two values for each point C, D, E and F and add the four products together. The number of paths between any two lattice points that is r steps right and d steps down is the number of combinations of $r + d$ things taken d at a time.

- (i) For $A \rightarrow C$: $r = 0, d = 5$ and ${}_5C_5 = 1$ and for $C \rightarrow B$: $r = 5, d = 0$ and ${}_5C_0 = 1$.
So, it follows that there is $1 \times 1 = \underline{1}$ path from $A \rightarrow C \rightarrow B$.
- (ii) For $A \rightarrow D$: $r = 1, d = 4$ and ${}_5C_4 = 5$ and for $D \rightarrow B$: $r = 4, d = 1$ and ${}_5C_1 = 5$.
So, it follows that there are $5 \times 5 = \underline{25}$ paths from $A \rightarrow D \rightarrow B$.
- (iii) For $A \rightarrow E$: $r = 4, d = 2$ and ${}_6C_2 = 15$ and for $E \rightarrow B$: $r = 1, d = 3$ and ${}_4C_3 = 4$.
So, it follows that there are $15 \times 4 = \underline{60}$ paths from $A \rightarrow E \rightarrow B$.
- (iv) For $A \rightarrow F$: $r = 5, d = 1$ and ${}_6C_1 = 6$ and for $F \rightarrow B$: $r = 0, d = 4$ and ${}_4C_4 = 1$.
So, it follows that there are $6 \times 1 = \underline{6}$ paths from $A \rightarrow F \rightarrow B$.

Total number of paths is $1 + 25 + 60 + 6 = \mathbf{92}$ paths.

8. For the product of integers to be 1, each integer must be +1 or -1, and the count of -1 factors must be even. This means that for a factor that is a difference of two letter values, it is necessary (but not sufficient) that the letters be consecutive in terms of assignment to the sequential numbers 1, 2, 3, 4, 5, 6. Therefore, M and A must be consecutive, so either M, A (yields $M - A = -1$) or A, M (yields $M - A = +1$); T must be consecutive with both H and E , so T must be between H and E , as E, T, H or H, T, E ; E must be consecutive with both L and T , so E must be between L and T , as L, E, T or T, E, L . Putting the last two lines together yields L, E, T, H (yields $(T - H)(L - E)(T - E) = (-1)(-1)(+1) = +1$) or H, T, E, L (yields $(T - H)(L - E)(T - E) = (+1)(+1)(-1) = -1$). Thus, we need M, A to go with H, T, E, L , either order, and A, M to go with L, E, T, H , either order.

Thus, we have 4 choices that satisfy the product criterion:

$$M = 1, A = 2, H = 3, T = 4, E = 5, L = 6;$$

$$H = 1, T = 2, E = 3, L = 4, M = 5, A = 6;$$

$$A = 1, M = 2, L = 3, E = 4, T = 5, H = 6;$$

$$L = 1, E = 2, T = 3, H = 4, A = 5, M = 6.$$

There are $6! = 720$ possible arrangements of the letters with the numeric values. Therefore, the fraction with the desired result is $\frac{4}{720} = \frac{1}{180}$.

2019 Chapter Team Round Solutions

1. Let's try a greedy algorithm, adding one triangle at a time, maximizing the contribution to the perimeter each time. If we attach a new triangle onto a side of 5 inches, that 5-inch side has disappeared, but we now have 14 inches showing, for a net increase of $14 - 5 = 9$ inches to the perimeter. If we attach a new triangle onto a side of 7 inches, that 7-inch side has disappeared, but we now have 12 inches showing, for a net increase of $12 - 7 = 5$ inches to the perimeter. Thus, we should want to attach along a side of 5 inches whenever possible and attach along a side of 7 inches only if such is the only choice. First, we start with one triangle and have perimeter 2×7 inches + 5 inches = 19 inches, and we have two 7-inch and one 5-inch sides to attach to. Let's attach the second triangle along the one available 5-inch side, increasing the perimeter to 19 inches + 9 inches = 28 inches, and we have four 7-inch sides to attach to. Since we have only 7-inch sides to attach the third triangle to, doing so increases the perimeter to 28 inches + 5 inches = **33** inches.

2. $5^{50} = 5^{2 \times 25} = (5^2)^{25} = 25^{25}$, so $n = \mathbf{25}$.

3. Let's use L for the amount Lior has at any given time, C for the amount Celine has at any given time, and E for the amount Elliot has at any given time.

We start off with $L = \frac{2}{3}$, $C = 0$, $E = 0$.

C takes $1/4$ of L : $C = \frac{1}{4} \times \frac{2}{3} = \frac{1}{6}$, $L = \frac{2}{3} - \frac{1}{6} = \frac{1}{2}$, $E = 0$.

E takes $1/2$ of L : $E = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$, $L = \frac{1}{2} - \frac{1}{4} = \frac{1}{4}$, $C = \frac{1}{6}$.

C and E take [add to their own] $1/3$ of L , thus $\frac{1}{3} \times \frac{1}{4} = \frac{1}{12}$, which is also the amount L keeps: $C = \frac{1}{6} + \frac{1}{12} = \frac{1}{4}$, with E ending up with $\frac{1}{3}$ and L with $\frac{1}{12}$, though there is no need to determine the last two.

4. Being the region between two concentric circles, an annulus has an area equal to the difference of the area within the larger circle minus the area within the smaller circle, thus of the form $\pi(R^2 - r^2)$. The radius R of the larger circle is easy to determine—the distance between the center point of the rotation and the farthest vertex. (Remember, we really need the square of the distance, so there is no need to do the square root portion of the Pythagorean formula only to square it again later.)

Between $(0; -3)$ and $(2; 0)$: $(2 - 0)^2 + [0 - (-3)]^2 = 4 + 9 = 13$.

Between $(0; -3)$ and $(10; 2)$: $(10 - 0)^2 + [2 - (-3)]^2 = 100 + 25 = 125$.

Between $(0; -3)$ and $(6; 6)$: $(6 - 0)^2 + [6 - (-3)]^2 = 36 + 81 = 117$.

Therefore, $R^2 = 125$.

The radius of the inner circle is not so easy—it is not necessarily the distance between the center point of rotation and the nearest vertex, as the shortest distance could be on a side between two vertices. Drawing a quick sketch is likely to convince under time pressure of a competition that the nearest point on the triangle is a vertex, and that is good enough. If you are really nervous and paranoid, though, the only time issues can arise (and it might not be serious even then) is when the negative reciprocal of the slope of a side is between the value of the slope between the rotation center point and each of the two end vertices of that side. This does occur for the side between $(10; 2)$ and $(6; 6)$, inclusive, for which the minimum distance squared between the rotation center point and that side is 112.5, which is greater than the distance squared between the rotation center point and vertex $(2; 0)$, so we will take 13 as the minimum distance squared, r^2 . Therefore, the answer is $\pi(R^2 - r^2) = \pi(125 - 13) = \mathbf{112\pi}$ units².

5. To average the same overall speed s , Crystal must spend $\frac{1.0-0.7}{1.1-0.7} = \frac{0.3}{0.4} = \frac{3}{4}$ of her time at speed 1.1s and $\frac{1.1-1.0}{1.1-0.7} = \frac{0.1}{0.4} = \frac{1}{4}$ at speed 0.7s, which means $\frac{11}{10} \times \frac{3}{4} = \frac{33}{40}$ of the distance at speed 1.1s.

6. If we number the rows of the table as r , with $r = 1$ for the top content (non-header) row to $r = 6$ for the bottom row, and the columns as c , with $c = 1$ for the left content (non-header) column and $c = 6$ for the right column, then the value in the cell at row r and column c is $6(r - 1) + c$, with the first part depending on only the row number and the last part depending on only the column number. The header column at the far left tells how many cells in that row are used and, therefore, how many times $6(r - 1)$ shows up in the sum due to row r ; similarly, the header row at the top tells how many cells in that column are used and, therefore, how many times c shows up in the sum due to column c . By splitting this way, each part of the value expression is handled exactly once and is in a meaningful way—no double counting, etc. Therefore, the sum of the coin-occupied values is:

$$3 \times 0 + 4 \times 6 + 3 \times 12 + 2 \times 18 + 4 \times 24 + 2 \times 30 + 2 \times 1 + 2 \times 2 + 1 \times 3 + 5 \times 4 + 3 \times 5 + 5 \times 6 = 0 + 24 + 36 + 36 + 96 + 60 + 2 + 4 + 3 + 20 + 15 + 30 = \mathbf{326}.$$

7. For a product of factors in the range of 1 to 10 to have a units digit of 0 (be divisible by 10), either 10 is one of the factors, or else 5 is one of the factors along with at least one even number. We must be carefully in assessing the probability because both conditions may occur together. Let's look at two main cases:

1. Of the 4 values, 1 of them is a 10; we do not care what the other 3 values are.

2. Of the 4 values, 1 of them is a 5, at least 1 (meaning 1, 2, or 3) is an even number other than 10 (2, 4, 6, 8), and the remaining ones (2, 1, or 0) is an odd number other than 5.

The two cases were deliberately chosen to be mutually exclusive, so the probabilities of the two can be merely added. We can use the generalized or multivariate hypergeometric probability distribution.

For case 1, we have $\frac{\binom{1}{1}\binom{9}{3}}{\binom{10}{4}} = \frac{1 \times 84}{210} = \frac{84}{210}$. (We will wait until the end to reduce the fractions.)

For case 2, we can decompose into 3 mutually exclusive subcases: 1, 2, or 3 values chosen from 2, 4, 6, and

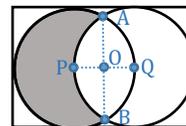

8, yielding $\frac{\binom{1}{1}\binom{1}{0}\binom{4}{1}\binom{4}{2}}{\binom{10}{4}} + \frac{\binom{1}{1}\binom{1}{0}\binom{4}{2}\binom{4}{1}}{\binom{10}{4}} + \frac{\binom{1}{1}\binom{1}{0}\binom{4}{3}\binom{4}{0}}{\binom{10}{4}} = \frac{\binom{1}{1}\binom{1}{0}}{\binom{10}{4}} \left[\binom{4}{1}\binom{4}{2} + \binom{4}{2}\binom{4}{1} + \binom{4}{3}\binom{4}{0} \right] =$

$$\frac{1}{210} (4 \times 6 + 6 \times 4 + 4 \times 1) = \frac{52}{210}.$$

Therefore, the total probability is $\frac{84}{210} + \frac{52}{210} = \frac{136}{210} = \frac{68}{105}$.

8. The rectangle height, 12, is the diameter of each circle, so the radius of the circles is 6.

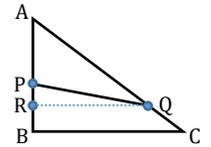

Let's put the origin of a coordinate system at the center O of the rectangle with the x -axis horizontal and y -axis vertical. Then the centers of circles Q and P are at $(\pm 3; 0)$ and the two circles intersect at A and B , $(0; \pm 3\sqrt{3})$. The area of the shaded region is the area of

circle P minus the area of overlap between the two circles. The overlap region can be partitioned into a segment of circle P bounded by \overline{AB} and arc BQA , and a segment of circle Q bounded by \overline{AB} and arc BPA ; these two segments are congruent, so the area of the overlap region is double the area of either segment. We can find the area of segment AQB by subtracting the area of the sector of circle P formed by arc BQA minus the area of $\triangle PAB$. $\angle AOP$ and $\angle BOP$ are \perp . The ratio of each of legs \overline{AO} and \overline{BO} to leg \overline{OP} is $\sqrt{3}$, meaning that $m\angle APO = m\angle BPO = 60^\circ$, so the measure of $\angle APB$ and arc BQA are $2 \times 60^\circ = 120^\circ$. Thus, the sector of circle P formed by arc BQA is $1/3$ of circle P and has area 12π ; $\triangle APB$ has base \overline{AB} of length $6\sqrt{3}$ and height \overline{PO} of 3, so area of $\triangle PAB$ is $\frac{1}{2} \times 6\sqrt{3} \times 3 = 9\sqrt{3}$. The overlap region has area $2(12\pi - 9\sqrt{3}) = 24\pi - 18\sqrt{3}$, so the shaded area is $36\pi - (24\pi - 18\sqrt{3}) = 12\pi + 18\sqrt{3}$. The area of the rectangle is $18 \times 12 = 216$, so the shaded area occupies $\frac{12\pi + 18\sqrt{3}}{216} = \frac{2\pi + 3\sqrt{3}}{36} = 0.31887\dots$, which rounds to the nearest hundredth as **0.32**.

9. Either Felix or Oscar goes in the red cage; the other goes in the blue cage—this yields 2 options. For each of those two options, there are 4 remaining hamsters. Any of the 4 may be second to occupy the red cage, and after that choice is made any of the 3 remaining ones may be third to occupy the red cage. Now, the last 2 go in the blue cage. Thus, it appears that there are $2 \times 4 \times 3 = 24$ ways of selecting which hamsters will occupy the red cage. However, we could have swapped which hamster was chosen second versus which hamster was chosen third, and we would end up with the same occupancy in each cage. Therefore, we need to divide by 2 to avoid double counting, so we end up with $24/2 = \mathbf{12}$ ways. We could also have done it as 2 (for Felix and Oscar) times the number of ways (combinations) to distribute 4 things (the remaining 4 hamsters) taken 2 at a time (2 to go in the red box) to get $2 \times \frac{4!}{2!2!} = 2 \times \frac{24}{2 \times 2} = \mathbf{12}$ ways.

10. The result does not depend on the shape nor on the size of the triangle. To make the intuition a little easier, let's use a right triangle:

The area of $\triangle APQ$ is $\frac{1}{2} \cdot AP \cdot RQ = \frac{1}{2} \cdot \frac{AP}{AB} \cdot AB \cdot \frac{QR}{BC} \cdot BC = \frac{AP}{AB} \cdot \frac{QR}{BC} \cdot \left(\frac{1}{2} \cdot AB \cdot BC\right)$.

The right end of the equation contains $\frac{AP}{AB} \cdot \frac{QR}{BC}$ times the area of $\triangle ABC$, and expression that

we are given to be $\frac{1}{2}$ the area of $\triangle ABC$. Therefore, $\frac{AP}{AB} \cdot \frac{QR}{BC} = \frac{1}{2}$. We are given that $\frac{PB}{AP} = a$, so $\frac{AP}{AB} = \frac{1}{a+1}$ and

$\frac{PB}{AB} = \frac{a}{a+1}$, with only the former being important to us. Let $q = \frac{QC}{QA}$, which we wish to be at most $\frac{1}{4}$. By

similarity, $q = \frac{QC}{QA} = \frac{BC-QR}{QR} = \frac{BC}{QR} - 1$, so $\frac{QR}{BC} = \frac{1}{q+1}$. Therefore, $\frac{1}{a+1} \cdot \frac{1}{q+1} = \frac{1}{2}$ and $a + 1 = \frac{2}{q+1}$, so

$a = \frac{2}{q+1} - 1 = \frac{1-q}{1+q}$; symmetrically, $q = \frac{1-a}{1+a}$. Because a is restricted to $0 < a < 1$, that means that q is

restricted to $0 < q < 1$. However, we want to know the fraction of values for which $q \leq \frac{1}{4}$. Now, we must be

extremely careful here. It might now appear that the probability is $\frac{1}{4}$ because the interval $0 < q \leq \frac{1}{4}$ is $\frac{1}{4}$ as wide as the interval $0 < q < 1$. However, we do not know that the various values of q are equally likely over these intervals. We are given only that a is randomly chosen—meaning all values in the specified interval are equally likely; q is not called out as random. The region of interest for q is $0 < q \leq \frac{1}{4}$, which

corresponds to $\frac{3}{5} \leq a < 1$, which is $\frac{1-\frac{3}{5}}{1-0} = \frac{2}{5}$ of the allowed interval for the randomly chosen a , so the

probability is $\frac{2}{5}$. [Because this value is not $\frac{1}{4}$, it demonstrates that the various possible values for q are not equally likely—unlike with a . This is to be expected since the relationship between a and q is non-linear.]

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ times The height of Hyperion, the tallest redwood tree, is 380 feet. The three-year old redwood tree in Paul's backyard is 19 feet tall. The height of Hyperion is how many times the height of Paul's tree?

2. _____ If $y = 2x + 7$ and $x = 2$, what is the value of y ?

3. _____ A bag has one white, two black, three red and four green marbles. If a single marble is randomly drawn from this bag, what is the probability it is black or white? Express your answer as a common fraction.

4. \$ _____ If Jessica works at a fixed hourly rate of pay, as represented by the double number line shown, what is Jessica's total pay for 8 hours of work?

5. _____ points So far, Ricardo has scores of 13, 17, 19 and 21 points for the first four rounds of a dice game. What does he need the total score to be for the next two rounds combined in order to achieve an average score of 20 points per round for all six rounds?

6. _____ cm The length of a particular rectangle is $\frac{2}{5}$ its perimeter. If the length of the rectangle is 12 cm, what is its width?
7. _____ Rico showed his friends a card quickly before hiding it. Dee said the card was the 8 of spades. Todd said it was the 7 of hearts. Nia said it was the 6 of spades. Dee, Todd and Nia were each correct about either the number or the suit, but not both. What number was on the card Rico showed?
8. _____ units² Two vertices of a triangle are at A(1, 5) and B(5, 5) in the coordinate plane. The third vertex, C, is the translation of point B three units down and one unit left. What is the area of triangle ABC?
9. _____ All of Bethany's math quiz scores are displayed in the stem and leaf plot shown. What is the absolute difference between the median and the mode of the 10 scores?

10. _____ What value of n satisfies $(n + 1)! - n! = 4320$?

11. _____ January 1, 2018 was a Monday. What is the next year in which January 1 will fall on a Monday?
12. _____ miles On weekdays Sally rides her bike m miles each day. On each of the two weekend days she rides it 5 miles farther. If Sally rides 94 miles each week, how many miles does she ride each weekday?
13. _____ What is the greatest integer p such that $33!$ has 3^p as a factor?
14. _____ What is the value of $\frac{5! + 6!}{4! + 3!}$?
15. _____ feet A rectangle is twice as long as it is wide. When the lengths of all sides are increased by 3 feet, the area of the new rectangle is triple that of the original rectangle. What is the length of the new rectangle?

16. _____ The sum of six consecutive integers, the least of which is 30, can also be written as a sum of five consecutive integers. What is the greatest of these five integers?

17. _____ If a , b , c and d are positive integers such that $1 - \frac{1}{324} = \frac{a}{b} \cdot \frac{c}{d}$, what is the least possible value of $a + c$?

18. _____ If C is a digit such that the product of the three-digit numbers $2C8$ and $3C1$ is the five-digit number $90C58$, what is the value of C ?

19. _____ The graph of the equation $\frac{(x-3)(y-7)}{(x+1)(2y-5)} = \frac{1}{2}$ is a line missing two points. What is the slope of the line? Express your answer as a common fraction.

20. _____ What is the sum of all the integers x for which $x^2 + 4x \leq 1$?

21. _____ Two points are randomly placed on a number line from -1 to $+1$. What is the probability that the origin lies between the two points? Express your answer as a common fraction.

22. _____ m/s A canary flies directly east 4000 meters at a speed of 20 m/s. It then immediately turns and flies directly north for 3000 meters at a speed of 30 m/s. The canary then flies back to its starting point in a straight line in 100 seconds. What is the average speed of the canary over the entire trip?

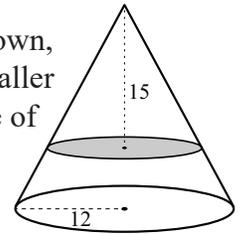

23. _____ If a , b and c are positive integers such that $a - bc = 19$ and $a + bc = 99$, what is the least possible value of $a + b + c$?

24. _____ Eliza creates a custom 6-sided die by randomly choosing six distinct integers from 1 to 7, inclusive, to paint onto the sides of a blank cube. She tells Philip that the faces of her die have a sum of 24. Philip rolls the die. What is the probability that Philip's die shows a prime number on the top face? Express your answer as a common fraction.

25. _____ units What is the greatest possible radius of a circle that passes through the points $(1, 2)$ and $(4, 5)$ and whose interior is contained in the first quadrant of the coordinate plane? Express your answer in simplest radical form.

26. _____ cm A regular tetrahedron is a solid with four equilateral triangular faces. What is the height of a regular tetrahedron with edges of length 5 cm? Express your answer as a common fraction in simplest radical form.

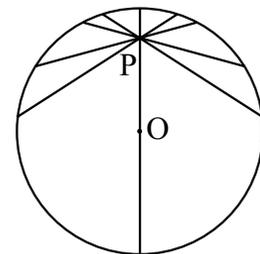

27. _____ cm³ A cone with base radius 12 cm is sliced parallel to its base, as shown, to remove a smaller cone of height 15 cm. If the height of the smaller cone is three-fourths that of the original cone, what is the volume of the remaining frustum? Express your answer in terms of π .

28. _____ units The circles given by the equations $x^2 + y^2 = 169$ and $x^2 + (y - 14)^2 = 225$ have a common chord. How many units long is that chord?

29. _____ Chris flips a coin 16 times. Given that exactly 12 of the flips land heads, what is the probability that Chris never flips five heads in a row? Express your answer as a common fraction.

30. _____ units Point P is the intersection of five distinct chords in circle O as shown. If the distance from P to the circle along each segment of the five chords is an integer, what is the least possible integer radius of circle O?

5. _____ points The Rockets had 6995 possessions during the first 70 basketball games of the season. With those possessions, the team made 1019 baskets worth three points each, 1797 baskets worth two points each and 1421 baskets worth one point each. If only one, two or three points are awarded for making baskets, on average, during those 70 games, how many points did the Rockets score per 100 possessions? Express your answer as a decimal to the nearest thousandth.

6. _____ cm^2 In the figure, square ABCD is divided into eight congruent right triangles and square EFGH, as shown. If the area of square ABCD is 1156 cm^2 and the area of square PQRS is 676 cm^2 , what is the area of square EFGH?

7. _____ Andy has a cube of edge length 8 cm. He paints the outside of the cube red and then divides the cube into smaller cubes, each of edge length 1 cm. Andy randomly chooses one of the unit cubes and rolls it on a table. If the cube lands so that an unpainted face is on the bottom, touching the table, what is the probability that the entire cube is unpainted? Express your answer as a common fraction.

8. _____ The sequence a_n is defined by $a_1 = 20$, $a_2 = 19$ and for $n \geq 3$, $a_n = |a_{n-1}| - |a_{n-2}|$. What is the value of a_{2019} ?

Team Round
Problems 1–10

School _____
Chapter _____
Team _____, Captain
Members _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 10 problems which the team has 20 minutes to complete. Team members may work together in any way to solve the problems. Team members may talk to each other during this section of the competition. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. The team captain must record the team's official answers on his/her own competition booklet, which is the only booklet that will be scored. If the team completes the problems before time is called, use the remaining time to check your answers.

1. _____ If n is a number such that $n^{12} = 216$, what is the value of n^4 ?

2. _____ What is the smallest prime number p for which $2^p - 1$ is composite?

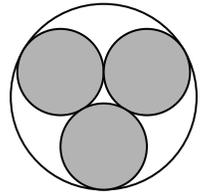

3. _____ The third and fourth terms of a geometric sequence are 100 and 200. What is the first term of the sequence?

4. _____ years Suppose that Martians have eight fingers and use a base-eight (octal) number system. If Marty the Martian says he is 37 years old on Mars, how old is he in Earth's base-ten system?

5. _____ M&Ms Mr. Schwin has a large jar containing M&Ms, each with the letter "m" stamped on it. He removes 1000 candies from the jar, and removes the letter "m" from each one. He then returns all of the M&Ms to the jar. After thoroughly mixing up the candies in the jar, he randomly removes 1000 candies from the jar and finds that 245 of them do not contain the letter "m". What is the expected number of M&Ms in the jar? Express your answer to the nearest whole number.

6. _____

In the figure, three congruent, non-overlapping shaded circles are inside a large circle. The greatest possible value of the ratio of the total area of the shaded regions to the area of the large circle can be expressed in the form $a + b\sqrt{c}$. What is the value of $a + b + c$?

7. _____

If a and b are real numbers with $a - b = 1$, what is the least possible value of $a^5 - b^5$? Express your answer as a common fraction.

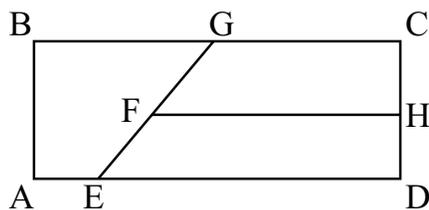

8. _____

If each question mark in the equation shown is replaced with an exponent of either 1 or -1 , what is the least possible value of $|x - 1|$? Express your answer as a common fraction.

$$x = 1^? \times 2^? \times 3^? \times 4^? \times 5^? \times 6^? \times 7^? \times 8^? \times 9^?$$

9. _____ units

In rectangle ABCD, $AB = 4$ units and $BC = 12$ units. Point E is on side AD such that $AE = 2$ units. Segment EG is drawn from point E to point G on side BC, as shown, so that the area of trapezoid ABGE is one-third that of rectangle ABCD. A segment is then drawn parallel to side BC from point F on segment EG to point H on side CD so that trapezoids FGCH and EFHD have equal area. What is the length of segment FH? Express your answer in simplest radical form.

10. _____ %

Amy and Rob are playing a dice game using a 10-sided fair die, with sides numbered 1 through 10. Rob earns 3 points if the number rolled is prime, and Amy earns 2 points if the number rolled is even. After 4 rolls, what is the percent probability that Amy has won more points than Rob? Express your answer to the nearest hundredth.

1. _____ If n is a two-digit positive integer, what is the sum of the digits of $99n$?
2. _____ (seconds) Kei beat Roger in a 5-km race by 13 seconds. If they run a 10-km race, each at the same pace they ran the 5-km race, by how many seconds will Kei beat Roger?
3. _____ Let B equal the sum of the positive integer multiples of 2 less than 40, and let Q equal the sum of the positive integer multiples of 4 less than 40. What is the value of $B - Q$?
4. _____ (integers) How many of the first 100 positive integers are divisible by at least three distinct primes?
5. _____ (dollars) An average orange weighs $\frac{1}{4}$ pound, and releases 1.6 ounces of juice when squeezed. If oranges cost \$1.60 per pound, how much does it cost to buy enough oranges to squeeze 8 ounces of orange juice?
6. _____ The value of $x \star y$ is defined as $\frac{1}{2}xy$. If $(a \star a) \star (a \star a) = a^3$ and $a > 0$, what is the value of a ?
7. _____ The first six terms of an arithmetic sequence are 12, w , x , 33, y , z . What is the value of $w + z$?
8. _____ (coins) The cash register at Puck's Grocery Store has pennies, nickels, dimes and quarters. If Magnus purchases \$19.37 worth of items and pays with a \$20 bill, what is the least number of coins he can receive as exact change?
9. _____ (integers) Consider all of the positive four-digit integers that can be formed using each of the digits 1, 2, 3 and 4 exactly once. How many of these integers have a hundreds digit of 2?
10. _____ (ways) In how many ways can 48 identical lemon drops be divided into two or more groups containing at least two lemon drops each so that each group has the same number of lemon drops?
11. _____ A regular octagon with side length 1 unit has area $2 + 2\sqrt{2}$ units². The area of a regular octagon with side length 3 units can be expressed in simplest radical form as $a(b + \sqrt{c})$ units². What is the value of $a + b + c$?
12. _____ For a particular sequence, each term is the sum of the three preceding terms. If $a, b, c, d, e, 0, 1, 2, 3$ are consecutive terms of this sequence, what is the value of $a + b + c + d + e$?
13. _____ Three positive integers have a sum of 6. What is the least possible value of the sum of their reciprocals? Express your answer as a mixed number.
14. _____ (percent) Each of Marianne's nine chickens is assigned to a different one of the nine nests in a chicken coop. Marianne lets all of the chickens out of the coop to play, and then randomly returns the chickens to the nine nests. What is the percent probability that Marianne returned exactly 8 of the chickens to their assigned nests? Express your answer to the nearest whole number.

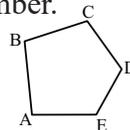

15. _____ (dollars) Tickets to the Glamorous Gaussian band performance cost \$37.50 each, or \$110 for a group of four. How many dollars could Johann save by taking advantage of the group deal to purchase a total of eight tickets?
16. _____ (integers) How many positive integers less than or equal to 33 are divisible by 2, 3 or 11?
17. _____ (circles) Coplanar circles O and P both have radius 1 cm and are tangent to each other. How many circles of radius 2 cm are in this plane and are tangent to both circles O and P?
18. _____ (white balls) A box contains red, white and pink balls. The probability of randomly selecting a red ball from this box is $\frac{5}{16}$. The probability of randomly selecting a white ball is $\frac{3}{8}$. The probability of randomly selecting a pink ball is $\frac{5}{16}$. What is the fewest number of white balls that could be in the box?
19. _____ (prices) All of the items in Sully's store have two-digit positive integer prices. When the cashier accidentally switches the digits of one item's price, the total cost of the purchase increases by \$18. For how many different prices is this possible?
20. _____ (cm³) How many cubic centimeters are in the volume of a rectangular prism whose faces have areas 8 cm², 10 cm² and 12 cm²? Express your answer in simplest radical form.
21. _____ If $x \neq 0$ and $x^2 = y^2$, what is the sum of all possible values of $\frac{x+y}{x}$?
22. _____ (percent) If the integer n is a perfect square from 1 to 2019, inclusive, what is the percent probability that n is within 1 of a multiple of 5? Express your answer to the nearest whole number.
23. _____ (pounds) Five babies were born in Strong Memorial Hospital. Betty weighed a pound more than Alec. Carly weighed five pounds less than twice Betty's weight. Dorothy and Ellen each weighed the average of Betty's and Carly's weights. If Alec weighed 6 pounds, what was the average weight, in pounds, of the five babies? Express your answer as a decimal to the nearest tenth.
24. _____ (inches) A recycle bin has an opening that is 8 inches high and 6 inches wide. What is the greatest possible diameter, in inches, of a rigid circular piece of cardboard that can be pushed through the opening?
25. _____ A three-digit number is formed using each of the digits 1, 3 and 4 exactly once. What is the least such number that is divisible by 7?
26. _____ Four circles, each of radius 6 units, are tangent to each other, as shown. Perpendicular segments can be drawn from the center of each circle to the centers of its two tangent circles. If the area of the gray region can be expressed as $a + b\pi$ units², what is the value of $a - b$?
27. _____ (hours) In the video game Alien Invaders, there are 1700 spaceships. Kylie must swipe the button 15 times to destroy each spaceship. If she swipes the button 375 times per hour, how many hours will it take her to destroy all the spaceships?

28. _____ (pennies) When Christine arranges her pennies in rows of 9, she has 8 pennies left over. When she arranges the same set of pennies in rows of 11, she has 1 penny left over. What is the smallest number of pennies Christine could have?

29. _____ (percent) Ella bought 12 ounces of cashews for the discounted price of \$5.61. If the original cost of the cashews was \$8.80 per pound, what percentage of the original price did Ella pay? Express your answer to the nearest whole number.

30. _____ (degrees) In convex pentagon ABCDE, shown here, the measures of interior angles A, B, C, D and E form an arithmetic progression. If the common difference is 6 degrees, what is the degree measure of the largest of the five interior angles?

31. _____ (baseballs) Sabine purchased some \$7 baseballs and some \$11 softballs. She paid a total of \$215. What is the greatest number of baseballs she could have purchased?

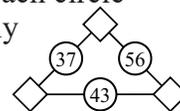

32. _____ Ginny scoops half of a sphere of radius r out of a perfectly cylindrical container of ice cream with radius r and height $2r$. What fraction of the ice cream is left in the container? Express your answer as a common fraction.

33. _____ If two fair six-sided dice are rolled, what is the probability that the sum of the numbers rolled is divisible by 5? Express your answer as a common fraction.

34. _____ (inches) A certain right triangle with integer leg lengths has a hypotenuse of $\sqrt{233}$ inches. In inches, what is the sum of its leg lengths?

35. _____ (liters) A particular toy tea pot is geometrically similar to an actual tea pot made by the same company. The base area of the actual teapot is 150π cm², and the base area of the toy teapot is 24π cm². If the actual tea pot holds 1 liter of liquid, how many liters of liquid does the toy teapot hold? Express your answer as a decimal to the nearest thousandth.

36. _____ Numbers will be placed in the squares shown so that the number in each circle is the sum of the numbers in the two adjacent squares. When correctly filled in, what is the greatest of the numbers placed in the squares?

37. _____ If $m = 2^5 \times 3^7 \times 5^9$, what is the least positive integer n for which the product mn is a perfect cube?

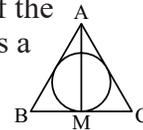

38. _____ (cents) Jill has two cylindrical cans of soup. The can of height 12 cm and diameter 8 cm costs \$5.76. The can of height 10 cm and diameter 6 cm costs \$4.50. What is the absolute difference in the number of cents charged per cubic centimeter between these two cans of soup? Express your answer as a common fraction in terms of π .

39. _____ If $x = \frac{1^3 + 2^3 + 3^3 + 4^3}{1 + 2 + 3 + 4}$, what is the value of x ?

40. _____ What is the largest prime divisor of $3^8 - 1$?

41. _____ If $\frac{4x^2 - 2}{3} = \sqrt{2}$, then the value of $\frac{600}{2x^2 - 1}$ can be expressed in simplest radical form as $a\sqrt{b}$. What is the value of ab ?

42. _____ Let p equal half the circumference of a circle inscribed in equilateral triangle ABC as shown. Let q equal the distance from vertex A to midpoint M of the opposite side. What is the value of the ratio $p:q$? Express your answer as a common fraction in terms of π .

43. _____ Scott is thinking of a positive integer that is one more than, or one less than a multiple of 4. Quincy is thinking of an integer that is one more than, or one less than a multiple of 10. Stella is thinking of an integer with an even number of positive integer divisors. If all three are thinking of the same integer n , what is the least possible value of n ?

44. _____ If $x = \frac{1}{\sqrt{5}} \times \frac{3}{\sqrt{15}} + \frac{2}{\sqrt{5}} \times \frac{1}{\sqrt{15}}$, what is the value of $\frac{1}{x^2}$?

45. _____ (units²) A certain right triangle has perimeter 16, and the sum of the squares of the lengths of its sides is 98. What is the area of this triangle, in square units?

46. _____ If a and b are integers such that $a^2 + b^2 = 61$, $a + b > 0$, $ab < 0$ and $|a| < |b|$, what is the value of a ?

47. _____ Starr rolls two fair six-sided dice. When she adds the two numbers rolled, the sum is an odd number. What is the probability that the sum is 7? Express your answer as a common fraction.

48. _____ (dollars) A blockbuster film earned \$240 million from theaters in the United States. This amount accounts for 30% of the film's total earnings from theaters worldwide. How many dollars did this film earn from theaters outside of the United States?

49. _____ The 3rd and 9th terms of a geometric sequence are 2 and 72, respectively. What is the absolute difference between the 6th and 12th terms of this sequence?

50. _____ (units) Andrea picks one vertex of a unit cube and measures its distance from each of the other vertices of the cube. What is the median of the distances that Andrea measured, in units? Express your answer as a decimal to the nearest tenth.

51. _____ Elsie is one of ten girls who took off two shoes and threw each of them, one at a time, into a pile. If Elsie is blindfolded and randomly selects two shoes from this pile, without replacement, what is the probability that Elsie will select the two shoes that she threw on the pile? Express your answer as a common fraction.

52. _____ What is the value of $(\sqrt{24} - \sqrt{6}) \times (\sqrt{48} + \sqrt{12})$? Express your answer in simplest radical form.

53. _____ (integers) In base five, how many integers greater than 4 have the property that its digits are in strictly decreasing order?

54. _____ If $a = 2$ and $b = 1$, what is the value of $(a - b)(a^2 + b^2)(a^4 + b^4)(a + b)$?
55. _____ What is the units digit of the sum $1 + 2 + 2^2 + 2^3 + \dots + 2^{200}$?
56. _____ (pounds) A 6-foot tall man is blasted with a shrink ray. As a result, his entire body shrinks by a factor of 2, reducing him to 3 feet tall with identical proportions, while maintaining his body density. If the man originally weighed 240 pounds, how many pounds does he weigh after being blasted by the shrink ray?
57. _____ (competitors) The scores of all 60 competitors in a math contest range from 1 to 8 points, inclusive. If the arithmetic mean of their scores is 3 points, what is the greatest number of competitors who could have scored 8 points?
58. _____ (integers) How many integers n satisfy the inequality $|n^2 - n| \leq 2n$?
59. _____ In a coordinate plane, B is the reflection of A(2, 3) about the y -axis, and C is the reflection of B about the x -axis. If D is the image when C is rotated 90 degrees counterclockwise about the origin, what is the sum of the coordinates of D?
60. _____ If $\frac{1+2+3+4+\dots+n}{n} = 8$, what is the value of n ?
61. _____ The least common multiple of 63 and 30 equals a and the least common multiple of 18 and 175 equals b . What is the greatest common factor of a and b ?
62. _____ (ways) Ten students are to be divided into two teams of five for a kickball game. If Jane, Jack and Jill all insist on playing on the same team while Bobby refuses to play on the same team as Billy, in how many ways can the two teams be formed?
63. _____ What is the value of $\frac{13! - 12!}{2 \times 10! + 11! - 10!}$?
64. _____ If the 7-digit number 3,A62,84B is divisible by both 4 and 11, what is the greatest possible value of $A + B$?
65. _____ Sid the magician has a hat containing a rabbit, two identical apples, three identical scarves and four identical wands. Sid randomly pulls four items from the hat, without replacement. What is the probability that the four items are distinct? Express your answer as a common fraction.
66. _____ The sum of the positive square roots of two numbers is 16. What is the sum of the arithmetic mean and the geometric mean of these two numbers?
67. _____ What is the greatest three-digit integer whose digits are all distinct and for which the geometric mean of its digits is an integer?
68. _____ (integers) For how many three-digit odd integers are its digits in increasing order?
69. _____ The graph of the equation $(x + 3)y = x^2 - 9$ passes through distinct points with coordinates $(0, a)$, $(b, 0)$ and $(c, 0)$. What is the value of $a + b + c$?

70. _____ (integers) How many two-digit integers n are there for which $n^5 + n^4$ is a perfect square?
71. _____ (km) Suzy walks 2 km northeast, then 4 km southeast, followed by 6 km southwest. How many kilometers is she from her starting position? Express your answer in simplest radical form.
72. _____ If a and b are positive integers and $a^2 + 6ab + 9b^2 = 100$, what is the sum of all possible values of a ?
73. _____ Suppose a , b and c are distinct perfect squares with $a < b < c$ and $\sqrt{abc} = 12$. If $S = a + b + c$, what is the sum of all possible values of S ?
74. _____ If a , b , c and d are values chosen randomly and without replacement from the set $\{1, 2, 3, 4, 5\}$, what is the probability that $ab - cd = 18$? Express your answer as a common fraction.
75. _____ If $\frac{\sqrt{x} + \sqrt{y}}{\sqrt{x} - \sqrt{y}} = \frac{7}{4}$, what is the value of $\frac{x}{y}$? Express your answer as a common fraction.
76. _____ If $x + y = 2$ and $(x^2 + y^2)^2 + 2xy(x^2 + y^2) = 40$, what is the value of xy ?
77. _____ The *Aurifeuillean* factors of an integer that can be written as $4n^4 + 1$ are often denoted as $L = 2n^2 - 2n + 1$ and $M = 2n^2 + 2n + 1$, where $LM = 4n^4 + 1$ and n is a positive integer. What is the sum of the two Aurifeuillean factors of 40,001?
78. _____ If (x, y) is a solution to the system of equations $3x + 10y = 29$ and $9x + y = 89$, what is the value of $5x + 7y$?
79. _____ What is the least positive integer with at least ten positive integer divisors?
80. _____ The line $y = kx$ is equidistant from the points with coordinates $(1, 3)$ and $(5, 4)$. What value of k minimizes the distance to either point? Express your answer as a common fraction.

MATHCOUNTS®

2019 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2019 MATHCOUNTS® State Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2019 State Sprint Round Solutions

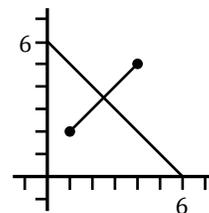

1. Dividing, we get $\frac{380 \text{ ft}}{19 \text{ ft}} = 20$. So, Hyperion is **20** times the height of Paul's tree.
2. Substituting, we get $y = 2x + 7 = 2(2) + 7 = 4 + 7 = \mathbf{11}$.
3. There is a total of $1 + 2 + 3 + 4 = 10$ marbles, of which $1 + 2 = 3$ are black or white, making the probability of black or white $\frac{3}{10}$.
4. According to the number line, Jessica earns \$36 for working 3 hours. So, for working 8 hours, she will earn $\frac{\$36}{3 \text{ h}} \times 8 \text{ h} = \$12 \times 8 = \mathbf{\$96}$ or **96.00**.
5. So far, 4 rounds have been played; playing 2 more yields a total of 6 rounds. To have an average of $20 \frac{\text{pt}}{\text{rd}}$ requires ending up with $20 \frac{\text{pt}}{\text{rd}} \times 6 \text{ rd} = 120$ points, of which $13 + 17 + 19 + 21 = 70$ have already been scored. To achieve a total of 120 points, Ricardo needs to score another $120 - 70 = \mathbf{50}$ points.
6. Let l and w represent the rectangles length and width, respectively. We know that $l = 12$ cm and $P = 2l + 2w = 2(12) + 2w = 24 + 2w$. Based on the first sentence we can we have $l = \frac{2}{5}P$. Now, substituting for l and P , we solve to get $12 = \frac{2}{5}(24 + 2w) \rightarrow 30 = 24 + 2w \rightarrow 2w = 6 \rightarrow w = \mathbf{3}$ cm.
7. Only one of them can be right about the number, so two of them must be wrong about the number, but right about the suit. So, the card must be a spade; otherwise, both Dee and Nia would be wrong about the suit, and both would be right about the number, which is impossible since their numbers are not the same. This contradicts the statement that nobody is wrong about both the suit and number. Furthermore, the number can not be 6 or 8 because that would make Dee or Nia correct about both the suit and number. This contradicts the statement that nobody is correct about both the suit and number. Therefore, the only option left for number, **7**, must be correct.
8. Let \overline{AB} be the base of the triangle. Because the y -coordinates are equal, the base is horizontal. The area of the triangle is half the product of the base times the height, where the height is the perpendicular distance of the third vertex C from the base. The perpendicular to the horizontal is the vertical, so the height is the up-or-down distance of C from the base—a distance given to be 3 (the "one unit left" being irrelevant, as is the direction down versus up). The length of a horizontal line segment is the absolute difference between the x -coordinates, $|1 - 5| = |-4| = 4$. Therefore, the area of the triangle is $\frac{1}{2}(4)(3) = \mathbf{6}$ units².
9. The only score occurring more than once is 87, so that is the mode. There are 10 scores (an even number), so the median score is the average of the scores of ranks $\frac{10}{2} = 5$ and rank $\frac{10}{2} + 1 = 6$. They are 83 and 87, with an average of $83 + \frac{1}{2}(87 - 83) = 83 + 2 = 85$. The absolute difference of the median and the mean is $|85 - 87| = |-2| = \mathbf{2}$.
10. For $n \geq 2$, $n! < (n + 1)! - n! < (n + 1)!$ We have that $6! = 720 < 5040 = 7!$ (knowing this through either memorization of the lower factorials or a quick hand calculation). Therefore, n must be 6. We confirm this by checking: $7! - 6! = 5040 - 720 = 4320$. Thus, $n = \mathbf{6}$.

11. Ordinary calendar years have 365 days, which is 52 weeks and 1 day; however, nominally every fourth year (called leap years, those year numbers divisible by 4) has an extra day (called leap day—a 29th day added to February), giving leap years 52 weeks and 2 days. [NOTE: The rules for a year being a leap year are actually more complicated than this, but the simple rule of divisibility by 4 will give you the correct result until 2100.] Therefore, to get to the first day of 2019, one starts off 2018 (which is an ordinary year) on a Monday. When a whole number of weeks pass (such as 52 weeks), the next day will be the same day of the week we started on, in this case Monday. However, there is 1 more day in the year, resulting in the next year starting on a Tuesday, so 2019 starts on a Tuesday. Since 2019 is an ordinary year, 2020 starts 1 day of the week later, Wednesday. Now 2020 is divisible by 4 and is thus a leap year, so we must advance 2 days of the week for 2021, which starts on a Friday. Since 2021 is an ordinary year, 2022 starts 1 day of the week later, Saturday. Since 2022 is an ordinary year, 2023 starts 1 day of the week later, Sunday. Since 2023 is an ordinary year, 2024 starts 1 day of the week later, Monday, which is our goal. Therefore, the answer is **2024**.
12. Sally rides 5 weekdays at a rate of m miles/day, and she rides 2 weekend days at a rate of $(m + 5)$ miles/day. Therefore, the total for one week is $5m + 2(m + 5) = 5m + 2m + 10 = (7m + 10)$ miles. Since Sally rides 94 miles each week, that means $7m + 10 = 94 \rightarrow 7m = 84 \rightarrow m = \mathbf{12}$ miles.
13. For $33!$, we have $1/3$ of the integers from 1 to 33, inclusive, divisible by 3, or $33/3 = 11$ integers. So, 11 of the factors are contributing a factor of 3. Of those 11, every third one is contributing a second factor of 3, or $11/3 = 3$ integers (must round down because we have not reached the fourth, which would be 36). Of those 3, every third one contributes a third factor of 3, or $3/3 = 1$ integer. If that resulted in a count of at least 3, we would keep repeating the process until we got to less than 3. Totalling all of these gives us $11 + 3 + 1 = 15$ factors of 3 in $33!$, so $p = \mathbf{15}$.
14. The expression $\frac{5!+6!}{4!+3!}$ can be rewritten as $\frac{5!+6 \times 5!}{4 \times 3!+3!}$. Simplifying, we get $\frac{7 \times 5!}{5 \times 3!} = \frac{7 \times 4!}{3!} = 7 \times 4 = \mathbf{28}$.
15. If the original rectangle has dimensions $l \times w$, then the new rectangle has dimensions $(l + 3) \times (w + 3)$. The area of the original rectangle is lw , and the area of the new rectangle is $lw + 3(l + w) + 9$. We are told that the new rectangle's area is three times that of the original rectangle. So, $3lw = lw + 3(l + w) + 9 \rightarrow 2lw - 3(l + w) - 9 = 0$. Since we know that $l = 2w$, we can substitute to get $2(2w^2) - 3(3w) - 9 = 0 \rightarrow 4w^2 - 9w - 9 = 0$. We can solve this equation by factoring the quadratic expression as follows: $(4w + 3)(w - 3) = 0$. So, $4w + 3 = 0 \rightarrow 4w = -3 \rightarrow w = -3/4$, or $w - 3 = 0 \rightarrow w = 3$. Since width must be a positive value, it follows that the original rectangle has width 3 feet and length $2(3) = 6$ feet. Recall that the new rectangle's length is 3 feet more than the original rectangle's length, or $6 + 3 = \mathbf{9}$ feet.
16. The original six consecutive integers are 30, 31, 32, 33, 34 and 35, with sum is $\frac{6}{2}(30 + 35) = 195$. The five consecutive integers we're looking for must have $\frac{195}{5} = 39$ as the mean and median. Therefore, the greatest integer is 2 more than 39, or **41**.
17. Simplifying, the left side of the equations yields $1 - \frac{1}{324} = \frac{323}{324} = \frac{(18+1)(18-1)}{18^2} = \frac{17}{18} \times \frac{19}{18}$. When we want to minimize a sum for a given product, in general the strategy is to make the values as close together as possible, and, indeed, $17 + 19 = \mathbf{36}$ works.
18. Let's work with just the rightmost two digits. For the units digit, $8 \times 1 = 8$ does not impact the tens digit. To get the tens digit of the product, we need to cross-multiply the units and tens digits of the two factors: $C \times 1 + 8 \times C = 9C$ must end in 5. The only digit C for which that works is $C = \mathbf{5}$.

19. The graph of $\frac{(x-3)(y-7)}{(x+1)(2y-5)} = \frac{1}{2}$ has two “missing” points at $x = -1$ and $y = 5/2$ because division by 0 is undefined. If we cross-multiply, we get $2(x-3)(y-7) = (x+1)(2y-5)$. For either of the two “problematic” values, the right side of the equation is 0, so the left side must be likewise 0. When $x = -1$, that means $y = 7$; the only other option would be $x = 3$, but that cannot be the case when x is already -1 . Similarly, when $y = \frac{5}{2}$, that means $x = 3$. Therefore, the two problematic points are $(-1, 7)$ and $(3, \frac{5}{2})$. These two points are problematic because of division by 0, but would otherwise have been on the line; therefore, the slope of the line in question is the same as the slope of the line containing these two points:
- $$\frac{\frac{5}{2}-7}{3-(-1)} = \frac{5-7 \times 2}{4 \times 2} = -\frac{9}{8}.$$
20. For a parabola given by $Ax^2 + Bx + C = 0$, the axis of symmetry is the line $x = -\frac{A}{2B}$. Consider the parabola whose equation is $y = x^2 + 4x$, where $A = 1$, $B = 4$ and $C = 0$. The vertical axis of symmetry for this parabola is at $x = -\frac{4}{2 \times 1} \rightarrow x = -2$. We quickly see that $x = 0$ satisfies the inequality since $0^2 + 4 \times 0 \leq 1$, but $x = 1$ does not since $1^2 + 4 \times 1 > 1$. Therefore, the greatest integer solution occurs when $x = 0$, which is two more than $x = -2$; by symmetry the least integer solution occurs when $x = -4$, which is 2 less than $x = -2$. Integer solutions occur for all x in the set $\{-4, -3, -2, -1, 0\}$. Their sum is $-4 + (-3) + (-2) + (-1) + 0 = -10$.
21. Because the interval is symmetric about 0, the probability of being on any one side of 0 is $1/2$. The probability of being exactly at 0 is regarded as exactly 0, so we do not need to account for that one point. If an event cannot happen, the probability of that event happening is indeed 0; however, the converse is *not* necessarily true, as in this case—choosing 0 is indeed a possible outcome but it has probability 0, the same as choosing any other specific point in the interval. The probability of the first point being negative and the second point positive is $\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$; the same occurs for the first point being positive and the second point negative. Therefore, the total probability is $\frac{1}{4} + \frac{1}{4} = \frac{1}{2}$. [NOTE: Some might argue that the problem is more trivial than that—namely, that the second point is either on the same side or the opposite side, each with probability $1/2$, and we want the case of the opposite side. However, that works only for the case of the breakpoint being at the center of the interval, as happens in this problem that 0 is at the midpoint between -1 and $+1$. This solution is more general and works for asymmetric cases as well, where the answer is not $1/2$. The computation with this solution is slightly slower, which is offset by not spending time verifying that the conditions required for the faster solution are met. It is a matter of individual preference.]
22. Average speed equals total distance divided by total time. There are three parts to the trip. Going east and going north are perpendicular motions, so those two motions form the legs of a right triangle. We are given that the legs are 4000 m and 3000 m, thus forming a 3-4-5 right triangle with scale factor 1000 m. The third part of the trip is a hypotenuse of $5 \times 1000 \text{ m} = 5000 \text{ m}$. This makes the total distance for the trip $4000 + 3000 + 5000 = 12,000 \text{ m}$. The time for the first part is $\frac{4000\text{m}}{20\text{m/s}} = 200 \text{ s}$ and for the second part is $\frac{3000\text{m}}{30\text{m/s}} = 100 \text{ s}$. We are told that the third part takes 100 s. So, the total time is $200 + 100 + 100 = 400 \text{ s}$. The result is an average speed of $\frac{12\,000 \text{ m}}{400 \text{ s}} = 30 \text{ m/s}$.
23. Adding the two equations $a - bc = 19$ and $a + bc = 99$ yields $2a = 118$. So, $a = 59$, which means $bc = 40$. The sum of two numbers is minimized for a fixed product when the two numbers are as close in value as possible. Neither 6 nor 7 divides 40, so $5 \times 8 = 40$ is the best we can do in the domain of the integers. That gives us the minimum sum $59 + 5 + 8 = 72$.

24. We have for the six faces the sum of the integers 1 through 7, inclusive, except for the one missing value m , and that sum is given to be 24. Therefore, $24 = 1 + 2 + 3 + 4 + 5 + 6 + 7 - m = 28 - m$. So, $m = 4$, and the six faces are 1, 2, 3, 5, 6, 7, of which four values (2, 3, 5, 7) are prime, making the probability of rolling a prime to be $\frac{2}{3}$.

25. The goal is to find the largest circle that contains the points (1, 2) and (4, 5), and is tangent to either the x -axis or the y -axis, whichever is closer. The center of the circle must be along the perpendicular bisector of the two given points. The slope of the given line segment is $\frac{5-2}{4-1} = 1$. So, the slope of the perpendicular bisector is the negative reciprocal of that, or -1 . The perpendicular bisector must go through the midpoint of the given segment, $(\frac{1+4}{2}, \frac{2+5}{2}) = (\frac{5}{2}, \frac{7}{2})$. The center of the circle, then, must be on the line $y = 6 - x$, and, for the circle to be in the first quadrant, $0 < x < 6$. The square of the distance between $(x, 6 - x)$ and each of (1, 2) and (4, 5) is $(x - 1)^2 + (x - 4)^2 = 2x^2 - 10x + 17$. For the circle to be tangent to the nearest axis, this value needs to match the square of the distance to the nearest axis. The nearest axis is the y -axis when $0 < x < 3$ and the square of that distance is x^2 . The nearest axis is the x -axis when $3 < x < 6$ and the square of that distance is $(x - 6)^2 = x^2 - 12x + 36$. We can observe from the figure that the given line segment is above the line $y = x$ that bisects the first quadrant, so there is more room to place a larger circle between that segment and the nearest axis below the segment than above the segment. So, the second case will yield the larger circle. Thus, we need $2x^2 - 10x + 17 = x^2 - 12x + 36$, so $x^2 + 2x - 19 = 0$. The quadratic formula yields $x = \frac{-2 \pm \sqrt{4+76}}{2} = -1 \pm 2\sqrt{5}$. Only the $+$ option yields the requisite $3 < x < 6$. Therefore, $x = -1 + 2\sqrt{5}$ and $y = 6 - x = 7 - 2\sqrt{5}$. The y -component is the needed radius, so the result is $7 - 2\sqrt{5}$ units.

26. A handy fact to know for MATHCOUNTS is that the volume of a regular tetrahedron with edge length s is given by $V = \frac{\sqrt{2}}{12} s^3$. In general, the volume of a tetrahedron with a triangular face of area A and perpendicular height with respect to that base h is given by $V = \frac{1}{3} hA$. Recall for a regular tetrahedron that each face is an equilateral triangle satisfying with area $A = \frac{\sqrt{3}}{4} s^2$. We can rewrite the formula $\frac{1}{3} hA$ as $\frac{1}{3} \times h \times \frac{\sqrt{3}}{4} s^2 = \frac{\sqrt{3}}{12} s^2 h$. We can equate the two expressions for the volume of this tetrahedron to get $\frac{\sqrt{2}}{12} s^3 = \frac{\sqrt{3}}{12} s^2 h$. Simplifying, we see that $h = \frac{\sqrt{6}}{3} s$. Since this tetrahedron has edge length $s = 5$ cm, we can substitute to get $h = \frac{5\sqrt{6}}{3}$ cm.

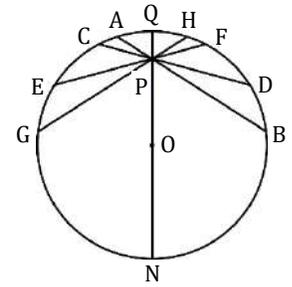

27. The height of the original cone is $(\frac{1}{3/4}) 15 = (\frac{4}{3}) 15 = 20$ cm. The radius of the original cone is given to be 12 cm. Therefore, the volume of the original cone is $\frac{1}{3} \times \pi \times 12^2 \times 20 = 960\pi$ cm³. The volume of two similar figures is proportional to the cube of the relative linear scaling. The smaller cone is $\frac{3}{4}$ as tall as the original cone, so the volume of the smaller cone is $(\frac{3}{4})^3 = \frac{27}{64}$ the volume of the original cone. The volume of the frustum is the rest of the volume of the original cone, so $(1 - \frac{27}{64}) 960\pi = \frac{37}{64} \times 960\pi = \frac{37}{8} 120\pi = 37 \times 15\pi = 555\pi$ cm³.

28. The equations of the two circles are $169 = x^2 + y^2$ and $225 = x^2 + (y - 14)^2 = x^2 + y^2 - 28y + 196$. When the second equation is subtracted from the first we get $-56 = 28y - 196$, so $28y = 140$ and $y = 5$. Thus, $y = 5$ is the equation of the line containing the common chord. Substituting into the first equation yields $169 = x^2 + 25$, so $x^2 = 144$ and $x = \pm 12$ for the endpoints of the common chord. Because both endpoints have the same y -coordinates, the length of the chord is the absolute difference between the two x -coordinates: $|12 - (-12)| = \mathbf{24}$ units.
29. Since 12 of the 16 coin flips, land heads up, it follows that 4 must land tails up. These 4 tails can occur in a mix of various patterns: as the first flips, as the last flips, or as separators between runs of heads up. With up to 4 such separators, there cannot be more than 5 runs of heads up. Because there are 12 flips that land heads up but no runs of more than 4 heads, there must be at least 3 runs of heads up. We need to account for the number of permutations of each pattern of runs of heads up and similarly of each pattern of runs of tails up. We will account for the runs of heads up by setting up patterns systematically starting with the longest possible runs and working down in sizes from right to left. For tails, we will look at how many flips land tails up before the first that lands heads up (may be 0, 1 or 2), how many flips land tails up between consecutive runs of heads (may be 1, 2 or 3), and how many flips land tails up after the last flip that lands heads up (may be 0, 1 or 2), with the sum of these values needing to be exactly 4. When there are 3 runs of heads up, we have the following possibilities: 2 1 1 0; 1 1 1 1; 0 1 1 2; 1 2 1 0; 1 1 2 0; 0 2 1 1; 0 1 2 1; 0 3 1 0; 0 2 2 0; 0 1 3 0—a total of 10 possibilities. When there are 4 runs of heads up, we have the following possibilities: 1 1 1 1 0; 0 1 1 1 1; 0 2 1 1 0; 0 1 2 1 0; 0 1 1 2 0—a total of 5 possibilities. When there are 5 runs of heads up, we have only the 1 possibility: 0 1 1 1 1 0. Now let's set up an organized table with the patterns of runs of heads up, the number of permutations of each pattern, the count of patterns of associated runs of tails up based on findings above, and the overall count of arrangements of those patterns:

| heads up pattern | # permutations of pattern | # associated tails up patterns | total # arrangements |
|------------------|----------------------------|--------------------------------|----------------------|
| 4 4 4 | $\frac{3!}{3!} = 1$ | 10 | 10 |
| 4 4 3 1 | $\frac{4!}{2!1!1!} = 12$ | 5 | 60 |
| 4 4 2 2 | $\frac{4!}{2!2!} = 6$ | 5 | 30 |
| 4 4 2 1 1 | $\frac{5!}{2!1!2!} = 30$ | 1 | 30 |
| 4 3 3 2 | $\frac{4!}{1!2!1!} = 12$ | 5 | 60 |
| 4 3 3 1 1 | $\frac{5!}{1!2!2!} = 30$ | 1 | 30 |
| 4 3 2 2 1 | $\frac{5!}{1!1!2!1!} = 60$ | 1 | 60 |
| 4 2 2 2 2 | $\frac{5!}{1!4!} = 5$ | 1 | 5 |
| 3 3 3 3 | $\frac{4!}{4!} = 1$ | 5 | 5 |
| 3 3 3 2 1 | $\frac{5!}{3!1!1!} = 20$ | 1 | 20 |
| 3 3 2 2 2 | $\frac{5!}{2!3!} = 10$ | 1 | 10 |
| Total | — | — | 320 |

Thus, 320 possible cases meet our criteria. There are a total of $\frac{16!}{12!4!} = \frac{16 \times 15 \times 14 \times 13}{4 \times 3 \times 2 \times 1} = 2 \times 5 \times 14 \times 13 = 1820$ total cases in all. So, the desired probability is $\frac{320}{1820} = \frac{16}{91}$.

30. In order to obtain the least possible integer radius satisfying all of the specified criteria, we will need to have the figure be symmetric about the NQ axis so that chords \overline{AB} and \overline{HG} are congruent (and their corresponding subsegments), as are chords \overline{CD} and \overline{FE} . The statement of the problem does not forbid such an outcome; otherwise, so many chords and segments all having to be different lengths would necessitate numbers with so many distinct factors as to fail being a least result. Therefore, we may ignore chords \overline{EF} and \overline{GH} as redundant. In order to have the radius (such as segment \overline{OQ}) be an integer, the diameter \overline{NQ} must have an even integer measure, so that segments \overline{NP} and \overline{PQ} must both have even integer measures or both have odd integer measures. The measures of the various segments must be integers satisfying $PQ < PA = PH < PC = PF < PD = PE < PB = PG < PN$. Thus, we must find six distinct integer values satisfying all the specified conditions, as well as the intersecting chords theorem, which says that $PA \times PB = PC \times PD = PQ \times PN$. Thus, there needs to be an underlying integer that has at least six distinct factors. We must keep in mind our restriction that PQ and PN must both be odd or both be even, meaning we have two cases to contend with.

Case 1: When PQ and PN are both odd, the minimum such underlying integer must itself be odd. The least odd positive integer having six or more factors is $3^2 \times 5 = 45$, so that $PQ = 1$ and $PN = 45$, with the radius of the circle being $(1 + 45)/2 = 23$. Incidentally, $PA = 3$, $PB = 15$, $PC = 5$ and $PD = 9$.

Case 2: When PQ and PN are both even, the least factor we are regarding, PQ , is at least 2. However, 1 is always a factor as is its counterpart $PQ \times PN$. That means we are ignoring at least 2 factors besides the six that we are processing, so our underlying number must have at least eight factors. The least positive integer having eight or more factors is $2^3 \times 3 = 24$. The least even factor is 2, with its counterpart being $24/2 = 12$. That yields a radius of $(2 + 12)/2 = 7$. As a side note, $PA = 3$, $PB = 8$, $PC = 4$, and $PD = 6$.

Case 2 yields the least possible integer radius of circle O , which is 7 units.

2019 State Target Round Solutions

1. Because $1 \text{ ft} = 12 \text{ in}$, the dimensions of the drawing are $\frac{3}{4} \text{ ft} \times 1 \text{ ft}$, for an area of $\frac{3}{4} \text{ ft}^2$. We are told that the actual area of 768 ft^2 . The ratio of the actual area to the drawing area is $\frac{4}{3} \times 768 = 1024$, making the ratio for a linear dimension $\sqrt{1024} = 32$. Thus, the longer side of the drawing is 1 ft , which corresponds to an actual length of $32 \times 1 \text{ ft} = \mathbf{32}$ feet.
2. Here we are to find the area of a polygon knowing the x - and y -coordinates of the vertices in order around the polygon; in this case, we have a triangle, meaning three vertices. There is a great algorithm, over 200 years old, for handling this problem, namely, the Gauss area formula, also known as the surveyor's formula and, more recently and affectionately among the MATHCOUNTS world, the shoelace theorem. Arrange the coordinate pairs of the vertices in a vertical stack of (x, y) values. Start at any vertex and follow the edges of the polygon from vertex to vertex and record its coordinates and the coordinates of each vertex as encountered until you reach the starting vertex and record its coordinates once more. You may go either direction around the polygon, with the direction affecting only the sign of the result, so we express the formula with an absolute value to avoid caring about direction. It is important that you remember to have the last ordered pair in the stack be the same as the first ordered pair. In this case vertex O is at the origin; when such happens, it is best to start and end at that vertex. Doing so guarantees that the formula will contribute 0 at the first step and last step. For this particular triangle, let's take the vertices in the order O-B-A-O:
(0, 0) [O]
(12, 9) [B]
(6, 12) [A]
(0, 0) [O].
The process is now to take every consecutive pair of vertex coordinates, referring to them generically as
 $\begin{array}{l} (a, b) \\ \times \\ (c, d) \end{array}$
Now cross-multiply ad and bc , and subtract to get $ad - bc$, calculate this for each consecutive pair, add those results, take absolute value and divide by 2 [the absolute value being only upon computing the sum of the values over the vertices, *not* for the value at each pair of vertices]:
OB: $0 \times 9 - 0 \times 12 = 0$;
BA: $12 \times 12 - 9 \times 6 = 144 - 54 = 90$;
AO: $6 \times 0 - 12 \times 0 = 0$. [See why starting with a vertex at the origin simplifies calculations.]
Sum: $0 + 90 + 0 = 90$, for which the absolute value is 90.
Dividing by 2 yields a final area of $\frac{90}{2} = \mathbf{45}$ units².
3. Because harvesting is allowed from September 1 through April 30, that means harvesting is not allowed May 1 through August 31 (must remember how many days are in each month). Since May, July and August each have 31 days, but June has 30 days, that means that an interval of $(3 \times 31 + 30) = 123$ days. There are 365 days in an ordinary calendar year. Therefore, the fraction of time in an ordinary year in which harvesting is not allowed is $\frac{123}{365} \approx 0.337 = \mathbf{33.7\%}$. [NOTE: The varying number of days across the various months means that we cannot simply say it is 4 months out of 12 months for the level of accuracy needed.]
4. To have an odd number of positive factors requires a number to be a perfect square.
Because $\sqrt{2018} = 44.9\dots$, there are $\mathbf{44}$ perfect squares between 1 and 2018, inclusive.

5. The average number of points per possession is $\frac{1019 \times 3 \text{ pt} + 1797 \times 2 \text{ pt} + 1421 \times 1 \text{ pt}}{6995 \text{ poss}} = \frac{8072 \text{ pt}}{6995 \text{ poss}} \approx 1.15397 \frac{\text{pt}}{\text{poss}}$. For 100 possession, the average number of points is 100 times this value, or **115.397 pt**.
6. The area of square PQRS is less than the area of square ABCD by the sum of the areas of the 4 congruent right triangles APS, BQP, CRQ and DSR—a difference equal to $1156 \text{ cm}^2 - 676 \text{ cm}^2 = 480 \text{ cm}^2$. The area of square EFGH is less than the area of square PQRS by the sum of the areas of the 4 congruent right triangles HSP, EPQ, FQR and GRS, which are congruent with the 4 right triangles APS, BQP, CRQ and DSR, making the difference in area between squares PQRS and EFGH also equal to 480 cm^2 . Therefore, the area of square EFGH is $676 \text{ cm}^2 - 480 \text{ cm}^2 = \mathbf{196 \text{ cm}^2}$.
7. When a cube is subdivided along each of the three face-centered axes into n congruent slabs, a block composed of n^3 congruent smaller cubes is formed. Each of those smaller cubes has 6 faces, resulting in a total of $6n^3$ faces. Only the outer surface—the 6 faces—of the original cube is painted. Each of the 6 faces of the original cube involves 1 face from each of the n^2 smaller cubes making up the larger face, yielding $6n^2$ smaller faces that are painted, with the remaining $6n^3 - 6n^2$ smaller faces unpainted. Removing the outer layer on each face yields an $(n - 2) \times (n - 2) \times (n - 2)$ cube of totally unpainted smaller blocks, with $6(n - 2)^3$ unpainted smaller faces. Thus, with each of the $6n^3 - 6n^2 = 6(n^3 - n^2)$ unpainted smaller faces equally likely, of which $6(n - 2)^3$ correspond to completely unpainted smaller cubes, the probability of landing on a completely unpainted small cube upon landing on an unpainted smaller face is $\frac{(n-2)^3}{n^3-n^2}$.
- When $n = 8$, this probability is $\frac{6^3}{8^3-8^2} = \frac{216}{512-64} = \frac{216}{448} = \frac{27}{56}$.
8. We are told that $a_1 = 20$ and $a_2 = 19$. We can derive the remainder of the terms of the sequence using the definition $a_n = |a_{n-1}| - |a_{n-2}|$. The table shows the first 12 terms of the sequence:

| | | |
|----------------|---------------|---------------|
| $a_1 = 20$ | $a_2 = 19$ | $a_3 = -1$ |
| $a_4 = -18$ | $a_5 = 17$ | $a_6 = -1$ |
| $a_7 = -16$ | $a_8 = 15$ | $a_9 = -1$ |
| $a_{10} = -14$ | $a_{11} = 13$ | $a_{12} = -1$ |

We are taught to look for patterns, but we must be careful about assuming the “most obvious” pattern is correct, especially when dealing with non-linear behavior—absolute value might look to be close to linear, but it most certainly is not. The repeated increase by 2 in the left column (except for minor sign issue of the first term), decrease by 2 in the middle column and apparent constancy of the right column might not hold when the left or middle column crosses 0. Let’s use this pattern to accelerate getting near this crossing:

| | | |
|------------------------------------|------------------------------------|------------------------------------|
| $a_{28} = -1 - 3 = 1 - 3 = -2$ | $a_{29} = -2 - -1 = 2 - 1 = 1$ | $a_{30} = 1 - -2 = 1 - 2 = -1$ |
| $a_{31} = -1 - 1 = 1 - 1 = 0$ | $a_{32} = 0 - -1 = 0 - 1 = -1$ | $a_{33} = -1 - 0 = 1 - 0 = 1$ |

Look at that sudden sign flip. Let’s continue to see what happens.

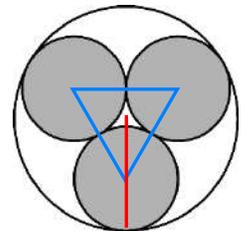

| | | |
|-----------------------------------|-----------------------------------|-----------------------------------|
| $a_{34} = 1 - -1 = 1 - 1 = 0$ | $a_{35} = 0 - 1 = 0 - 1 = -1$ | $a_{36} = -1 - 0 = 1 - 0 = 1$ |
|-----------------------------------|-----------------------------------|-----------------------------------|

We have two consecutive rows with the exact same sequence of values. That will continue to hold. Because 2019 is divisible by 3, a_{2019} falls in the right column, with value **1**.

2019 State Team Round Solutions

1. We are told that $n^{12} = 216$, and we know that $n^4 = n^{12/3} = (n^{12})^{1/3}$. So, it follows that $(n^{12})^{1/3} = 216^{1/3} = \sqrt[3]{216} = 6$.
2. Let's try substituting prime numbers (in ascending order) for p in $2^p - 1$ and stop when the result is composite. For $p = 2$, we have $2^2 - 1 = 3$, which is prime. For $p = 3$, we have $2^3 - 1 = 7$, which is prime. For $p = 5$, we have $2^5 - 1 = 31$, which is prime. For $p = 7$, we have $2^7 - 1 = 127$, which is prime. For $p = 11$, we have $2^{11} - 1 = 2047$, which equals 23×89 , so it must be composite. Thus, **11** is the answer.
3. The fourth term, 200, is 2 times its predecessor, the third term, of 100. Therefore, the common ratio of this geometric sequence is 2, meaning that each term has a successor 2 times as big and a predecessor (except for the first term) $1/2$ as big. The first term is the second predecessor of the third term, so its value is $\left(\frac{1}{2}\right)\left(\frac{1}{2}\right)100 = \mathbf{25}$.
4. Just as 37 as a base-ten number means $3 \times 10^1 + 7 \times 10^0 = 3 \times 10 + 7 \times 1 = 37$, so 37 as a base-eight number means $3 \times 8^1 + 7 \times 8^0 = 3 \times 8 + 7 \times 1 = 24 + 7 = \mathbf{31}$ years in base ten.
5. When 1000 M&Ms are randomly drawn from the jar and 245 of them do not have the "m," that means our best estimator of the probability of a candy not having the "m" is $245/1000 = 0.245$. Thus, if there are n M&Ms in total, then we expect that $0.245n$ M&Ms should not have the "m." But we know that the number of M&Ms without the "m" is 1000, so it follows that $0.245n \approx 1000$. Since there are an integer number of M&Ms, we see that $n \approx 1000/0.245 \approx \mathbf{4082}$ M&Ms are expected to be in the jar.

6. Let r and R represent the radius of the smaller circles and the large circle, respectively. The centers of the smaller circles form the vertices of an equilateral triangle whose centroid is the center of the large circle. The sides of the equilateral triangle are $2r$ so the altitude of the triangle (which is also a median of the triangle) has length $\sqrt{3}/2 \times 2r = \sqrt{3}r$. The radius of the large circle is one radius of a small circle plus the distance from a vertex to the centroid of the triangle. The distance from a triangle vertex to its centroid is $2/3$ of the length of the median, in this case $(2/3)\sqrt{3}r$. Thus, $R = \left(1 + (2/3)\sqrt{3}\right)r$. The requested ratio is the area of three small circles divided by the area of the large circle, or $3\pi r^2/\pi R^2$. Substituting for R , we get

$$\begin{aligned} \frac{3\pi r^2}{\pi R^2} &= \frac{3r^2}{\left(1 + \frac{2}{3}\sqrt{3}\right)^2 r^2} = \frac{3}{\left(1 + \frac{2}{3}\sqrt{3}\right)^2} = \frac{3\left(1 - \frac{2}{3}\sqrt{3}\right)^2}{\left(1 + \frac{2}{3}\sqrt{3}\right)^2 \left(1 - \frac{2}{3}\sqrt{3}\right)^2} = \frac{3\left(1 - \frac{4}{3}\sqrt{3} + \frac{4}{3}\right)}{\left(1 - \frac{4}{3}\right)^2} = 9(3 - 4\sqrt{3} + 4) \\ &= 63 - 36\sqrt{3}. \end{aligned}$$

If $a + b\sqrt{c} = 63 - 36\sqrt{3}$, then $a = 63$, $b = -36$, $c = 3$. So, $a + b + c = 63 - 36 + 3 = \mathbf{30}$.

7. Since $a - b = 1$, we can let $a = c + \frac{1}{2}$ and let $b = c - \frac{1}{2}$. Then, using the binomial theorem, we have $a^5 - b^5 = \left(c + \frac{1}{2}\right)^5 - \left(c - \frac{1}{2}\right)^5 = c^5 + \frac{5}{2}c^4 + \frac{5}{2}c^3 + \frac{5}{4}c^2 + \frac{5}{16}c + \frac{1}{32} - \left(c^5 - \frac{5}{2}c^4 + \frac{5}{2}c^3 - \frac{5}{4}c^2 + \frac{5}{16}c - \frac{1}{32}\right) = 5c^4 + \frac{5}{2}c^2 + \frac{1}{16}$. The first two terms are always at least 0, with the least value 0 occurring if and only if $c = 0$. Thus, the least possible value of $a^5 - b^5$ is $\frac{1}{16}$.

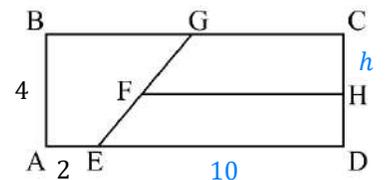

8. We need to find two positive factors n and d of $9! = 362,880 = 2^7 \times 3^4 \times 5 \times 7$ such that $nd = 9!$, with n and d as close to each other as possible. In order for $x = n/d$ to minimize $|x - 1|$, we need $n \leq d$, because $\left| \frac{\min(n,d)}{\max(n,d)} - 1 \right| \leq \left| \frac{\max(n,d)}{\min(n,d)} - 1 \right|$, with equality holding if and only if $n = d$, and this holds for all positive real numbers n and d . Because $\sqrt{9!} = 602.395 \dots$, we thus need $n \leq 602$ and $d \geq 603$. We need to be very careful in seeking the answer because $9!$ has $(7 + 1) \times (4 + 1) \times (1 + 1) \times (1 + 1) = 160$ factors, so that there are 80 pairs (n, d) —that is too many to determine all the pairs but we need to make sure we do not miss the key pair. There is only one factor of 5 and one of 7, so let's see whether they go in the numerator or denominator.

Case 1: Both 5 and 7 are in the numerator or both are in the denominator: Because $602/35$ is between 17 and 18, we know that $35 \times 17 = 595$ and $35 \times 18 = 630$ bound 602. Now, 630 is indeed a factor of $9!$ since $18 = 2^1 \times 3^2$ divides $2^7 \times 3^4$. However, the prime value 17 makes 595 not work because 17 is not a factor of $9!$; the largest value that works is $35 \times 16 = 560$. This case generates two possible pairs: $(576, 630)$ and $(560, 648)$, with the two values in the first pair being the ones closer to equal.

Case 2: One of 5 and 7 is in the numerator and the other is in the denominator: The closest we can come to making the numerator and denominator equal in this case is to put all four factors of 3 with the 7 and all seven factors of 2 with the 5 to yield the pair $(568, 640)$.

The components of $(576, 630)$ in Case 1 are closer to equal than those of $(568, 640)$ in Case 2. Therefore, $n = 576, d = 630$ and $x = \frac{576}{630} = \frac{32}{35}$, for which $|x - 1| = \frac{3}{35}$.

9. We are given that $AB = 4$, and that $AE = 2$, which combined with $AD = BC = 12$ means that $ED = 10$, and the area of the rectangle $ABCD$ is $12 \times 4 = 48$. The area of trapezoid $AEGB$ is given by the product of AB times the average of AE and BG ; this area is given as being $1/3$ the area of rectangle $ABCD$, or 16. Thus, $16 = 4 \times \frac{2+BG}{2}$, so $8 = 2 + BG$, meaning that

$BG = 6$ and $GC = 6$ since their sum is 12. The area of trapezoid $DEGC$ is the area of rectangle $ABCD$ minus the area of trapezoid $AGEB$, so 32. We are to find the vertical placement of \overline{FH} so that trapezoids $FHCG$ and $EDHF$ each have area $32/2 = 16$. The vertical placement of \overline{FH} is specified by the length h of \overline{CH} , where $0 < h < 4$. For $h = 0$, \overline{FH} coincides with \overline{GC} and has length 6; as h grows toward 4, \overline{FH} lengthens linearly, becoming 10 when \overline{FH} coincides with \overline{ED} of length 10 at $h = 4$. This means $FH = 6 + h$. The area of each trapezoid is to be 16, but it is also the product of CH and the average of GC and FH . So, we have

$16 = h \frac{6+(6+h)}{2} = h \left(6 + \frac{h}{2} \right) = \frac{1}{2} h^2 + 6h$, so $0 = \frac{1}{2} h^2 + 6h - 16$. Using the quadratic formula, we obtain:

$$h = \frac{-6 \pm \sqrt{6^2 - 4\left(\frac{1}{2}\right)(-16)}}{2(1/2)} = -6 \pm \sqrt{36 + 32} = -6 \pm \sqrt{68} = -6 \pm 2\sqrt{17}.$$

Because h is restricted to being positive, we must use the + sign, so $h = -6 + 2\sqrt{17}$. The length of \overline{FH} is 6 greater, thus $2\sqrt{17}$ units.

10. The probabilities for Amy and for Rob are not independent of one another: The probability that points are scored on any one roll by Amy or Rob is $1/2$ or $2/5$, respectively, but the probability that both score points on one roll is $1/10$, not $\left(\frac{1}{2}\right)\left(\frac{2}{5}\right) = \frac{1}{5}$. This means that one cannot validly determine the probabilities for Amy and Rob separately and multiply them together. Let's focus on relative gain in points rather than absolute numbers of points (particularly on a roll of 2, where Amy wins 2 points while Rob wins 3 points, which is a net gain of 1 point for Rob). Let's set up a table of what can happen on any one roll:

| Point impact | Relevant roll values | Probability | Event type symbol |
|-----------------------|----------------------------------|-------------|-------------------|
| Net gain of 2 for Amy | 4, 6, 8, 10 [even but not prime] | 0.4 | W |
| None | 1, 9 [neither even nor prime] | 0.2 | X |
| Net gain of 1 for Rob | 2 [both even and prime] | 0.1 | Y |
| Net gain of 3 for Rob | 3, 5, 7 [prime but not even] | 0.3 | Z |

When the results of 4 rolls are combined, we want Amy to have a net positive number of points. We need to collect all of the mixes of 4 event types for which this occurs:

| Event type mix | # net points for Amy | # permutations of mix | Probability of mix |
|----------------|----------------------|----------------------------|--|
| W, W, W, W | 8 | $\frac{4!}{4!} = 1$ | $1 \times 0.4^4 = 0.0256$ |
| W, W, W, [XYZ] | 6, 5, or 3 | $\frac{4!}{3! 1!} = 4$ | $4 \times 0.4^3 \times 0.6 = 0.1536$ |
| W, W, X, X | 4 | $\frac{4!}{2! 2!} = 6$ | $6 \times 0.4^2 \times 0.2^2 = 0.0384$ |
| W, W, X, [YZ] | 3 or 1 | $\frac{4!}{2! 1! 1!} = 12$ | $12 \times 0.4^2 \times 0.2 \times 0.4 = 0.1536$ |
| W, W, Y, Y | 2 | $\frac{4!}{2! 2!} = 6$ | $6 \times 0.4^2 \times 0.1^2 = 0.0096$ |
| W, X, X, X | 2 | $\frac{4!}{1! 3!} = 4$ | $4 \times 0.4 \times 0.2^3 = 0.0128$ |
| W, X, X, Y | 1 | $\frac{4!}{1! 2! 1!} = 12$ | $12 \times 0.4 \times 0.2^2 \times 0.1 = 0.0192$ |
| Total | — | — | $0.4128 = \mathbf{41.28\%}$ |

Vol. 39 Issue 2

Daniel Mai is the 2019 Raytheon MATHCOUNTS National Champion

Daniel Mai was set up for a nail-biting final match-up. He had traveled from his hometown of Acton, Mass. to Orlando, Fla. for his second appearance at the Raytheon MATHCOUNTS National Competition. He had just emerged victorious from a notoriously long 11-minute semifinals match—one where neither he nor semifinalist Sam Wang from Virginia buzzed in with a correct answer for six questions in a row. He was up against Suyash Pandit, the underdog from Oregon who had won the first match of the day, plus his quarter-final and semifinal match-ups to qualify for the finals.

Yet after his tough semifinals match, Daniel clearly found his groove during the final round, sweeping the board as he answered the first three questions of the finals correctly. He cemented his victory when he successfully solved the last problem of the 2019 MATHCOUNTS Competition Series: *What is the quotient of 5040 divided by the product of its unique prime factors?*

Level-headed on stage, 13-year-old Daniel knew the answer was 24—and it only took him 22.53 seconds to figure it out.

Massachusetts coach Josh Frost describes Daniel as humble and hardworking, and it shows in his response to his success. How did he feel after the big win? “Very tired,” Daniel said.

Above: From left: Runner-up Suyash Pandit, National Champion Daniel Mai and Tracey Gray (Vice President, Communications & Public Affairs, Space & Airborne Systems, Raytheon Company).

Below: Actor, author and audiobook narrator Wil Wheaton hosts the Countdown Round for the second year in a row.

After such an action-packed weekend, his response was understandable. The 2019 Raytheon MATHCOUNTS National Competition began with three rounds of written tests on Sunday, May 12, requiring students to work both individually and collaboratively in their four-person state teams. On Monday, May 13, the 12 students with the highest scores on the Written Competition advanced to the Countdown Round, hosted for the second year by actor, author and audiobook narrator Wil Wheaton. This final round challenged students in fast-paced one-on-one match-ups in which competitors had at most 45 seconds to answer each question.

Rankings for the Countdown Round also were determined by the students' scores on the Written Competition. Daniel was one of four individuals with the highest written scores who received a bye in the first match of the Countdown Round, along with Written Competition Champion Jeff Lin, an eighth grader from Lexington, Mass.; eighth grader William Chen from Fremont, Calif., and seventh grader Jessica Wan from San Juan, P.R. The two Countdown Round Semifinalists were Sam Wang and Ethan Zhou, both eighth graders from Virginia.

The 12 Countdown Round participants. Back row from left: Rich Wang, Suyash Pandit, Eric Shen, Alan Kappler, Ram Goel and Karthik Vedula. Front row from left: Sam Wang, Ethan Zhou, Jessica Wan, William Chen, Daniel Mai and Jeff Lin.

Daniel was one of 224 Mathletes from across the country who competed at the 2019 Raytheon MATHCOUNTS National Competition on May 12–13 at the Hilton Orlando Lake Buena Vista at the Walt Disney World Resort. National competitors represented all 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands, the Department of Defense and State Department.

As the National Champion, Daniel received the \$20,000 Donald G. Weinert Scholarship and will appear on “Live! With Kelly & Ryan” on June 7, where he will compete against hosts Kelly Ripa and Ryan Seacrest in a math competition. After that? Daniel has some ideas. His dream is “to find the cure for cancer. I want to do this to better society so that we can live longer and this way, society would have new innovations and progress faster.” With Daniel’s problem-solving skills and ambition, winning the MATHCOUNTS Competition Series is just the beginning.

Runner-up Suyash Pandit concedes to National Champion Daniel Mai.

2019 NATIONAL COMPETITION WINNERS

NATIONAL CHAMPION:

Daniel Mai, MA

- \$20,000 Donald G. Weinert Scholarship
- Trip to U.S. Space Camp

COUNTDOWN ROUND

RUNNER-UP:

Suyash Pandit, OR

- \$7,500 Scholarship

COUNTDOWN ROUND

SEMIFINALISTS:

Sam Wang, VA

Ethan Zhou, VA

- \$3,000 Scholarship each

WRITTEN COMPETITION

CHAMPION: Jeff Lin, MA

- \$2,500 Scholarship

1ST PLACE TEAM:

Massachusetts

Kaylee Ji, Jeff Lin,

Daniel Mai, Max Xu

- \$2,000 Scholarship each

- Trip to U.S. Space Camp

WRITTEN COMPETITION

RUNNER-UP: Daniel Mai, MA

Alan Kappler, OR

Eric Shen, CA

Karthik Vedula, FL

2ND PLACE TEAM: Florida

3RD PLACE TEAM: California

Massachusetts wins Team Competition

The team from Massachusetts, led by coach Josh Frost, won First Place in the Written Competition. This was the first time that the Massachusetts team had won the Competition Series since 2013. Team members Kaylee Ji from Andover, Jeff Lin from Lexington, Daniel Mai from Acton and Max Xu from Westford—all eighth graders—each won a \$2,000 scholarship and a trip to U.S. Space Camp.

From left: Tracey Gray (Vice President, Communications & Public Affairs, Space & Airborne Systems, Raytheon Company), Max Xu, Daniel Mai, Jeff Lin, Kaylee Ji, Coach Josh Frost, John Daegele (Chair, MATHCOUNTS Board of Directors).

The Florida team, led by coach Pushpa Kurian, won Second Place. The team members were Wesley Chen, an eighth grader from Tallahassee; Aaron Hu, a seventh grader from Tallahassee; Razzi Masroor, a seventh grader from Miami and Karthik Vedula, an eighth grader from Tallahassee. The team from California, coached by Peta-Gaye Robinson, won Third Place. The team members—all in eighth grade—were William Chen from Fremont, Alan Lee from Palo Alto, Eric Shen from San Jose and Andrew Wen from Fremont.

MATHCOUNTS Congratulates the 2019 National Competitors

MATHCOUNTS congratulates all 224 national competitors. Advancing to the national level is an outstanding accomplishment, and every Mathlete who participated this year should be incredibly proud of his or her achievements. Links to competition results, photographs and the archived ESPN webcast are available at the [MATHCOUNTS website](#). “Algenite” Wins First Place at 2019 Math Video Challenge Finals

A video about four friends who race against the clock to make an antidote drink won the 2019 [Math Video Challenge](#). Jordan Adeyemi, Robert Hardy, Naima Johnson and Emily Ramirez—all seventh graders from Ron Clark Academy in Atlanta, Ga.—each won a \$1,000 college scholarship. The team was led by advisor Dr. Valerie Camille Jones and co-advisor Junior Bernadin.

Team Switcharoo Crew introduces their video with a rap. From left: Robert, Emily, Jordan, Naima and Chandler.

Inspired by the video game “Fortnite,” “Algenite” depicts a Freaky Friday-esque switch that can only be fixed with a special drink called Algenite. The video solved problem #76 from the 2018-2019 MATHCOUNTS School Handbook:

Emily purchased two heptajugs and one slope pot for \$74. Jordan purchased two algeforts and one slope pot for \$50. Robert purchased one heptajug and two algeforts for \$57. Based on this, how much does one algefert cost?

Team Switcharoo Crew was one of four teams that presented a video at the 2019 Math Video Challenge Finals, which took place on Monday, May 13 at the Hilton Orlando Lake Buena Vista at the Walt Disney World Resort. The 224 national competitors voted to determine the winning video.

The team members of RMSPG2018 present their video. From left: Johnny Sevilla, Karol Lopez Valadez, Isaias Barrera, Jamie Clemons Richardson, and MATHCOUNTS Executive Director Kristen Chandler.

2019 MATH VIDEO CHALLENGE WINNERS

FIRST PLACE:

“Algenite” by Team Switcharoo Crew

Jordan Adeyemi, GA

Robert Hardy, GA

Naima Johnson, GA

Emily Ramirez, GA

▪ \$1,000 Scholarship each

FINALIST:

“Going Home” by RMSPG2018

Isaias Barrera, IL

Jamie Clemons Richardson, IL

Karol Lopez Valadez, IL

Johnny Sevilla, IL

FINALIST:

“Remainder” by The Remainders

Sanai Edwards, GA

Haley Jones, GA

Amari May, GA

Maia Pope, GA

FINALIST:

“#VI Strong” by BCB Blazers

Malik Francis, VI

Taragee Gumbs, VI

Gloria Lugo, VI

Ciara Rodney, VI

Mathletes Shoot for the Moon

Team New Jersey visits the Kennedy Space Center

Fifty years ago, the world's brightest minds in mathematics, science, technology and engineering worked together to achieve what had once seemed impossible: sending the first humans, American astronauts Neil A. Armstrong and Edwin "Buzz" Aldrin, to the moon.

The 2019 Raytheon MATHCOUNTS National Competition commemorated the anniversary of this remarkable milestone by celebrating the next generation of STEM thinkers. The 244 MATHCOUNTS national finalists are tomorrow's problem solvers who will tackle global challenges and accomplish feats we cannot yet even imagine.

In honor of the "Moonshot" theme, many of our Mathletes shared their personal moonshot goals at the National Competition—the problems they aim to solve and the impossible feats they want to make possible.

"My moonshot goal is to combine math with creativity in a way to make it more accessible/less intimidating."

-Audrey Lim, NV

"I would like to investigate dying coral reefs to determine how to reverse their deterioration, even as the globe continues to warm."

-Eamon McGlashan, ME

"My moonshot goal is to eliminate things like the wage gap and pink taxes from the world."

-Joy An, WA

"I have a dream that one day I will discover and modify a species of bacteria that is able to break down plastic."

-Jerry Chen, PR

Meena Boppana Wins 2019 MATHCOUNTS Alumni Scholarship

Meena Boppana of Somerville, Mass. won the \$3,000 MATHCOUNTS Alumni Scholarship. Meena is a Harvard graduate who grew up in New York City. After participating in the MATHCOUNTS National Competition with the New York State Team, Meena made a goal to increase female participation in MATHCOUNTS. As a high school student, she started her own MATHCOUNTS team at Girls Prep in Lower Manhattan. Reflecting on this experience, Meena said, "I discovered a deep passion for teaching math, as well as for leveling the playing field in education by race, gender and income. The experience showed me that if I saw an injustice, I could take direct steps to be the change I wanted to see." After working as a software engineer for a few years, Meena decided to return to Harvard to earn a Master's in education and become a math teacher in the Boston Public School System.

Meena Boppana, 2019 MATHCOUNTS Alumni Scholarship Winner.

"I discovered a deep passion for teaching math, as well as for leveling the playing field in education by race, gender and income. The experience showed me that if I saw an injustice, I could take direct steps to be the change I wanted to see."

Left: Meena accepts the New York team's Spirit Award at the 2008 National Competition after convincing her teammates to sing and dance about math.

This year's applications were so impressive that for the first time, the MATHCOUNTS Foundation chose a scholarship runner-up. Karen Ge is a high school senior from Naperville, Ill. At 18, Karen already has become a MATHCOUNTS coach, founded her own non-profit tutoring organization and even published her own book about her MATHCOUNTS experiences. "Mathematics is woefully misconstrued in the public eye as a cold, unimaginative discipline when it is in reality a vibrant, ever-shifting patron deity of all social and intellectual progress. These lessons about mathematics, the communities it fosters, and about the character and morals that it inspires, are what MATHCOUNTS truly means to me," says Karen.

Karen Ge, 2019 MATHCOUNTS Alumni Scholarship Runner-up.

2019 FINALISTS

Annette Belleman, DD
Christina Bingham, ND
Jude Flynn, FL
Alexander Kalbach, PA
Arjun Krishna, AR
Isabella Mahal, CO
Erin Melton, WI
Prastik Mohanraj, CT
Anusha Murali, NH

Tyler Phung, NV
Annie Shen, WA
Sonal Sinha, MN
Collin Van Cuyk, WI
William Wang, KS
Lucy Ward, UT
Catherine Ye, NY
Saba Zerefa, AZ
Michelle Zhu, IN

**The application for the
2020 MATHCOUNTS Alumni
Scholarship will be available
in the fall at
mathcounts.org/scholarship**

Spotlight on State and Chapter Donors

We would like to express our gratitude to the outstanding donors at the state and chapter level whose generosity reached thousands of students attending chapter and state competitions this year. They helped make the 2018-2019 MATHCOUNTS Competitions Series a success!

WestEd has recognized MATHCOUNTS as having one of the nation's most effective STEM learning programs, listing the Math Video Challenge as an Accomplished Program in STEMworks.

The National Association of Secondary School Principals has placed all three MATHCOUNTS programs on the NASSP Advisory List of National Contests and Activities for 2018-2019.

How To Use This School Handbook

If You're a New Coach

Welcome! We're so glad you're a coach this year.
Check out the **Guide for New Coaches**
starting on the next page.

If You're a Returning Coach

Welcome back! Thank you for coaching again.
Get the **2018-2019 Handbook Materials**
starting on page 8.

Guide For New Coaches

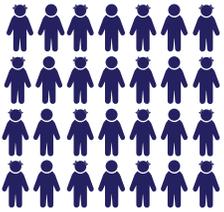

Welcome to the MATHCOUNTS® Competition Series! Thank you so much for serving as a coach this year. Your work truly does make a difference in the lives of the students you mentor. We've created this Guide for New Coaches to help you get acquainted with the Competition Series and understand your role as a coach in this program.

If you have questions at any point during the program year, please feel free to contact the MATHCOUNTS national office at info@mathcounts.org.

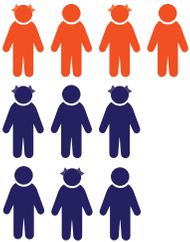

The MATHCOUNTS Competition Series in a Nutshell

The MATHCOUNTS Competition Series is a national program that provides students the opportunity to compete in live, in-person math contests against and alongside their peers. Created in 1983, it is the longest-running MATHCOUNTS program and is open to all sixth-, seventh- and eighth-grade students.

HOW DOES IT WORK? The Competition Series has 4 levels of competition—school, chapter, state and national. Here's what a typical program year looks like.

Schools register in the fall and work with students during the year. Coaches administer the **School Competition**, usually in January. Any number of students from your school can participate in your team meetings and compete in the School Competition. MATHCOUNTS provides the School Competition to coaches in November. Many coaches use this to determine which student(s) will advance to the Chapter Competition.

Between 1 and 10 students from each school advance to the local **Chapter Competition**, which takes place in February. Each school can send a team of 4 students plus up to 6 individual competitors. All chapter competitors—whether they are team members or individuals—participate in the individual rounds of the competition; then just the 4 team members participate in the team round. Schools also can opt to send just a few individual competitors, rather than forming a full team. Over 500 Chapter Competitions take place across the country.

Top students from each Chapter Competition advance to their **State Competition**, which takes place in March. Your school's registration fees cover your students as far as they get in the Competition Series. If your students make it to one of the 56 State Competitions, no additional fees are required.

Top 4 individual competitors from each State Competition receive an all-expenses-paid trip to the **National Competition**, which takes place in May. These 224 students combine to form 4-person state teams, while also competing individually for the title of National Champion.

WHAT DOES THE TEST LOOK LIKE? Every MATHCOUNTS competition consists of 4 rounds—Sprint, Target, Team and Countdown Round. Altogether the rounds are designed to take about 3 hours to complete. Here's what each round looks like.

Sprint Round

40 minutes
30 problems total
no calculators used
focus on speed and accuracy

Target Round

Approx. 30 minutes
8 problems total
calculators used
focus on problem-solving and mathematical reasoning

The problems are given to students in 4 pairs. Students have 6 minutes to complete each pair.

Team Round

20 minutes
10 problems total
calculators used
focus on problem-solving and collaboration

Only the 4 students on a school's team can take this round officially.

Countdown Round

Maximum of 45 seconds per problem
no calculators used
focus on speed and accuracy

Students with highest scores on Sprint and Target Rounds compete head-to-head. This round is optional at the school, chapter and state level.

HOW DO I GET MY STUDENTS READY FOR THESE COMPETITIONS? What specifically you do to prepare your students will depend on your schedule as well as your students' schedules and needs. But in general, working through lots of different MATHCOUNTS problems and completing practice competitions is the best way to prepare to compete. Each year MATHCOUNTS provides the *School Handbook* to all coaches, plus lots of additional free resources online.

The next sections of this Guide for New Coaches will explain the layout of the *MATHCOUNTS School Handbook* and other resources, plus give you tips on structuring your team meetings and preparation schedule.

The Role of the Competition Coach

Your role as the coach is such an important one, but that doesn't mean you need to know everything, be a math expert or treat coaching like a full-time job. Every MATHCOUNTS coach has a different coaching style and you'll find the style that works best for you and your students. But in general **every good MATHCOUNTS coach must do the following.**

- Schedule and run an adequate number of practices for participating students.
- Help motivate and encourage students throughout the program year.
- Select the 1-10 student(s) who will represent the school at the Chapter Competition in February.
- Take students to the Chapter Competition or make arrangements with parents and volunteers to get them there.

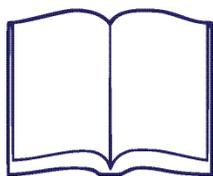

Looking for tools to help you become a top-notch coach? check out our videos at the coach section of the MATHCOUNTS website!

You don't need to know how to solve every MATHCOUNTS problem to be an effective coach. In fact, many coaches have told us that they themselves improved in mathematics through coaching. Chances are, you'll learn with and alongside your students throughout the program year.

You don't need to spend your own money to be an effective coach. You can prepare your students using solely the free resources and this handbook. We give coaches numerous detailed resources and recognition materials so you can guide your Mathletes® to success even if you're new to teaching, coaching or competition math, and even if you use only the free resources MATHCOUNTS provides all competition coaches.

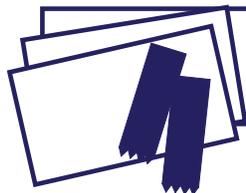

Making the Most of Your Resources

As the coach of a registered competition school, you already have received what we at MATHCOUNTS call the **School Competition Kit**. Your kit includes the following materials for coaches.

2018-2019 MATHCOUNTS School Handbook

The most important resource included in the School Competition Kit. Includes 250 problems.

Student Recognition Ribbons and Certificates

10 participation certificates, 1 Champion ribbon and 1 Second Place ribbon.

You'll also get access to electronic resources. The following resources are available to coaches online at www.mathcounts.org/coaches. This section of the MATHCOUNTS website is restricted to coaches and you already should have received an email with login instructions. *If you have not received this email, please contact us at info@mathcounts.org to make sure we have your correct email address.*

Official 2019 MATHCOUNTS School Competition

Released in November 2018
Includes all 4 test rounds and the answer key

2018 MATHCOUNTS School, Chapter + State Competitions

Released by mid-April 2018
Each level includes all 4 test rounds and the answer key

MATHCOUNTS Problem of the Week

Released each Monday
Each multi-step problem relates to a timely event

You can use the **2019 MATHCOUNTS School Competition** to choose the students who will represent your school at the Chapter Competition. Sometimes coaches already know which students will attend the Chapter Competition. If you do not need the School Competition to determine your chapter competitors, then we recommend using it as an additional practice resource for your students.

The **2018-2019 MATHCOUNTS School Handbook** will be your primary resource for the Competition Series this year. It is designed to help your students prepare for each of the 4 rounds of the test, plus build critical thinking and problem-solving skills. This section of the Guide for New Coaches will focus on how to use this resource effectively for your team.

WHAT'S IN THE HANDBOOK? There is a lot included in the *School Handbook*, and you can find a full table of contents on pg. 8 of this book, but below are the sections that you'll use the most when coaching your students.

- **Handbook Problems:** 250 math problems divided into Warm-Ups, Workouts and Stretches. These problems in-

crease in difficulty as the students progress through the book. (pg. 11)

- **Solutions to Handbook Problems:** complete step-by-step explanations for how each problem can be solved. These detailed explanations are only available to registered coaches. (pg. 56)
- **Answers to Handbook Problems:** key available to the general public. Your students can access this key, but not the full solutions to the problems. (pg. 49)
- **Problem Index + Common Core State Standards Mapping:** catalog of all handbook problems organized by topic, difficulty rating and mapping to Common Core State Standards. (pg. 53)

There are 3 types of handbook problems to prepare students for each of the rounds of the competition. You'll want to have your students practice all of these types of problems.

| | | |
|--|---|--|
| <p style="text-align: center;">Warm-Ups</p> <p>14 Warm-Ups in handbook 10 questions per Warm-Up no calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Warm-Ups prepare students particularly for the Sprint and Countdown Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Workouts</p> <p>8 Workouts in handbook 10 questions per Workout calculators used</p> <div style="text-align: center;">  </div> <p style="text-align: center;"><i>Workouts prepare students particularly for the Target and Team Rounds.</i></p> <div style="text-align: center;">  </div> | <p style="text-align: center;">Stretches</p> <p>3 Stretches in handbook Number of questions and use of calculators vary by Stretch</p> <p style="text-align: center;"><i>Each Stretch covers a particular math topic that could be covered in any round. These help prepare students for all 4 rounds.</i></p> <div style="text-align: center;">  </div> |
|--|---|--|

IS THERE A SCHEDULE I SHOULD FOLLOW FOR THE YEAR? On average coaches meet with their students for an hour once a week at the beginning of the year, and more often as the competitions approach. Practice sessions may be held before school, during lunch, after school, on weekends or at other times, coordinating with your school's schedule and avoiding conflicts with other activities.

Designing a schedule for your practices will help ensure you're able to cover more problems and prepare your students for competitions. We've designed the *School Handbook* with this in mind. Below is a suggested schedule for the program year that mixes in Warm-Ups, Workouts and Stretches from the *School Handbook*, plus free practice competitions from last year. This schedule allows your students to tackle more difficult problems as the School and Chapter Competition approach.

| | | | |
|---|---|--|--|
| <p>Mid-August – September 2018</p> <p>Warm-Ups 1, 2 + 3 Workouts 1 + 2</p> | <p>October 2018</p> <p>Warm-Ups 4, 5 + 6 Workout 3 Measurement Stretch</p> | <p>November 2018</p> <p>Warm-Ups 7 + 8 Workouts 4 + 5 Expected Value Stretch</p> | <p>December 2018</p> <p>Warm-Ups 9, 10 + 11 Workout 6 Transformations Stretch</p> |
| <p>January 2019</p> <p>Warm-Ups 12, 13 + 14 Workouts 7 + 8 <i>2019 MATHCOUNTS School Competition</i> <i>Select chapter competitors (optional at this time)</i></p> | | <p>February 2019</p> <p>Practice Competition: 2018 School Competition Practice Competition: 2018 Chapter Competition <i>Select chapter competitors (required by this time)</i> <i>2019 MATHCOUNTS Chapter Competition</i></p> | |

You'll notice that in January or February you'll need to select the 1-10 student(s) who will represent your school at the Chapter Competition. This must be done before the start of your local Chapter Competition. You'll submit the names of your chapter competitors either online at www.mathcounts.org/coaches or directly to your local Chapter Coordinator.

It's possible you and your students will meet more frequently than once a week and need additional resources. If that happens, don't worry! You and your Mathletes can work together using the **Interactive MATHCOUNTS Platform**, powered by NextThought. This free online platform contains numerous *MATHCOUNTS School Handbooks* and past competitions, not to mention lots of features that make it easy for students to collaborate with each other and track their progress. You and your Mathletes can sign up for free at mathcounts.nextthought.com.

And remember, just because you and your students will meet once a week doesn't mean your students can only prepare for MATHCOUNTS one day per week. Many coaches assign "homework" during the week so they can keep their students engaged in problem solving outside of team practices. Here's one example of what a 2-week span of practices in the middle of the program year could look like.

| Monday | Tuesday | Wednesday (Weekly Team Practice) | Thursday | Friday |
|---|--|--|---|--|
| -Students continue to work individually on Workout 4, due Wednesday | -Students continue to work on Workout 4 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 4 -Coach gives Warm-Up 7 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 5 as individual work, due Wednesday | -Students continue to work individually on Workout 5 |
| -Students continue to work individually on Workout 5, due Wednesday | -Students continue to work on Workout 5 -Coach emails team to assign new Problem of the Week, due Wednesday | -Coach reviews solutions to Workout 5 -Coach gives Warm-Up 8 to students as timed practice and then reviews solutions -Students discuss solutions to Problem of the Week in groups | -Coach emails math team to assign Workout 6 as group work, due Wednesday | -Students work together on Workout 6 using online Interactive Platform |

WHAT SHOULD MY TEAM PRACTICES LOOK LIKE? Obviously every school, coach and group of students is different, and after a few practices you'll likely find out what works and what doesn't for your students. Here are some suggestions from veteran coaches about what makes for a productive practice.

- Encourage discussion of the problems so that students learn from each other
- Encourage a variety of methods for solving problems
- Have students write math problems for each other to solve
- Use the **Problem of the Week** (posted online every Monday)
- Practice working in groups to develop teamwork (and to prepare for the Team Round)
- Practice oral presentations to reinforce understanding

On the following page is a sample agenda for a 1-hour practice session. There are many ways you can structure math team meetings and you will likely come up with an agenda that works better for you and your group. It also is probably a good idea to vary the structure of your meetings as the program year progresses.

MATHCOUNTS Team Practice Sample Agenda – 1 Hour

Review Problem of the Week (20 minutes)

- Have 1 student come to the board to show how s/he solved the first part of the problem.
- Discuss as a group other strategies to solve the problem (and help if student answers incorrectly).
- Have students divide into groups of 4 to discuss the solutions to the remaining parts of the problem.
- Have 2 groups share answers and explain their solutions.

Timed Practice with Warm-Up (15 minutes)

- Have students put away all calculators and have one student pass out Warm-Ups (face-down).
- Give students 12 minutes to complete as much of the Warm-Up as they can.
- After 12 minutes is up, have students hold up pencils and stop working.

Play Game to Review Warm-Up Answers (25 minutes)

- Have students divide into 5 groups (size will depend on number of students in meeting).
- Choose a group at random to start and then rotate clockwise to give each group a turn to answer a question. When it is a group's turn, ask the group one question from the Warm-Up.
- Have the group members consult their completed Warm-Ups and work with each other for a maximum of 45 seconds to choose the group's official answer.
- Award 2 points for a correct answer on questions 1-3, 3 points for questions 4-7 and 5 points for questions 8-10. The group gets 0 points if they answer incorrectly or do not answer in 45 seconds.
- Have all students check their Warm-Up answers as they play.
- Go over solutions to select Warm-Up problems that many students on the team got wrong.

OK I'M READY TO START. HOW DO I GET STUDENTS TO JOIN? Here are some tips given to us from successful competition coaches and club leaders for getting students involved in the program at the beginning of the year.

- Ask Mathletes who have participated in the past to talk to other students about participating.
- Ask teachers, parent volunteers and counselors to help you recruit.
- Reach parents through school newsletters, PTA meetings or Back-to-School-Night presentations.
- Advertise around your school by:
 1. posting intriguing math questions (specific to your school) and referring students to the first meeting for answers.
 2. designing a bulletin board or display case with your MATHCOUNTS poster (included in your School Competition Kit) and/or photos and awards from past years.
 3. attending meetings of other extracurricular clubs (such as honor society) so you can invite their members to participate.
 4. adding information about the MATHCOUNTS team to your school's website.
 5. making a presentation at the first pep rally or student assembly.

Good luck in the competition! If you have any questions during the year, please contact the MATHCOUNTS national office at info@mathcounts.org.

Get the problem at the beginning of the week and the step-by-step solution the following week.</p> <p> </p> <p>www.mathcounts.org/potw</p> | <p>MATHCOUNTS Minis</p> <p>A fun monthly video series featuring Richard Rusczyk from Art of Problem Solving. Each video looks at a particular math skill and walks through how to solve different MATHCOUNTS problems using creative problem-solving strategies.</p> <p> </p> <p>www.mathcounts.org/minis</p> |

Critical 2018-2019 Dates

2018

Aug. 15 –
Dec. 14

Submit your school's registration to participate in the Competition Series and receive this year's School Competition Kit, which includes a hard copy of the *2018-2019 MATHCOUNTS School Handbook*. Kits are shipped on an ongoing basis between mid-August and December 31.

The fastest way to register is online at www.mathcounts.org/compreg. You also can download the MATHCOUNTS Competition Series Registration form and mail or email it with payment to:

MATHCOUNTS Foundation – Competition Series Registrations
1420 King Street, Alexandria, VA 22314
Email: reg@mathcounts.org

To add students to your school's registration, log in at www.mathcounts.org/coaches to access the Dashboard. **Questions?** Email the MATHCOUNTS national office at info@mathcounts.org.

Nov. 2

The 2019 School Competition will be available online. All registered coaches can log in at www.mathcounts.org/coaches to download the competition.

Nov. 2
(postmark)

Deadline to register for the Competition Series at reduced registration rates (\$30 per student, \$300 for full registration of 10 students). After November 2, registration rates will be \$35 per student, \$350 for full registration.

Dec. 14
(postmark)

Competition Series Registration Deadline

In some circumstances, late registrations might be accepted at the discretion of MATHCOUNTS and the local coordinator. *Late fees will apply. Register on-time to ensure your students' participation.*

2019

Early Jan.

If you have not been contacted with details about your upcoming competition, call your local or state coordinator. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

Late Jan.

If you have not received your School Competition Kit, contact the MATHCOUNTS national office at info@mathcounts.org.

Feb. 1-28

Chapter Competitions

March 1-31

State Competitions

May 12-13

2019 Raytheon MATHCOUNTS National Competition in Orlando, FL

Measurement Stretch

1. _____ units

Merri places weights of 6 units and 28 units on the right side of a balance and weights of 3 units and 19 units on the left side. If she adds an object to the left side that makes the balance level, how many units does the object weigh?

2. _____ tacks The weight of a small clip is $\frac{2}{3}$ the weight of a large clip. If 2 tacks weigh the same amount as a large clip, how many tacks weigh the same amount as 12 small clips?

3. _____ Dems On the planet Klem, 1 Bem plus 7 Dems equals 4 Pems, and 2 Bems plus 1 Dem equals 1 Pem. How many Dems equal 7 Bems?

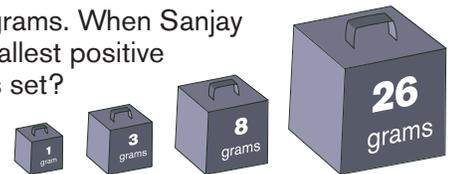

4. _____ meters If a race car is traveling at 99 mi/h, how many meters does it travel in a second, given that 0.305 meter = 1 foot? Express your answer as a decimal to the nearest tenth.

5. _____ %

If the results when reading a measuring stick can be off by at most 1 cm, what is the maximum percent error when 24 cm is measured? Express your answer to the nearest tenth.

6. _____ grams Vijay gives Sanjay a set of four weights of 1, 3, 8 and 26 grams. When Sanjay places weights on either side of a balance, what is the smallest positive integer number of grams that he **cannot** measure with this set?

7. _____ gallons If Clem has 2 cups, 7 pints, 8 quarts and 11 half-gallons of lemonade, how many total gallons of lemonade does she have? Express your answer as a mixed number.

8. _____ Klegs If 2 Blams equal 15 Droms and 5 Droms equal 28 Klegs, how many Klegs are in a Blam?

9. _____ What is the ratio of 1 ounce to 1000 grams, given that 1 pound equals 454 grams? Express your answer as a decimal to the nearest thousandth.

10. _____ times If one order of fries and five burgers cost twice as much as three orders of fries and two burgers, how many times as much does a burger cost compared to one order of fries?

Expected Value Stretch

If the outcomes of random variable X have values $x_1, x_2, x_3, \dots, x_n$ and the probabilities of these outcomes occurring are $p_1, p_2, p_3, \dots, p_n$, respectively, then the **expected value** of the outcome is the sum of the products of the probability of each outcome and the value of that outcome.

$$E(X) = p_1 x_1 + p_2 x_2 + p_3 x_3 + \dots + p_n x_n$$

11. _____ An unfair six-sided die with faces labeled 1, 2, 3, 5, 8 and 13 is rolled. The table lists the probability of the die landing with each number showing on the top face. The expected value of the roll is the sum of the products of each face value and its corresponding probability of being rolled. What is the expected value when the die is rolled? Express your answer as a mixed number.

| Top Face Value | Probability |
|----------------|----------------|
| 1 | $\frac{1}{3}$ |
| 2 | $\frac{1}{15}$ |
| 3 | $\frac{1}{6}$ |
| 5 | $\frac{1}{5}$ |
| 8 | $\frac{2}{15}$ |
| 13 | $\frac{1}{10}$ |

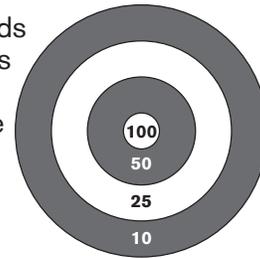

12. \$ _____ Terry plays a game with prizes of 5, 10, 15 and 20 dollars. The graph shows each possible prize amount and its corresponding probability. The expected value of her prize is the sum of the products of each prize and the probability of winning that prize. What is the expected value of Terry's prize?

13. _____ A fair 10-sided die with one face labeled 1, two faces labeled 2, three faces labeled 3 and four faces labeled 4 is rolled. What is the expected value when this die is rolled?

14. _____ cm² Ana has a bowl containing two square tiles, one with side length 2 cm and the other with side length 3 cm. She randomly chooses a tile from the bowl. The expected value of the area of the chosen tile is the sum of the products of each tile's area and its corresponding probability of being chosen. If the probability of choosing a particular tile is proportional to its area, what is the expected value of the area of the tile Ana chooses? Express your answer as a common fraction.

15. _____ points For the dartboard shown, the number of points scored when a dart lands in each region is indicated. The innermost circle of the board has radius 1 inch, and each subsequent circle has a radius 2 inches greater than the previous circle. Kane throws a dart that lands randomly somewhere on the board. What is the expected value of the number of points he scores? Express your answer as a decimal to the nearest tenth.

16. _____ Gwen randomly draws a card from a deck of 40 cards numbered 1 through 40. What is the expected value of the number on the card she draws? Express your answer as a decimal to the nearest tenth.
17. _____ faces Luke paints each face of a $5 \times 5 \times 5$ cube red. He then cuts the cube into 125 unit cubes and randomly chooses a single unit cube. What is the expected value of the number of painted faces on this unit cube? Express your answer as a decimal to the nearest tenth.

A property of E is that it is a linear function of the random variable. So, for random variables X and Y , the expected value of the sum of random variables equals the sum of their expected values.

$$E(X + Y) = E(X) + E(Y)$$

18. _____ points In each round of a particular game, Dinara can win at most one point. If she has a 70% chance of winning a point in each round, what is the expected value of Dinara's total score after three rounds? Express your answer as a decimal to the nearest tenth.
19. _____ Jo and her four friends each secretly pick a random integer from -5 to 5 , inclusive. What is the expected value of the sum of the five chosen numbers?
20. _____ jelly beans Allen randomly distributes 1000 jelly beans into 10 jars lined up in a row from left to right. What is the expected value of the number of jelly beans in the leftmost jar?

Transformations Stretch

21. _____ units A point $P(-3, 2)$ is translated right 4 units to its image P' . The point P' is then translated up 3 units to its image P'' . What is the distance from P to P'' ?
22. _____ units A segment has endpoints $A(0, 0)$ and $B(-3, 4)$. Point C is the image of point B translated down 4 units and left 3 units. What is the perimeter of $\triangle ABC$?
23. (_____ , _____) A point $Q(-3, 4)$ is reflected across the x -axis, and then the image Q' is reflected across the line $x = 2$. What are the coordinates of the image Q'' ? Express your answer as an ordered pair.
24. _____ A point $S(1, 6)$ is reflected across the line $x - 2y = -6$. What is the sum of the coordinates of the image S' ?
25. (_____ , _____) What are the coordinates of the image of point $D(-5, -3)$ when it is rotated 90 degrees clockwise about the origin? Express your answer as an ordered pair.
26. (_____ , _____) What are the coordinates of the image of the point $E(3, -1)$ when it is rotated 90 degrees counterclockwise about the point $F(5, 4)$? Express your answer as an ordered pair.
27. _____ A segment with endpoints $G(-2, 3)$ and $H(4, 7)$ is dilated by a scale factor of $\frac{2}{3}$ with center of dilation $(0, 0)$. What is the sum of all the coordinates of G' and H' ?
28. _____ Point $J(4, 8)$ is dilated by a scale factor of $\frac{3}{2}$ with center of dilation $K(2, 2)$. What is the product of the coordinates of J' ?
29. _____ units² A point $L(-2, 4)$ is rotated 90 degrees clockwise about the point $M(3, 2)$. Point N is the image of L' dilated by a scale factor of $\frac{3}{2}$ with center of dilation M . What is the area of $\triangle LMN$? Express your answer as a common fraction.
30. _____ units A point $R(-5, 3)$ is reflected across the line $y = x - 2$, and then the image R' is rotated 90 degrees clockwise about the origin. What is the distance from R to R'' ? Express your answer in simplest radical form.

Warm-Up 1

31. _____ combinations Bob has 40 cents in his pocket. If Bob has no pennies, how many different combinations of quarters, dimes and/or nickels could he have?

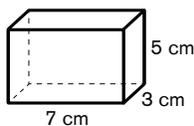

32. _____ On the number line shown, what is the value of $x - y$? Express your answer as a mixed number.

33. _____  Ted flips a coin that is equally likely to land heads up or tails up. Ted flips the coin 10 times, and each time it lands heads up. What is the probability that the next flip will also land heads up? Express your answer as a common fraction.

34. _____ What is the value of $9 + 5 \times 3 - 8 \div 2$?

35. _____ If two more than three times x is equal to five less than ten times x , what is the value of x ?

36. _____ cm^3  What is the volume of a rectangular prism of height 5 cm, width 7 cm and depth 3 cm?

37. _____ What is the average of the prime numbers between 20 and 30?

38. _____ lines How many lines of symmetry does an isosceles right triangle have?

39. _____ What is the quotient when 1,000,000,000 is divided by $2^8 \times 5^7$?

40. _____ people Of 1000 people surveyed, one-third of the 630 people who reported owning a cat also own a dog. If each person surveyed owns a cat, a dog or both, how many own a dog?

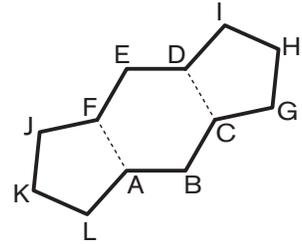

Warm-Up 2

41. _____ If the value of x is 10, what is the value of $3x + 4x + 5x$?

42. _____ feet In the figure, two regular pentagons have been attached to a regular hexagon to create a 12-gon. If each regular polygon has side length 3 feet, what is the perimeter of the resulting 12-gon?

43. _____ ft/s A speed of 60 miles per hour is equal to 88 feet per second. If the speed limit in a school zone is 15 miles per hour, what is the speed limit in this zone in feet per second?

44. _____ divisors How many divisors of 64 are perfect squares?

45. _____ If $ab = 2c$, $bd = c$, $b \neq 0$ and $d = 16$, what is the value of a ?

46. _____ square blocks

All of the streets in Tom's city are on a regular rectangular grid and run east-west or north-south. Tom starts at the intersection of Poyntz Avenue and Eleventh Street and walks 2 blocks east, then 3 blocks north, then 4 blocks east, then 5 blocks north. Tom then returns to his starting location by walking 6 blocks west, then 8 blocks south. What is the area, in square blocks, enclosed by Tom's path?

47. _____ What is the value of $\frac{\frac{1}{2} + \frac{1}{3}}{\frac{1}{4} - \frac{1}{5}}$? Express your answer as a common fraction.

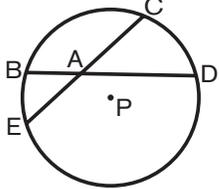

48. _____ What is the arithmetic mean of $\frac{2}{3}$, $\frac{7}{9}$, $\frac{1}{4}$ and $\frac{5}{16}$? Express your answer as a common fraction.

49. _____ If a and b are real numbers such that $a + b = a - b$ and $a \neq b$, what is the value of $\frac{a^2b + a + b - ab^2}{a - b}$?

50. _____ Given that 75% of a certain number is 88, what is $\frac{3}{8}$ of the number?

Warm-Up 3

51. _____ jelly beans All the jelly beans in Sammi's cup are red, yellow or orange. Five are red and seven are orange. If two-thirds are yellow, how many jelly beans are there in Sammi's cup?
52. _____ What is the value of the sum $0.49 + 0.53 + 0.55 + 0.47 + 0.48$? Express your answer as a decimal to the nearest hundredth.
53. _____ outfits If an outfit consists of jeans, a shirt, a sweater and a scarf, how many different outfits can Allie make from one pair of jeans, four shirts, three sweaters and two scarves?
54. _____ minutes Destiny can run one-eighth of a mile in three-quarters of a minute, and she can walk one-quarter of a mile in 4 minutes. How many minutes total will it take for Destiny to run one mile and then walk one mile?
55. _____ What is the value of $27^2 - 23^2$?
56. _____ units In circle P, two chords intersect at A, as shown, with $AB = 3$ units, $AC = 8$ units and $AD = 6$ units. What is the value of AE ? Express your answer as a mixed number.
- 
57. _____ days Six people are invited to attend a five-day conference scheduled for Monday through Friday. Grace will attend only on Monday and Thursday. Becca will attend every day except Monday. Carmen will attend every day except Thursday. Davis will attend only on Thursday. Ernie will only attend either Thursday or Friday. Frank will attend every day except Monday and Wednesday. On how many days during the conference will at least three of these six people be in attendance?
58. _____ miles  The bus from Kevin's home to the middle school travels 8 miles west, then turns and travels 8 miles north, then turns and travels 7 miles west to arrive at school. If the bus were able to travel directly from Kevin's house to the middle school along a straight path, how much shorter would the trip be?
59. _____ When twenty-one-and-a-half trillion is written in scientific notation, what is the exponent needed on the base of 10?
60. _____ diagonals If a polygon has 17 sides, how many diagonals does it have?

Warm-Up 4

61. _____ degrees What is the degree measure of the complement to an angle that is a supplement to an angle of measure 163 degrees?

62. _____ If $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$, what is the value of x when $\begin{vmatrix} x & 4 \\ 3 & 10 \end{vmatrix} = 38$?

63. _____ : _____ a.m. Every morning, the Sharetrain arrives in Mountain View at 9:19 a.m. It takes Miranda between 17 and 21 minutes to walk to the train station from home. If she wants to guarantee that she will arrive at the station with at least 5 minutes to spare, what is the latest time she can leave home?

64. _____ Ryan picks two different numbers from the set $\{2, 3, 5, 7\}$ and multiplies them. What is the absolute difference between the greatest and the least products that Ryan can get?

65. \$ _____ Zu's zoo offers a promotional deal: get a free \$3 cotton candy and a free \$2 soda with the purchase of five \$12 admission tickets. A group of 20 students will each purchase an admission ticket. If half of them want cotton candy and one-fourth of them want soda, how many dollars would they save by using the promotional deal?

66. _____ ounces Preston has four potatoes, each of which weighs a whole number of ounces. The median weight of his potatoes is 11 ounces, and the mean weight of his potatoes is 12 ounces. What is the greatest possible difference between the weight of the heaviest and lightest of his potatoes?

67. _____ mm Photographers often rely on a rule to choose a shutter speed in seconds that is the reciprocal of the effective focal length of the lens in millimeters. If Jackie is shooting at a focal length of 80 mm, Clarise is shooting at 200 mm, Sage is shooting at 400 mm, and they all apply this reciprocal rule, what focal length corresponds to the sum of their shutter speeds?

68. _____ in² Hexagons A and B are geometrically similar. The shortest sides of the two hexagons are 4 inches and 3 inches, respectively. If the area of hexagon A is 48 in², what is the area of hexagon B?

69. _____ What is the value of $1 \times 12 + 2 \times 11 + 3 \times 10 + 4 \times 9 + 5 \times 8 + 6 \times 7 + 7 \times 6 + 8 \times 5 + 9 \times 4 + 10 \times 3 + 11 \times 2 + 12 \times 1$?

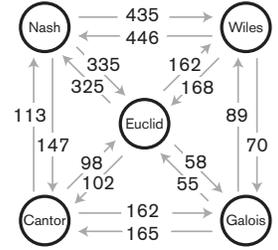

70. _____ degrees What is the measure of an interior angle of a regular polygon with 90 sides?

Warm-Up 5

71. \$ _____ For each lawn Kayla mows, she charges a flat fee of \$15, plus an amount proportional to the area of the lawn. If Kayla charges the owner of a 20-foot by 40-foot lawn \$24, how much would she charge the owner of a 60-foot by 80-foot lawn?

72. \$ _____ Alicia needs to make her way from Nash to Wiles. Available flights and their respective costs, in dollars, are indicated in the figure shown. If Alicia can take any sequence of flights, what is the total cost of her least expensive route from Nash to Wiles?

73. _____ Ancient Egyptians used the symbols shown in Figure 1 to express certain quantities by placing the symbols in any order. What quantity is represented by the symbols in Figure 2?

| | | | | |
|-------|------|------|-------|--------|
| | | | | |
| Staff | Heel | Rope | Lotus | Finger |
| 1 | 10 | 100 | 1000 | 10,000 |

Figure 1

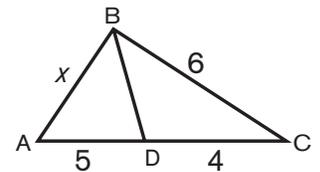

Figure 2

74. _____ Yixin thinks of a positive number that is a perfect cube, and Aly thinks of a number that is a perfect square. If the sum of their numbers is 31, what is the product of their numbers?

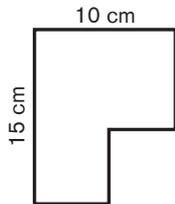

75. _____ integers Jalacia erases some integers from the following list: 5, 9, 2, 3, 7, 8, 6, 5, 6, 4, 1, 7, 9, 8. When she is done, the range of the remaining list is 2. What is the least possible number of integers that Jalacia could have erased?

76. \$ _____ Esther purchased two rock tumblers and one spy pen for \$74. Eli purchased two puzzles and a spy pen for \$50. Sabine purchased a rock tumbler and two puzzles for \$57. Based on this, how much does one puzzle cost?

77. _____ cm In triangle ABC, shown here, segment BD bisects angle ABC. If $CD = 4$ cm, $AD = 5$ cm and $BC = 6$ cm, what is the value of AB? Express your answer as a common fraction.

78. _____ cm In the figure shown, two sides have lengths 10 cm and 15 cm. If all line segments intersect at right angles, what is the perimeter of the figure?

79. _____ If $a = 2 + \frac{3}{4 + \frac{5}{6}}$ and $b = 6 + \frac{5}{4 + \frac{3}{2}}$, what is the value of $\frac{a}{b}$? Express your answer as a common fraction.

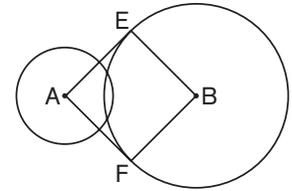

80. _____ sides If the difference between the measures of an interior angle and an exterior angle of a regular polygon is 100 degrees, how many sides does the polygon have?

Warm-Up 6

81. _____ inches When Jim was 10 years old, he was 4 feet 8 inches tall. When he was 20 years old, Jim was 6 feet 2 inches tall. By how many inches did Jim's height increase in those 10 years?

82. _____ Circles A and B intersect, and points E and F are on circle B as shown. If quadrilateral AEBF is a square, what is the probability that a randomly chosen line through point A intersects both circles? Express your answer as a common fraction.

83. _____  Lauren randomly picks two cards, without replacement, from a group of six cards numbered 2, 3, 5, 6, 7 and 10. What is the probability that the product of the two numbers on the selected cards is a multiple of 10? Express your answer as a common fraction.

84. _____ Alana draws four squares, five pentagons and six octagons. Marie draws n hexagons and notices that the combined number of diagonals in her hexagons is equal to the combined number of diagonals in Alana's polygons. What is the value of n ?

85. _____ Consider the set of all four-digit positive integers less than 2000 whose digits have a sum of 24. What is the median of this set of integers?

86. _____ If $x^2 - y^2 = 7$, $x = \frac{12}{y}$ and $y < 0$, what is the value of $x^4 + y^4$?

87. \$ _____ At the county fair, two hot dogs and an ice cream cone cost \$2.50. Two slices of pizza and an ice cream cone cost \$3.50. What is the total cost of one hot dog, one slice of pizza and one ice cream cone at the county fair?

88. _____ When the positive integer divisors of 385 are arranged from least to greatest, what is the sum of the 4th, 5th and 6th divisors?

89. _____ minutes Gavin goes for a run at a constant pace of 9 minutes per mile. Ten minutes later, Lars goes for a run, along the same route, at a constant pace of 7 minutes per mile. How many minutes does it take for Lars to reach Gavin?

90. _____ degrees Lines are drawn from the center of a 72-gon to two of its vertices. The smaller central angle formed by these lines includes seven sides of the polygon. What is the degree measure of this central angle?

Warm-Up 7

91. _____ problems Two days ago, Neil was assigned a set of problems to solve. Today he solved the final three. Yesterday he solved half of those then remaining plus half a problem. The first day he solved half of those assigned plus half a problem. How many problems were in the assigned set?

92. _____ scores A deck of 14 cards numbered 1 through 14 is dealt to Ken and Gunther so that each gets 7 cards. Each player's score is the sum of his card values, and the player with the lower score wins. How many different winning scores are possible?

93. _____ What is the units digit of the sum $1! + 2! + 3! + \dots + n!$ when $n = 2019$?

94. _____ inches

The sum of the heights of Alex and his two brothers, Evan and Joel, is 221 inches. Alex is 8 inches taller than Evan and 5 inches taller than Joel. What is Alex's height, in inches?

95. _____ If all test scores are integers from 0 to 100, inclusive, what is the least possible median of five test scores that add to 204?

96. _____ If $f(x) = \frac{4-x^2}{x+2}$ and $g(x) = x - 2$, what is the value of $\frac{f(x)}{g(x)}$, for $x \neq \pm 2$?

97. _____ jumps

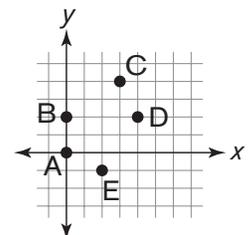

Freddie Frog traveled 29 yards in 261 jumps, at a constant distance per jump. After hurting a toe, her distance per jump decreased by 1 inch. How many jumps more than 261 will it take for her to travel another 29 yards but with a hurt toe?

98. _____ On the first day of class, Smiley's teacher gave her a piece of paper containing Smiley's seven-digit locker combination. Smiley noticed that the seven-digit number was a multiple of 11. When she went to her locker, she saw that one digit on the paper had been completely smudged, as shown. Smiley had forgotten the smudged digit. What was Smiley's seven-digit locker combination?

99. _____ ways How many ways are there to put twelve identical donuts into three differently colored boxes if there must be at least two donuts in each box?

100. _____ units² On a coordinate grid, Micah constructs a pentagon with vertices $A(0, 0)$, $B(0, 2)$, $C(3, 4)$, $D(4, 2)$ and $E(2, -1)$. What is the area of pentagon ABCDE?

Warm-Up 8

101. _____ kg Don's signature coffee blend is 60% dark roast and 40% light roast. He has 10 kg of blend A, which is 80% dark roast and 20% light roast, and 10 kg of blend B, which is 20% dark roast and 80% light roast. How many kilograms of blend A will Don need to use to make 10 kg of his signature blend? Express your answer as a mixed number.

102. _____ minutes Coordinated Universal Time (UTC) is 5 hours later than Eastern Standard Time (EST). If Nico and Jon start playing a tennis match in London at 8:00 a.m. UTC and finish at 12:15 p.m. EST, for how many minutes did they play?

103. _____ times While working on a history project, Erika writes down a list of years starting with 1809 and ending with 2019. How many times did Erika write the digit 1?

104. _____ What is the probability that a sequence of five flips of a fair coin will not land heads up twice in a row? Express your answer as a common fraction.

105. _____ games Liz, Eva and Ace have played trivia as a team 33 times and won 24 times. What is the minimum number of games they must win to have an overall winning percentage of 80%?

106. _____ ways A certain vending machine accepts nickels, dimes, quarters and dollar bills, and it provides change using nickels, dimes and quarters. If Sarah selects a healthful snack priced at \$1.30 after inserting \$2.00, in how many ways can the vending machine provide Sarah's change?

107. _____ What is the geometric mean of the median and mode of the set {23, 25, 3, 25, 20, 22, 21, 2, 1, 14, 12}? Express your answer in simplest radical form.

108. _____ What is the mean of all three-digit positive integers whose digits are in the set {2, 0, 1, 9}?

109. _____ If we define the binary operation \otimes as $a \otimes b = ab + b$ for all numbers a and b , what positive value of x satisfies the equation $x \otimes (4 \otimes x) = 550$?

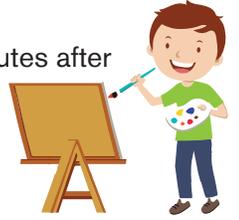

110. _____ degrees A circle with center P is inscribed in isosceles triangle ABC with apex angle A measuring 34 degrees. What is the degree measure of angle APC? Express your answer as a decimal to the nearest tenth.

Warm-Up 9

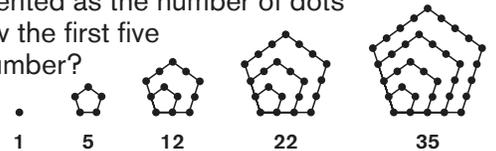

111. _____ points Thomas is a basketball player who is x inches tall. One season he averaged y points per game. The sum of x and y is 98, and x is 11 more than twice y . Based on these statistics, how many points did Thomas score in the 60 games he played that season?

112. _____ : _____ p.m. Pierre needs 39 minutes to paint a painting. The painting will be dry 55 minutes after Pierre finishes. If Pierre starts painting at 1:00 p.m., what is the earliest time when he can have three finished, dry paintings?

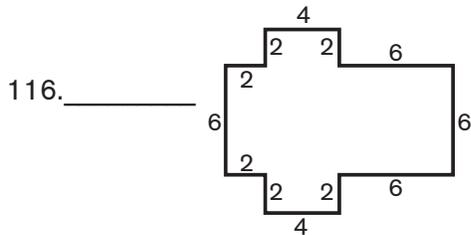

113. _____ pounds Blackbeard and Redbeard take a total of 60 pounds of gold from Treasure Cove. Because Blackbeard outranks Redbeard, Blackbeard gets $\frac{5}{8}$ of the gold and Redbeard gets the remaining $\frac{3}{8}$. How many more pounds of gold does Blackbeard get than Redbeard?

114. _____ A pentagonal number is a number that can be represented as the number of dots on a regular pentagon as in these figures, which show the first five pentagonal numbers. What is the 20th pentagonal number?

115. _____ What is the arithmetic mean of all 3-digit numbers whose digits are distinct and nonzero?

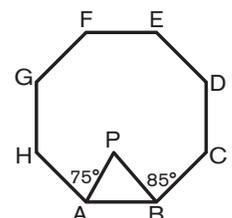

The figure shown can be folded into a rectangular prism. What is the absolute difference between the numerical values of the surface area and volume of the prism?

117. _____ If the sum of three numbers is equal to their product, and two of the numbers are $\frac{4}{3}$ and 1, what is the third number?

118. _____ Alvin plays mini-golf with four friends. The median and unique mode of all their scores are both 10, and the range of their scores is 16. If the mean of all their scores is 15, what is the sum of all possible values of the lowest score?

119. _____ Cayley has a fair six-sided die whose faces are numbered -2 , -1 , 0 , 0 , 1 and 2 . She rolls the die three times. What is the probability that the sum of the three numbers she rolls is 0? Express your answer as a common fraction.

120. _____ degrees Triangle ABP is drawn inside a regular octagon as shown. What is the degree measure of acute angle P if $m\angle HAP = 75$ degrees and $m\angle CBP = 85$ degrees?

Warm-Up 10

121. _____ If $\odot x = 2x + 1$ and $\triangle x = 2x - 1$, what is the value of $\odot \triangle \pi - \triangle \odot \pi$?

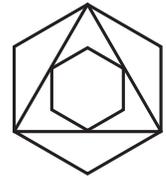

122. _____ What is the sum of the two values of x for which $|x - 3| + |x - 7| = 6$?

123. _____ units² What is the area of triangle ABC, with vertices A(6, 8), B(9, 2) and C(17, 6)?

124. _____ students  A local college has 985 students, of whom 460 play a varsity sport and 571 belong to a club. What is the absolute difference between the least and greatest possible numbers of students who play a varsity sport AND belong to a club?

125. _____ in² What is the smallest possible area of an isosceles triangle with side lengths 5 inches and 6 inches? Express your answer as a decimal to the nearest tenth.

126. _____ An equilateral triangle is inscribed in a regular hexagon, and a smaller regular hexagon is inscribed inside the triangle so that three of its vertices are each the midpoint of a side of the triangle, as shown. What is the ratio of the area of the smaller hexagon to that of the larger hexagon? Express your answer as a common fraction.

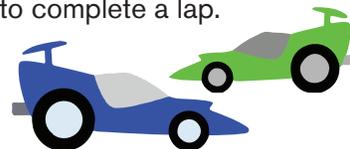

127. _____ divisors How many positive integer divisors of 23,328 are perfect cubes?

128. _____ points Saila took nine exams, each scored out of 100 points. She received a passing score of 60 or above on each of them. If the mean of her nine scores was 80 points, what is the greatest possible value of the median of her nine scores?

129. _____ paths If A(0, 0, 0) and B(2, 2, 2) are points in coordinate space, how many paths are there from A to B that move from one lattice point to another in the positive x -, y - or z -direction?

130. _____ seconds Two race cars travel in opposite directions in separate lanes of a circular track. Car F takes 120 seconds to complete a lap. Car S takes 240 seconds to complete a lap. Once the two cars pass each other, how long does it take for them to pass each other again?

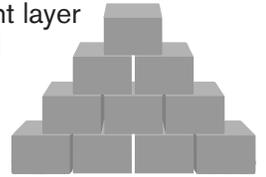

Warm-Up 11

131. _____ What is the greatest common divisor of 2563 and 4147?

132. _____ widgets Hongyi is making a triangular display of widgets. The bottom layer will contain n widgets. The layer immediately above it will contain $n - 1$ widgets. Each subsequent layer will contain one fewer widget than the previous layer, and the top layer will contain one widget. If widgets are packed 25 per case, and Hongyi must use all of the widgets in every case he opens, what is the smallest positive number of widgets Hongyi can use to build the display?

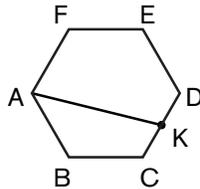

133. _____ degrees Regular pentagon ABCDE has diagonal BE. If P is the midpoint of side ED, what is the degree measure of angle EBP?

134. _____ prime dates A *prime date* is a date for which the number of the month and the number of the day are both prime numbers. How many prime dates are there in the month of March?

135. _____ miles Bennie and Flossie are traveling on a straight road, going in the same direction and starting at the same place. Bennie is traveling at an average speed of 62 mi/h, and Flossie is traveling at an average speed of 75 mi/h. After 2 hours, Flossie stops for a 20-minute break before continuing. After a total of 5 hours, what is the distance between them?

136. _____ cm

Regular hexagon ABCDEF has side length 4 cm. Point K is the midpoint of side CD. What is the length of AK? Express your answer in simplest radical form.

137. _____ crackers At every lunch, three friends share their cheesy crackers with each other but agree not to eat them until they all have the same number. At the first lunch, Axel gives Ben and Chloe as many crackers as they each already have. At the second lunch, Ben gives Axel and Chloe as many crackers as they each already have. At the third lunch, Chloe gives Axel and Ben as many crackers as they each already have, after which they each have 8 crackers, so they eat them. How many crackers did Axel start with?

138. _____ sequences

Paul and his friends play a version of tag football in which a team earns 5 points for every touchdown and 3 points for every field goal. If Paul's team has a total of 25 points, how many different sequences of field goals and touchdowns could the team have scored?

139. _____ Five numbers form an arithmetic sequence with a mean of 18. If the mean of the squares of the five numbers is 374, what is the greatest of the five original numbers?

140. _____ dolphins

An oceanographer tags every dolphin that she sees over a one-week period. At the end of the week, she has tagged 1000 dolphins. One month later, when she returns and examines 2000 dolphins, she finds that 400 of them are ones that she tagged. Assuming that each time, she saw a random subset of the local dolphin population, what is the expected number of dolphins in the local population?

Warm-Up 12

141. _____ cubes Exactly 512 small cubes perfectly fill a lidless cubical box. All of the small cubes are removed except those touching the bottom of the box and those touching the sides of the box. How many of the small cubes were removed?

142. _____ To earn Gold Status on a social media site, Max needs 800 points. He earns a point for every 3 posts he reads, and he gets 15 points for each post he writes. Max can write at most 3 posts a day. He can read up to 120 posts on a weekday and 225 posts on a weekend day. If he starts with 0 points on a Monday morning, what day of the week is the day on which he can first earn Gold Status?

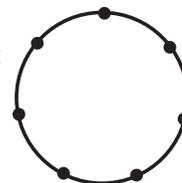

143. _____ If $\frac{a}{3} = \frac{4}{\frac{a}{3}}$, what is the value of a^2 ?

144. _____ cm Segment AC is a diameter of circle P, which has radius 13 cm. If B is a point on circle P such that $AB = 10$ cm, what is the length of segment BC?

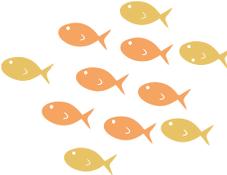

145. _____ integers How many positive integers are each a divisor of both 630 and 360 but not a divisor of 60?

146. _____ penta-
gons Seven points are equally spaced around a unit circle. How many non-congruent convex pentagons can be drawn by using a subset of the points as vertices of the pentagons?

147. _____ If the value of a is 25 and $a - b = \frac{a}{b} - 1$, what is the sum of all possible values of b ?

148. _____ If square WXYZ has vertices $W(2, 1)$, $X(a, b)$, $Y(4, 7)$ and $Z(c, d)$, what is the value of $|ab - cd|$?

149. _____  The ten guppies in Vida's tank are 5, 5, 8, 8, 8, 9, 10, 11, 11 and 33 weeks old. A guppy of age n weeks is added to her tank. The sum of the mean, median and unique mode of the eleven guppies' ages equals the range. What is the sum of all possible integer values of n ?

150. _____ cm If a rhombus with area 26 cm^2 has one diagonal of length 4 cm, what is the length of its other diagonal?

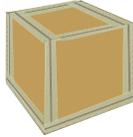

Warm-Up 13

151. _____ What is the coefficient of abc when the product $(a + 2b)(b + 2c)(c + 2a)$ is expanded and like terms are combined?

152. _____ candies Jenny has a bag that contains equal numbers of red, green, yellow, orange and purple candies. She likes only the red candies. If she randomly selects a candy from her bag and discards any non-red candy she selects, then she is guaranteed to select a red candy within a minimum of 45 random selections. What is the total number of candies in her bag?

153. _____ feet

The dimensions of a packing box are 15 inches by 13 inches by 10 inches. Every edge of the box is to be secured with packing tape. If the length of tape along each edge is equal to the edge length, how many feet of tape are needed? Express your answer as a mixed number.

154. _____ units What is the length of the hypotenuse of a right triangle with legs of length $12\sqrt{3}$ units and $23\sqrt{3}$ units? Express your answer in simplest radical form.

155. _____ people

It takes a crew of eight people three days to paint an aircraft. At this rate, how many people are needed to paint five aircraft in six days?

156. _____ In a particular sequence, the ratio between consecutive terms remains constant. If the 2nd term is 2, and the 5th term is 5, what is the value of the 11th term of the sequence? Express your answer as a common fraction.

157. _____

Ilana rolls a fair 8-sided die with faces labeled 1 through 8, and Yolanda rolls a fair 12-sided die with faces labeled 1 through 12. What is the probability that Ilana rolls a smaller number than Yolanda? Express your answer as a common fraction.

158. _____ units

Rectangle PQRS is drawn on a coordinate plane. The y -coordinate of Q is 24 units greater than the y -coordinate of S, the x -coordinate of R is 25 units greater than the x -coordinate of P, and the y -coordinate of P is equal to the y -coordinate of R. What is the perimeter of rectangle PQRS?

159. _____ miles

Hannah ran five races, each of which was a different positive integer number of miles. The mean of her distances was 4 miles. What is the maximum possible distance of her longest race?

160. _____

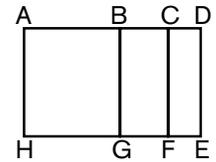

If the coefficients c and d of $x^3 - 19x^2 + cx + d = 0$ are chosen so that the roots of the equation are positive integers that form a geometric sequence, what is the value of $c + d$?

Warm-Up 14

161. _____ units

Rectangles ABGH, BCFG and CDEF are adjacent, as shown, with $AH = n$, $AB = n + 3$, $BC = n - 3$ and $CD = n - 6$. If rectangle BDEG has area 110 units², what is the perimeter of rectangle ACFH?

162. _____ units

The larger of two right triangles has area numerically equal to 3 times the sum of its integer leg lengths, a and b . The other right triangle has area numerically equal to 2 times the sum of its integer leg lengths, c and d . If the triangles have areas in the ratio 3:2, what is the value of $a + b + c + d$?

163. _____

The vertices of a cube are labeled with the integers 1 through 8, in some order, with each integer used exactly once. Each edge of the cube is labeled with the product of the integers at its two endpoints. Each face of the cube is labeled with the sum of the labels of its four edges. What is the greatest possible absolute difference between the labels of two adjacent faces of the cube?

164. _____

Burt has a set of tiles spelling BANANAS. Ernie randomly chooses a set of five tiles from Burt's set. What is the probability that Ernie can create a palindrome using all five tiles? Express your answer as a common fraction.

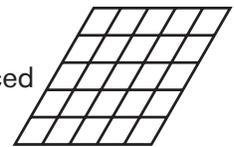

165. _____

Screen sizes of rectangular television sets are measured on the diagonal. If Joe owns a television with a 62-inch screen, and Daniel owns a geometrically similar television with a 31-inch screen, what is the ratio of the area of Daniel's screen to the area of Joe's screen? Express your answer as a common fraction.

166. _____ rhombi

How many rhombi of any size are in this figure, composed of equally spaced horizontal lines and parallel diagonal lines that are also equally spaced?

167. _____

What is the 15th digit to the right of the decimal point in the decimal expansion of $\frac{3}{7}$?

168. _____

If 6, a , b , c , d , e , 34 is a list of seven different positive integers written in increasing numerical order such that c is both the mean and the median of the list, what is the least possible value for c ?

169. _____

Two real numbers from 0 to 10, inclusive, are to be chosen at random. What is the probability that the absolute difference between the two numbers will be less than 3? Express your answer as a common fraction.

170. _____ permutations

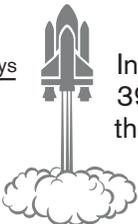

How many permutations of the digits 1, 2, 3 and 4 can be arranged in a line, so that no adjacent digits differ by more than two?

Workout 1

171. _____ cm A rectangular sheet of paper is cut in half perpendicular to the longer side. One half is discarded, and the other half is cut into thirds as shown. Two of the thirds are discarded, and the remaining third is cut into fourths by vertical lines. Three of the fourths are discarded, and the remaining fourth is cut into fifths by horizontal lines. Four of the fifths are discarded, and the remaining fifth is cut into sixths by vertical lines. Five of the sixths are discarded, leaving a square piece with side length 2 cm. What is the perimeter of the original sheet of paper?

172. _____ days  In 1969, the Apollo 10 mission set the record for the fastest crewed space travel, at 39,897 km/h. At that speed, how many days would it take to travel 54.6 million km, the minimum distance from Earth to Mars? Express your answer to the nearest whole number.

173. _____ Yeong multiplies two-digit positive integers AB and CD . If the digits A , B , C and D are all distinct, what is the greatest possible value of the product?

174. \$ _____ Karli paid \$3.00 for lunch every day she attended school. During a six-week period, Karli attended school every Monday through Friday, with the exception of one school holiday. What is the total amount that Karli spent on school lunches during this six-week period?

175. _____ What is the sum of the mean, median, mode and range of the numbers 15, 33, 24, 10, 20 and 24?

176. _____ gallons A certain race car consumes 1.3 gallons of fuel during each lap of a race. If each lap is 2.5 miles, and the entire race is 500 miles, how much fuel does the race car consume from start to finish?

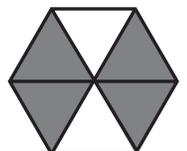

177. _____ inches One television screen measures 56 inches long and 33 inches wide. A smaller, geometrically similar television screen measures 48 inches long. What is the width of the smaller screen? Express your answer as a decimal to the nearest tenth.

178. _____ mi/h  Lindsay starts at the peak of a mountain, and it takes her 50 minutes to hike 15,000 feet. What was her average walking speed, in miles per hour, given 1 mile = 5280 feet? Express your answer as a decimal to the nearest tenth.

179. _____ Let a be the arithmetic mean of 3.27 and 17.95. Let b be the product of 32.7 and 0.4382. Let c be the quotient of 2.637 and 0.316. Let d be the absolute difference between 793.241 and 804.3692. What is the numerical value of the median of a , b , c and d ? Express your answer as a decimal to the nearest hundredth.

180. _____ units² Jessie makes butterfly wings by shading four sections of a regular hexagon as shown. If the hexagon has side length $4\sqrt{3}$ units, what is the area of the shaded region? Express your answer in simplest radical form.

Workout 2

181. _____ units² What is the area of a triangle with sides of length 16, 30 and 34?

182. _____ gallons How many gallons are in the volume of a cylinder with height 12 inches and diameter 14 inches if 1 gallon = 231 in³? Express your answer to the nearest whole number.

183. _____ If $x @ y = \text{LCM}(x, y)$ and $x \# y = \text{GCD}(x, y)$, what is the value of $((2 @ 7)^2 \# 42) \# 105$?

184. _____ minutes On a digital clock that shows hours and minutes, for how many minutes, during a single day, between 4:00 a.m. and 6:00 a.m. will the sum of the digits be 10?

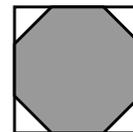

185. _____ cm³ The density of an object is the mass of the object per unit volume. The density of water is 1 gram/cm³, and the density of ice is 91.67% that of water. If 1 kilogram of water completely freezes, what is the volume, in cubic centimeters, of the resulting ice block? Express your answer to the nearest whole number.

186. _____ If $\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & k \end{vmatrix} = aek + bfg + cdh - ceg - afh - bdk$, what is the value of $\begin{vmatrix} 2 & -5 & 3 \\ 0 & 4 & -6 \\ -1 & 8 & 7 \end{vmatrix}$?

187. _____ degrees A certain trapezoid has these properties: its diagonals are congruent and perpendicular to each other, and its longer base length is equal to the length of a diagonal. What is the sum of the degree measures of the two acute angles of this trapezoid?

188. _____ sub-sets How many subsets of $\{1, 2, 3, 4, 6, 8, 10, 15\}$ are there for which the sum of the elements is 15?

189. _____ % The figure shows a shaded regular octagon inscribed in a square. What percent of the figure is shaded? Express your answer to the nearest whole number.

190. _____ minutes Spike can dig 8 holes in 3 hours. Butch can dig 7 holes in 4 hours. Lucky can dig 6 holes in 5 hours. How many minutes will it take them to dig 3 holes if all three work together? Express your answer to the nearest whole number.

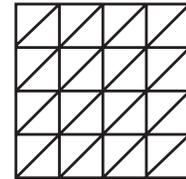

Workout 3

191. _____ Let q be the sum of the lengths of all 12 edges of a cube, and let A be the total surface area of the cube. If $q \times A$ is k times the volume of the cube, what is the value of k ?

192. _____ Alta's favorite sphere has six times as much surface area compared to her favorite cylinder, which is right circular. If the height of her favorite cylinder is equal to its diameter, what is the ratio of the volume of Alta's favorite cylinder to the volume of her favorite sphere? Express your answer as a common fraction.

193. _____ triangles How many triangles of any size are in the figure shown here?

194. _____ page Rex reads a novel at a constant rate while Wren writes a report at a constant rate. Rex finishes page 313 of his novel at the same time Wren finishes page 5 of her report. Rex later finishes page 409 of his novel when Wren finishes page 9 of her report. What page of his novel will Rex finish when Wren finishes page 12 of her report?

195. _____ The Fibonacci sequence is defined by the function $F(n) = F(n - 2) + F(n - 1)$, for $n > 2$ and $F(1) = F(2) = 1$. What is the value of $F(11)$?

196. _____ What is the ratio of the area of the largest square that can fit inside a circle of diameter 2 cm compared to the area of the largest square that can fit inside a semicircle of diameter 2 cm? Express your answer as a common fraction.

197. _____ If $20! = 2^a \times b$ for some integer b , what is the greatest possible value of a ?

198. _____ % At a certain middle school, the 6th-grade class of 390 increased by 10%, the 7th-grade class of 350 increased by 22% and the 8th-grade class of 420 increased by 20%. Overall, what was the percentage increase of students for this middle school? Express your answer to the nearest tenth.

199. _____ units³ A 6-8-10 right triangle is rotated about the side of length 10 units. What is the volume of the resulting solid? Express your answer as a decimal to the nearest tenth.

200. _____

Vikram attempted to calculate 67×58 , but he entered exactly one digit incorrectly, resulting in a product of 3596. What is the sum of the two values he actually multiplied?

Workout 4

201. \$ _____ Alice's car travels 29 miles per gallon of gas. Phil's car uses 0.02 gallon of gas per mile traveled. If gas costs \$2.50 per gallon, what is the absolute difference in the amounts Alice and Phil would each spend on the gas needed to drive 113 miles?

202. _____ A cheese cube is sliced diagonally from one edge to another, as shown. One piece of the cheese is melted and then reformed into a perfect sphere. What is the ratio of the side length of the original cheese cube to the radius of the cheese sphere? Express your answer as a decimal to the nearest hundredth.

203. _____ : _____ a.m. Three consecutive rounds of an X-game last 24 minutes, 48 minutes and 96 minutes. If the game begins at 6:00 a.m., at what time will the third round end?

204. _____ meters

| | | |
|-----|--|---------------|
| 1.2 | | 1 3 6 6 |
| 1.3 | | 2 4 5 5 7 9 |
| 1.4 | | 0 1 4 8 |
| 1.5 | | 0 3 4 6 8 8 9 |
| 1.6 | | 0 5 7 |
| 1.7 | | 1 |

Ms. Santa asks the 25 students in her math class to measure their heights in meters. The students' heights are recorded in the stem-and-leaf plot shown here, where 1.2 | 1 represents 1.21 meters. What is the median height of the students in Ms. Santa's class? Express your answer as a decimal to the nearest hundredth.

205. _____ ordered pairs How many ordered pairs of positive integers (a, b) satisfy the equation $\frac{2}{a} - \frac{3}{b} = \frac{1}{5}$?

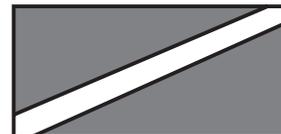

206. _____ steps

R.J.'s pedometer indicates that he has walked 10,002 steps and equates that to traveling 4.11 miles. Based on this, how many additional steps must he walk to travel the equivalent of 5 miles total? Express your answer to the nearest whole number.

207. \$ _____ A liter of fuel cost £1.33. At that rate, what would be the cost, in U.S. currency, of 1 gallon of fuel, given that 1 gallon \approx 3.78541 liters and US\$1.30 \approx £1.00?

208. \$ _____ A 10-meter by 20-meter garden is going to have a concrete walkway constructed diagonally through the middle as shown. The longest sides of the walkway each start 1 meter from the closest corner of the garden. If the walkway will have a uniform depth of 10 cm and the concrete costs \$70 per cubic meter, what will be the cost of the concrete used for the walkway?

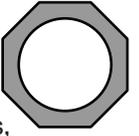

209. _____ years old On his 15th birthday, Bo invests \$10,000 in a bank that pays 7.5% interest, compounded annually. At this rate and assuming Bo makes no deposits or withdrawals, how old will Bo be on the first birthday when his account balance is at least \$30,000?

210. _____ permutations How many different two-letter permutations can be made from two distinct letters in the word MATHCOUNTS?

Workout 5

211. _____ cm A regular octagon with side length 4 cm is concentric with a circle, as shown. If the area of the circle is equal to the area of the shaded region between the shapes, what is the radius of the circle? Express your answer as a decimal to the nearest tenth.

212. _____ ounces Jonas has a $1\frac{1}{2}$ -inch by 4-inch by 3-inch rectangular block of tofu weighing 16 ounces. He cuts the block into smaller pieces, each of which is a triangular prism having a right triangle base with legs of length $1\frac{1}{3}$ inch and $\frac{3}{4}$ inch. If each tofu prism has height $\frac{1}{2}$ inch, what is the weight of one tofu prism? Express your answer as a common fraction.

213. _____ sequences

Blake has a repertoire of 15 songs, of which 5 are acoustic. In his concert, he plans to perform 10 distinct songs, of which 4 will be acoustic. He wants to perform the 4 acoustic songs consecutively in the second half of the concert but doesn't want to end the concert with an acoustic song. How many different sequences of songs can Blake perform?

214. _____ % Each time Chris bats, he has a 37% probability of getting a hit, independent of his previous performance at bat. What is his percent probability of getting at least two hits in four times at bat? Express your answer to the nearest whole number.

215. _____ % The Bobcats had a win-loss record of 41-23 before their star player, Melissa, got injured. Melissa didn't play in any more games, and the Bobcats finished the season with an overall win-loss record of 54-34. What is the absolute difference in the Bobcats' win percentages with and without Melissa? Express your answer to the nearest whole number.

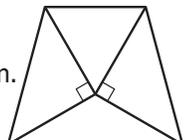

216. _____ points On a test, Walter scored 86, Bev scored 72, Claire scored 61 and Rachel scored 93. Tyler didn't remember his score, but he knew that his score was both the mean and the median of all five students' scores. What was Tyler's score?

217. _____ The two values of x that satisfy the equation $x^2 + bx + c = 0$, for integers b and c , are $x = 6$ and $x = -4$. What is the value of b ?

218. _____ An eight-digit number N has one 2, three 3s, two 4s and two 5s as digits. If N can be expressed as a power of 2, what is the value of N ?

219. \$ At Randolph's furniture store, a standard breakfast table has a price of \$1000. Karthik wants to purchase the luxury version of the table, which costs 35% more than the standard one, and he has a coupon that gives him a 15% discount on his purchase. After applying 6% sales tax to the discounted price, how much will Karthik pay for the luxury table?

220. _____ Tarin and Sonja construct the trapezoid shown, which contains an equilateral triangle and three isosceles triangles, two of which are right triangles. What is the ratio of the length of the shorter base to the length of the longer base of the trapezoid? Express your answer as a common fraction in simplest radical form.

Workout 6

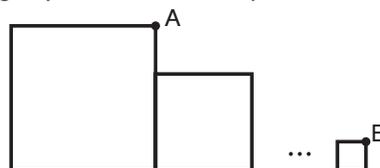

221. _____ spells

Ronald is attempting to cast a levitation spell. On his first attempt, he has a 20% chance of success. Ronald's likelihood of success improves by 5% after each failed attempt. For example, his second attempt has a 25% chance of success if he fails on the first attempt. What is the minimum number of spells that he must attempt to guarantee a successful casting?

222. _____ units

In a sequence of adjacent squares, a portion of which is shown, the side length of each successive square is two-thirds that of the preceding square. In the completed sequence, the areas of the largest and smallest squares are 6561 units² and 256 units², respectively. What is the length of the segment with endpoints A and B? Express your answer to the nearest whole number.

223. _____ ways

A cheerleading squad consists of ten cheerleaders of ten different heights. How many ways are there for the cheerleaders to line up for a photo in two rows of five people each so that each cheerleader in the back row is taller than the one immediately in front?

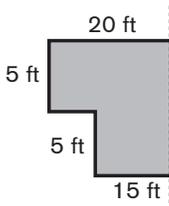

224. \$ _____

The math club purchased a number of gadgets to sell. Each box of gadgets cost the club \$75 and contained 30 gadgets. In the first 15 days, the club members sold 22 gadgets each day at the regular price of \$6.80 each. In the next 10 days, they sold 17 gadgets per day at a discount of 25% off. They then sold the remaining 220 gadgets at 30% off the discounted price. After all the gadgets were sold, what was the math club's total profit?

225. _____

If A, B and C are the digits of the base-five number ABC, which is equal to the base-ten number 47, what digit does B represent?

226. _____ feet

The figure, which shows half of the cross section of a pool, can be rotated 360 degrees around the dotted line to create a three-dimensional pool with depth 10 feet in the center and 5 feet at the outer edge. What is the average depth of the pool? Express your answer as a decimal to the nearest tenth.

227. _____ games

In his first 319 career games, goaltender Braden Holtby had 200 wins and 119 losses. If he were to maintain this rate of winning games, what is the least number of games he would need to play in his career to pass Martin Brodeur's career record of 691 wins?

228. _____

What is the least positive odd integer with exactly nine natural number divisors?

229. _____ seconds

Noa completes $5\frac{1}{3}$ laps around a track in the same amount of time it takes Lev to complete 6 laps. Lev is running at a pace of 7.5 minutes per mile. How many seconds longer will it take Noa to run 1 mile, compared to Lev? Express your answer to the nearest whole number.

230. _____ in²

What is the area of a triangle with side lengths of 4, 6 and 8 inches? Express your answer in simplest radical form.

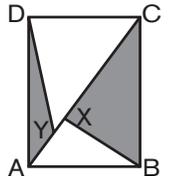

Workout 7

231. _____ If a number x plus its reciprocal is equal to 4, what is the absolute difference between x and its reciprocal? Express your answer in simplest radical form.

232. \$ _____ For making house numbers, 5-inch digits can be purchased online for \$8.79 each for the digits 1, 3, 5 and 6 and \$5.98 each for the digits 0, 2, 4, 7, 8 and 9. Ashera wishes to create consecutive house numbers beginning with 5100 and ending with 5200. What is the total cost to purchase the necessary digits online, excluding tax and shipping?

233. _____ units² Rectangle ABCD is shown here with $AB = 6$ and $BC = 8$. If X and Y lie on diagonal AC , and $XY = 1$, what is the total area of shaded triangles BCX and DAY ? Express your answer as a decimal to the nearest tenth.

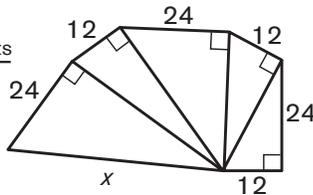

234. _____ orders

Fran has four dogs whose ages are 3, 4, 5 and 6 years. She feeds them one at a time according to the rule that a younger dog can never eat right before a dog that is only one year older. In how many different orders can Fran feed her four dogs?

235. _____ What is the arithmetic mean of the terms of a five-term geometric sequence of positive numbers whose second term is 15 and whose fourth term is 135?

236. _____ units

Five right triangles are constructed adjacent to each other as shown. All five triangles share a vertex. The longer leg of each triangle, except the rightmost triangle, is the hypotenuse of an adjacent triangle. What is the length of the longest hypotenuse, labeled x ? Express your answer in simplest radical form.

237. _____ cm An equilateral triangle and a regular hexagon have a combined perimeter of 42 cm and a combined area of $49\sqrt{3}$ cm². What is the side length of the hexagon? Express your answer as a decimal to the nearest tenth.

238. _____ Ty flips a fair coin 20 times. What is the probability that it lands heads up and tails up equal numbers of times? Express your answer as a decimal to the nearest thousandth.

239. _____ troy ounces

One hundred years ago, a newly minted Walking Liberty Half Dollar contained 0.36 troy ounce of silver, a Standing Liberty Quarter contained 90% silver (by mass) and a Mercury Dime was made from the same alloy as the other two coins. If the mass of each coin was proportional to its face value, what was the total mass of a Mercury Dime? Express your answer as a decimal to the nearest hundredth.

240. _____ units

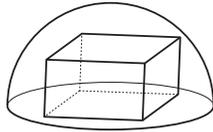

Two right triangles have areas in the ratio 1:2. If the smaller triangle has legs of length 3 units and 4 units, and the larger triangle has a side of length 8 units, what is the sum of the possible lengths of the hypotenuse of the larger triangle? Express your answer in simplest radical form.

Workout 8

241. _____ inches Scott thinks that Miguel is 6 feet 3 inches tall. If Miguel's height is actually 96% of Scott's estimate, how many inches tall is Miguel?

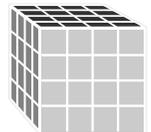

242. _____ in³

A hemisphere of radius 6 inches lies flat on its circular base, and a rectangular prism with two square bases lies inside the hemisphere, with one square base on the base of the hemisphere and all four vertices of the other square base touching the upper boundary of the hemisphere. The height of the prism is one-third of the length of the square base. What is the volume of the prism? Express your answer as a decimal to the nearest tenth.

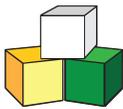

243. _____ If N is a perfect square and a divisor of $13!$, what is the greatest possible value of N ?

244. _____ lines When 64 unit cubes are glued together seamlessly to form a $4 \times 4 \times 4$ cube, as shown, there are 76 distinct lines that pass through the centers of exactly four unit cubes. If 1000 unit cubes are glued together seamlessly to form a $10 \times 10 \times 10$ cube, how many distinct lines pass through the centers of ten unit cubes?

245. _____ Suppose (a, b, c) is an ordered triple such that $a^2 + b^2 = c^2$. If $b = x + y\sqrt{2}$ when $a = 12 + 10\sqrt{2}$ and $c = 15 + 8\sqrt{2}$, what is the positive integer value of $x + y$?

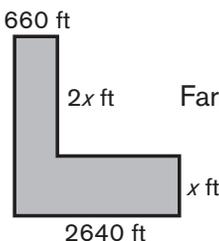

246. _____ yellow blocks

Camsie has a large number of identical yellow blocks, identical green blocks and identical white blocks. Using a balance scale, she finds that 3 green blocks will balance 1 yellow plus 3 white blocks and that 5 white blocks will balance 1 green plus 5 yellow blocks. How many yellow blocks will balance 30 green plus 60 white blocks?

247. _____ A box contains only quarters and dimes. If there were 10% more quarters, there would be 7.5% more money in the box. What is the ratio of the original number of quarters to the original number of dimes in the box? Express your answer as a common fraction.

248. _____ feet

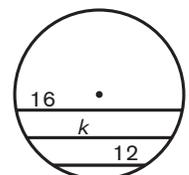

Farmer John's field has area 60 acres. The field is in the shape of an "L", with right angles at every vertex and dimensions as shown. If one acre is equal in area to a strip of land 40 rods long and 4 rods wide, and one rod is equal in length to 16.5 feet, what is value of x in feet?

249. _____ ways Notice that 2019 can be written as the sum of consecutive integers in increasing order in numerous ways, for example $1009 + 1010 = 2019$ and $(-2018) + (-2017) + \dots + 2018 + 2019 = 2019$. Including these two examples, in how many ways can 2019 be written as the sum of at least two consecutive integers in increasing order?

250. _____ units

Three parallel chords of lengths 12, k and 16 units are in a circle, as shown. If the chord of length k is equally spaced 2 units away from each of the other chords, what is the value of k ? Express your answer in simplest radical form.

OFFICIAL RULES + PROCEDURES

The following rules and procedures govern all MATHCOUNTS competitions. The MATHCOUNTS Foundation reserves the right to alter these rules and procedures at any time. **Coaches are responsible for being familiar with the rules and procedures outlined in this handbook.** Coaches should bring any difficulty in procedures or in student conduct to the immediate attention of the appropriate chapter, state or national official. Students violating any rules may be subject to immediate disqualification.

Any questions regarding the MATHCOUNTS Competition Series Official Rules + Procedures articulated in this handbook should be addressed to the MATHCOUNTS national office at (703) 299-9006 or info@mathcounts.org.

REGISTRATION

The fastest and easiest way to register for the MATHCOUNTS Competition Series is online at www.mathcounts.org/compreg.

For your school to participate in the MATHCOUNTS Competition Series, a school representative is required to complete a registration form and pay the registration fees. A school representative can be a teacher, administrator or parent volunteer who has received expressed permission from his/her child's school administration to register. By completing the Competition Series Registration Form, the coach attests to the school administration's permission to register students for MATHCOUNTS.

School representatives can register online at www.mathcounts.org/compreg or download the Competition Series Registration Form and mail or email a scanned copy of it to the MATHCOUNTS national office. Refer to the Critical 2019-2019 Dates on pg. 10 of this handbook for contact information.

WHAT REGISTRATION COVERS: Registration in the Competition Series entitles a school to:

- 1) send 1-10 student(s)—depending on number registered—to the Chapter Competition. *Students can advance beyond the chapter level, but this is determined by their performance at the competition.*
- 2) receive the School Competition Kit, which includes the *2018-2019 MATHCOUNTS School Handbook*, one recognition ribbon for each registered student, 10 student participation certificates and a catalog of additional coaching materials. *Mailings of School Competition Kits will occur on a rolling basis through December 31, 2018.*
- 3) receive online access to the 2019 School Competition, along with electronic versions of other competition materials at www.mathcounts.org/coaches. *Coaches will receive an email notification no later than November 2, 2018 when the 2019 School Competition is available online.*

Your state or chapter coordinator will be notified of your registration, and then you will be informed of the date and location of your Chapter Competition. **If you have not been contacted by mid-January with competition details, it is your responsibility to contact your local coordinator** to confirm that your registration has been properly routed and that your school's participation is expected. Coordinator contact information is available at www.mathcounts.org/findmycoordinator.

DEADLINES: The sooner your Registration Form is received, the sooner you will receive your preparation materials. To guarantee your school's participation, submit your registration by one of the following deadlines:

| | |
|---|---|
| <i>Early Bird Discount Deadline:</i> November 2, 2018 | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by November 2, 2018 |
| <i>Regular Registration Deadline:</i> December 14, 2018* | Online registrations: submitted by 11:59 PST Emailed forms: received by 11:59 PST Mailed forms: postmarked by December 14, 2018 |

*Late Registrations may be accepted at the discretion of the MATHCOUNTS national office and your local coordinators, but are not guaranteed. If a school's late registration is accepted, an additional \$20 processing fee will be assessed.

REGISTRATION FEES: The cost of your school's registration depends on when your registration is postmarked/mailed/submitted online. The cost of your school's registration covers the students for the entire Competition Series; there are no additional registration fees to compete at the state or national level. Title I schools (as affirmed by a school's administration) receive a 50% discount off the total cost of their registration.

| | |
|--|--|
| <i>Early Bird Registrations</i> (by November 2, 2018) | \$30 per student \$120 for 1 team of 4 \$300 for 1 team of 4 + 6 individuals |
| <i>Regular Registrations</i> (by December 14, 2018) | \$35 per student \$140 for 1 team of 4 \$350 for 1 team of 4 + 6 individuals |
| <i>Late Registrations</i> (after December 14, 2018) | \$35 per student + \$20 late fee on entire order \$160 for 1 team of 4 \$370 for 1 team of 4 + 6 individuals |

CANCELLATION FEES: Registered schools that need to cancel their Competition Series registration must notify the MATHCOUNTS national office in writing via email or mail. Schools may request and receive a full refund minus a \$30 non-refundable cancellation fee to cover refund processing and the cost of materials shipped to the school. MATHCOUNTS will verify a school's non-participation with local coordinators and reserves the right to refuse a refund request. No cancellations or refund requests will be processed after February 1, 2019. *This fee does not apply to schools that reduce their number of registered students but remain registered with at least one student.*

ELIGIBILITY REQUIREMENTS

Eligibility requirements for the MATHCOUNTS Competition Series are different from other MATHCOUNTS programs. Eligibility for the National Math Club or the Math Video Challenge does not guarantee eligibility for the Competition Series.

WHO IS ELIGIBLE:

- U.S. students enrolled in the 6th, 7th or 8th grade can participate in MATHCOUNTS competitions.
- Schools that are the students' official school of record can register.
- Any type of school, of any size, can register—public, private, religious, charter, virtual or homeschools—but virtual and homeschools must fill out additional forms to participate (see pgs. 39-40).
- Schools in 50 U.S. states, District of Columbia, Guam, Puerto Rico and Virgin Islands can register.
- Overseas schools that are affiliated with the U.S. Departments of Defense and State can register.

WHO IS NOT ELIGIBLE:

- Students who are not full-time 6th, 7th or 8th graders cannot participate, even if they are taking middle school math classes.
- Academic centers, tutoring centers or enrichment programs that do not function as students' official school of record cannot register. *If it is unclear whether your educational institution is considered a school, please contact your local Department of Education for specific criteria governing your state.*
- Schools located outside of the U.S. states and territories listed on the previous page cannot register.
- Overseas schools not affiliated with the U.S. Departments of Defense or State cannot register.

NUMBER OF STUDENTS ALLOWED: A school can register a maximum of one team of four students and six individuals; these 1-10 student(s) will represent the school at the Chapter Competition. Any number of students can participate at the school level. Prior to the Chapter Competition, coaches must notify their chapter coordinator of which students will be team members and which students will compete as individuals.

NUMBER OF YEARS ALLOWED: Participation in MATHCOUNTS competitions is limited to 3 years for each student, but there is no limit to the number of years a student may participate in school-based coaching.

WHAT TEAM REGISTRATION MEANS: Members of a school team will participate in the Target, Sprint and Team Rounds. Members of a school team also will be eligible to qualify for the Countdown Round (where conducted). Team members will be eligible for team awards, individual awards and progression to the state and national levels based on their individual and/or team performance. It is recommended that your strongest four Mathletes form your school team. Teams of fewer than four will be allowed to compete; however, the team score will be computed by dividing the sum of the team members' scores by four (see pg. 43), meaning, teams of fewer than four students will be at a disadvantage. *Only one team (of up to four students) per school is eligible to compete.*

WHAT INDIVIDUAL REGISTRATION MEANS: Students registered as individuals will participate in the Target and Sprint Rounds, but not the Team Round. Individuals will be eligible to qualify for the Countdown Round (where conducted). Individuals also will be eligible for individual awards and progression to the state and national levels. A student registered as an "individual" may not help his/her school's team advance to the next level of competition. *Up to six students may be registered in addition to or in lieu of a school team.*

HOW STUDENTS ENROLLED PART-TIME AT TWO SCHOOLS PARTICIPATE: *A student may compete only for his/her official school of record.* A student's school of record is the student's base or main school. A student taking limited course work at a second school or educational center may not register or compete for that second school or center, even if the student is not competing for his/her school of record. MATHCOUNTS registration is not determined by where a student takes his or her math course. If there is any doubt about a student's school of record, the chapter or state coordinator must be contacted for a decision before registering.

HOW SMALL SCHOOLS PARTICIPATE: MATHCOUNTS does not distinguish between the sizes of schools for Competition Series registration and competition purposes. Every "brick-and-mortar" school will have the same registration allowance of up to one team of four students and/or up to six individuals. A school's participants may not combine with any other school's participants to form a team when registering or competing.

HOW HOMESCHOOLS PARTICIPATE: Homeschools and/or homeschool groups in compliance with the homeschool laws of the state in which they are located are eligible to participate in MATHCOUNTS competitions in accordance with all other rules. Homeschool coaches must complete the 2018-2019 Homeschool + Virtual School Participation Form, verifying that students from the homeschool or homeschool group are in the 6th, 7th or 8th grade and that each homeschool complies with applicable state laws. Forms can be downloaded at www.mathcounts.org/competition and must be submitted to the MATHCOUNTS national office in order for registrations to be processed.

HOW VIRTUAL SCHOOLS PARTICIPATE: Virtual schools that want to register must contact the MATHCOUNTS national office by December 7, 2018 for specific registration details. Any student registering as a virtual school student must compete in the MATHCOUNTS Chapter Competition assigned according to the student's home address. Additionally, virtual school coaches must complete the 2018-2019 Homeschool + Virtual School Participation Form, verifying that the students from the virtual school are in the 6th, 7th or 8th grade and that the virtual school complies with applicable state laws. Forms must be submitted to the national office in order for registrations to be processed; forms can be downloaded at www.mathcounts.org/competition.

WHAT IS DONE FOR SUBSTITUTIONS OF STUDENTS: Coaches determine which students will represent the school at the Chapter Competition. Coaches cannot substitute team members for the State Competition unless a student voluntarily releases his/her position on the school team. Additional requirements and documentation for substitutions (such as requiring parental release or requiring the substitution request be submitted in writing) are at the discretion of the State Coordinator. A student being added to a team need not be a student who was registered for the Chapter Competition as an individual. Coaches cannot make substitutions for students progressing to the State Competition as individuals. At all levels of competition, student substitutions are not permitted after on-site competition registration has been completed.

WHAT IS DONE FOR RELIGIOUS OBSERVANCES: A student who is unable to attend a competition due to religious observances may take the written portion of the competition up to one week in advance of the scheduled competition. In addition, all competitors from that student's school must take the Sprint and Target Rounds at the same earlier time. If the student who is unable to attend the competition due to a religious observance: (1) is a member of the school team, then the team must take the Team Round at the same earlier time; (2) is not part of the school team, then the team has the option of taking the Team Round during this advance testing or on the regularly scheduled day of the competition with the other school teams. The coordinator must be made aware of the team's decision before the advance testing takes place. Advance testing will be done at the discretion of the chapter and state coordinators. If advance testing is deemed possible, it will be conducted under proctored conditions. Students who qualify for an official Countdown Round but are unable to attend will automatically forfeit one place standing.

WHAT IS DONE FOR STUDENTS WITH SPECIAL NEEDS: Reasonable accommodations may be made to allow students with special needs to participate. However, many accommodations that are employed in a classroom or teaching environment cannot be implemented in the competition setting. Accommodations that are not permissible include, but are not limited to: granting a student extra time during any of the competition rounds or allowing a student to use a calculator for the Sprint or Countdown Rounds. A request for accommodation of special needs must be directed to chapter or state coordinators in writing at least three weeks in advance of the Chapter or State Competition. This written request should thoroughly explain a student's special need, as well as what the desired accommodation would entail. In conjunction with the MATHCOUNTS Foundation, coordinators will review the needs of the student and determine if any accommodations will be made. In making final determinations, the feasibility of accommodating these needs at the National Competition will be taken into consideration.

LEVELS OF COMPETITION

There are four levels in the MATHCOUNTS Competition Series: school, chapter (local), state and national. Competition questions are written for 6th, 7th and 8th graders. The competitions can be quite challenging, particularly for students who have not been coached using MATHCOUNTS materials. All competition materials are prepared by the national office.

SCHOOL COMPETITIONS (TYPICALLY HELD IN JANUARY 2019): After several months of coaching, schools registered for the Competition Series should administer the 2019 School Competition to all interested

students. The School Competition should be an aid to the coach in determining competitors for the Chapter Competition. *Selection of team and individual competitors is entirely at the discretion of the coach and does not need to be based solely on School Competition scores.* School Competition materials are sent to the coach of a school, and it may be used by the teachers and students only in association with that school's programs and activities. The current year's School Competition questions must remain confidential and may not be used in outside activities, such as tutoring sessions or enrichment programs with students from other schools. For updates or edits, please check www.mathcounts.org/coaches before administering the School Competition.

It is important that the coach look upon coaching sessions during the academic year as opportunities to develop better math skills in all students, not just in those students who will be competing. Therefore, it is suggested that the coach postpone selection of competitors until just prior to the Chapter Competition.

CHAPTER COMPETITIONS (HELD FEB. 1–28, 2019): The Chapter Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be conducted. The chapter and state coordinators determine the date and location of the Chapter Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The winning team will advance to the State Competition. Additionally, the two highest-ranking competitors not on the winning team (who may be registered as individuals or as members of a team) will advance to the State Competition. This is a minimum of six advancing Mathletes (assuming the winning team has four members). Additional teams and/or individuals also may progress at the discretion of the state coordinator, but the policy for progression must be consistent for all chapters within a state.

STATE COMPETITIONS (HELD MAR. 1–31, 2019): The State Competition consists of the Sprint, Target and Team Rounds. The Countdown Round (official or just for fun) may or may not be included. The state coordinator determines the date and location of the State Competition in accordance with established national procedures and rules. Winning teams and students will receive recognition. The four highest-ranked Mathletes and the coach of the winning team from each State Competition will receive an all-expenses-paid trip to the National Competition.

2019 RAYTHEON MATHCOUNTS NATIONAL COMPETITION (HELD MAY 12–13 IN ORLANDO, FL): The National Competition consists of the Sprint, Target, Team and Countdown Rounds (conducted officially). Expenses of the state team and coach to travel to the National Competition will be paid by MATHCOUNTS. The national program does not make provisions for the attendance of additional students or coaches. All national competitors will receive a plaque and other items in recognition of their achievements. Winning teams and individuals also will receive medals, trophies and college scholarships.

COMPETITION COMPONENTS

The four rounds of a MATHCOUNTS competition, each described below, are designed to be completed in approximately three hours:

TARGET ROUND (approximately 30 minutes): In this round eight problems are presented to competitors in four pairs (six minutes per pair). The multi-step problems featured in this round engage Mathletes in mathematical reasoning and problem-solving processes. *Problems assume the use of calculators.*

SPRINT ROUND (40 minutes): Consisting of 30 problems, this round tests accuracy, with the time period allowing only the most capable students to complete all of the problems. *Calculators are not permitted.*

TEAM ROUND (20 minutes): In this round, interaction among team members is permitted and encouraged as they work together to solve 10 problems. *Problems assume the use of calculators.*

Note: The order in which the written rounds (Target, Sprint and Team) are administered is at the discretion of the competition coordinator.

COUNTDOWN ROUND: A fast-paced oral competition for top-scoring individuals (based on scores on the Target and Sprint Rounds), this round allows pairs of Mathletes to compete against each other and the clock to solve problems. Calculators are not permitted.

At Chapter and State Competitions, a Countdown Round (1) may be conducted officially, (2) may be conducted unofficially (for fun) or (3) may be omitted. However, the use of an official Countdown Round must be consistent for all chapters within a state. In other words, *all* chapters within a state must use the round officially in order for *any* chapter within a state to use it officially. All students, whether registered as part of a school team or as individual competitors, are eligible to qualify for the Countdown Round.

An official Countdown Round determines an individual's final overall rank in the competition. If a Countdown Round is used officially, the official procedures as established by the MATHCOUNTS Foundation must be followed, as described below.*

- The top 25% of students, up to a maximum of 10, are selected to compete. These students are chosen based on their Individual Scores.
- The two lowest-ranked students are paired; a question is read and projected, and students are given 45 seconds to solve the problem. A student may buzz in at any time, and if s/he answers correctly, a point is scored. If a student answers incorrectly, the other student has the remainder of the 45 seconds to answer.
- Three total questions are read to the pair of students, one question at a time, and the student who scores the higher number of points (not necessarily 2 out of 3) progresses to the next round and challenges the next-higher-ranked student.
- If students are tied in their matchup after three questions (at 1-1 or 0-0), questions should continue to be read until one is successfully answered. The first student who answers an additional question correctly progresses to the next round.
- This procedure continues until the 4th-ranked Mathlete and his/her opponent compete. For the final four matchups, the first student to correctly answer three questions advances.
- The Countdown Round proceeds until a 1st place individual is identified. More details about Countdown Round procedures are included in the 2019 School Competition.

**Rules for the Countdown Round change for the National Competition.*

An unofficial Countdown Round does not determine an individual's final overall rank in the competition, but is done for practice or for fun. The official procedures do not have to be followed. Chapters and states choosing not to conduct the round officially must determine individual winners solely on the basis of students' scores in the Target and Sprint Rounds of the competition.

SCORING

MATHCOUNTS Competition Series scores do not conform to traditional grading scales. Coaches and students should view an Individual Score of 23 (out of a possible 46) as highly commendable.

INDIVIDUAL SCORE: calculated by taking the sum of the number of Sprint Round questions answered correctly and twice the number of Target Round questions answered correctly. There are 30 questions in the Sprint Round and eight questions in the Target Round, so the maximum possible Individual Score is $30 + 2(8) = 46$. If used officially, the Countdown Round yields final individual standings.

TEAM SCORE: calculated by dividing the sum of the team members' Individual Scores by four (even if the team has fewer than four members) and adding twice the number of Team Round questions answered correctly. The highest possible Individual Score is 46. Four students may compete on a team, and there are 10 questions in the Team Round. Therefore, the maximum possible Team Score is $((46 + 46 + 46 + 46) \div 4) + 2(10) = 66$.

TIEBREAKING ALGORITHM: used to determine team and individual ranks and to determine which individuals qualify for the Countdown Round. In general, questions in the Target, Sprint and Team Rounds increase in difficulty so that the most difficult questions occur near the end of each round. In a comparison of questions to break ties, generally those who correctly answer the more difficult questions receive the higher rank. The guidelines provided below are very general; competition officials receive more detailed procedures.

- ***Ties between individuals:*** the student with the higher Sprint Round score will receive the higher rank. If a tie remains after this comparison, specific groups of questions from the Target and Sprint Rounds are compared.
- ***Ties between teams:*** the team with the higher Team Round score, and then the higher sum of the team members' Sprint Round scores, receives the higher rank. If a tie remains after these comparisons, specific questions from the Team Round will be compared.

RESULTS DISTRIBUTION

Coaches should expect to receive the scores of their students, as well as a list of the top 25% of students and top 40% of teams, from their competition coordinators. In addition, single copies of the blank competition materials and answer keys may be distributed to coaches after all competitions at that level nationwide have been completed. *Before distributing blank competition materials and answer keys, coordinators must wait for verification from the national office that all such competitions have been completed.* Both the problems and answers from Chapter and State Competitions will be posted on the MATHCOUNTS website following the completion of all competitions at that level nationwide, replacing the previous year's posted tests.

Student competition papers and answers will not be viewed by or distributed to coaches, parents, students or other individuals. Students' competition papers become the confidential property of MATHCOUNTS.

ADDITIONAL RULES

All answers must be legible.

Pencils and paper will be provided for Mathletes by competition organizers. However, students may bring their own pencils, pens and erasers if they wish. They may not use their own scratch paper or graph paper.

Use of notes or other reference materials (including dictionaries and translation dictionaries) is prohibited.

Specific instructions stated in a given problem take precedence over any general rule or procedure.

Communication with coaches is prohibited during rounds but is permitted during breaks. All communication between guests and Mathletes is prohibited during competition rounds. Communication between teammates is permitted only during the Team Round.

Calculators are not permitted in the Sprint and Countdown Rounds, but they are permitted in the Target, Team and Tiebreaker (if needed) Rounds. When calculators are permitted, students may use any calculator (including programmable and graphing calculators) that does not contain a QWERTY (typewriter-like) keypad. Calculators that have the ability to enter letters of the alphabet but do not have a keypad in a standard typewriter arrangement are acceptable. Smart phones, laptops, tablets, iPods®, personal

digital assistants (PDAs) and any other “smart” devices are not considered to be calculators and may not be used during competitions. Students may not use calculators to exchange information with another person or device during the competition.

Coaches are responsible for ensuring their students use acceptable calculators, and students are responsible for providing their own calculators. Coordinators are not responsible for providing Mathletes with calculators or batteries before or during MATHCOUNTS competitions. Coaches are strongly advised to bring backup calculators and spare batteries to the competition for their team members in case of a malfunctioning calculator or weak or dead batteries. Neither the MATHCOUNTS Foundation nor coordinators shall be responsible for the consequences of a calculator’s malfunctioning.

Pagers, cell phones, tablets, iPods® and other MP3 players should not be brought into the competition room. Failure to comply could result in dismissal from the competition.

Should there be a rule violation or suspicion of irregularities, the MATHCOUNTS coordinator or competition official has the obligation and authority to exercise his/her judgment regarding the situation and take appropriate action, which might include disqualification of the suspected student(s) from the competition.

FORMS OF ANSWERS

The following rules explain acceptable forms for answers. Coaches should ensure that Mathletes are familiar with these rules prior to participating at any level of competition. Competition answers will be scored in compliance with these rules for forms of answers.

Units of measurement are not required in answers, but they must be correct if given. When a problem asks for an answer expressed in a specific unit of measure or when a unit of measure is provided in the answer blank, equivalent answers expressed in other units are not acceptable. For example, if a problem asks for the number of ounces and 36 oz is the correct answer, 2 lb 4 oz will not be accepted. If a problem asks for the number of cents and 25 cents is the correct answer, \$0.25 will not be accepted.

All answers must be expressed in simplest form. A “common fraction” is to be considered a fraction in the form $\pm \frac{a}{b}$, where a and b are natural numbers and $\text{GCF}(a, b) = 1$. In some cases the term “common fraction” is to be considered a fraction in the form $\frac{A}{B}$, where A and B are algebraic expressions and A and B do not have a common factor. A simplified “mixed number” (“mixed numeral,” “mixed fraction”) is to be considered a fraction in the form $\pm N\frac{a}{b}$, where N , a and b are natural numbers, $a < b$ and $\text{GCF}(a, b) = 1$. Examples:

Problem: What is $8 \div 12$ expressed as a common fraction? *Answer:* $\frac{2}{3}$ *Unacceptable:* $\frac{4}{6}$
Problem: What is $12 \div 8$ expressed as a common fraction? *Answer:* $\frac{3}{2}$ *Unacceptable:* $\frac{12}{8}, 1\frac{1}{2}$
Problem: What is the sum of the lengths of the radius and the circumference of a circle of diameter $\frac{1}{4}$ unit expressed as a common fraction in terms of π ? *Answer:* $\frac{1+2\pi}{8}$
Problem: What is $20 \div 12$ expressed as a mixed number? *Answer:* $1\frac{2}{3}$ *Unacceptable:* $1\frac{8}{12}, \frac{5}{3}$

Ratios should be expressed as simplified common fractions unless otherwise specified. Examples:

Acceptable Simplified Forms: $\frac{7}{2}, \frac{3}{\pi}, \frac{4-\pi}{6}$ *Unacceptable:* $3\frac{1}{2}, \frac{1}{3}, 3.5, 2:1$

Radicals must be simplified. A simplified radical must satisfy: 1) no radicands have a factor which possesses the root indicated by the index; 2) no radicands contain fractions; and 3) no radicals appear in the denominator of a fraction. Numbers with fractional exponents are *not* in radical form. Examples:

Problem: What is $\sqrt{15} \times \sqrt{5}$ expressed in simplest radical form? *Answer:* $5\sqrt{3}$ *Unacceptable:* $\sqrt{75}$

Answers to problems asking for a response in the form of a dollar amount or an unspecified monetary unit (e.g., “How many dollars...,” “How much will it cost...,” “What is the amount of interest...”) should be expressed in the form (\$) $a.bc$, where a is an integer and b and c are digits. The *only* exceptions to this rule are when a is zero, in which case it may be omitted, or when b and c are both zero, in which case they both may be omitted. Answers in the form (\$) $a.bc$ should be rounded to the nearest cent, unless otherwise specified. Examples:

Acceptable Forms: 2.35, 0.38, .38, 5.00, 5 *Unacceptable:* 4.9, 8.0

Do not make approximations for numbers (e.g., π , $\frac{2}{3}$, $5\sqrt{3}$) in the data given or in solutions unless the problem says to do so.

Do not do any intermediate rounding (other than the “rounding” a calculator performs) when calculating solutions. All rounding should be done at the end of the calculation process.

Scientific notation should be expressed in the form $a \times 10^n$ where a is a decimal, $1 \leq |a| < 10$, and n is an integer. Examples:

Problem: What is 6895 expressed in scientific notation? *Answer:* 6.895×10^3
Problem: What is 40,000 expressed in scientific notation? *Answer:* 4×10^4 or 4.0×10^4

An answer expressed to a greater or lesser degree of accuracy than called for in the problem will not be accepted. Whole-number answers should be expressed in their whole-number form. Thus, 25.0 will not be accepted for 25, and 25 will not be accepted for 25.0.

The plural form of the units will always be provided in the answer blank, even if the answer appears to require the singular form of the units.

Competition Coach Toolkit

This is a collection of lists, formulas and terms that Mathletes frequently use to solve problems like those found in this handbook. There are many others we could have included, but we hope you find this collection useful.

| Fraction | Decimal | Percent |
|----------------|----------------|---------------|
| $\frac{1}{2}$ | 0.5 | 50 |

Common Arithmetic Series

$$1 + 2 + 3 + 4 + \dots + n = \frac{n(n+1)}{2}$$

$$1 + 3 + 5 + 7 + \dots + (2n-1) = n^2$$

$$2 + 4 + 6 + 8 + \dots + 2n = n^2 + n$$

Prime Numbers

| | |
|----|----|
| 2 | 43 |
| 3 | 47 |
| 5 | 53 |
| 7 | 59 |
| 11 | 61 |
| 13 | 67 |
| 17 | 71 |
| 19 | 73 |
| 23 | 79 |
| 29 | 83 |
| 31 | 89 |
| 37 | 97 |
| 41 | |

Combinations & Permutations

$${}^nC_r = \frac{n!}{r!(n-r)!} \quad {}^nP_r = \frac{n!}{(n-r)!}$$

| n | n^2 | n^3 |
|-----|-------|-------|
| 1 | 1 | 1 |
| 2 | 4 | 8 |
| 3 | 9 | 27 |
| 4 | 16 | 64 |
| 5 | 25 | 125 |
| 6 | 36 | 216 |
| 7 | 49 | 343 |
| 8 | 64 | 512 |
| 9 | 81 | 729 |
| 10 | 100 | 1000 |
| 11 | 121 | 1331 |
| 12 | 144 | 1728 |
| 13 | 169 | 2197 |
| 14 | 196 | 2744 |
| 15 | 225 | 3375 |

Geometric Mean

$$\frac{a}{x} = \frac{x}{b} \quad \text{and} \quad x = \sqrt{ab}$$

Divisibility Rules

2: units digit is 0, 2, 4, 6 or 8

3: sum of digits is divisible by 3

4: two-digit number formed by tens and units digits is divisible by 4

5: units digit is 0 or 5

6: number is divisible by both 2 and 3

8: three-digit number formed by hundreds, tens and units digits is divisible by 8

9: sum of digits is divisible by 9

10: units digit is 0

Equation of a Line

Standard Form

$$Ax + By = C$$

Slope-Intercept Form

$$y = mx + b$$

m = slope b = y -intercept

Point-Slope Form

$$y - y_1 = m(x - x_1)$$

m = slope (x_1, y_1) = point on the line

Distance Traveled

$$\text{Distance} = \text{Rate} \times \text{Time}$$

Pythagorean Triples

(3, 4, 5) (5, 12, 13) (7, 24, 25)

(8, 15, 17) (9, 40, 41) (12, 35, 37)

Quadratic Formula

For $ax^2 + bx + c = 0$, where $a \neq 0$,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Difference of Squares

$$a^2 - b^2 = (a + b)(a - b)$$

Sum and Difference of Cubes

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

Circles

Circumference $2 \times \pi \times r = \pi \times d$ Area $\pi \times r^2$

For radius r

Arc Length $\frac{x}{360} \times 2 \times \pi \times r$ Sector Area $\frac{x}{360} \times \pi \times r^2$

For central angle of x degrees

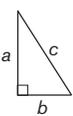

Given $A(x_1, y_1)$ and $B(x_2, y_2)$

Distance from A to B = $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

Midpoint of $\overline{AB} = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$

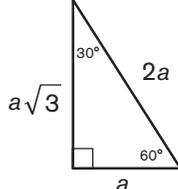

Slope of $\overline{AB} = \frac{y_2 - y_1}{x_2 - x_1}$

Pythagorean Theorem

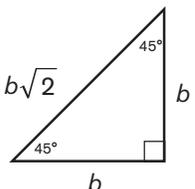

$a^2 + b^2 = c^2$

Special Right Triangles

30-60-90
Right Triangle

45-45-90
Right Triangle

| Area of Polygons | | |
|----------------------|--|-------------------------------------|
| Square | side length s | s^2 |
| Rectangle | length l , width w | $l \times w$ |
| Parallelogram | base b , height h | $b \times h$ |
| Trapezoid | bases b_1, b_2 , height h | $\frac{1}{2}(b_1 + b_2) \times h$ |
| Rhombus | diagonals d_1, d_2 | $\frac{1}{2} \times d_1 \times d_2$ |
| Triangle | base b , height h | $\frac{1}{2} \times b \times h$ |
| Triangle | semi-perimeter s , side lengths a, b, c | $\sqrt{s(s-a)(s-b)(s-c)}$ |
| Equilateral Triangle | side length s | $\frac{s^2\sqrt{3}}{4}$ |

Polygon Angles (n sides)

Sum of the interior angle measures:
 $180 \times (n - 2)$

Central angle measure of a regular polygon:
 $\frac{360}{n}$

Interior angle measure of a regular polygon:
 $\frac{180 \times (n - 2)}{n}$ or $180 - \frac{360}{n}$

| Solid | Dimensions | Surface Area | Volume |
|-------------------|-------------------------------------|--|--|
| Cube | side length s | $6 \times s^2$ | s^3 |
| Rectangular Prism | length l , width w , height h | $2 \times (l \times w + w \times h + l \times h)$ | $l \times w \times h$ |
| Circular Cylinder | base radius r , height h | $2 \times \pi \times r \times h + 2 \times \pi \times r^2$ | $\pi \times r^2 \times h$ |
| Circular Cone | base radius r , height h | $\pi \times r^2 + \pi \times r \times \sqrt{r^2 + h^2}$ | $\frac{1}{3} \times \pi \times r^2 \times h$ |
| Sphere | radius r | $4 \times \pi \times r^2$ | $\frac{4}{3} \times \pi \times r^3$ |
| Pyramid | base area B , height h | | $\frac{1}{3} \times B \times h$ |

Vocabulary & Terms

The following list is representative of terminology used in the problems but **should not** be viewed as all-inclusive. It is recommended that coaches review this list with their Mathletes.

| | | |
|--------------------------------------|---|--|
| absolute difference | GCF (GCD) | range of a function |
| absolute value | geometric sequence | rate |
| acute angle | hemisphere | ratio |
| additive inverse (<i>opposite</i>) | image(s) of a point(s) (<i>under a transformation</i>) | rational number |
| adjacent angles | improper fraction | ray |
| apex | infinite series | real number |
| arithmetic mean | inscribe | reciprocal (<i>multiplicative inverse</i>) |
| arithmetic sequence | integer | reflection |
| base ten | interior angle of a polygon | regular polygon |
| binary | intersection | relatively prime |
| bisect | inverse variation | revolution |
| box-and-whisker plot | irrational number | right angle |
| center | isosceles | right polyhedron |
| chord | lateral edge | rotation |
| circumscribe | lateral surface area | scalene triangle |
| coefficient | lattice point(s) | scientific notation |
| collinear | LCM | sector |
| common divisor | median of a set of data | segment of a circle |
| common factor | median of a triangle | segment of a line |
| common fraction | mixed number | semicircle |
| complementary angles | mode(s) of a set of data | semiperimeter |
| congruent | multiplicative inverse (<i>reciprocal</i>) | sequence |
| convex | natural number | set |
| coordinate plane/system | obtuse angle | significant digits |
| coplanar | ordered pair | similar figures |
| counting numbers | origin | slope |
| counting principle | palindrome | space diagonal |
| diagonal of a polygon | parallel | square root |
| diagonal of a polyhedron | Pascal's Triangle | stem-and-leaf plot |
| digit-sum | percent increase/decrease | supplementary angles |
| dilation | perpendicular | system of equations/inequalities |
| direct variation | planar | tangent figures |
| divisor | polyhedron | tangent line |
| domain of a function | polynomial | term |
| edge | prime factorization | transformation |
| equiangular | principal square root | translation |
| equidistant | proper divisor | triangular numbers |
| expected value | proper factor | trisect |
| exponent | proper fraction | twin primes |
| exterior angle of a polygon | quadrant | union |
| factor | quadrilateral | unit fraction |
| finite | random | variable |
| frequency distribution | range of a data set | whole number |
| frustum | | y-intercept |
| function | | |

ANSWERS

In addition to the answer, we have provided a difficulty rating for each problem. Our scale is 1-7, with 7 being the most difficult. These are only approximations, and how difficult a problem is for a particular student will vary. Below is a general guide to the ratings:

Difficulty 1/2/3 - One concept; one- to two-step solution; appropriate for students just starting the middle school curriculum.

4/5 - One or two concepts; multistep solution; knowledge of some middle school topics is necessary.

6/7 - Multiple and/or advanced concepts; multistep solution; knowledge of advanced middle school topics and/or problem-solving strategies is necessary.

Measurement Stretch

| Answer | Difficulty | | | |
|---------|------------|-------------------|-----|--|
| 1. 12 | (1) | 6. 13 | (4) | |
| 2. 16 | (4) | 7. $8\frac{1}{2}$ | (3) | |
| 3. 3 | (4) | 8. 42 | (3) | |
| 4. 44.3 | (3) | 9. 0.028 | (3) | |
| 5. 4.2 | (3) | 10. 5 | (4) | |

Expected Value Stretch

| Answer | Difficulty | | | |
|--------------------|------------|----------|-----|--|
| 11. $4\frac{1}{3}$ | (2) | 16. 20.5 | (3) | |
| 12. 12.75 | (2) | 17. 1.2 | (4) | |
| 13. 3 | (3) | 18. 2.1 | (3) | |
| 14. 97/13 | (4) | 19. 0 | (3) | |
| 15. 23.3 | (4) | 20. 100 | (3) | |

Transformations Stretch

| Answer | Difficulty | | | |
|-------------|------------|------------------|-----|--|
| 21. 5 | (2) | 26. (10, 2) | (5) | |
| 22. 16 | (3) | 27. 8 | (4) | |
| 23. (7, -4) | (3) | 28. 55 | (5) | |
| 24. 5 | (5) | 29. $87/4$ | (6) | |
| 25. (-3, 5) | (3) | 30. $2\sqrt{17}$ | (5) | |

Warm-Up 1

| Answer | Difficulty | | | |
|--------------------|------------|---------|-----|--|
| 31. 7 | (2) | 36. 105 | (2) | |
| 32. $4\frac{1}{6}$ | (2) | 37. 26 | (3) | |
| 33. 1/2 | (2) | 38. 1* | (2) | |
| 34. 20 | (2) | 39. 50 | (3) | |
| 35. 1 | (3) | 40. 580 | (3) | |

Warm-Up 2

| Answer | Difficulty | | | |
|---------|------------|-------------|-----|--|
| 41. 120 | (2) | 46. 36 | (3) | |
| 42. 36 | (2) | 47. 50/3 | (3) | |
| 43. 22 | (2) | 48. 289/576 | (3) | |
| 44. 4 | (2) | 49. 1 | (3) | |
| 45. 32 | (3) | 50. 44 | (3) | |

Warm-Up 3

| Answer | Difficulty | | | |
|----------|------------|--------------------|-----|--|
| 51. 36 | (3) | 56. $2\frac{1}{4}$ | (4) | |
| 52. 2.52 | (1) | 57. 3 | (3) | |
| 53. 24 | (2) | 58. 6 | (4) | |
| 54. 22 | (3) | 59. 13 | (3) | |
| 55. 200 | (4) | 60. 119 | (4) | |

* The plural form of the units is always provided in the answer blank, even if the answer appears to require the singular form of the units.

Warm-Up 4

| Answer | Difficulty | | | |
|-----------------|------------|---------|-----|--|
| 61. 73 | (3) | 66. 24 | (4) | |
| 62. 5 | (3) | 67. 50 | (4) | |
| 63. 8:53 | (2) | 68. 27 | (4) | |
| 64. 29 | (2) | 69. 364 | (2) | |
| 65. 20 or 20.00 | (4) | 70. 176 | (3) | |

Warm-Up 5

| Answer | Difficulty | | | |
|----------------------|------------|-----------------|-----|--|
| 71. 69 or 69.00 | (4) | 76. 15 or 15.00 | (5) | |
| 72. 392 or 392.00 | (3) | 77. $15/2$ | (5) | |
| 73. 52,413 | (2) | 78. 50 | (3) | |
| 74. 108 | (3) | 79. $11/29$ | (3) | |
| 75. 8 | (4) | 80. 9 | (5) | |

Warm-Up 6

| Answer | Difficulty | | | |
|------------|------------|---------------|-----|--|
| 81. 18 | (2) | 86. 337 | (5) | |
| 82. $1/2$ | (5) | 87. 3 or 3.00 | (4) | |
| 83. $7/15$ | (4) | 88. 101 | (3) | |
| 84. 17 | (4) | 89. 35 | (4) | |
| 85. 1878 | (4) | 90. 35 | (4) | |

Warm-Up 7

| Answer | Difficulty | | | |
|--------|------------|-------------|-----|--|
| 91. 15 | (4) | 96. -1 | (4) | |
| 92. 25 | (5) | 97. 87 | (3) | |
| 93. 3 | (3) | 98. 8217902 | (2) | |
| 94. 78 | (3) | 99. 28 | (5) | |
| 95. 2 | (3) | 100. 12 | (4) | |

Warm-Up 8

| Answer | Difficulty | | | |
|---------------------|------------|-------------------|-----|--|
| 101. $6\frac{2}{3}$ | (4) | 106. 16 | (3) | |
| 102. 555 | (3) | 107. $10\sqrt{5}$ | (4) | |
| 103. 242 | (3) | 108. 433 | (4) | |
| 104. $13/32$ | (4) | 109. 10 | (4) | |
| 105. 12 | (4) | 110. 126.5 | (5) | |

Warm-Up 9

| Answer | Difficulty | | | |
|-----------|------------|---------------|-----|--|
| 111. 1740 | (3) | 116. 40 | (4) | |
| 112. 3:52 | (2) | 117. 7 | (3) | |
| 113. 15 | (2) | 118. 27 | (5) | |
| 114. 590 | (5) | 119. $19/108$ | (5) | |
| 115. 555 | (4) | 120. 70 | (4) | |

Warm-Up 10

| Answer | Difficulty | | |
|-----------|------------|--------------------|-----|
| 121. 6 | (3) | 126. $\frac{1}{4}$ | (5) |
| 122. 10 | (3) | 127. 6 | (4) |
| 123. 30 | (4) | 128. 96 | (3) |
| 124. 414 | (4) | 129. 90 | (5) |
| 125. 12.0 | (4) | 130. 80 | (4) |

Warm-Up 11

| Answer | Difficulty | | |
|----------|------------|-------------------|-----|
| 131. 11 | (3) | 136. $2\sqrt{13}$ | (5) |
| 132. 300 | (4) | 137. 13 | (4) |
| 133. 18 | (5) | 138. 22 | (4) |
| 134. 11 | (2) | 139. 28 | (5) |
| 135. 40 | (3) | 140. 5000 | (3) |

Warm-Up 12

| Answer | Difficulty | | |

| 245. 3 | (5) | 250. $6\sqrt{6}$ | (7) |

MATHCOUNTS Problems Mapped to Common Core State Standards (CCSS)

Forty-two states, the District of Columbia, four territories and the Department of Defense Education Activity (DoDEA) have voluntarily adopted the Common Core State Standards (CCSS). As such, MATHCOUNTS considers it beneficial for teachers to see the connections between the *2018-2019 MATHCOUNTS School Handbook* problems and the CCSS. MATHCOUNTS not only has identified a general topic and assigned a difficulty level for each problem but also has provided a CCSS code in the Problem Index (pages 54-55). A complete list of the Common Core State Standards can be found at www.corestandards.org.

The CCSS for mathematics cover K-8 and high school courses. MATHCOUNTS problems are written to align with the NCTM Standards for Grades 6-8. As one would expect, there is great overlap between the two sets of standards. MATHCOUNTS also recognizes that in many school districts, algebra and geometry are taught in middle school, so some MATHCOUNTS problems also require skills taught in those courses.

In referring to the CCSS, the Problem Index code for each of the Standards for Mathematical Content for grades K-8 begins with the grade level. For the Standards for Mathematical Content for high school courses (such as algebra or geometry), each code begins with a letter to indicate the course name. The second part of each code indicates the domain within the grade level or course. Finally, the number of the individual standard within that domain follows. Here are two examples:

- *6.RP.3* → *Standard #3 in the Ratios and Proportional Relationships domain of grade 6*
- *G-SRT.6* → *Standard #6 in the Similarity, Right Triangles and Trigonometry domain of Geometry*

Some math concepts utilized in MATHCOUNTS problems are not specifically mentioned in the CCSS. Two examples are the Fundamental Counting Principle (FCP) and special right triangles. In cases like these, if a related standard could be identified, a code for that standard was used. For example, problems using the FCP were coded 7.SP.8, S-CP.8 or S-CP.9 depending on the context of the problem; SP → Statistics and Probability (the domain), S → Statistics and Probability (the course) and CP → Conditional Probability and the Rules of Probability. Problems based on special right triangles were given the code G-SRT.5 or G-SRT.6, explained above.

There are some MATHCOUNTS problems that either are based on math concepts outside the scope of the CCSS or based on concepts in the standards for grades K-5 but are obviously more difficult than a grade K-5 problem. When appropriate, these problems were given the code SMP for Standards for Mathematical Practice. The CCSS include the Standards for Mathematical Practice along with the Standards for Mathematical Content. The SMPs are (1) Make sense of problems and persevere in solving them; (2) Reason abstractly and quantitatively; (3) Construct viable arguments and critique the reasoning of others; (4) Model with mathematics; (5) Use appropriate tools strategically; (6) Attend to precision; (7) Look for and make use of structure and (8) Look for and express regularity in repeated reasoning.

PROBLEM INDEX

It is difficult to categorize many of the problems in the *MATHCOUNTS School Handbook*. It is very common for a MATHCOUNTS problem to straddle multiple categories and cover several concepts. This index is intended to be a helpful resource, but since each problem has been placed in exactly one category and mapped to exactly one Common Core State Standard (CCSS), the index is not perfect. In this index, the code **9 (3) 7.SP.3** refers to problem 9 with difficulty rating 3 mapped to CCSS 7.SP.3. For an explanation of the difficulty ratings refer to page 49. For an explanation of the CCSS codes refer to page 53.

SOLUTIONS

The solutions provided here are only *possible* solutions. It is very likely that you or your students will come up with additional—and perhaps more elegant—solutions. Happy solving!

**SOLUTIONS ARE
AVAILABLE
EXCLUSIVELY FOR
REGISTERED
COACHES AND
THOSE WHO
PURCHASE A HARD
COPY OF THE
HANDBOOK.**

- Learn more about how you can register your school for the Competition Series at www.mathcounts.org/competition.
- Purchase a copy of the *2018-2019 MATHCOUNTS School Handbook* at www.mathcounts.org/store.

Other MATHCOUNTS Programs

MATHCOUNTS was founded in 1983 as a way to provide new avenues of engagement in math for middle school students. MATHCOUNTS began solely as a competition, but has grown to include 3 unique but complementary programs: the **MATHCOUNTS Competition Series**, the **National Math Club** and the **Math Video Challenge**. Your school can participate in all 3 MATHCOUNTS programs!

The **National Math Club** is a free enrichment program that provides teachers and club leaders with resources to run a math club. The materials provided through the National Math Club are designed to engage students of all ability levels—not just the top students—and are a great supplement for classroom teaching. This program emphasizes collaboration and provides students with an enjoyable, pressure-free atmosphere in which they can learn math at their own pace.

Active clubs also can earn rewards by having a minimum number of club members participate (based on school/organization/group size). **There is no cost to sign up for the National Math Club**, and registration is open to schools and non-school groups that consist of at least 4 U.S. students in grades 6-8 that have regular in-person meetings. More information can be found at www.mathcounts.org/club, and the 2018-2019 School Registration Form is included on the next page.

The **Math Video Challenge** is an innovative program that challenges students to work in teams of 4 to create a video explaining the solution to a MATHCOUNTS handbook problem and demonstrating its real-world application. This project-based activity builds math, communication and collaboration skills.

Students post their videos to the contest website, where the general public votes for the best videos. The 100 videos with the most votes advance to judging rounds, in which 20 semifinalists and, later, 4 finalists are selected. This year's finalists will present their videos to the students competing at the 2019 Raytheon MATHCOUNTS National Competition, and the 224 Mathletes will vote to determine the winner. Members of the winning team receive college scholarships. **Registration is completely free** and open to all students in grades 6-8. More information can be found at videochallenge.mathcounts.org.

! The fastest way to register is online at www.mathcounts.org/clubreg!

2018-2019 **SCHOOL** REGISTRATION FORM

This registration form is for U.S. middle schools only. To register a non-school group (such as a Girl Scout troop, Boys and Girls Club Chapter or math circle) for the National Math Club, please go to www.mathcounts.org/club to review eligibility requirements and register.

.....
*indicates required information

STEP 1 Tell Us About Your School

U.S. School (Including Homeschools) with Students in Grades 6-8

One school can have multiple clubs, as long as each club has a different club leader.

School Name* _____

School Type (check one)* Public Charter Private Homeschool Virtual

Title I School? (check one)* Yes No

Overseas U.S. schools must provide additional information below:

My school is sponsored by the U.S. Department of: Defense (DoDDS) State

Country _____

Estimated Number of Students Participating in Club (Minimum 4)* _____

Typically, what percentage of your club members are female?* _____ %

My school participated in the National Math Club last year (2017-2018).

How did you hear about the National Math Club?* Prior Participation Word-of-mouth Email

Mailing (postcard or newsletter) Internet Search Workshop/Conference

STEP 2 Tell Us About You

.....
Club Leader First & Last Name* _____

Club Leader Email* _____

Club Leader Alternate Email* _____

Your email and alternate email address will not be made public or shared and will only be used by MATHCOUNTS.

Club Street Address* _____

City, State and ZIP Code* _____

I participated in MATHCOUNTS when I was in middle school. → Please tell us more info. below!

When? (for example, 1999-02) _____ Where? (state/territory) _____

Which Program(s)? MATHCOUNTS Competition Series → Highest Level Reached: _____

The National Math Club (formerly MATHCOUNTS Club Program)

Math Video Challenge (formerly Reel Math Challenge)

STEP 3 Turn in Your Form

! **IMPORTANT!** *By submitting this form you attest your group consists of at least 4 U.S. students in grades 6-8 who meet in person regularly, and is therefore eligible to participate in the National Math Club. The club leader will receive an emailed confirmation once this registration has been processed.*

Mail or email a scanned copy of this completed form to:

Address: MATHCOUNTS Registration | 1420 King Street | Alexandria, VA 22314

Email: reg@mathcounts.org

! The fastest way to register is online
at www.mathcounts.org/compreg!

2018–2019 SCHOOL REGISTRATION FORM

STEP 1: SCHOOL & COACH INFORMATION

Coach First and Last Name* _____ Is this your first year coaching?* Yes No *required information

Coach Email* _____

Coach Phone _____ Coach Alternate Email _____

School Name* _____ School Type* Public Charter Private Homeschool Virtual

School Street Address* _____ City, State & ZIP* _____

County/District* _____ MATHCOUNTS Chapter (if known) _____

Ship Materials to:* School Address Alternate Address Here: _____

Total # of students participating in school's MATHCOUNTS meetings* _____ My school previously participated in the MATHCOUNTS Competition Series.

Co-Coach Name _____ Co-Coach Email _____

I participated in MATHCOUNTS when I was in middle school. → When? (for ex. 1999-02) _____ Where? (state/territory) _____

Which Program(s)? Competition Series → Highest Level Reached: _____ National Math Club Math Video Challenge (formerly Reel Math Challenge)

My co-coach participated in MATHCOUNTS when s/he was in middle school. → When? (for ex. 1999-02) _____ Where? (state/territory) _____

Which Program(s)? Competition Series → Highest Level Reached: _____ National Math Club Math Video Challenge (formerly Reel Math Challenge)

Overseas U.S. schools must be affiliated with the U.S. Dept. of Defense or State and must provide additional information below.

My school is sponsored by the U.S. Dept. of: Defense (DoDDS). State. Country _____

STEP 2: # OF COMPETITORS

Please circle below the number of students you will bring to the Chapter Competition and the associated cost (depending on the date your registration is postmarked).

| # of Students to Be Registered (Ind = Individual; T = Team) | 1 (1 Ind) | 2 (2 Ind) | 3 (3 Ind) | 4 (1 T) | 5 (1 T + 1 Ind) | 6 (1 T + 2 Ind) | 7 (1 T + 3 Ind) | 8 (1 T + 4 Ind) | 9 (1 T + 5 Ind) | 10 (1 T + 6 Ind) |
|--|--------------|--------------|--------------|--------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|
| Early Bird Rate: \$30 per student (postmarked by Nov. 2, 2018) | \$30 | \$60 | \$90 | \$120 | \$150 | \$180 | \$210 | \$240 | \$270 | \$300 |
| Regular Rate: \$35 per student (postmarked by Dec. 14, 2018) | \$35 | \$70 | \$105 | \$140 | \$175 | \$210 | \$245 | \$280 | \$315 | \$350 |
| Late Registration: +\$20 late fee (postmarked after Dec. 14, 2018) | \$55 | \$90 | \$125 | \$160 | \$195 | \$230 | \$265 | \$300 | \$335 | \$370 |

My school qualifies for the **50% Title I discount**, so the Amount Due in Step 3 will be half the amount circled above. Principal signature required to verify Title I eligibility.

Principal Name _____ Principal Signature _____

STEP 3: PAYMENT

Amount Due \$ _____ Credit Card Check (payable to MATHCOUNTS Foundation) Money Order Purchase Order # _____ (must include copy of P.O.)

Do NOT include any credit card information on this form. Within 5 business days you will receive an email invoice enabling you to pay by credit card.

! **IMPORTANT!** By submitting this form you (1) agree to adhere to the rules of the MATHCOUNTS Competition Series; (2) attest you have the school administration's permission to register students for this program under this school's name; and (3) affirm the above named school is a U.S. school eligible for this program and not an academic or enrichment center. The coach will receive an emailed confirmation and receipt once this registration has been processed.

Mail or email a scanned copy of this completed form to:

Address: MATHCOUNTS Registration | 1420 King Street | Alexandria, VA 22314

Email: reg@mathcounts.org

Acknowledgments

The MATHCOUNTS Foundation wishes to acknowledge the hard work and dedication of those volunteers instrumental in the development of this handbook: the question writers who develop the questions for the handbook and competitions, the judges who review the competition materials and serve as arbiters at the National Competition and the proofreaders who edit the questions selected for inclusion in the handbook and/or competitions.

MATHCOUNTS[®]

2020

■ **School Competition** ■
Sprint Round
Problems 1–30

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ cm According to the ruler, how many centimeters long is the piece of washi tape shown here?

2. _____ What is the tens digit of this sum?
- $$\begin{array}{r} 12,345 \\ + 56,789 \\ \hline \end{array}$$

3. _____ ounces Dora drinks a 12-ounce can of cola. Erika drinks half of a 20-ounce bottle of cola. How many more ounces of cola does Dora drink than Erika?

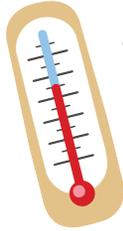

4. _____ What is the result when one hundred twenty-eight thousand is subtracted from one million?

5. _____ inches What is the side length of a rectangle that has width 7 inches and area 105 in^2 ?

6. _____ What integer is closest to -7π ?

7. _____ degrees

On Monday at 8 p.m., the temperature measured -17 degrees. Between 8 p.m. on Monday and 6 a.m. on Tuesday, the temperature increased 23 degrees. On Tuesday, between 6 a.m. and 3 p.m., the temperature decreased 5 degrees. What was the temperature on Tuesday at 3 p.m.?

STUDENT LUNCH DATA

8. _____ %

| LUNCH | ORDERS |
|-----------|--------|
| PIZZA | 132 |
| NUGGETS | 112 |
| BURGER | 88 |
| SPAGHETTI | 44 |
| SALAD | 24 |

This table shows all five lunch options on Friday at a middle school and the number of students that ordered each. Based on this, what percent of the lunch orders on Friday were for spaghetti?

9. _____ What is the 40th positive odd integer?

10. _____ What is the value of the expression $1 + \frac{2}{1 - \frac{2}{3}}$, in simplest form?

11. _____ If $(x^2y^3)^2 = x^ay^b$, what is the value of $a + b$?

12. _____ matches For each rock-paper-scissors match, paper beats rock, rock beats scissors, scissors beat paper and two identical items result in a tie. Based on this table, which summarizes the results of Kalyani and Mark's last 200 matches, how many matches did Kalyani win?

| | | KALYANI | | |
|------|----------|---------|-------|----------|
| | | ROCK | PAPER | SCISSORS |
| MARK | ROCK | 30 | 24 | 20 |
| | PAPER | 26 | 21 | 21 |
| | SCISSORS | 20 | 20 | 18 |

13. _____ inches Given that a mile equals 5280 feet, how many inches are in one-sixth of a mile?

14. _____ Maria was born on January 1, 2000. Her mother was born on January 1, 1975 and her father was born on January 1, 1970. In what year was the sum of their ages 100?

15. _____ % A bicycle that originally cost \$200 is on sale for \$140. By what percent was the price reduced?

16. _____ feet Jay's dog outgrew his rectangular pen that measured 10 feet by 14 feet. To make it larger, he increased each side length by the same amount, which increased the pen's area by 81 square feet. What is the greater side length of the larger pen?

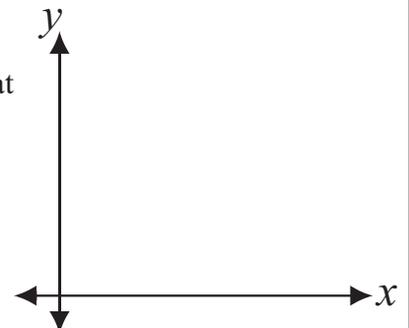

17. _____ years Parker has three sons: Alfred, Beto and Dell. When Alfred turned 11 years old, Beto was 9 years old and Dell was 4 years old. What was the average of their ages when Alfred turned 37?

18. _____ units² Triangle ABC has an area of 40 units². Point D is on side AC, and AD:DC = 3:1. What is the area of triangle BDC?

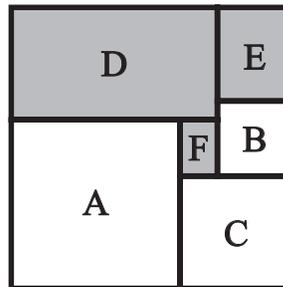

19. _____ people Kendra surveyed 100 people who own a dog or a cat, or both. Of those surveyed, 15 own both a dog and a cat, and the number of people who own a dog is four times the number of people who own a cat. How many people surveyed own a cat?

20. _____ units² What is the area of the region in the first quadrant that lies between the lines $x + 3y = 12$ and $x + 3y = 18$?

21. _____ What is the absolute difference between the mean and median of the first 100 positive integers?

22. _____ units² The square labeled A has area 81 units². The square labeled B has area 16 units². The square labeled C has area 36 units². These three squares along with the shaded, non-overlapping rectangles labeled D, E and F are arranged to form a large square as shown. What is the area of rectangle D?

23. _____  If a fair coin is tossed four times, what is the probability of it landing heads up at least three times? Express your answer as a common fraction.

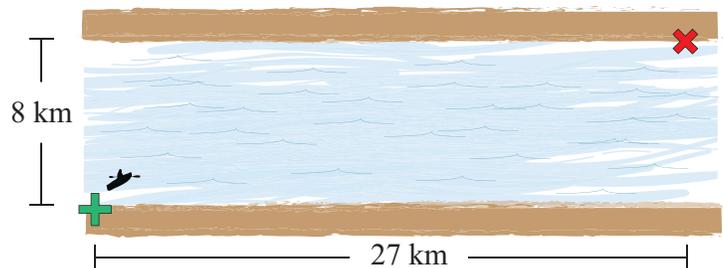

24. _____ If n is an integer for which the greatest common factor of n and 18 is 6 and the least common multiple of n and 9 is 126, what is the value of n ?

25. _____ The lines given by the equations $y = 9 - \frac{1}{3}x$ and $y = mx + b$ are perpendicular and intersect at a point on the x -axis. What is the value of b ?

26. _____ If two standard, fair 6-sided dice are rolled, what is the probability that the product of the two numbers rolled is a perfect square? Express your answer as a common fraction.

27. _____ gallons Gracie has made 2 gallons of punch that contains 50% juice. After Gracie pours out some of her mixture and replaces it with an equal amount of pure 100% juice, she has 2 gallons of punch that contains 65% juice. How many gallons of the original mixture did Gracie pour out? Express your answer as a common fraction.

28. _____ hours Ursula's starting location (+) is on the shore of a river that measures 8 km across. Her destination (x) is 27 km downshore on the opposite side of the river. Ursula rows a boat in a straight line, at a speed of 5 km/h, to a point that is 6 km downshore on the opposite side, and then runs the remaining distance, at a speed of 14 km/h. How many hours will it take Ursula to reach her destination? Express your answer as a mixed number.

29. _____ A cylinder whose height is 3 times its radius is inscribed in a cone whose height is 6 times its radius. What fraction of the cone's volume lies inside the cylinder? Express your answer as a common fraction.

30. _____ What value of x yields the minimum value of the sum $|x - 2^0| + |x - 2^1| + |x - 2^2| + |x - 2^3| + \dots + |x - 2^{10}|$?

Target Round
Problems 1 & 2

Name _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. _____ %

William counted all the animals he saw at the zoo. This graph shows the data he collected. Based on this, what percentage of the animals that William saw are mammals? Express your answer to the nearest hundredth.

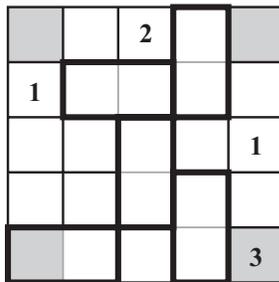

2. _____ ways

How many ways are there to arrange the four integers 1, 2, 3 and 4 in a row so that no two adjacent numbers have a sum of 5?

3. _____

There are 93 sixth graders and 108 seventh graders entering a raffle. In each grade, the number of dog owners is twice the number of students who do not own a dog. What is the probability that a seventh grader who does not own a dog wins the raffle? Express your answer as a common fraction.

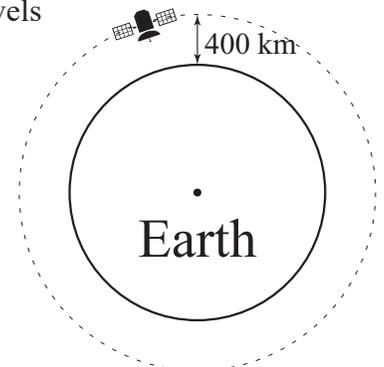

4. _____

In the 5×5 grid shown, each row and each column is to contain the integers 1 through 5 exactly once with one integer per cell. The sum of the two integers in each outlined pair of cells is 5. What is the product of the integers in the four corner cells that are shaded?

5. _____ minutes

A satellite, located 400 km above Earth's surface, travels at a speed of 28,000 km/h. For simplicity, assume that Earth is a perfect sphere with circumference 40,075 km. How many minutes does it take the satellite to orbit Earth one time? Express your answer as a decimal to the nearest tenth.

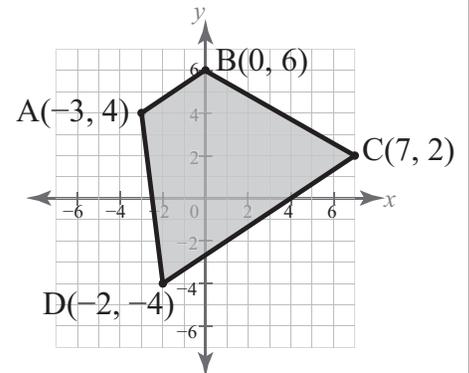

6. _____ Three children each live in one of three houses, equally spaced and arranged as shown. Each child is equally likely to live in any of the houses, and it is possible that a house has no children living in it. All three children will play in the house that minimizes the total distance they have to travel. What is the probability that they will play in house B? Express your answer as a common fraction.

7. _____ integers How many distinct positive integers n can be expressed as $n = ab$ for integers such that $1 \leq a \leq 10$ and $1 \leq b \leq 10$?

8. _____ ft^2
-
- In the figure, square ABCD has side length 6 feet, and E is a point in the exterior of the square such that triangle ADE is equilateral. How many square feet are in the area of shaded triangle BEC? Express your answer as a decimal to the nearest tenth.

9. _____ units^2 What is the area of the quadrilateral ABCD as shown?

10. _____ integers How many of the first million positive integers share no common factors greater than 1 with 2020?

MATHCOUNTS®

2020 School Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less than 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

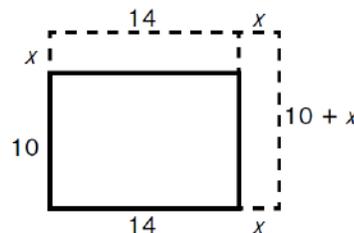

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2020 MATHCOUNTS® School Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

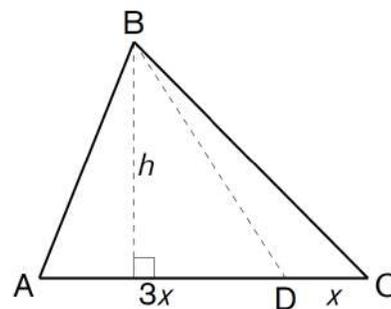

12. Kalyani won when she chose rock and Mark chose scissors, when she chose paper and Mark chose rock and when she chose scissors and Mark chose paper, as shown by the circled numbers in the table. In total, Kalyani won $20 + 24 + 21 = 65$ matches.
13. With 5,280 feet in 1 mile and 12 inches in 1 foot, there are $5,280 \times 12 = 63,360$ inches in 1 mile. So, there are $63,360 \div 6 = 10,560$ inches in one-sixth of a mile.
14. In 2000, the sum of their ages was $0 + 25 + 30 = 55$. Every year that passes will add 3 years to the sum of their ages since each of them will age one year. We can set up the equation $55 + 3x = 100$. Solving for x , we find that $x = (100 - 55)/3 = 45/3 = 15$. This means the sum of their ages will be 100 in the year $2000 + 15 = 2015$.
15. The dollar amount the price was reduced is $\$200 - \$140 = \$60$. So, we want to know what percent \$60 is of \$200. We can find this by dividing $60/200 = 0.3$, and then multiplying by 100. So, $0.3 \times 100 = 30\%$.

16. One way to solve this is geometrically. We can draw the figure shown at the left and call the unknown distance we extend each side x . Using this figure, we can set up the equation $14x + x(10 + x) = 81$ or $x^2 + 24x - 81 = 0$. We can factor this equation into two binomials and write it as $(x - 3)(x + 27)$. The two solutions to this equation are -27 and 3 . The solution $x = 3$ is the only one that makes sense in this context, therefore, we know the side lengths were extended by 3 feet each and our largest side will be $14 + 3 = 17$ feet.

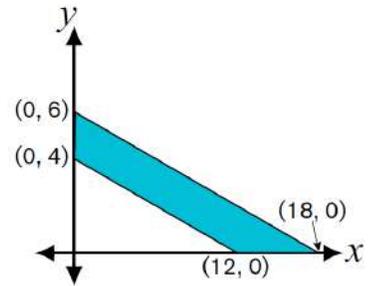

Alternatively, you could solve numerically. The pen had an original area of $10 \times 14 = 140 \text{ ft}^2$. With the increase, the total is $140 + 81 = 221 \text{ ft}^2$. Factoring, we can say $221 = 13 \times 17$, which is an increase of 3 feet from each of the original dimensions. The larger dimension of the new pen is **17 feet**. We'll need to look at the differences in the sons' ages in order to determine their ages when Alfred is 37. The difference in Alfred's and Beto's ages is $11 - 9 = 2$ years. So, when Alfred is 37, Beto is $37 - 2 = 35$. The difference in Alfred's and Dell's ages is $11 - 4 = 7$ years. So, when Alfred is 37, Dell is $37 - 7 = 30$. The average of their ages when Alfred is 37 is $(37 + 35 + 30)/3 = 34$ years.

18. Let's draw $\triangle ABC$ oriented with side AC as the base, shown to the right. We don't know the length of AC, but we know that AD is three times DC so let's label these lengths $3x$ and x . If we measure the height of $\triangle ABC$ and $\triangle BDC$ as the perpendicular distance from side AC to point B, they have the same height, h . Using these, we can write the equation for area of $\triangle ABC$ and $\triangle BDC$ as $(1/2)(4x)(h)$ and $(1/2)(x)(h)$, respectively. We see that the area of $\triangle BDC$ is $[(1/2)(x)(h)]/[(1/2)(4x)(h)] = 1/4$ the area of $\triangle ABC$, which we have been given. So we can conclude that the area of $\triangle BDC$ is $(1/4)(40) = 10$ units².

19. We can use an equation to represent the provided scenario, $(d + 15) = 4(c + 15)$, where d = the number of people who own a dog and c = the number of people who own a cat. We can simplify this equation as follows: $d + 15 = 4c + 60 \rightarrow d = 4c + 45$. We also know that Kendra surveyed a total of 100 people, so $c + d + 15 = 100$. If we substitute $4c + 45$ in for d , we get: $c + (4c + 45) + 15 = 100 \rightarrow 5c + 60 = 100 \rightarrow 5c = 40 \rightarrow c = 8$. So, if we take the 8 people who own only a cat and the 15 people who own both a cat and a dog, we get $8 + 15 = 23$ people who own a cat.

20. Let's first find the intersection of each of the two lines with the x - and y -axes. When $x = 0$, the lines will intersect the y -axis at $y = 4$ and $y = 6$. When $y = 0$, they will intersect the x -axis at $x = 12$ and $x = 18$, respectively. We can sketch this in the first quadrant as shown. We can think of each of the two lines as forming a right triangle with the x - and y -axis and find the shaded area by subtracting the smaller one from the larger one. Setting this up and solving, we get $(1/2)(18)(6) - (1/2)(12)(4) = 9(6) - 6(4) = 6(9 - 4) = 6(5) = 30$ units².

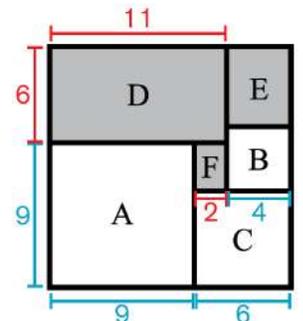

21. The first positive 100 integers are 1, 2, 3, 4, 5, ..., 98, 99, 100. We know that the median must fall exactly in the middle of the increasing arranged numbers, so it will fall between 50 and 51. We can find the median by averaging 50 and 51: $(50 + 51)/2 = 50.5$. In order to find the mean, we must first add up all of the positive integers between 1 and 100. Let's start by lining up the numbers 1 to 50 in increasing order, matched up with the numbers 51 to 100 in decreasing order. See below:

| | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | | 40 | 41 | 42 | 43 | 44 | 45 | 46 | 47 | 48 | 49 | 50 |
| 100 | 99 | 98 | 97 | 96 | 95 | 94 | 93 | 92 | 91 | | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 |

You'll notice that each column sums to 101. For example, $1 + 100 = 101$; $2 + 99 = 101$; $3 + 98 = 101$; etc. So, since we have 50 of these sums, we can calculate $101 \times 50 = 5050$ to give the sum of the positive integers from 1 through 100. To find the mean, $5050/100 = 50.5$. So, by taking the difference between the mean and median of $50.5 - 50.5 = 0$, we get an absolute difference of **0**.

Alternatively, you could get the final answer without any calculation. Because we are looking at the first 100 positive integers, we know that the distribution of numbers is symmetric which means the mean and median will be the same and therefore have an absolute difference of **0**.

22. Since the area of square A is 81 units², the area of square B is 16 units² and the area of square C is 36 units², we know the side lengths of squares A, B and C, respectively, are 9, 4 and 6 units. The width of rectangle F will be the length of the side of square C minus the length of the side of square B or $6 - 4 = 2$ units. With this information, we can now find the dimensions of rectangle D. Its width will be the length of side A plus the width of rectangle F or $9 + 2 = 11$ units. Since the entire figure is a square, we know that all sides of will be $9 + 6$ units in length, which means that the height of rectangle D must be 6 units. The area of rectangle D is $11 \times 6 = 66$ units².

23. The total number of possibilities for arrangements of how the coins land over four tosses is $2 \times 2 \times 2 \times 2 = 16$. This is because there are two possibilities (heads or tails) for each toss of the coin. Of those 16 possible arrangements, we want to know how many have at least 3 heads (i.e. how many have 3 or 4 heads). Those arrangements are: HHHH, HHHT, HHTH, HTHH, and THHH. So, there are 5 arrangements with at least 3 heads, and thus the probability of this happening is **5/16**.
24. The prime factorization of 126 is $2 \times 3^2 \times 7$. Since this is the least common multiple of n and $9 = 3^2$, we know n has to have 2 and 7 as factors. Suppose these were the only factors and $n = 2 \times 7 = 14$, this would not satisfy the condition that the greatest common factor of n and 18 is 6. The $GCF(14, 18) = 2$ since $14 = 2 \times 7$ and $18 = 2 \times 3^2$. To make it so the $GCF(n, 18) = 6$ or 2×3 , we need to add an additional factor of 3 to n . This makes our $n = 2 \times 3 \times 7 = 42$.

25. We know the lines intersect on the x-axis, which means the y -coordinate of this intersection point is equal to 0. So, let's substitute this into the equation $y = 9 - 1/3x$ and solve for the value of x . We get $0 = 9 - 1/3x \rightarrow -9 = -1/3x \rightarrow 27 = x$. In addition, we know that the slopes of perpendicular lines are opposite reciprocals of each other. So, since the provided slope is $-1/3$, the slope of the other line, $y = mx + b$, must be 3. Now, let's substitute everything we know into the equation $y = mx + b$ and solve for b . We get $0 = 3(27) + b \rightarrow 0 = 81 + b \rightarrow -81 = b$. Therefore, $b = -81$.
26. There are two scenarios in which a product of two standard dice is a perfect square: (1) Double of the same number are rolled. (2) A 4 and a 1 are rolled. When rolling two 6-sided dice, there are $6 \times 6 = 36$ possible rolls. Of these, there are 6 possible double rolls—each of the 6 possible numbers on the dice are rolled together. There are 2 possible rolls of a 4 and a 1—the first die is a 4 and the second die is a 1 and vice versa. This gives us a probability of $(6 + 2)/36 = 8/36 = 2/9$.

Alternatively, if we can chart all the possibilities by create the table shown to the right. Across the top are all the possible rolls of die 1 and down the left side are all the possible rolls for die 2. Filling in the products and highlighting the perfect squares, we find there is a probability of $8/36 = 2/9$.

| X | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|----|----|----|----|----|
| 1 | 1 | 2 | 3 | 4 | 5 | 6 |
| 2 | 2 | 4 | 6 | 8 | 10 | 12 |
| 3 | 3 | 6 | 9 | 12 | 15 | 18 |
| 4 | 4 | 8 | 12 | 16 | 20 | 24 |
| 5 | 5 | 10 | 15 | 20 | 25 | 30 |
| 6 | 6 | 12 | 18 | 24 | 30 | 36 |

27. The best way to organize the information in this problem is to create a table, as seen below. Let's start with the information most obvious to us - the Percent Juice column. We are told that the original punch contains 50% juice, the punch that is added contains 100% juice, and the result is a punch with 65% juice. So, we can fill these percents in in decimal form in column 2: 0.5, 1.0, and 0.65. Next, let's look at column 1, Gallons. Say x = the number of gallons of 50% juice and y = the number of gallons of 100% juice. We can add these into the corresponding cells. We know that $x + y = 2$ gallons. So, this information can go in the Mixture row of the Gallons column. Finally, we can multiply the number of gallons of each percent juice by the percent juice to get the total gallons of juice, which can be found below in column 3.

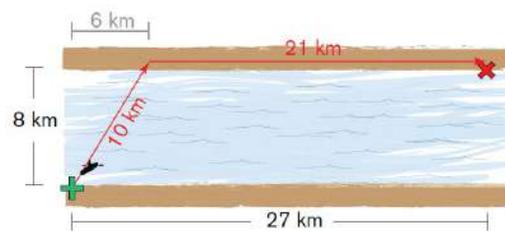

| | Gallons | Percent Juice (in decimal form) | Total Gallons of Juice |
|------------|-------------|------------------------------------|---------------------------|
| 50% Juice | x | 0.5 | $0.5x$ |
| 100% Juice | y | 1.0 | $1y$ |
| Mixture | $x + y = 2$ | 0.65 | $(0.65)(2) = 1.30$ |

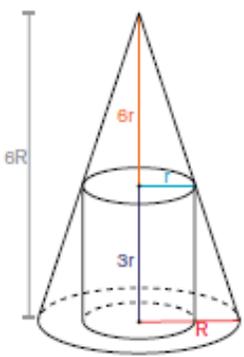

We know that we're going to need to solve for y - the amount of the mixture that was poured out is the same as the amount of the 100% juice with which it was replaced. Therefore, we can create an equation using column 3, Total Gallons of Juice: $0.5x + 1y = 1.30$. However, with two unknowns, we'll need to do some manipulation before we can solve for y . First, if we know $x + y = 2$, we can subtract y from both sides of the equation to get $x = 2 - y$. We can substitute x in the Gallons column with $2 - y$ in our table, as seen below. Similarly, we can rewrite our total gallons of 50% juice as $0.5(2 - y)$, as seen in the Total Gallons of Juice column below.

| | Gallons | Percent Juice (in decimal form) | Total Gallons of Juice |
|------------|-------------|------------------------------------|---------------------------|
| 50% Juice | $2 - y$ | 0.5 | $0.5(2 - y)$ |
| 100% Juice | y | 1.0 | $1y$ |
| Mixture | $x + y = 2$ | 0.65 | 1.30 |

Finally, we can rewrite our equation in terms of y and solve for y : $0.5(2 - y) + 1y = 1.30 \rightarrow 1 - 0.5y + 1y = 1.30 \rightarrow 1 + 0.5y = 1.30 \rightarrow 0.5y = 0.30 \rightarrow y = 3/5$. Therefore, we would need $3/5$ of a gallon of 100% juice to create the 65% juice mixture, which tells us that Gracie poured $3/5$ of a gallon of the original mixture out.

28. Since Ursula rows in a straight line to a point 6 km downshore, we notice this forms a right triangle with legs of 8 km and 6 km. The hypotenuse or distance Ursula rowed is therefore 10 km. We know this without solving the Pythagorean Theorem because the triangle is a multiple of the 3-4-5 Pythagorean Triple. The remaining distance Ursula travels by running is $27 - 6 = 21$ km. The total time to reach her distance is therefore $10 \text{ km} \div 5 \text{ km/h} + 21 \text{ km} \div 14 \text{ km/h} = 2 \text{ hr} + 1\frac{1}{2} \text{ hr} = 3\frac{1}{2}$ hours.

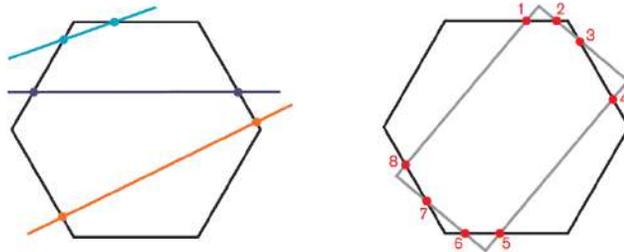

29.  Take a look at the figure. It is important to understand that the cylinder is inscribed, so the space within the larger cone that is above the top of the cylinder creates a smaller cone that is proportional to the larger cone. Knowing this, let's break down the dimensions shown in the image. From the provided information in the problem, we know that the height of the larger cone is $6R$, where R = the radius of the larger cone. Because the smaller cone above the cylinder is proportional to the larger cone, we know that the height of the smaller cone is $6r$, where r = the radius of the smaller cone. This radius, r , is also the radius of the base of the cylinder, since the base of the cylinder is also the base of the smaller cone. Finally, from provided information in the problem, we know that the height of the cylinder is $3r$. From this, we can derive that the height of the larger cone in terms of r is $6r + 3r = 9r$. In order to use the volume formulas, we'll also need to know the value of R in terms of r . So, if we know that $9r:6R$, we can reduce this ratio to be $3/2r:1R$, so $R = 3/2r$. Using this, let's solve for the volume of the cone in terms of r . We get $V = \pi R^2(h/3) \rightarrow V = \pi (3/2r)^2(9r/3) \rightarrow V = \pi (9/4)r^2(3r) \rightarrow V = \pi (27/4)r^3$. Next, we'll need to find the volume of the inscribed cylinder. We get $V = \pi r^2h \rightarrow V = \pi r^2(3r) \rightarrow V = \pi 3r^3$. Now, we can compare the volumes of the two figures: $\text{Volume of cylinder}/\text{Volume of larger cone} = (3 \pi r^3)/((27/4) \pi r^3) \rightarrow 3/(27/4) = 4/9$. This tells us that $4/9$ of the larger cone's volume lies inside the cylinder.

30. Suppose the value we choose x to be is 25 which is the median value of the set $\{20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 210\}$. Each absolute value term in the sum measures a distance from x . With $x = 25$, the middle term, $|x - 25|$, will be 0. There will be 10 non-zero values left in the sum. Let's think of these 10 non-zero values as a measure of distance from this middle point—five values are to the left of our chosen x and five values are to the right. If we increase our x by 1 to be $25 + 1$, we add 1 to all of the distances to the left, subtract 1 from all of the distances to the right and added 1 to our middle term which is no longer zero. This leads to a net change in the sum of +1. Similarly, if we decreased our x by 1 to be $25 - 1$, we would add 1 to all of the distances to the right, subtract 1 from all of our distances to the left and add 1 to our middle term which is no longer zero. Again, for a net change of +1. We can conclude that any shift in x from this median value will result in an increase in the value of the sum. The x that minimizes the sum is therefore $2^5 = 32$. Note: It can be stated generally, that for any set of S of real numbers, is minimized by x equal to the median of the set. The set values chosen for this problem are arbitrary.

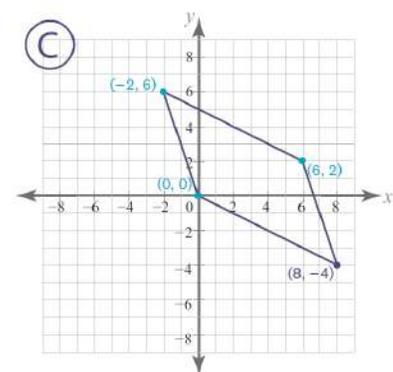

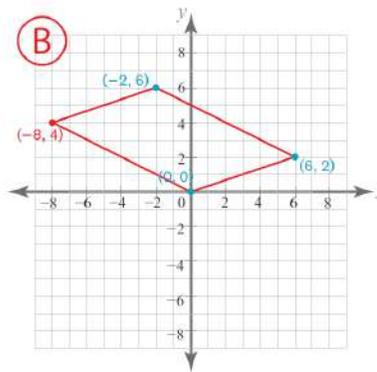

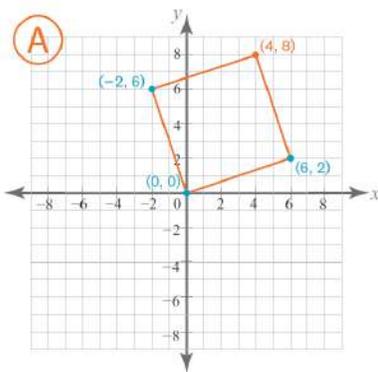

2020 School Target Round Solutions

1. In order to calculate the total amount of money Charles earned, we'll need to take the number of hires and multiply it by the amount earned per hire for each chore. Clothes ironing earnings = $9.50 \times 10 = \$95$. Dog walking earnings = $7.50 \times 12 = \$90$. Kitchen cleaning earnings = $12.00 \times 7 = \$84$. Snow shoveling earnings = $14.00 \times 5 = \$70$. So, in the month of January, Charlie's Chores earned a total of $\$95 + \$90 + \$84 + \$70 = \$339$.
2. Let's take a look at just one side of the quadrilateral—a straight line. Since we are told that no side of the quadrilateral lies on the same line as a side of the hexagon, the maximum number of times a side of the quadrilateral could intersect the hexagon is 2. You can use a ruler to test this on the image of the hexagon. There is no way to pass a straight line through the hexagon and have it intersect the shape more than 2 times. Therefore, the maximum number of points at which the quadrilateral could intersect the hexagon would be at 2 points per side, at $2 \times 4 = 8$ points.

3. Express each of Penelope's and George's amount of candy in an equation. Let d = the number of days. So, Penelope's candy = $152 - 5d$ and George's candy = $124 - 4d$. Since we want to know how many days it will take for them to have the same amount of candy, we can set the equations for Penelope and George equal to each other and solve for d , the number of days. We get $152 - 5d = 124 - 4d \rightarrow 152 = 124 + 1d \rightarrow 28 = d$. So, after **28** days George and Penelope will have the same amount of candy.
4. We're being asked to find the total number of bushels, and we are given the number of bushels grown per acre. We are also given the square footage of an acre, so we'll first need to find the area of the triangular field in square feet. For a triangle with base length b and height h , $Area = 1/2bh = 1/2(1320)(660) = 435,600 \text{ ft}^2$. If 1 acre = $43,560 \text{ ft}^2$, then there are $435,600 \text{ ft}^2 / 43,560 \text{ ft}^2 = 10$ acres. Finally, knowing there are 160 bushels grown per acre, Rosie grows a total of $160 \times 10 = \mathbf{1,600}$ bushels.
5. Rolling a six-sided die five times produces $6^5 = 7,776$ possible combinations of rolls, since there are 6 possible results in each of the five rolls. We're being asked to look specifically at the situations where all of the rolls are the same and where all of the rolls are different. We can deduce that there are exactly 6 scenarios where all of the rolls are the same - 11111, 22222, 33333, 44444, 55555, and 66666. To represent the scenarios where all of the rolls are different, we can use $6!$ This shows that on the first roll, the result could be any of the 6 numbers on the die. However, since all of the rolls must produce different results, there are now only 5 possibilities for the second roll in order to satisfy this requirement. By the same logic, there are only 4 possibilities for the third roll, and so on. To simplify, $6! = 6 \times 5 \times 4 \times 3 \times 2 = 720$ possibilities. Since there are only 5 rolls in this scenario, we do not multiply by 1 at the end of this factorial expansion. However, we achieve the same result either way in this case, so we do not need to modify our $6!$ result in any way. Therefore, there are $720 + 6 = 726$ possible combinations of rolls where either all are the same or all are different. So, the probability of this happening is $726 / 7776$, which is approximately equal to **9.34%**.

6. As you can see in the images, there are three possible parallelograms that can be created with the three provided vertices. In image A, we find the slope between $(0, 0)$ and $(-2, 6)$ to be $(6 - 0) / (-2 - 0) = 6 / -2 = -3$. Because we must create a parallelogram, we know that the missing vertex must create a line segment that is parallel to the line segment between $(0, 0)$ and $(-2, 6)$, which means it must have the same slope. So, working up from $(6, 2)$, using the slope of -3 , we find the missing vertex to be $(4, 8)$. So, $a + b = 4 + 8 = 12$. In image B, we find the slope between $(6, 2)$ and $(-2, 6)$ to be $(6 - 2) / (-2 - 6) = 4 / (-8) = -1/2$. Because we must create a parallelogram, we know that the missing vertex must create a line segment that is parallel to the line segment between $(6, 2)$ and $(-2, 6)$, which means it must have the same slope. So, working up from $(0, 0)$, using the slope of $-1/2$, we find the missing vertex to be $(-8, 4)$. So, $a + b = -8 + 4 = -4$. In image C, as with image B, we find the slope between $(6, 2)$ and $(-2, 6)$ to be $-1/2$. Again, we know that the missing vertex must create a line segment that is parallel to the line segment between $(6, 2)$ and $(-2, 6)$, which means it must have the same slope. So, working down from $(0, 0)$, using the slope of $-1/2$, we find the missing vertex to be $(8, -4)$. So, $a + b = 8 + -4 = 4$. We can see from the above work that the least possible value for $a + b$ is -4 .

7. Let's say Alan is the oldest, Ben is the second-oldest, and Craig is the youngest of the three. Let's also say that $A = \text{Alan}$, $B = \text{Ben}$, $C = \text{Craig}$, and the other two children are labeled 1 and 2. We're looking for all of the scenarios in which A finishes before B, who finishes before C. Let's start by looking at the scenarios where A, B, and C finish in adjacent places. This would mean we're looking for all of the possible arrangements of (ABC) , 1, and 2. This can be represented by $3!$, which simplifies to $3 \times 2 \times 1 = 6$. Next, let's look at the scenarios where none of A, B, and C are in adjacent places. There are only 2 possible orders that satisfy this scenario: $A1B2C$ and $A2B1C$. Finally, we need to consider the scenarios in which two of the three boys finish in adjacent places. There are 6 scenarios in which A and B finish in adjacent places: $AB1C2$, $AB2C1$, $AB12C$, $AB21C$, $1AB2C$, and $2AB1C$. Additionally, there are 6 scenarios in which B and C finish in adjacent places: $A12BC$, $A21BC$, $A1BC2$, $A2BC1$, $1A2BC$, and $2A1BC$. Taking all of these possibilities together, we get $6 + 2 + 6 + 6 = 20$ possible orders.
8. We can find the greatest trime by looking at the prime numbers between 1 and 100, which are: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97. We can see from the provided example that in order to form a trime, we can "merge" two double-digit prime numbers that share a digit. This way, we know that at least two of the two-digit numbers produced are prime, and simply need to check the third. Since we're looking for the greatest trime, we can start with 97 and work our way down. 97 can be "merged" with any of the primes in the 70s, so 79, 73, or 71. However, 979 produces 99 as one of its two-digit numbers, 973 produces 93 as one of its two-digit numbers, and 971 produces 91 as one of its two-digit numbers, all of which are not prime. 89 can be "merged" with 97 to make 897, but 87 is not prime. 83 can be merged with 37 or 31, but neither of 87 or 81 are prime. 79 can be "merged" with 97 to make 797, which produces 77 as one of its two-digit numbers, which is not prime. 73 can be "merged" with 37 or 31. While 737 produces 77 as one of its two-digit numbers, which is not prime, 731 produces three two-digit prime numbers: 73, 31, and 71. So, **731** is the greatest possible trime.

2020 School Team Round Solutions

- There are a total of $93 + 62 + 63 + 127 + 42 = 387$ animals at the zoo. With 93 mammals, $93/387 = 24.03\%$ of the animals in the zoo are mammals, rounded to the nearest hundredth.
- There are $4! = 4 \times 3 \times 2 \times 1 = 24$ total possible arrangements of the four integers 1, 2, 3, and 4. We need to subtract out all of the arrangements that include 2 and 3 in adjacent positions or 1 and 4 in adjacent positions, since $2 + 3 = 5$ and $1 + 4 = 5$. There are 6 arrangements that include 2 directly followed by 3: 1234, 2314, 2341, 1423, 4123, and 4231. So, we know that there will be an additional 6 arrangements where 3 is directly followed by 2: 1324, 3214, 3241, 1432, 4132, and 4321. We also see that in some of the cases above, we have already accounted for arrangements in which 1 and 4 are adjacent. In particular, we have accounted for arrangements where we see 1 and 4 in adjacent positions at the beginning of the sequence (1423, 1432, 4123, 4132) and at the end of the sequence (2314, 2341, 3214, 3241). So, we need to account for the arrangements where 1 and 4 are in adjacent positions in the middle of the arrangement. These arrangements are: 3412, 3142, 2413, and 2143. So, in total, we have $6 + 6 + 4 = 16$ arrangements where we have adjacent numbers that sum to 5. So, there are $24 - 16 = 8$ arrangements of 1, 2, 3, and 4 where no two adjacent numbers have a sum of 5.
- Start by writing an equation to represent what we know about each grade. Let $d =$ dog owners and $n =$ non-dog owners. Since we're asked about the probability of a 7th grader who does not own a dog, we can focus on just the 7th grade. We can represent the 7th grade scenario with $108 = d + n$. We also know that the number of dog owners is twice the number of students who do not own a dog, which can be represented by $d = 2n$. So, we can substitute into the 7th grade equation from above and solve: $108 = 2n + n \rightarrow 108 = 3n \rightarrow n = 36$. In total, there are $93 + 108 = 201$ students, so the probability of a seventh grader who does not own a dog winning the raffle is $36/201 = 12/67$.

- Start with the lower left-hand corner. You know that this cell and the cell directly to the right of it must contain values that sum to 5. Therefore, using the values between 1 and 5, the possibilities to fill these two squares are either 2 and 3 or 1 and 4. However, we can see that there is a 3 already in the lower right-hand corner, in the same row. Since 1 through 5 will appear exactly once in each row, we know that the lower left-hand corner will contain either 1 or 4. We can see there is already a 1 in the left-most column, and since 1 through 5 will appear exactly once in each column, the lower left-hand corner must contain a 4. Continuing to use similar strategies to fill in the cells, we find that the upper left corner will contain a 3 and the upper right corner will contain a 4 (see image). So, the product of the integers in the four corner shaded cells is $3 \times 4 \times 4 \times 3 = 144$.

start here

- The circumference of a circle is represented by $C = \pi d$, where $d =$ diameter. We are given that the circumference of the Earth is 40,075 km. So, we can substitute this value into the formula in order to solve for the diameter of the Earth: $40,075 = \pi d \rightarrow 12,756.268688815 = d$. We'll need to find the length of the satellite's orbit (i.e. its circumference) in order to figure out how long the satellite's orbit will take. If 12,756.268688815 km is the diameter of the Earth, then in order to find the diameter of the satellite's orbit, we must extend the "line" that is the Earth's diameter to span the satellite's orbit. This means we'll need to add 400 km (the distance between the satellite and Earth) to Earth's diameter on both ends. So, the diameter of the satellite's orbit is $12,756.268688815 + 400 + 400 = 13,556.268688815$ km. With this, we can calculate

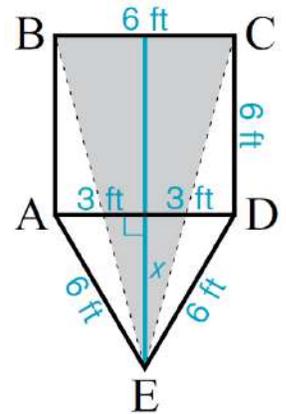

the circumference of the satellite's orbit. We have $C = \pi(13,556.268688815) \rightarrow C = 42,588.27412287$ km. Finally, we know that the satellite travels at 28,000 km/h. In order to calculate the time it takes to travel the satellite's orbit at this speed, we need to use the formula for distance, $d = r \times t$, where d = distance, r = rate, and t = time. We can substitute what we know and solve. We have $42,588.27412287 = 28,000 \times t \rightarrow 1.5210097901 = t$. This means that it takes the satellite 1.5210097901 hours to orbit around the Earth one time. However, we are asked how many minutes this orbit will take. So, knowing there are 60 minutes in 1 hour, take $1.5210097901 \times 60 = 91.2605874062$, which is 91.3 rounded to the nearest tenth. Therefore, it takes the satellite **91.3** minutes to orbit Earth one time.

6. There are three possibilities for how the children are divided among the houses. There could be 1 child living in each house; 2 children living in one house and 1 child living in another; or 3 children living in one house. Let's start with the scenario where there is 1 child in each house. There are $3! = 3 \times 2 \times 1 = 6$ possibilities of how the children could be arranged in the houses with 1 child in each house. In 6/6 of these scenarios, the children would play in house B, because no child would have to travel more than one house away from their own. Two children would travel the distance of one house over, and one child would not have to travel at all. If the children were to play in house A or house C, one child would have to travel two houses away from their own while another would have to travel one house away from their own, which is a greater total amount of travel than if they played in house B. Now, let's look at the scenario where 2 children live in one house and 1 child lives in another (meaning there is one house that has no children). Let's say that the three children are named 1, 2, and 3. Within this arrangement, there are three possibilities: children 1 and 2 live together, children 2 and 3 live together, or children 1 and 3 live together. If children 1 and 2 live together, for example, we can still say that we are arranging 3 things: (1,2), 3, and 0 (where 0 represents the empty house). So, there would be $3! = 3 \times 2 \times 1 = 6$ possible arrangements. In two of these arrangements (where children 1 and 2 live together in house B), (i.e. in 2/6 of these arrangements), the children would play in house B. This is because in the two scenarios where children 1 and 2 live in house B, only child 3 would need to travel, and it would only be the distance of one house over. This is the minimum possible distance traveled in this scenario. This situation is the same if children 2 and 3 live together, and if children 1 and 3 live together - there would still be 2/6 arrangements for each case where the children would play in house B. So, there are a total of $6 + 6 + 6 = 18$ possibilities of how the children could be arranged in the houses with 2 children in one house and 1 child in the other, and $2 + 2 + 2 = 6$ of these arrangements would have the children playing in house B to minimize distance traveled. Finally, there are 3 possible arrangements when all three of the children live in the same house. Either they all live in house A; they all live in house B; or they all live in house C. In only 1 of these scenarios would the children play in house B. This would be when they all live in house B, because they would not have to travel at all to play. Therefore, there are a total of $6 + 18 + 3 = 27$ possible arrangements of the children, and $6 + 6 + 1 = 13$ of these arrangements would have the children playing in house B. So, the probability of the children playing in house B is **13/27**.
7. If $n = ab$, and both a and b have values somewhere between 1 and 10, then when $a = 1$, there are 10 distinct product expressions of a and b (because b could be equal to 10 different values). When $a = 2$, we would have already multiplied 1 by 2 when $a = 1$. So, when $a = 2$, there are 9 distinct product expressions of a and b (because b could be equal to 9 different values, between 2 and 10). Continuing with this reasoning, there will be one fewer distinct product expression of a and b each time the value of a is increased by 1. So, there are $10 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 55$ distinct product expressions of a and b . However, there are some resulting positive integers that we have double counted. For example, while 2×8 and 4×4 are different product expressions, they result in the same positive integer, 16. So, we'll need to subtract out the product expressions that result in a duplicate positive integer, which can be found below.

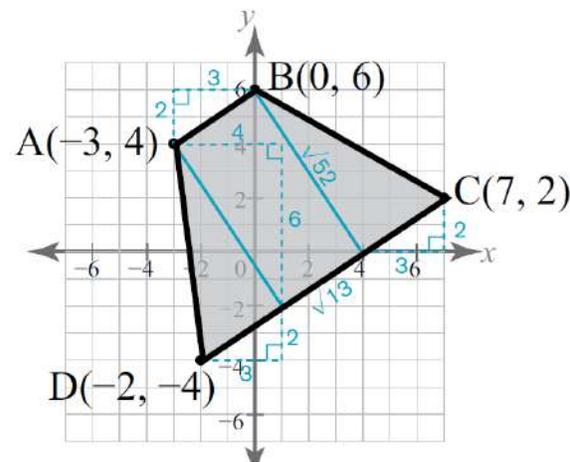

| | | | |
|---------------------------------|--------------------------------|---------------------------------|---------------------------------|
| $2 \times 2 = 4 \times 1 = 4$ | $2 \times 3 = 6 \times 1 = 6$ | $2 \times 4 = 8 \times 1 = 8$ | $2 \times 5 = 10 \times 1 = 10$ |
| $2 \times 6 = 3 \times 4 = 12$ | $2 \times 8 = 4 \times 4 = 16$ | $2 \times 9 = 3 \times 6 = 18$ | $2 \times 10 = 4 \times 5 = 20$ |
| $3 \times 3 = 9 \times 1 = 9$ | $3 \times 8 = 6 \times 4 = 24$ | $3 \times 10 = 5 \times 6 = 30$ | $4 \times 9 = 6 \times 6 = 36$ |
| $4 \times 10 = 5 \times 8 = 40$ | | | |

You'll notice there are 13 sets above, each of two product expressions that are equal to the same positive integer. We want to "keep" one of each of these positive integers, and simply eliminate the duplicates. So, we find that there are $55 - 13 = 42$ distinct positive integers.

8. The formula for the area of a triangle is $A = (1/2)bh$, where b = base and h = height. So, in order to find the area of the shaded triangle, BEC, we'll need to know the measurements for the base and the height of this triangle. Since the base of BEC is shared with the square ABCD, and we know the side lengths of the square are all 6 feet, we know that the base of triangle BEC is 6 feet long. Because we know that ADE is an equilateral triangle, we can say that a line segment from E to the midpoint of segment AD would be perpendicular to AD and would represent the height of triangle ADE. We also know that since AD is also a side of the square, AD is 6 feet in length, as is AE and DE, since ADE is an equilateral triangle. This would also mean that the two smaller triangles formed by drawing the line segment from E to the midpoint of AD would create two halves of AD, each equal to 3 feet in length, which would serve as the bases of the smaller triangles formed. Using this information and the Pythagorean Theorem, we can find the height of triangle ADE. Since $a^2 + b^2 = c^2$, we have $3^2 + b^2 = 6^2 \rightarrow 9 + b^2 = 36 \rightarrow b^2 = 27 \rightarrow b = \sqrt{27}$ feet. If we extend the line segment between E and the midpoint of AD all the way down to BC, we are representing the height of the shaded triangle BEC, since ADE is an equilateral triangle that is exactly aligned with the perfect square ABCD. So, since the square has a height of 6 feet, we can find the height of triangle BEC by adding $6 + \sqrt{27}$. Using this information and the formula for the area of a triangle, we can find the area of BEC. We have $A = (1/2)(6)(6 + \sqrt{27}) \rightarrow A = 3(11.1961524227) \rightarrow A = 33.5884572681$ ft². So, the area of triangle BEC is **33.6** ft², rounded to the nearest tenth.

9. Start by drawing a line segment from A down to CD that creates a right angle at AB and a right angle at CD. Then, draw another line segment from B down to CD that creates another right angle at AB and another right angle at CD. These lines should divide the original figure into a rectangle and two right triangles. Let's start by looking at the rectangle. Create a right triangle between A and B, where AB is the hypotenuse. You should find that there is one side of this triangle that is of length 2 units and one side that is of length 3 units. Use the Pythagorean Theorem to determine the length of AB. We have $a^2 + b^2 = c^2 \rightarrow 2^2 + 3^2 = c^2 \rightarrow 4 + 9 = c^2 \rightarrow 13 = c^2 \rightarrow \sqrt{13}$ units = c . Next, use the same process to find the length of the line segment you've drawn from A to CD (as this is a side of your rectangle). When you create a right triangle where this line segment is the hypotenuse, you should find that you have a triangle with sides of length 4 units and 6 units. Use the Pythagorean Theorem to determine the length of AB. We have $a^2 + b^2 = c^2 \rightarrow 4^2 + 6^2 = c^2 \rightarrow 16 + 36 = c^2 \rightarrow 52 = c^2 \rightarrow \sqrt{52}$ units = c . Using the formula for the area of a rectangle, $A = bh$ (where b = base and h = height), calculate the area of the rectangle. We get $A = (\sqrt{13})(\sqrt{52}) \rightarrow A = 26$ units². Because the rectangle and each triangle shares a side (of length $\sqrt{52}$ units), you only need to find the length

of the remaining side of each triangle in order to calculate the area of each triangle. Using the same process as described above, you'll find that the missing side length of both triangles is $\sqrt{13}$ units. (The triangles are in fact equal.) Using the formula for area of a triangle, we can calculate the area of each triangle. We have $A = (1/2)bh \rightarrow A = (1/2)(\sqrt{13})(\sqrt{52}) \rightarrow A = 13 \text{ units}^2$. Therefore, the area of the full figure is $26 + 13 + 13 = 52 \text{ units}^2$.

10. Start by determining the factors of 2020: 1, 2, 4, 5, 10, 20, 101, 202, 404, 505, 1010, 2020. We know that there is no even integer that will share no common factors greater than 1 with 2020 (even integers will always share at least a factor of 2 with 2020). So, divide $1,000,000/2 = 500,000$ to get the number of odd integers between 1 and 1,000,000. In doing this, we have ensured that all integers have been eliminated from our pool that would share 2, 4, 10, 20, 202, 404, 1010, and/or 2020 as a factor with 2020. Next, let's look at integers that would share a factor of 5 with 2020. We know that there are $1,000,000/5 = 200,000$ integers with 5 as a factor. However, since we have already eliminated all integers with a factor of 10 from our pool with the previous step, we only need to account for integers ending in 5 (which is half of all integers with factors of 5). So, $200,000/2 = 100,000$ integers that need to be eliminated from our pool. We're down to $500,000 - 100,000 = 400,000$ integers. You'll notice that with these two steps, we have actually already eliminated integers that share any factor with 2020, with the exception of 101. So, let's look at integers that would share 101 as a factor with 2020. When we divide 1,000,000 by 101, we find that we do not get a whole number result. Here, we'll need to round down to the nearest whole number. Since we're looking at only integers between 1 and 1,000,000, we only need to look at the integers in this range with a factor of 101, and there are 9,900 of these integers. Half of these integers will be even (202, 404, 606, etc.), and all even integers have already been eliminated from our pool. So, we can take $9,900/2 = 4,950$, which gives us the number of odd integers with a factor of 101. In the previous step, however, we already eliminated all integers from our pool with a factor of 5. This means that certain factors of 101 (505, 1515, etc.) have already been eliminated from our pool. In fact, it will be every 10th multiple of 101 that has already been removed, so $9,900/10 = 990$. We can subtract $4,950 - 990 = 3,960$ to get the number of integers that share 101 as a factor with 2020 and have not already been eliminated. So, there are $400,000 - 3,960 = 396,040$ integers between 1 and 1,000,000 that share no factor greater than 1 with 2020.

HONOR PLEDGE

I pledge to uphold the highest principles of honesty and integrity as a Mathlete[®]. I will neither give nor accept unauthorized assistance of any kind. I will not copy another's work and submit it as my own. I understand that any competitor found to be in violation of this honor pledge is subject to disqualification.

Signature _____ Date _____

Printed Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ minutes How many minutes are in 4.5 hours?

2. _____ apples Herbert's gift basket contains three oranges for every five apples. If the basket has nine oranges, how many apples does it have?

3. _____ If $x = \frac{1}{2}$ and $y = 6$, what is the value of $12xy$?

4. _____ mi/h The table shows the minimum and maximum wind speeds for four categories of hurricanes. What is the absolute difference between the minimum wind speed of a category four hurricane and the maximum wind speed of a category one hurricane?

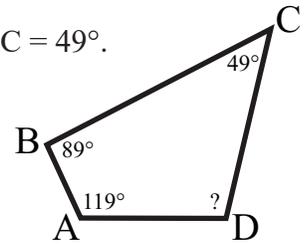

HURRICANE WIND SPEEDS (mi/h)

| Category | Min Speed | Max Speed |
|----------|-----------|-----------|
| Four | 130 | 156 |
| Three | 111 | 129 |
| Two | 96 | 110 |
| One | 74 | 95 |

5. _____ cm What is the perimeter of a square whose area is 144 cm^2 ?

6. furlongs If 3 miles equal 1 league and 1 league equals 24 furlongs, how many furlongs are equal to 1 mile?

7. degrees In quadrilateral ABCD, $m\angle A = 119^\circ$, $m\angle B = 89^\circ$ and $m\angle C = 49^\circ$.
What is the degree measure of $\angle D$?

8. If the first four terms of a geometric sequence are 2, 4, 8, 16 what is the fifth term of this sequence?

9. sides Gladys draws two polygons. Her second polygon has two fewer than twice as many sides as her first polygon. If Gladys' first polygon is a triangle, how many sides does her second polygon have?

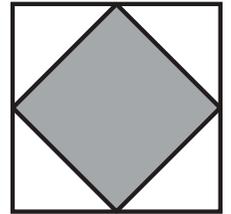

10. \$ Lolli's Candy Store sells fruit-flavored candy rope, priced by length, at \$4.00 per meter. At this rate, how much will it cost to buy 50 cm of candy rope?

11. _____ Misko had an average score of 70 for her first three rounds of golf. If her scores for the first two rounds were 68 and 72, what was her score for the third round?

12. _____ cm^2 In the figure shown, the shaded inner square has area 36 cm^2 , and each of its vertices intersects the midpoint of a side of the outer square. What is the area of the outer square?

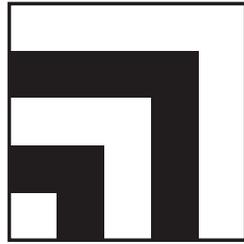

13. _____ meters Rafa and Sascha played a long 320-point tennis match. If Rafa ran an average of 12.7 meters per point and Sascha ran an average of 11.8 meters per point, how many more meters did Rafa run over the course of the match?

14. _____ units^2 The length and width of a rectangle add up to 16 units, and the length is three times the width. What is the area of the rectangle?

15. _____ What is the value of $\sqrt{5 \cdot 6 \cdot 10 \cdot 12}$?

16. _____ in²

The figure shown is a square with sides of length 5 inches. The shaded stripes run parallel to the sides of the square, and they divide the bottom and left-hand sides of the square into segments of length 1 inch. What is the total area of the shaded stripes?

17. _____ numbers

How many two-digit prime numbers have 1 as their units digit?

18. _____ laps

For a charity walk-a-thon, Jen donated \$10 and pledged to donate 10¢ for each lap Mira walked. Joy pledged to donate 35¢ for each lap Mira walked. If the total amount Jen donated equals the total amount Joy donated, how many laps did Mira walk?

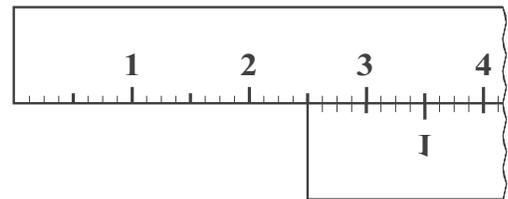

19. _____ values

$$\begin{array}{r} 4A \\ + 53 \\ \hline 1 \end{array}$$

Some of the digits in the following correctly-worked arithmetic problem are missing. How many possible values are there for the digit represented by A?

20. _____

This figure shows two transparent foot-long rulers; the numerical markings on each ruler are in inches. If the marking on the top ruler for 6 inches will line up with the marking on the bottom ruler for q inches, what is the value of q ? Express your answer as a mixed number.

21. _____

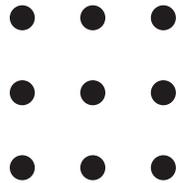

Noah wants to fill in the two blanks in the numeral 5_1_2 to create a five-digit positive integer that is divisible by 6. What is the greatest five-digit multiple of 6 that he can create?

22. _____

What is the integer nearest to x if $3^x = 1500$?

23. _____ lines

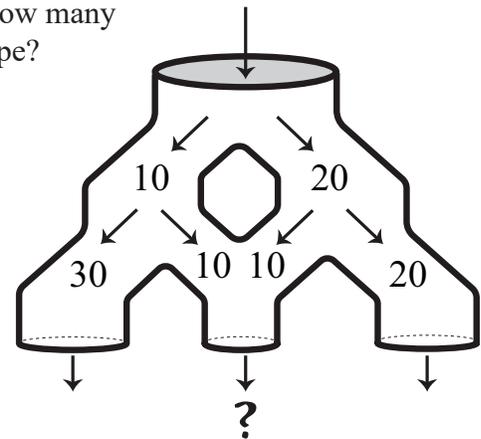

How many different lines pass through at least two of the nine points in the grid below?

24. _____

If $(2x - 3)^3 = a_3x^3 + a_2x^2 + a_1x + a_0$, what is the value of $a_3 + a_2 + a_1 + a_0$?

25. _____ marbles

Ten thousand marbles are released into the top pipe as shown and roll down the pipe system. Anytime the pipe forks, the marbles split in proportion to the cross-sectional areas of the pipes. All pipes have circular cross-sections with diameters as indicated in the figure. How many marbles exit through the bottom, middle pipe?

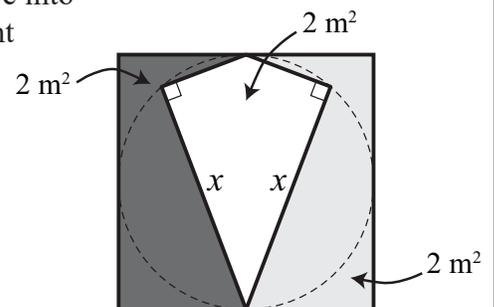

26. _____ prisms A rectangular prism of size $3 \times 4 \times 5$ is made from 60 unit cubes. Including the full $3 \times 4 \times 5$ prism and the 60 unit prisms, how many total rectangular prisms can be found in the large rectangular prism by taking a subset of the 60 cubes?

27. _____ Ms. Pauling's chemistry class has 5 lab benches, each of which seats 2 students. If 6 students file into her otherwise empty classroom, and each student picks a random available open seat, what is the probability that at least one of the lab benches is completely empty? Express your answer as a common fraction.

28. _____ In the figure, a kite with two right angles is circumscribed by a circle. The circle is then circumscribed by a square such that the diagonals of the kite are parallel to the sides of the square as shown. The longer sides of the kite each have length x meters. The sides of the kite divide the square into three regions, shaded dark gray, white and light gray as shown, with each region of area 2 m^2 . If $x^2 = a + \sqrt{b}$, what is the value of $a + b$?

29. (_____ , _____) When $9!$ is expressed as an integer in base 9, the result ends in m zeros, and the last nonzero digit immediately preceding the m zeros is n . What is the value of the ordered pair (m, n) ?

30. _____ Triangle ABC has vertices $A(0, 5)$, $B(12, 0)$ and $C(0, 0)$ in the coordinate plane. The image when triangle ABC is rotated clockwise about the origin is triangle $A'B'C'$ with vertex $A'(3, 4)$. What fraction of the area of triangle $A'B'C'$ is below the x -axis? Express your answer as a common fraction.

- For the 5×5 array shown, Chad fills in each empty cell with a positive integer so that any two cells that are vertically or horizontally adjacent contain numbers that differ by exactly 1. What is the greatest number that can appear in any of these cells?

3. _____ times Marko's heart beats 72 times per minute during normal activity. It beats 65 times per minute during sleep, and 118 times per minute when Marko is exercising. During a 24-hour period, Marko slept from 10:00 p.m. until 5:00 a.m. and then exercised from 5:30 a.m. to 7:30 a.m. For the remaining time he had normal activity. During that 24-hour period, how many times did Marko's heart beat?

4. _____ years Kepler's third law of planetary motion states that the square of the amount of time it takes for a planet to orbit the Sun is proportional to the cube of the planet's greatest distance from the Sun. Based on this and the data for Mars, Jupiter, Uranus and Neptune included in the table shown, how many Earth years does it take for Neptune to orbit the Sun? Express your answer to the nearest whole number.

Sun Distances and Orbit Times

| PLANET | GREATEST DISTANCE <i>(kilometers to Sun)</i> | ORBIT TIME <i>(Earth years)</i> |
|---------|---|------------------------------------|
| Mars | 2.28×10^8 | 1.882 |
| Jupiter | 7.78×10^8 | 11.86 |
| Uranus | 2.87×10^9 | 84.01 |
| Neptune | 4.50×10^9 | ? |

5. _____ An ordered triple (a, b, c) is randomly chosen from the set of all ordered triples for which a, b and c are nonnegative integers that satisfy $a + b + c = 22$. What is the probability that $a < b < c$? Express your answer as a common fraction.

6. sequences Lincoln stands at vertex A of hexagon ABCDEF and rolls a die three times. For each roll, if the number rolled is even, he moves clockwise that number of vertices. If the number rolled is odd, he moves counter-clockwise that number of vertices. How many different sequences of three rolls will result in Lincoln ending at vertex A?
7. _____ An abundant number is a positive integer n for which the sum of the positive integer factors of n is greater than $2n$. What is the sum of all the abundant numbers that are less than 60?
8. lengths Suppose 7 points lie in a plane, and a line segment is drawn connecting each pair of points, forming a total of 21 line segments. What is the minimum number of distinct lengths among the 21 line segments?
9. _____ A standard 52-card deck of playing cards has thirteen ranks in each of four suits. If five cards are randomly selected from the deck, without replacement, what is the probability that they are all the same suit? Express your answer as a decimal to the nearest thousandth.
10. units² Let R be the set of all points (x, y) satisfying $x^2 + y^2 \leq 100$. What is the least possible area of a right triangle with three integer side lengths that cannot fit inside R ?

2. _____ (minutes) How many minutes are there in half of a day?
3. _____ A certain gameboard consists of an $n \times n$ array of squares. Vijay places a token on every square that does not border an edge of the board. If Vijay uses exactly 169 tokens, what is the value of n ?
4. _____ What is the greatest common factor of the first 100 positive prime numbers?
5. _____ (weeks) This week, Rudy began saving his \$5 weekly allowance to buy a new gaming system. How many weeks worth of allowance must Rudy save to buy a gaming system that costs \$299?
6. _____ (cm) Triangle ABC has perimeter 24 cm and area 20 cm^2 . Triangle DEF is similar to triangle ABC and has area 45 cm^2 . What is the perimeter of triangle DEF, in centimeters?
7. _____ (minutes) If Colin can wrap a gift in 18 seconds, how many minutes will it take him to wrap 100 gifts?
8. _____ What number is halfway between $\frac{3}{7}$ and $\frac{6}{7}$? Express your answer as a common fraction.
9. _____ For what value of k does the straight line passing through the points $(4k + 1, 3k + 2)$ and $(3k + 2, 2k + 1)$ have slope 2?
10. _____ (feet) George has five ribbons, each 4 feet 8 inches in length. What is the combined length of George's ribbons? Express your answer to the nearest foot.
11. _____ What is the value of the expression $(1 - 8) \div (2 - 7) + (3 - 6) \div (4 - 5)$? Express your answer as a decimal to the nearest tenth.
12. _____ Carl received a text notifying him that the release date for "102 Dachshunds" would be 102 days from the notification date. If the movie release day will be a Saturday, on what day of the week did Carl receive the text?
13. _____ (blue marbles) A jar contains 8 red, 10 green, 36 yellow and some blue marbles. If the ratio of green to blue marbles is 5:12, how many blue marbles are in the jar?
14. _____ (units²) What is the area of the triangle with side lengths 5, 5 and 6, in square units?
15. _____ If $a * b = a^2 - b$, what is the value of $12 * 12$?

16. _____ (members) A math club for seventh and eighth graders starts with 14 seventh graders and 8 eighth graders. Each week, 3 new seventh graders and 4 new eighth graders join the club. What will be the total number of members when the club has an equal number of seventh graders and eighth graders?
17. _____ (cm²) What is the surface area, in square centimeters, of a cube with volume 1000 cm³?
18. _____ What is the product of the least common multiple and the greatest common factor of 10 and 15?
19. _____ The product of three distinct prime numbers is 130. What is the greatest of the three prime numbers?
20. _____ (costumes) How many distinct Halloween costumes can be made by choosing one of three different capes, one of two different wigs and two of four different accessories?
21. _____ (dollars) Courtney has ten nickels, ten dimes and ten quarters. If she has no other coins, what is the total value of her coins, in dollars?
22. _____ (posts) A fence that is 33 feet long is held up by a number of posts. There must be a post at each end of the fence, and consecutive posts cannot be more than 6 feet apart. What is the minimum number of posts needed to hold up this fence?
23. _____ What is the value of the expression $1.2 \times 1.2 + 1.2 \div 1.2 - 1.2$? Express your answer as a decimal to the nearest hundredth.
24. _____ (integers) A three-digit positive integer is *pristine* if all three of its digits are distinct prime numbers. How many three-digit positive integers are pristine?
25. _____ What is the product of 42 and 48?
26. _____ (ft²) A rectangle is twice as long as it is wide. If its perimeter is 18 feet, what is its area, in square feet?
27. _____ (dollars) Tom can pay for phone service at a rate of \$45 per month or \$500 per year. How many dollars will Tom save by choosing the cheaper payment plan for one year of service?
28. _____ (inches) Two brothers, Timmy and Jimmy, have heights totaling 12 feet. If Timmy is 6 inches taller than Jimmy, what is Timmy's height in inches?

29. _____ (marbles) Nathan lost his marbles. He found 30 of them, which was $\frac{1}{3}$ of the number that he started with. How many marbles did he have to begin with?
30. _____ (points) Through the first 81 games of an 82-game basketball season, Michael averaged 29 points per game. Assuming Michael has played in all 81 games, how many points must he score in the final game to average 30 points per game for the season?
31. _____ What is the value of 150% of 50% of 100?
32. _____ If $2x = 15.6$, what is the value of x ? Express your answer as a decimal to the nearest tenth.
33. _____ (miles) Dana's car averages 28 miles per gallon of gas, and it currently contains 1 gallon of gas. If Dana adds \$10.00 worth of gas, sold for \$2.50 per gallon, how many miles can he expect to drive before running out of gas?
34. _____ What is the greatest common factor of 36, 54, 66 and 17?
35. _____ (dollars) Liam pays \$60.00 for a sweater that is on sale for 25% off its original price. How many dollars did the sweater originally cost?
36. _____ If $x = 9$, what is the value of the expression $2x \cdot 5x$?
37. _____ The points A and B are located on a number line with coordinates -8 and 32 , respectively. If the point P is located between A and B so that the ratio of AP to PB is 1:4, what is the coordinate of point P?
38. _____ What is the value of $((2 + 3) \times 5) - (2 + 3 \times 5)$?
39. _____ (minutes) Marcus can walk 15 blocks in one hour. How many minutes does it take him to walk 50 blocks?
40. _____ What is $\frac{1}{3}$ of $2\frac{1}{3}$? Express your answer as a common fraction.
41. _____ (dollars) Adrienne and Michelle split a \$20 payment that they receive for doing some extra chores. Since Adrienne did three times the work that Michelle did, Adrienne's share of the payment is three times Michelle's share. How many dollars is Michelle's share?

42. _____ (mi/h) Tina drove 140 miles in $2\frac{1}{2}$ hours. What was her average speed, in miles per hour?
43. _____ (%) Richard bakes a pie. He gives his mom half of the pie. He gives his dad a quarter of the pie. What percentage of the pie is left?
44. _____ The product of two consecutive negative integers is 42. What is their sum?
45. _____ (in²) The perimeter of a rectangle is 20 inches. If the length of the rectangle is 7 inches, what is the area of the rectangle, in square inches?
46. _____ What is the value of $\frac{\frac{1}{2} + \frac{1}{3} + \frac{1}{4}}{\frac{5}{2} + \frac{5}{3} + \frac{5}{4}}$? Express your answer as a common fraction.
47. _____ (albums) Bobbie has 260 photos that she would like to put into physical photo albums. Each album can hold up to 50 photos. What is the fewest number of albums Bobbie will need?
48. _____ Two integers that add to 15 differ by 3. What is the product of the two integers?
49. _____ (degrees) If angle A is an acute angle, what is the absolute difference between the degree measures of the supplement of A and the complement of A, in degrees?
50. _____ If a and b are positive integers such that $a^2 + b^2 = 197$, what is the value of $a + b$?
51. _____ (cm²) Right triangle ABC is similar to triangle XYZ. The legs of triangle ABC have lengths of 3 cm and 4 cm. The hypotenuse of triangle XYZ is 15 cm long. What is the area, in square centimeters, of triangle XYZ?
52. _____ (feet) The lowest point in Death Valley is Badwater at 282 feet below sea level. The highest point in the surrounding mountains is Telescope Peak at 11,043 feet above sea level. How many feet higher is Telescope Peak than Badwater?
53. _____ If a is a positive integer such that $a = \sqrt{(-16) \times (-16) \times (-16) \times (-16)}$, what is the value of \sqrt{a} ?
54. _____ (inches) A regular hexagon, with perimeter 30 inches, is divided into six congruent equilateral triangles as shown. What is the perimeter of the gray triangle, in inches?

55. _____ If $a + b$ is twice $a - b$ and $ab \neq 0$, what is the ratio of b to a ? Express your answer as a common fraction.
56. _____ One-half of the students in Mr. Meyer's class are boys, and one-third of the students in Ms. Sanchez's class are boys. If both classes have the same number of students, what fraction of the two classes combined are boys? Express your answer as a common fraction.
57. _____ (units) The area of a certain triangle is numerically equal to five times the length of its base. What is the height of the triangle, in units?
58. _____ What is the sum of all of the integers a that satisfy the equation $a = a^3$?
59. _____ If the line $y = 2x - 6$ intersects the line $x = 10$ at the point $(10, b)$, what is the value of b ?
60. _____ (pages) It takes Ty 4 hours 30 minutes to read his favorite book, reading at a constant rate of 100 pages every 50 minutes. How many pages are in Ty's favorite book?
61. _____ (ounces) Reuben had 15 ounces of fudge. He gave half of the fudge to his sister. How many ounces of fudge did he keep? Express your answer as a decimal to the nearest tenth.
62. _____ If x is a number such that $2x + 5 = 9$, what is the value of the expression $(2x + 6)(2x + 7)$?
63. _____ What is the least positive integer that is even and is a perfect square and is divisible by 3?
64. _____ Last night $\frac{5}{8}$ of the students in the dorm looked at Facebook, $\frac{3}{8}$ looked at Twitter, and $\frac{1}{4}$ looked at both. What fraction of the students looked at neither? Express your answer as a common fraction.
65. _____ If $5y = -60$, what is the value of y ?
66. _____ What is the greatest common factor of 78 and 90?

67. (\$) Clara buys a bunch of bananas at the grocery store. If the total is \$2.54 and she pays with a \$5 bill, how much change should she get back, to the nearest cent?
68. What is the value of $\frac{20^{20}}{20^{19} + 20^{19} + 20^{19} + 20^{19}}$?
69. (eggs) Jadon buys three large cartons of eggs. Each carton holds $1\frac{1}{2}$ dozen eggs. How many eggs does he buy in all?
70. (units²) What is the area, in square units, of a rectangle whose perimeter is 14 units and whose side lengths are prime numbers?
71. Brent flips three fair coins in succession. Given that the first coin lands heads, what is the probability that all his coins will land heads? Express your answer as a common fraction.
72. What is the value of the sum $\frac{1}{3} + \frac{2}{3} + \frac{4}{3} + \frac{5}{3} + \frac{7}{3} + \frac{8}{3}$?
73. Jin has scores of 80, 91 and 96 on his tests this term. What is the lowest score that he can get on the next test that will raise his average to at least 90?
74. If $\sqrt{x} + \sqrt{36} = \sqrt{64}$, what is the value of x ?
75. What is the smallest perfect square divisible by at least three distinct prime numbers?
76. What is the smallest value of n with the property that $1 + 2 + 3 + \dots + n$ is a two-digit number whose digits are equal?
77. What is the greatest prime number less than 50 that can be written in the form $4n + 1$, where n is a positive integer?
78. (zeros) How many zeros appear at the end of the product of the first 2020 primes?
79. What is the units digit of $2020^0 + 2020^1 + 2020^2 + 2020^3 + \dots + 2020^{2020}$?
80. (\$) Paul paid for a sandwich with a \$5 bill and received three pennies, two dimes and one quarter in change. What was the cost of the sandwich, to the nearest cent?

MATHCOUNTS®

2020 Chapter Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2020 MATHCOUNTS® Chapter Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

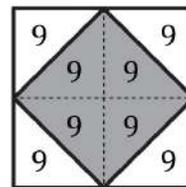

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2020 Chapter Competition Sprint Round

1. Each hour has 60 minutes. Therefore, 4.5 hours has 4.5×60 minutes = 45×6 minutes = **270** minutes.
2. The ratio of apples to oranges is 5 to 3. Therefore, $\frac{5}{3} = \frac{a}{9}$, where a represents the number of apples. So, $3a = 5 \times 9 = 45$. Thus, $a = \frac{45}{3} = \mathbf{15}$ apples.
3. Substituting for x and y yields $12xy = 12 \times \frac{1}{2} \times 6 = 6 \times 6 = \mathbf{36}$.
4. The minimum Category 4 speed is 130 mi/h. The maximum Category 1 speed is 95 mi/h. Absolute difference is $|130 - 95|$ mi/h = **35** mi/h.
5. Area $A = s^2 = 144 \text{ cm}^2$. Perimeter $p = 4s = 4\sqrt{A} = 4\sqrt{144} = 4 \times 12 \text{ cm} = \mathbf{48}$ cm.
6. Since 3 miles = 1 league, 1 mile = $\frac{1}{3}$ league = $\frac{1}{3} \times 24$ furlongs = **8** furlongs.
7. The sum of the measures of the 4 interior angles of a quadrilateral is 360 degrees. Therefore, $360 = 119 + 89 + 49 + m\angle D = 257 + m\angle D$, so $m\angle D = 360 - 257 = \mathbf{103}$ degrees.
8. In any nonzero geometric sequence, the ratio of the n th term to the $(n - 1)$ th term, for $n > 1$, is constant, and is called the common ratio. Therefore, $t_5/t_4 = t_2/t_1 = 4/2 = 2$, so $t_5 = 2t_4 = 2 \times 16 = \mathbf{32}$.
9. The first polygon, a triangle, has 3 sides. The other polygon has $2 \times 3 - 2 = 6 - 2 = \mathbf{4}$ sides.
10. Solve using cross cancelation to get $50 \text{ cm} \times \frac{\$4.00}{1 \text{ meter}} = 50 \text{ cm} \times \frac{1 \text{ meter}}{100 \text{ cm}} \times \frac{\$4.00}{\text{meter}} = \frac{1}{2} \times \$4.00 = \mathbf{\$2.00}$ or **\\$2**.
11. The average of 70 over 3 rounds is the sum of the scores for the 3 rounds divided by 3. Therefore, the sum of the scores over 3 rounds is $3 \times 70 = 210$. The two known scores are 68 and 72, which sum to 140. Therefore, the third round score must have been $210 - 140 = \mathbf{70}$.
12. The diagonals of the inner shaded square are congruent to the sides of the outer square—call that length s . Then the area of the inner shaded square is $s^2/2$ while the area of the outer square is s^2 , which is 2 times as big as the inner square. Because the inner square has area 36 cm^2 , the area of the outer square is $2 \times 36 \text{ cm}^2 = \mathbf{72 \text{ cm}^2}$.

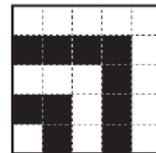

Alternatively, if we draw the diagonals of the shaded square, we create 8 congruent 45-45-45 right triangles. Since the shaded square, which is made up of four of these right triangles, has area 36 cm^2 , it follows that each triangle has area $36/4 = 9 \text{ cm}^2$. Therefore, the outer square, composed of 8 of these right triangles, has area $9 \times 8 = \mathbf{72 \text{ cm}^2}$.

13. Because Rafa averages moving 12.7 meters per point and Sascha averages 11.8 meters per point, Rafa averages $12.7 - 11.8 = 0.9$ meters per point more than Sascha. Given 320 points for the match at that rate, Rafa will run a total of $320 \times 0.9 = \mathbf{288}$ meters more than Sascha.
14. Let l be the length and w be the width of the rectangle. Then $l + w = 16$ u and $l = 3w$. Thus, we have $16 \text{ units} = 3w + w = 4w$, $w = 4$ units, $l = 16 \text{ units} - 4 \text{ units} = 12$ units, and $lw = 12 \text{ units} \times 4 \text{ units} = \mathbf{48 \text{ units}^2}$.

15. The expression $\sqrt{5 \times 6 \times 10 \times 12}$ can be rewritten as $\sqrt{5 \times 10 \times 6 \times 12}$. Simplifying, we get $5\sqrt{2} \times 6\sqrt{2} = 30 \times 2 = \mathbf{60}$.
16. The smallest, unshaded square has area $(1 \text{ in})^2 = 1^2 \text{ in}^2 = 1 \text{ in}^2$. The area formed by the smallest, unshaded square combined with the smallest shaded strip is $(2 \text{ in})^2 = 4 \text{ in}^2$. Thus, the area of the smallest shaded strip is $4 \text{ in}^2 - 1 \text{ in}^2 = 3 \text{ in}^2$. The area of the smallest, unshaded square plus the smaller, shaded strip plus the next unshaded strip is $(3 \text{ in})^2 = 9 \text{ in}^2$. Adding the next shaded strip yields $(4 \text{ in})^2 = 16 \text{ in}^2$. The absolute difference of the last two yields the area of the larger shaded strip: $16 \text{ in}^2 - 9 \text{ in}^2 = 7 \text{ in}^2$. The total area of the two shaded strips is $3 \text{ in}^2 + 7 \text{ in}^2 = \mathbf{10 \text{ in}^2}$.

Alternatively, if we divide the figure, as shown, into 25 squares, each 1 inch \times 1 inch, we can see that 10 of these squares are shaded, giving us a total area of $10 \times 1 \text{ in}^2 = \mathbf{10 \text{ in}^2}$.

17. The positive two-digit integers with 1 as units digit are 11, 21, 31, 41, 51, 61, 71, 81, 91, of which $21 = 3 \times 7$, $51 = 3 \times 17$, $81 = 9 \times 9$ and $91 = 7 \times 13$ are not prime, leaving **5** numbers that are.
18. Let l be the number of laps Mira walked. Equating the two donations yields: $\$(10 + 0.10l) = \$0.35l$. Simplifying, we get $10 = 0.35l - 0.10l = 0.25l = l/4$. Therefore, $l = 4 \times 10 = \mathbf{40}$ laps.
19. Let m represent the first addend $4A\Box$, with temporarily allowing each of A and \Box to represent any digit 0 through 9 meaning $400 \leq m \leq 499$. Let n represent the second addend $53\Box$, with temporarily allowing \Box to represent any digit 0 through 9 meaning $530 \leq n \leq 539$. We have an additional criterion that the sum must be of the form $1\Box\Box\Box$, so letting each \Box represent, independently, any digit 0 through 9 means we must have $1000 \leq m + n \leq 1999$. For $A = 9$, $499 + 539 = 1038$, so this case works. For $A = 8$, $489 + 539 = 1028$, so this case works. For $A = 7$, $479 + 539 = 1018$, so this case works. For $A = 6$, $469 + 539 = 1008$, so this case works. For $A = 5$, $459 + 539 = 998$, so this case does not work. In fact any smaller A (less than or equal to 5) requires n to be at least $1000 - 459 = 541$ just to reach the bare minimum allowed sum, but this is above its maximum allowed value for n , so A can have any one of the **4** values 6, 7, 8, or 9.
20. The left end (0 inches) is directly under the $2\frac{1}{2}$ in mark. Therefore, the reading on the lower ruler will always be $2\frac{1}{2}$ in less than the reading on the upper ruler, wherever the two rulers overlap, so when the upper ruler shows 6 in, the lower ruler will show 6 inches $- 2\frac{1}{2}$ inches $= 3\frac{1}{2}$ inches. So, $q = \mathbf{3\frac{1}{2}}$.
21. An integer is divisible by 6 if and only if it is divisible by 2 and by 3. An integer is divisible by 2 if and only if its units digit is 0, 2, 4, 6 or 8, and the number in question has units digit 2, so it is divisible by 2. An integer is divisible by 3 if and only if the sum of its digits is divisible by 3. The sum of the three known digits is $5 + 1 + 2 = 8$, which is 1 short of being a multiple of 3. Therefore, the two undetermined digits must add to a multiple of 3 plus 1; because digits cannot exceed 9, the sum of the two undetermined digits cannot exceed 18. As a result, the two digits in question can have of sum of 1, 4, 7, 10, 13 or 16. The desire is for the maximum value, which is 16 for the sum. A 9 in the left blank and a 7 in the right blank yields the greatest result, **59,172**.
22. Recall that $3^2 = 9$; $3^4 = 3^2 \times 3^2 = 9 \times 9 = 81$; $3^6 = 9 \times 81 = 729$, which gets us close to 1500. So, now multiply by 3 rather than 3^2 to get $3^7 = 3 \times 729 = 2187$. Because $x < y$ if and only if $3^x < 3^y$, having $729 = 3^6 < 1500 = 3^x < 2187 = 3^7$ means that $6 < x < 7$. To know whether x is closer to 6 or to 7, we need to know about $3^{6.5} = 3^6 \times 3^{0.5} = 729\sqrt{3} < 729 \times 2 = 1458 < 1500$, meaning that $6.5 < x < 7$, so the integer that x is closest to is **7**.

23. There are 9 points in the grid. Two distinct points determine a line. There are $\frac{9 \times 8}{2} = 36$ combinations of pairs of points. However, there is a bit of a problem in that when we have 3 distinct points on some lines, meaning there are $\frac{3 \times 2}{2} = 3$ pairings of points that generate the same line, so we are counting those lines 3 times instead of just once. Take the top row of dots for example: The same line is generated by the left and middle dots, the left and right dots, and the middle and right dots—a total of 3, just as the calculation said we would find. How many sets of 3 collinear dots do we have? There are 3 such horizontal rows, 3 such vertical rows, and 2 such corner-to-opposite-corner diagonals, for a total of $3 + 3 + 2 = 8$. There is no other way to overcount lines due to having 3 or more collinear points in our figure. Thus, we have counted 8 of the lines 3 times each, for a total of $8 \times 3 = 24$ times, instead of just 8 times, for an overcount of 16. Therefore, the number of distinct lines is $36 - 16 = 20$ inches.

24. We have $a_3 + a_2 + a_1 + a_0 = a_3 \cdot 1^3 + a_2 \cdot 1^3 + a_1 \cdot 1 + a_0 = (2 \times 1 - 3)^3 = (-1)^3 = -1$.

25. The number of marbles that take one path versus the other at a fork is proportional to ratio of the cross-sectional areas of the pipes for each path, which, in turn, is proportional to the squares of the given diameters. At the top fork, the left to right ratio of marbles is $10^2 : 20^2 = 100 : 400 = 1 : 4$. As fractions, the left path gets $\frac{1}{1+4} = \frac{1}{5}$ of the marbles and the right path gets $\frac{4}{1+4} = \frac{4}{5}$ of the marbles. Since there are 10,000 marbles, $10,000/5 = 2000$ go left and the remaining 8000 go right at the top fork. The bottom row has three pipes: one on the left (L), one in the middle (M), and one on the right (R)—the only one we really care about is M. The fork between L and M gets 2000 marbles, which are split proportionally $30^2 = 900$ for L to $10^2 = 100$ for M. Thus, $\frac{100}{900+100} = \frac{1}{10}$ of the 2000, or 200, go through M. The fork between M and R gets 8000 marbles, which are split proportionally $10^2 = 100$ for M to $20^2 = 400$ for R. Thus, $\frac{100}{100+400} = \frac{1}{5}$ of the 8000, or 1600, go through M. Therefore, the total going through M is $200 + 1600 = 1800$ marbles.

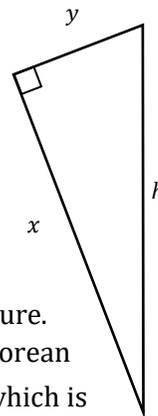

26. Let's start with one row of n rectangles all the same height (width is unimportant) lined up end to end:

There are n individual rectangles, $n - 1$ pairs of adjacent rectangles [1-2, 2-3, 3-4, ..., $(n - 2)$ - $(n - 1)$, $(n - 1)$ - n]. We have $n - 2$ groupings of 3 consecutive individual rectangles [1-2-3, 2-3-4, ..., $(n - 2)$ - $(n - 1)$ - n]. This pattern continues until we have 2 groupings of $n - 1$ consecutive individual rectangles, and ultimately a count of 1 for the full rectangle containing all n individual rectangles, for a total of $n + (n - 1) + (n - 2) + \dots + 2 + 1 = \frac{n(n+1)}{2}$ distinct rectangles. If we have m copies of such rows, these form, independently, $\frac{m(m+1)}{2}$ options for rows of rectangles, and $\frac{l(l+1)}{2}$ options for l layers. Our $3 \times 4 \times 5$ prism produces a total of $\left[\frac{3 \times 4}{2} \right] \left[\frac{4 \times 5}{2} \right] \left[\frac{5 \times 6}{2} \right] = 6 \times 10 \times 15 = 900$ prisms.

27. There are 10 seats, of which 6 are occupied. We care only about each seat being occupied versus unoccupied, not who is occupying it, so order does not matter. We need the number of combinations of 10 things taken 6 at a time: $\frac{10 \times 9 \times 8 \times 7}{4 \times 3 \times 2 \times 1} = 210$ seating arrangements. These can be categorized into 3 layout patterns: (1) 3 fully occupied benches and 2 unoccupied benches; (2) 2 fully occupied benches, 2 partially occupied benches and 1 unoccupied bench; (3) 1 fully occupied bench, 4 partially occupied benches. We are interested in the probability for case (1) or case (2), which is 1 minus the probability of case (3). For case (3), any one of the 5 benches is equally likely to be fully occupied, so we get 5 equally likely options. For each of those options, there are 4 partially occupied benches, each with 2 options as to which of the 2 seats is occupied. Altogether we have $5 \times 2^4 = 80$ arrangements with no empty bench out of 210 total seating arrangements. Therefore, our desired probability is $1 - \frac{80}{210} = \frac{13}{21}$.

28. The area enclosed by the square is the sum of the three given areas, or $2 \text{ m}^2 + 2 \text{ m}^2 + 2 \text{ m}^2 = 6 \text{ m}^2$. Since the square's area is its side length squared, it follows that each side is $\sqrt{6}$ meters. The long sides of the kite are given as length x ; let's call the length of the short sides y . The vertical diagonal of the kite is congruent to each side of the square, thus $\sqrt{6}$ meters. Each of the two long sides and adjacent short side form the legs of a right triangle whose hypotenuse is the vertical diagonal of the kite. One of the triangles is shown in the figure. The area of the triangle is $xy/2 = 1 \text{ m}^2$, so $xy = 2 \text{ m}^2$ and $y = 2 \text{ m}^2/x$. Based on the Pythagorean Theorem, $x^2 = h^2 - y^2 = 6 - \frac{4}{x^2}$. Multiplying through by x^2 , we get $(x^2)^2 - 6x^2 + 4 = 0$, which is an equation that is quadratic in x^2 . Let's use the quadratic formula to solve for x^2 , which is our quantity of interest: $x^2 = \frac{6 \pm \sqrt{(-6)^2 - 4 \times 4}}{2} = 3 \pm \frac{\sqrt{20}}{2} = (3 \pm \sqrt{5}) \text{ m}^2$. We must be careful about the \pm . The $+$ gives the square of the longer side, x^2 ; the $-$ gives the square of the shorter side, which is actually y^2 . Therefore, $x^2 = (3 + \sqrt{5}) \text{ m}^2$, which is of the form $(a + \sqrt{b}) \text{ m}^2$, with $a = 3, b = 5$, so $a + b = 8$.

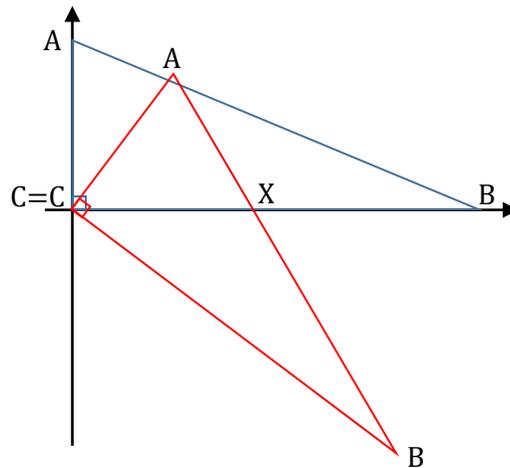

29. The number of 0s that an integer ends in when expressed in base 9 is the number of factors of $9 = 10_9$, the integer has and the rightmost nonzero digit in base 9 is the remainder upon dividing by 9 the integer with all of the factors of 9 removed.

$$9! = 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 9 \times 3 \times 6 \times 8 \times 7 \times 5 \times 4 \times 2 \quad [\text{move 3 and 6; drop 1}]$$

$= 9 \times 9 \times 16 \times 7 \times 5 \times 4 \times 2 = 9^2 \times 16 \times 280$. [combine 3s to make 9s, merge all 9s together and do the trivial parts of the remaining multiplications].

The exponent on the base 9 is $m = 2$. The product 16×280 has the same remainder when divided by 9 as does the product of the remainders of each of 16 and 280 when divided by 9. Also an integer and the sum of the digits of that integer have the same remainder when divided by 9. Thus, 16 and $1 + 6 = 7$ have the same remainder, 7 when divided by 9, while 280, $2 + 8 + 0 = 10$, and $1 + 0 = 1$ have the same remainder when divided by 9. Therefore, 16×280 and 7×1 have the same remainder, 7, when divided by 9 (much easier than multiplying 16×280 and then dividing by 9). Thus, $n = 7$, and $(m, n) = (2, 7)$.

30. Given congruent right triangles ABC and $A'B'C'$, $A = (0, 5)$, $B = (12, 0)$, $C = (0, 0)$, $A' = (3, 4)$, $C' = (0, 0)$, and X is the intersection of $\overline{A'B'}$ and the x -axis. What is the area enclosed by triangle $XB'C'$ divided by the area of $A'B'C'$? The area enclosed by $A'B'C'$ is the same as that of ABC , which is $12 \times 5/2 = 30$ units². The slope of $C'A'$ is $4/3$, so the slope of perpendicular $C'B'$ is the negative reciprocal, or $-3/4$. The length of $\overline{C'B'}$ is the same as the length of CB , namely 12 units. Therefore, the coordinates of B' are $B'_x = 0 + \frac{4}{\sqrt{3^2+4^2}} \times 12 = +9.6$ and $B'_y = 0 - \frac{3}{\sqrt{3^2+4^2}} \times 12 = -7.2$, so $B' = (9.6, -7.2)$. Based on the y -component values, X is $\frac{4}{4+7.2} = \frac{4}{11.2} = \frac{5}{14}$ of the way from A' to B' , so $X_x = 3 + \frac{5}{14}(9.6 - 3) = \frac{75}{14}$. Therefore, the base of $XB'C'$ is the length of $\overline{C'X}$, which is $\frac{75}{14}$ while the height is $7.2 = \frac{36}{5}$, making the enclosed area equal to one-half the product of these two values: $\frac{1}{2} \times \frac{75}{14} \times \frac{36}{5} = \frac{270}{14} = \frac{135}{7}$, which needs to be divided by 30, the area enclosed by $A'B'C'$: $\frac{135}{30 \times 7} = \frac{9}{14}$.

2020 Chapter Target Round Solutions

1. Natasha has $14 - 8 = 6$ more candy bars than Soren. To be equal, Natasha must give Soren $1/2$ of her "excess" 6, thus **3** candy bars.
2. A vertical line along $x = 7$ splits the figure in question into two triangles: to the left of the line is a triangle of base 6 units and height 3 units for an area of 9 units, and to the right of the line is a triangle of base of 5 units and height 8 units for an area of 20 units². The two triangles combined have area $9 + 20 = \mathbf{29}$ units².
3. The factor theorem says polynomial $P(x)$ has $x - r$ as a factor if and only if $P(r) = 0$, so $5x - 3 = 5\left(x - \frac{3}{5}\right)$ is a factor if the polynomial has value 0 at $x = 3/5$: $0 = 5\left(\frac{3}{5}\right)^2 + 7\left(\frac{3}{5}\right) + k = \frac{9}{5} + \frac{21}{5} + k = 6 + k$, so $k = -6$.
Alternatively, since $5x - 3$ is a factor of the polynomial, then $(5x - 3)(x + a) = 5x^2 + 7x + k$. Expanding the left side of the equation yields $5x^2 + 5ax - 3x - 3a = 5x^2 + (5a - 3)x - 3a$. That must mean that $5a - 3 = 7$ and $5a = 10$ so $a = 2$. That also means that $k = -3a = -3(2) = -6$.
4. Dividing, we get $\frac{\$35.3 \times 10^6}{4.29 \times 10^6} = \$8.228 \approx \mathbf{\$8.23}$. [NOTE: The given values are clearly rounded off and could represent values of total gross being between \$35.25 million and \$35.35 million and total tickets being between 4.285 million and 4.295 million, for which the most extreme values would yield an average ticket price between \$8.21 and \$8.25, so in reality, the result may be as much as \$0.02 off from what we calculated, but the best estimate that we can give with the data provided is \$8.23, and only that value.]
5. Let x and y be two distinct nonzero numbers. We have $x + y = xy = x/y$. $xy = x/y$ implies $xy^2 = x$, so $y^2 = 1$, meaning $y = +1$ or $y = -1$. Now, $y = 1$ requires $x + 1 = x$, which is nonsense, so we must have $y = -1$. Then $x - 1 = -x$, so $x = \frac{1}{2}$ and $-y = \frac{1}{2} + 1 = \frac{3}{2}$.
6. The lengths of the legs of the triangle are in the ratio (shorter to longer) $\frac{6.2 \text{ cm}}{9.3 \text{ cm}} = \frac{2}{3}$, so the ratio of the lengths of short leg to long leg to hypotenuse is $2 : 3 : \sqrt{13}$. Area is proportional to square of length, so the ratio of the three corresponding areas is $4 : 9 : 13$. Therefore, the area of the smallest profile is $4/13$ the area of the largest profile, thus $\frac{4}{13} \times 25 \text{ cm}^2 = \frac{100}{13} \text{ cm}^2$.
7. The original figure shown in the problem presents a dodecagon with the 6 diagonals that connect opposite vertices, all intersecting at the dodecagon center. The dodecagon and the 6 shown diagonals partition the dodecagon and its interior into 12 isosceles triangles. All 12 isosceles triangles have legs whose length is half that of the given diagonals, namely 5 meters. Each side of the dodecagon constitutes the base of one of the isosceles triangles—8 of them have length $\sqrt{10}$ meters and 4 have length $\sqrt{2}$ meters, so we need to find the area enclosed by those triangles—half the base times the height. We are given the base, and the hypotenuse is the 5 meters. We use the Pythagorean Theorem to find the base length of each triangle. For the triangles with base length $\sqrt{10}$ meters, the height is $\sqrt{5^2 - \left(\frac{\sqrt{10}}{2}\right)^2} = \sqrt{25 - 2.5} = \sqrt{22.5}$ meters. That means there are 8 triangles with area $\frac{1}{2}\sqrt{10} \times \sqrt{22.5} = \frac{1}{2}\sqrt{225} = \frac{15}{2} \text{ m}^2$. For the triangles with base length $\sqrt{2}$ meters, the height is $\sqrt{5^2 - \left(\frac{\sqrt{2}}{2}\right)^2} = \sqrt{25 - 0.5} = \sqrt{24.5}$ meters. That means there are 4 triangles with area $\frac{1}{2}\sqrt{2} \times \sqrt{24.5} = \frac{1}{2}\sqrt{49} = \frac{7}{2} \text{ m}^2$. The total area of the dodecagon, then, is $8 \times \frac{15}{2} + 4 \times \frac{7}{2} = 60 + 14 = \mathbf{74} \text{ m}^2$.

8. To be ahead, Team South can have a score of:

1, with Team North at 0, for probability $0.27 \times 0.55 = 0.1485$;

2, with Team North at 0 or 1, for probability $0.05 \times (0.55 + 0.33) = 0.0440$;

3, with Team North at 0 or 1 or 2, for probability $0.01 \times (0.55 + 0.33 + 0.10) = 0.0098$.

The total probability is $0.1485 + 0.0440 + 0.0098 = 0.2023 = 20.23\%$, which rounds to **20%**.

2020 Chapter Team Round Solutions

1. Jack spent $10.44 \text{ gal} \times \$2.47/\text{gal} = \$25.79$ in Las Cruces, NM. He spent $10.01 \text{ gal} \times \$2.41/\text{gal} = \$24.12$ in Tucson, AZ. He spent $10.39 \text{ gal} \times \$2.65/\text{gal} = \$27.53$ in Flagstaff, AZ. And he spent $9.16 \text{ gal} \times \$2.62/\text{gal} = \$24.00$ in Las Vegas, NV. Jack spent the greatest amount in Flagstaff, AZ **\$27.53**.

2. Start with the layout of 5 rows and 5 columns of cells with only the two shaded cells filled in with a number. Start with the shaded cell containing 23 (because it is the smaller value). Fill in any empty adjacent (horizontally or vertically, not diagonally) cell with 24 (1 more than 23). We don't use 22, because that doesn't move us closer to a number that is 1 more or 1 less than the 26 that is already filled in. Furthermore, we are trying to maximize the values in these cells. So, next we put 25 in any empty cell adjacent to a cell containing 24. Then put 26 in any empty cells adjacent to a cell containing 25. Then put 27 in any empty cell adjacent to a cell containing 26 (including the shaded cell). Then put 28 in any empty cell adjacent to a cell containing 27. Finally, put 29 in the last empty cell. Once every cell is filled, we see that the greatest value is **29**.

| 27 | 28 | 27 | 26 | 27 |

3. Marko slept from 10:00 p.m. to 5:00 a.m., a total of 7 hours. At a rate of 65 times per minutes, which equals 3900 times per hour, his heart beat $7 \times 3900 = \underline{27,300}$ times. He exercised from 5:30 a.m. to 7:30 a.m., a total of 2 hours. At a rate of 118 times per minute, which equals 7080 times per hour, his heart beat $2 \times 7080 = \underline{14,160}$ times. During the remaining $24 - 9 = 15$ hours, Marko had normal activity. At a rate of 72 times per minute, which equals 4320 times per hour, his heart beat $15 \times 4320 = \underline{64,800}$ times. So, his heart beat a total of $27,300 + 14,160 + 64,800 = \mathbf{106,260}$ times.

4. Let t represent the orbit time and d represent the maximum distance from the Sun. We are given that t^2 is proportional to d^3 , so t is proportional to $\sqrt{d^3}$. Therefore, $t_2/t_1 = \sqrt{(d_2/d_1)^3}$, or more conveniently, $t_2 = t_1 \sqrt{(d_2/d_1)^3}$, where the subscripts 1 and 2 refer to the two planets being compared. In this case, planet 2 is Neptune; for planet 1 we are given information for three planets when any one by itself will suffice. If we use Mars for planet 1, we get: $t_2 = 1.882 \text{ yr} \times \sqrt{(4.50 \times 10^9 / (2.28 \times 10^8))^3} = 1.882 \times \sqrt{19.74^3} = 165.02$ years, which we would round to **165** years. In fact, the values for all 3 given planets result in 164.94 years to 165.02 years—all rounding to the same **165** years.

5. When there are n variables that all take on nonnegative integer values that sum to s , the number of distinct ordered n -tuple solutions is given by the number of combinations of $n + s - 1$ things taken s at a time, that is $\frac{(n+s-1)!}{(n-1)!s!}$. In this problem, $s = 22$, and there are 3 variables, so $n = 3$. Therefore, we have $\frac{24!}{2!22!} = \frac{24 \times 23}{2 \times 1} = 276$ equally likely ordered triples as solutions. However, some of these involve ordered triples for which 2 of the components are equal, so there is no order of the components with $a < b < c$. The two that are equal can be anywhere from 0 to 11 inclusive, allowing the third component to be nonnegative. It can be any one of the 3 components that is the unequal one making $12 \times 3 = 36$ "problem cases", leaving 240 cases with 3 mutually distinct values. Of these, 1 out of every 6, for a total of 40, is in the right order, for a probability of $\frac{40}{276} = \frac{10}{69}$.

Alternatively, the following tables provide an organized listing of the 52 combinations of three nonnegative integers a , b and c for which $a + b + c = 22$. As indicated, there are 40 ordered triples for which $a < b < c$.

| | | | | | | | | | | | |

| 7 |
| 8 |

To determine the total number of ordered triples (a, b, c) for which $a + b + c = 22$, we can count the number of arrangements for each of these 52 combinations and add them together. Each of the 40 combinations with three distinct integers has $3! = 6$ arrangements, and each of the 12 combinations in which two of the three integers are the same has $\frac{3!}{2} = 3$ arrangements. That's $6(40) + 3(12) = 240 + 36 = 276$ arrangements in total.

Therefore, the desired probability is $\frac{40}{276} = \frac{10}{69}$.

6. Let's regard a clockwise rotation as negative and a counterclockwise rotation as positive. Then on each roll, one of $+1, -2, +3, -4, +5$, or -6 steps will be taken. In order to get back to the starting point, the sum of the three counts of steps must be a multiple of 6. This means either 0 or 2 of the rolls must be odd. (Otherwise, the sum is odd and cannot be a multiple of 6.) The patterns of working 3-roll combinations are as follows: For 3 even rolls, the combinations are $-2, -2, -2$, with 1 order; $-2, -4, -6$, with 6 orders; $-4, -4, -4$, with 1 order; and $-6, -6, -6$, with 1 order. For 2 odd rolls, the combinations are $1, 1, -2$, with 3 orders; $1, 3, -4$, with 6 orders; $1, 5, -6$, with 6 orders; $3, 3, -6$, with 3 orders; $3, 5, -2$, with 6 orders; and $5, 5, -4$, with 3 orders. That gives us a total of $1(3) + 6(4) + 3(3) = 36$ sequences.

7. What sorts of numbers must be abundant or must not be abundant? Powers of prime numbers cannot be abundant: To have $1 + p + \dots + p^{n-1} + p^n > 2p^n$ requires $1 + p + \dots + p^{n-1} > p^n$, but the left side is $\frac{p^n - 1}{p - 1}$, with numerator less than p^n and denominator at least 1. This knocks out 1, 2, 3, 4, 5, 7, 8, 9, 11, 13, 16, 17, 19, 23, 25, 27, 29, 31, 32, 37, 41, 43, 47, 49, 53, and 59. Semiprime numbers that are the product of two distinct prime numbers cannot be abundant: To have $1 + p + q + pq > 2pq$ requires $1 + p + q > pq$, but the left side is at most $2 \max(p, q) \leq pq$. This knocks out 6, 10, 14, 15, 21, 22, 26, 33, 34, 35, 38, 39, 46, 51, 55, 57, and 58. Perfect numbers are numbers the sum of whose factors is exactly twice the number, in which case an integer $k > 1$ multiplied by the prime number is abundant. The first two perfect numbers are 6 and 28, making 12, 18, 24, 30, 36, 42, 48, 54, and 56 abundant. This leaves 20, 40, 44, 45, 50, and 52 to evaluate individually. [Note: In number theory $\sigma(n)$ or $\sigma_1(n)$ is often used to indicate the sum of the divisors of n .]

$$\sigma(20) = \sigma(2^2 \times 5^1) = (1 + 2^1 + 2^2)(1 + 5^1) = 7 \times 6 = 42 > 2 \times 20, \text{ so abundant.}$$

40, as a multiple of an abundant number, is also abundant.

$$\sigma(44) = \sigma(2^2 \times 11^1) = (1 + 2^1 + 2^2)(1 + 11^1) = 7 \times 12 = 84 \leq 2 \times 44, \text{ so not abundant.}$$

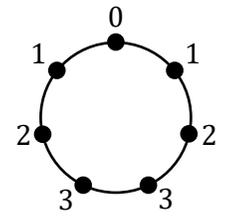

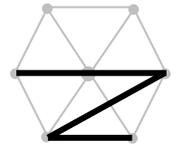

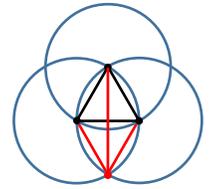

$$\sigma(45) = \sigma(3^2 \times 5^1) = (1 + 3^1 + 3^2)(1 + 5^1) = 13 \times 6 = 78 \leq 2 \times 45, \text{ so not abundant.}$$

$$\sigma(50) = \sigma(2^1 \times 5^2) = (1 + 2^1)(1 + 5^1 + 5^2) = 3 \times 31 = 93 \leq 2 \times 50, \text{ so not abundant.}$$

$$\sigma(52) = \sigma(2^2 \times 13^1) = (1 + 2^1 + 2^2)(1 + 13^1) = 7 \times 14 = 98 \leq 2 \times 52, \text{ so not abundant.}$$

The sum of these abundant numbers is $12 + 18 + 20 + 24 + 30 + 36 + 40 + 42 + 48 + 54 + 56 = 380$.

8. Let's start with 3 points. There is 1, and only 1, way for the 3 resulting line segments to be congruent: when the points form the vertices of an equilateral triangle as shown. Is there a way to add a 4th distinct point such that the 3 newly formed segments are all congruent to the first 3 segments? Each of the three congruent smaller circles shows the points that are the same distance from the point that is the center of the circle as are the other two points. In order for all the 6 segments to be the same length, the new point must be placed where all 3 circles intersect—but there is no such point. The best we can do is put the 4th point where two of the circles intersect. These 4 points form a rhombus whose 4 sides and short diagonal are congruent, but the long diagonal is not, for two lengths of line segments. It might appear that stacking of equilateral triangles would always yields the minimum number of distinct lengths of segments for n points. The case here, $n = 7$, does work; black line segments in the figure to the right indicate the 3 distinct sizes of segments formed by 6 vertex points of a regular hexagon and its center point. However, this technique works for only a few values of n , and 7 just happens to be one of them. A fully general technique, working for all n , involves organizing the n points as the vertices of a regular n -gon (n -sided polygon) or, equivalently, equally spaced around a circle, as shown. Label any one of the points as #0. Due to rotational symmetry of order n , it does not matter which point is so picked—all the points have identical behavior. Label each vertex adjacent to #0 as #1. Continue around the circle labeling each vertex 1 more than its predecessor until all of them are numbered. If n is even, there will be one vertex across the diameter from #0 that is labeled $n/2$; otherwise (as in our case of $n = 7$), there will be two adjacent vertices labeled $(n - 1)/2$ with their midpoint being across the diameter from #0. In either case, the highest-numbered point[s] will be $\lfloor n/2 \rfloor$, where the notation $\lfloor x \rfloor$ denotes the greatest integer less than or equal to x and is often called the floor of x . The shortest line segments have the length between #0 and #1; the second shortest line segments have the length between #0 and #2; this pattern continues until the longest line segments have the length between #0 and $\lfloor n/2 \rfloor$. Again, due to symmetry, it does not matter whether one follows the vertices around the left versus around the right. In summary, there are $\lfloor n/2 \rfloor$ distinct lengths of line segments, each in the form of the length of the line segment connecting #0 and # m for $1 \leq m \leq \lfloor n/2 \rfloor$, in strictly increasing order. [Note that the length of the segment connecting #1 and #3 is the same as that between #0 and #2,] Therefore, the answer to this problem is $\lfloor 7/2 \rfloor = 3$ lengths.

9. Any card can be chosen first and that establishes the suit—there is no such thing as a wrong suit for the first card. However, each card after that must be of the same suit as the first. For the second pick there are 12 cards left of the same suit as the first out of 51 cards left to pick. If the second pick matches, then there remain 11 of the same suit out of 50 total left to pick third. If all picks have matched so far, there remain 10 of the same suit out of 49 total to pick fourth. If still all picks have matched, there remain 9 of the same suit out of 48 total to pick fifth. These probabilities are independent of previous picks, thus multiplicative, so the overall probability is: $\frac{12}{51} \times \frac{11}{50} \times \frac{10}{49} \times \frac{9}{48} = \frac{12}{48} \times \frac{11}{49} \times \frac{10}{50} \times \frac{9}{51} = \frac{1 \times 11 \times 1 \times 3}{4 \times 49 \times 5 \times 17} = \frac{33}{16\,660} = 0.001\,98\dots$, which rounds to the nearest thousandth as **0.002**.

10. Any right triangle will fit interior to a circle if the hypotenuse of the triangles is less than the diameter of the circle. A right triangle whose hypotenuse has the same length as a diameter of the circle can be inscribed in the circle with the hypotenuse coinciding with the diameter. Therefore, to fail this requirement with the given data requires the hypotenuse to exceed the diameter, which is twice the radius, or $2\sqrt{100} = 20$. Thus, we must find a Pythagorean triple whose hypotenuse exceeds 20. The least such hypotenuse is 25, which can occur with 7-24-25 and with 15-20-25. To meet the given criteria (minimize the area), the best situation is to spread the lengths of the two legs as far apart as possible, so the 7-24-25 will win, with an area of $7 \times 24/2 = 84$ units²

Chapter _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of 30 problems. You will have 40 minutes to complete all the problems. You are not allowed to use calculators, books or other aids during this round. If you are wearing a calculator wrist watch, please give it to your proctor now. Calculations may be done on scratch paper. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the competition booklet. If you complete the problems before time is called, use the remaining time to check your answers.

In each written round of the competition, the required unit for the answer is included in the answer blank. The plural form of the unit is always used, even if the answer appears to require the singular form of the unit. The unit provided in the answer blank is the only form of the answer that will be accepted.

1. _____ degrees In triangle ABC, $m\angle A = 60^\circ$, $m\angle B = 100^\circ$ and $m\angle C = 20^\circ$. If segment BD is constructed inside this triangle so that it bisects $\angle ABC$, what is the degree measure of $\angle BDC$?

2. _____ What is the value of the expression $\frac{1.2 \times 10^2}{4.8 \times 10^5}$? Express your answer as a common fraction.

3. _____ If $\textcircled{+} + \text{✈} = 14$, and $\textcircled{+} - \text{✈} = 4$, what is the value of ✈ ?

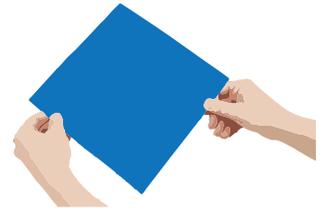

4. _____ units Hexagon ABCDEF is drawn in the coordinate plane with vertices A(0, 0), B(4, 0), C(4, 2), D(2, 2), E(2, 4) and F(0, 4). What is the perimeter of hexagon ABCDEF?

5. _____ square tiles A school wishes to use square tiles of artificial turf to cover an outdoor play area that measures 40 feet by 72 feet. Only whole tiles that are congruent squares of the largest possible size will be used. How many such square tiles are needed?

6. _____ miles If Rose and Robyn ran 29 miles combined, and Robyn ran 4 miles less than twice as much as Rose, how many miles did Rose run?

7. _____ inches Jamie folds a piece of paper in half, and then folds it in half again. If the resulting folded piece of paper is a 4-inch by 5-inch rectangle, what is the largest possible perimeter of Jamie's original unfolded piece of paper?

8. _____ If $k! = 2^7 \cdot 3^2 \cdot 5 \cdot 7$, what is the value of k ?

9. _____ The square of 207 can be computed by multiplying 200 by $200 + x$ and adding 49. What is the value of x ?

10. _____ units A, B, C, D, E, F and G are points on the same line and $AB = 24$ units. The midpoint of segment AB is C. The midpoint of segment CB is E. The midpoint of segment AE is D. The midpoint of segment AC is F. The midpoint of segment EB is G. What is the length of segment FG?

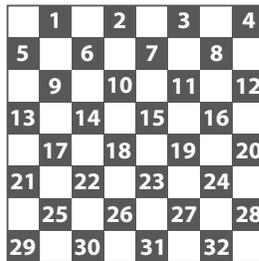

11. _____ minutes Starting at 9:00 p.m., Joe watches three films consecutively, with no breaks in between. The first film is the same length as the third film, and the second film is 50% longer than each of the other two films. If Joe finishes the third film at 2:15 a.m., how many minutes long is the second film?

12. _____ % If d is 10% greater than c , c is 25% less than b , and a is 50% greater than b , by what percent is d less than a ?

13. _____ If A, B, C, D, E, F and G satisfy the equations shown, what is the value of the absolute difference between $A + G$ and $A - G$?

| | |
|---------|------------|
| $A+B+C$ | $= 5$ |
| $B+C+D$ | $= 7$ |
| $C+D+E$ | $= 9$ |
| $D+E+F$ | $= 11$ |
| $E+F+G$ | $= 13$ |
| $F+G$ | $= 10$ |
| $A+$ | $F+G = 11$ |

14. _____ ways

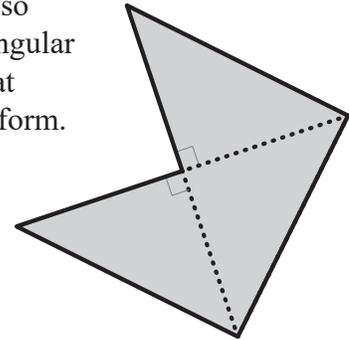

A checker starts at square 4 of the checkerboard shown here. At any time, it can move to any diagonally adjacent square below its current position. How many possible ways are there for the checker to move from square 4 to square 32?

15. _____ units² Sanjay cuts off a corner from a rectangular piece of paper, forming a pentagon. The side lengths of this pentagon, in order, are 10 units, 2 units, 11 units, 10 units and 5 units. What is the area of this pentagon?

16. _____ The sum of nine nonnegative numbers is 200. If M and A represent the median and arithmetic mean of the nine numbers, respectively, what is the greatest possible value of $M - A$? Express your answer as a common fraction.

17. _____ in² A five-sided piece of paper is divided into three congruent right triangles as shown in this figure, in which the dotted segments have length 4 inches. If the piece of paper is folded along the dotted segments so that the triangles become three faces of a right triangular pyramid, what is the area of the missing face of that pyramid? Express your answer in simplest radical form.

18. _____ If the equation shown is true for every value of x , what is the value of $b + c$?

$$(x^3 + x^2 - 3x + b)(2x^4 + cx^3 + x^2 - x + 1) = 2x^7 + 8x^6 + x^5 - 4x^4 + 39x^3 + 11x^2 - 10x + 7$$

19. _____ Suppose $a_0 = 10$ and $a_{n+1} = a_n^2$ for every non-negative integer n . What is the smallest value of n for which $a_1 \cdot a_2 \cdot a_3 \cdots a_{n-1} \cdot a_n$ has at least 100 digits?

20. _____ $\frac{\text{positive}}{\text{integers}}$ How many of the first 1024 positive integers are neither perfect squares nor perfect fifth-powers?

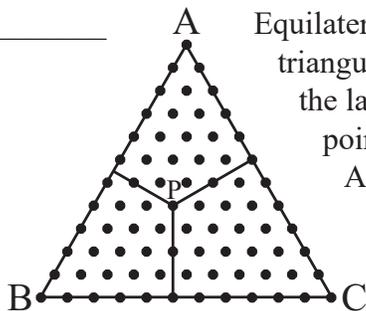

21. _____ Call a multi-digit positive integer *divisorly* if, for each pair of adjacent digits A and B, either $A = Bn$ or $B = An$ for some integer n . For example, 12639 is divisorly because 1 evenly divides 2, 2 evenly divides 6, 3 evenly divides 6, and 3 evenly divides 9. What is the greatest divisorly integer whose digits are all different?

22. _____ The lines $x + y = a$, $3x + 2y = a + 15$ and $4x + 5y = a + 19$, when graphed in the xy -plane, all intersect at the same point. What is the value of a ? Express your answer as a common fraction.

23. _____ All of the permutations of the digits 1, 3, 5, 7 and 9 are listed in numerical order from 13,579 to 97,531. What is the 100th permutation in the list?

24. _____ Erica chooses seven not necessarily distinct digits A, B, C, D, E, F and G, and forms the seven 4-digit numbers: ABCD, BCDE, CDEF, DEFG, EFGA, FGAB, GABC. If S is the sum of Erica's seven numbers, what is the greatest possible prime factor of S ?

25. _____ Equilateral triangle ABC with side length 11 is constructed on a triangular lattice grid with 12 lattice points are on each side. One of the lattice points inside the triangle is randomly selected and labeled point P. If a , b and c are the distances from P to sides BC, AC and AB, respectively, as shown, what is the probability that a triangle exists with side lengths a , b and c ? Express your answer as a common fraction.

26. _____ A circle is tangent to the positive x -axis at $x = 3$. It passes through the distinct points $(6, 6)$ and (p, p) . What is the value of p ? Express your answer as a common fraction.

27. _____ $\frac{\text{positive}}{\text{integers}}$ How many of the first 2019 positive integers have no odd single-digit prime factors?

28. _____ What is the value of $\sqrt{11,111,111 \times 100,000,011 + 4}$?

29. _____ David throws a dart at a triangular dartboard whose side lengths are 5, 5 and 6, and the dart lands in a random location on the dartboard. What is the probability that the sum of the squares of the 3 distances from the dart's location to the corners of the dartboard is less than 30? Express your answer as a common fraction in terms of π .

30. _____ Hank builds an increasing sequence of positive integers as follows: The first term is 1 and the second term is 2. Each subsequent term is the smallest positive integer that does NOT form a three-term arithmetic sequence with any previous terms of the sequence. The first five terms of Hank's sequence are 1, 2, 4, 5, 10. How many of the first 729 positive integers are terms in Hank's sequence?

1. _____ days The cheapest available ticket for Super Bowl LI on the secondary market costs \$2400. Suppose Joel earns the federal minimum wage of \$7.25 per hour, 20% of which is deducted for taxes, and he works from 9 a.m. to 5 p.m. each day. How many days must Joel work to pay for a single ticket? Express your answer to the nearest whole number.

2. _____ Six function machines are connected as shown. Three of the function machines are “dividers”, while three of the function machines are “averagers”. Each divider takes two inputs (into the left) and sends their quotient to the output (on the right). Each averager takes two inputs (into the left) and sends their arithmetic mean to the output (on the right). Given that the initial inputs are $x = 5$ and $y = 5$, as shown, what is the final result emitted by the right-most function machine? Express your answer as a mixed number.

1. _____ What is the smallest five-digit positive integer whose digits are all even and have a sum of 14?

2. _____ meters Melinda and her father are building a rectangular horse pen that will have 12 posts along two sides and 20 posts along the other two sides, as shown. The posts will be 12 meters apart with three wires: one wire near the top, one in the middle and one near the bottom. Besides the wire between the posts, an additional half meter of wire is needed to wrap around each post on each level. How many meters of wire will be required to make the pen?

3. _____ % In basketball, a field goal can be worth either two or three points. During his career, an NBA player has made 49.93% of his two-point field goal attempts and 36.51% of his three-point field goal attempts. Assuming the value of a missed attempt is 0, the average value of this player's career field goal attempts is 1.0389 points. What percent of his career field goal attempts have been three-point attempts? Express your answer as a percent to the nearest whole number.

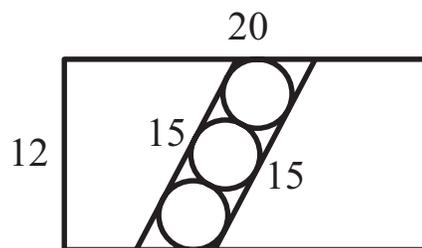

4. _____ degrees Coplanar isosceles triangles ABC and QAP are similar with vertex angles A and Q, respectively. If segment AP is perpendicular to segment BC and the $m\angle QAC = 16^\circ$, what is $m\angle PAQ$, in degrees?

5. _____ The operation \star is defined on ordered pairs as $\star(a, b) = (a + 3b, 9a - 5b)$. If x and y are nonzero real numbers such that $\star(x, y) = (-8x, -8y)$, what is the value of the ratio $x:y$? Express your answer as a common fraction.

6. (,) Line segment AB, with endpoints A(1, 1), B (10, 8), is rotated about point C(x, y) to its image A'B' with endpoints A'(1, 11), B'(12, 8). What are the coordinates of point C? Express your answer as an ordered pair.

7. _____ feet A parallelogram with three congruent inscribed circles is painted across a 20-foot by 12-foot rectangular banner as shown. The longer sides of the parallelogram have length 15 feet. What is the radius of each circle? Express your answer as a common fraction.

8. _____ integers The *prime-sum radical* of a number n is the sum of the distinct prime divisors of n . For example, the prime-sum radical of 45 is 8 and the prime-sum radical of 42 is 12. How many integers from 2 to 1000, inclusive, have a prime-sum radical of 10?

9. _____ ways A cheerleading squad has 14 cheerleaders, each a different height. How many ways are there for the cheerleaders to line up for a photo in two rows with seven people each, so that each cheerleader in the back row is taller than the one immediately in front of them, and so that the heights of the cheerleaders in the back row descend from the middle to each side?

10. _____ % If six numbers are chosen at random, with replacement, from the set of integers from 1 to 900, inclusive, what is the probability that the product of these six integers leaves a remainder of 4 when divided by 30? Express your answer as a percent to the nearest thousandth.

1. _____ The arithmetic mean of Josh's four test scores is 80. If three of Josh's test scores have a mean of 87, what is Josh's score for the fourth test? Express your answer to the nearest whole number.
2. _____ What is the value of the expression $\sqrt{3^4 + 3^4 + 3^4 + 3^4}$?
3. _____ What is the sum of the integer solutions of the inequality $|5x - 3| \leq 8$?
4. _____ What is the value of $\frac{7 + \frac{4}{9}}{9 + \frac{4}{7}}$? Express your answer as a common fraction.
5. _____ (unit cubes) The top and bottom faces of a large cube are painted orange, and the four lateral faces are painted purple. The large cube is then cut into 125 unit cubes. How many of the unit cubes have exactly one purple face?
6. _____ (years) The sum of Andrea's age and her younger sister's age is 25. If the product of their ages is 150, how many years older than her sister is Andrea?
7. _____ (minutes) The speed of light in space is 299,792.46 km/s. How many minutes does light take to travel 54,600,000 km from Mars to Earth? Express your answer to the nearest whole number.
8. _____ A list of four single-digit positive integers has median m and unique mode d . What is the greatest possible value of $m - d$? Express your answer as a decimal to the nearest tenth.
9. _____ (students) Every student at Bo Jackson High School plays football, baseball or both football and baseball. Half of the football players also play baseball, and twice as many students play baseball as play football. If 200 students play both sports, how many total students attend Bo Jackson High School?
10. _____ (units²) What is the area, in square units, of a right triangle that has integer side lengths and perimeter 36 units?
11. (Day) _____ A town in Fantasyland had a high temperature of 60 degrees on Day 1. Every day thereafter, the high temperature was 4 degrees lower than it was the previous day. On what day was the high temperature 8 degrees?
12. _____ (units) In equilateral triangle ABC, the length of the angle bisector from vertex A to side BC is 12 units long. What is the perimeter of the triangle, in units? Express your answer in simplest radical form.
13. _____ If $\sqrt{8} + \sqrt{18} = \sqrt{x}$, what is the value of x ?

14. _____ (degrees) Equilateral triangle ABC contains congruent isosceles triangles ZAB, YAC and XBC as shown. If $m\angle ZAB = 13$ degrees, what is the degree measure of $\angle YAZ$?
15. _____ If $2A2,7B5$ is divisible by 99, for digits A and B, what is the value of $10A + B$?
16. _____ What is the least positive odd number that has a remainder of 2 when it is divided by 3 and that has a remainder of 3 when it is divided by 5?
17. _____ (ordered triples) How many ordered triples of positive integers (x, y, z) satisfy $xyz = 12$?
18. _____ (miles) Melissa runs a mile in 8 minutes 30 seconds. At this rate, how many full miles will she run in 45 minutes?
19. _____ What is the arithmetic mean of all two-digit numbers whose digits sum to 9?
20. _____ (cents) Ali has five coins totaling less than \$1.00, with no more than three of any type of coin. No combination of four of his coins is enough to purchase an apple for 83 cents. If Ali is able to purchase the apple using all five coins, how many cents worth of change should he get?
21. _____ (cm) A certain right triangle has one leg of length 30 cm and a hypotenuse of length 34 cm. How many centimeters long is the other leg?
22. _____ If x is a number such that $x^2 + x - 1 = 0$, what is the value of $4x^2 + 4x + 1$?
23. _____ (fabric squares) Rachel is decorating a rectangular box that measures 12 inches by 16 inches by 8 inches. She plans to cover five of the six faces of the box with congruent non-overlapping fabric squares. What is the fewest whole fabric squares that Rachel needs to cover the box as described?
24. _____ What is the value of $8100 - (94 \times 86)$?
25. _____ Trajan randomly selects three distinct numbers from the set $\{1, 2, 3, 4, 5\}$. What is the probability that the sum of the selected numbers is divisible by 3? Express your answer as a common fraction.
26. _____ What is the remainder when $50!$ is divided by 51?
27. _____ One-half of two-thirds of one-fourth of some number is 11. What is the number?
28. _____ (ways) Six students will form a 3-person red team and a 3-person blue team to play a game. In how many ways can the teams be formed if two of the students, Eric and David, cannot be on the same team?
29. _____ (dollars) A lawn measuring 30 feet by 60 feet is to be covered with grass turf that costs \$40 per square yard. How many dollars will it cost to cover the entire lawn with grass turf?

30. _____ (ways) How many distinct ways are there to arrange the seven letters in ALGEBRA?
31. _____ If x and y are positive numbers such that 20% of $x\%$ of y is equal to x , what is the value of y ?
32. _____ (miles) To get to the grocery store from her apartment, Kathy walks one block south, then six blocks west, then nine blocks north. A block is 0.1 mile. If Kathy could walk in a straight line from her apartment to the store, how many miles would the trip be?
33. _____ (cm³) What is the volume of a right circular cone of height 4 cm that is similar to a cone that has radius 3 cm and volume 6π cm³? Express your answer in terms of π .
34. _____ What is the sum of the solutions of the equation $4x^2 = 12x + 7$?
35. _____ An integer is called *eclectic* if all its digits are distinct. What is the sum of the greatest 3-digit eclectic integer and the least positive 3-digit eclectic integer?
36. _____ Sky attempted to score a goal five times. For each attempt, she was equally likely to make a goal or miss. What is the probability that Sky scored at least two goals? Express your answer as a common fraction.
37. _____ (units²) Two opposite vertices of a square have coordinates (3, 5) and (-11, 7). What is the area of this square, in square units?
38. _____ (ft³) How many total cubic feet of glass are needed to make a 4-foot by 6-foot window that is $\frac{1}{8}$ inch thick? Express your answer as a common fraction.
39. _____ (m/s) Agent 020 chases a fugitive who is initially 600 meters ahead of her. The fugitive runs at a constant speed of 4 m/s. Agent 020 also runs at a constant speed, and takes 5 minutes to catch the fugitive. What is Agent 020's speed, in meters per second?
40. _____ If $3^k \times 9^2 \times 27 = 3^{13}$, what is the value of k ?
41. _____ What is the closest integer to the fourth root of 4000?
42. _____ (ways) In how many distinct ways can regular pentagon ABCDE be constructed so that each side is either red or blue and no pair of adjacent sides are the same color?
43. _____ (cents) Rae pays \$4.69 for a six-inch sub sandwich, and Elijah pays \$8.30 for a foot-long sub sandwich. How many more cents per inch of sub sandwich does Rae pay than Elijah?
44. _____ What is the median of the set of all positive divisors of 2020? Express your answer as a decimal to the nearest tenth.

45. _____ (units) In triangle ABC, $AB = 10$ units and $BC = 16$ units. What is the sum of the least and greatest possible integer lengths for side AC?
46. _____ The sum of the first five terms of an arithmetic sequence is 15. What is the third term of this sequence?
47. _____ What is the value of $123.45 + 234.51 + 345.12 + 451.23 + 512.34$? Express your answer as a decimal to the nearest hundredth.
48. _____ (ways) How many ways are there to make exactly 50 cents using quarters, dimes and nickels if at least one of each type of coin must be used?
49. _____ What is the value of $111^2 - 11^2 + 1^2$?
50. _____ Including Gene, 10 individuals audition for the three available parts in a new musical. If everyone is equally likely to be chosen for any part, but no one can be chosen for more than one part, what is the probability that Gene gets a part in the musical? Express your answer as a common fraction.
51. _____ (in²) What is the area, in square inches, of an isosceles trapezoid with bases of lengths 6 inches and 14 inches and nonparallel sides of length 5 inches?
52. _____ What is the quotient when 1,000,000,000 is divided by $2^8 \cdot 5^7$?
53. _____ If $f(x, y) = \sqrt{y + \sqrt{x + \sqrt{y}}}$, what is the value of $f(116, 25)$?
54. _____ What is the value of $\frac{10^7 - 10^6}{18}$?
55. _____ (amounts) Elias has four \$100 bills, three \$10 bills and six \$1 bills. How many different amounts of money can Elias make using some or all of these bills?
56. _____ What is the ratio of the area of the gray region to the total area of the regular hexagon shown here? Express your answer as a common fraction.
57. _____ (minutes) James can eat 12 jelly beans per minute, and Jenny can eat 8 jelly beans per minute. How many minutes will it take Jenny and James to eat a combined total of 100 jelly beans?
58. _____ The arithmetic mean of seven consecutive integers is x . What is the absolute difference between the greatest of the seven integers and x ?
59. _____ Andrea lists six prime numbers whose sum is a multiple of 10. Andrea's numbers, in increasing order, are 13, 29, 31, p , 47, 53. What is the value of p ?

60. (ordered pairs) For how many ordered pairs of integers (x, y) is the point (x, y) exactly 5 units away from the point $(20, 15)$?

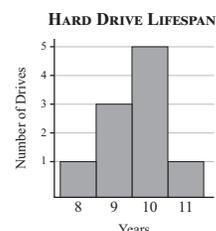

61. If the lines defined by the equations $3x + 2y = 9$ and $bx - y = 119$ are parallel to each other, what is the value of b ? Express your answer as a common fraction.

62. (meters) A certain rectangular prism has two faces, each of area 42 m^2 , two faces, each of area 54 m^2 and two faces, each of area 63 m^2 . What is the sum of the 12 edge lengths of the prism, in meters?

63. If $5^{x^3-8} + 9 = 10$, what is the value of x ?

64. What is the value of $\sqrt{\frac{1}{36} + \frac{1}{64}}$? Express your answer as a common fraction.

65. (years) Jimmy tested the lifespans, in years, of several hard drives. His results are given in the histogram shown. How many years is the average lifespan of the hard drives Jimmy tested? Express your answer as a decimal to the nearest tenth.

66. (mi/h) Jenny ran 1 mile up a hill in 15 minutes. If it took her 9 minutes to run back down the hill, along the same path, what was Jenny's average speed, in miles per hour, over the whole run?

67. Define the binary operation \square as $a \square b = a^2 + 2ab + b^2$. What is the value of $(1 \square 1) \square 9$?

68. What is the value of $\frac{3^{2019} + 3^{2016}}{3^{2018} - 3^{2015}}$? Express your answer as a common fraction.

69. The numbers $\{6, 5, 3, 7, y\}$ have arithmetic mean y . What is the median of these numbers? Express your answer as a decimal to the nearest hundredth.

70. (years) A giant sequoia tree measures 246 feet tall, and a nearby California redwood tree measures 278 feet tall. If each tree continues to grow exactly one foot per year, in how many years will the California redwood be exactly 10% taller than the giant sequoia?

71. A special machine has an input slot and an output slot, such that for every real number, x , if $5x + 8$ is dropped into the input slot, $3x + 1$ will be the output. If the input is -12 , what number will be the output?

72. What is the value of $\sqrt{6! + 3! + 2! + 1!}$?

73. _____ Circle A has area 16 units^2 and circle B has area 64 units^2 . What is the ratio of the radius of circle A to the radius of circle B? Express your answer as a common fraction.
74. _____ (dollars) In 2017, Jonah's income was \$57,500. His income increased by 400% in 2018, but then decreased by 80% in 2019. What was Jonah's income in 2019, in dollars?
75. _____ What is the remainder when $1 + 3 + 3^2 + 3^3 + \dots + 3^{2020}$ is divided by 81?
76. _____ Together, the total value of $2n$ nickels, $5n$ pennies and n dimes is \$1.50. What is the value of n ?
77. _____ A magic square is a square in which the sum of the numbers in each row, each column and each diagonal is the same. What is the value of $a + k$ in the magic square shown?
- | | | |
|-----|-----|-----|
| x | 3 | 8 |
| 9 | a | y |
| b | c | k |
78. _____ The sum of the digits of a particular three-digit number is 16. The tens digit of this number is three times the units digit, and the hundreds digit is one more than the units digit. What is the number?
79. _____ If a and b are positive integers with $a^b = 64$, what is the sum of all possible values of b ?
80. _____ What is the value of $2020^2 - 2020 \times 2019 + 2019^2 - 2019 \times 2020$?

MATHCOUNTS®

2020 State Competition Solutions

Are you wondering how we could have possibly thought that a Mathlete® would be able to answer a particular Sprint Round problem without a calculator?

Are you wondering how we could have possibly thought that a Mathlete would be able to answer a particular Target Round problem in less 3 minutes?

Are you wondering how we could have possibly thought that a particular Team Round problem would be solved by a team of only four Mathletes?

The following pages provide solutions to the Sprint, Target and Team Rounds of the 2020 MATHCOUNTS® State Competition. These solutions provide creative and concise ways of solving the problems from the competition.

There are certainly numerous other solutions that also lead to the correct answer, some even more creative and more concise!

We encourage you to find a variety of approaches to solving these fun and challenging MATHCOUNTS problems.

*Special thanks to solutions author
Howard Ludwig
for graciously and voluntarily sharing his solutions
with the MATHCOUNTS community.*

2020 State Competition Sprint Round Solutions

- The angle referred to initially as $\angle B$ is more specifically $\angle ABC$ after the bisection. Due to the bisection, $m\angle DBC = \frac{1}{2}m\angle ABC = 100/2 = 50$ degrees. Because the sum of the measures of the three angles of a triangle is always 180° , we have:
 $180 = m\angle DBC + m\angle BCD + m\angle BDC = 50 + 20 + m\angle BDC = 70 + m\angle BDC$, so:
 $m\angle BDC = 180 - 70 = \mathbf{110}$ degrees.
- We can divide both the numerator and the denominator by the numerator 1.2×10^2 , resulting in a numerator of 1 (dividing any nonzero number by itself yields 1), and a denominator of $\frac{4.8 \times 10^5}{1.2 \times 10^2} = 4 \times 10^{5-2} = 4 \times 10^3 = 4000$. Thus, we end up with the simplification $\frac{1.2 \times 10^2}{4.8 \times 10^5} = \frac{1}{4000}$.
- I will use a instead of the airplane symbol and b instead of the ball symbol, making our two equations:
 $b + a = 14$;
 $b - a = 4$. Subtracting this lower equation from the above equation yields:
 $2a = 10$, so $a = 5$.
- Starting at A we go 4 units right to get to B, then 2 units up to get to C, then 2 units left to get to D, then 2 units up to get to E, then 2 units left to get to F, and finally 4 units down to get back to the starting point A. The total number of units traveled is $4 + 2 + 2 + 2 + 2 + 4 = \mathbf{16}$.
- We want to partition the $40 \text{ ft} \times 72 \text{ ft}$ play area into squares of size $n \text{ ft} \times n \text{ ft}$. To avoid gaps and overlap without cutting tiles, both 40 and 72 must be divisible by n ; since we want the largest possible tiles, we need n to be the greatest common divisor of 40 and 72, which is 8. We will need $40/8 = 5$ rows each with $72/8 = 9$ tiles for a total tile count of $5 \times 9 = \mathbf{45}$ square tiles.
- Let s and b be the distance that Rose and Robyn, respectively, ran. We are given:
 $s + b = 29$ mi and $b = 2s - 4$ mi, with the latter equation being equivalent to $2s - b = 4$ mi. Since we want s and not b , let's add the two equations to get:
 $3s = 33$ mi, so that $s = \mathbf{11}$ miles.
- The problem does not state whether the two folds are parallel or perpendicular to each other, nor if parallel whether the fold is along the short or the long edge of the original paper, so we consider all options. If the two folds are perpendicular, then each dimension of the final paper is $1/2$ of the original, making the original sheet $8 \text{ in} \times 10 \text{ in}$, with a perimeter double the sum of the two side lengths for 36 in. If the two folds are parallel, the effect of the two folds is to make one side the paper $1/4$ as long as the original while keeping the other side unchanged, making the original sheet either $4 \text{ in} \times 20 \text{ in}$ or $16 \text{ in} \times 5 \text{ in}$, depending on which original side the folds were made, resulting in a perimeter of 48 in or 42 in, respectively. The greatest of these three possible values is $\mathbf{48}$ inches.
- In order for $k!$ to have 7 factors of 2, we must have $8 \leq k \leq 9$; in order to have 2 factors of 3, we must have $6 \leq k \leq 8$. These two pairs of constraints together tell us that $k = \mathbf{8}$, which is consistent with having exactly 1 factor of each of 5 and 7.
- $200(200 + x) = 207^2 - 49 = 207^2 - 7^2 = (207 + 7)(207 - 7) = (214)200 = 200(200 + 14)$ so $x = \mathbf{14}$.
- Let's put the 0 point of our number line at A and put B on the positive side of A, thus at 24. C is at the midpoint of AB, thus 12. E is at the midpoint of CB, thus $\frac{12+24}{2} = 18$. D is at the midpoint of AE, thus at

$\frac{0+18}{2} = 9$. F is at the midpoint of AC, thus $\frac{0+12}{2} = 6$. G is at the midpoint of EB, thus $\frac{18+24}{2} = 21$. The distance between F and G is $|21 - 6| = \mathbf{15}$ units.

11. Let l be the duration of a long movie and s be the duration of a short movie. The total time duration of the movie watching was 5 hours + 15 minutes = $(5 \times 60 + 15)$ minutes = 315 minutes. Other given information includes: $l + 2s = 315$ minutes and $l = 1.50s = \frac{3}{2}s$, so $s = \frac{2}{3}l$.

Thus, $315 \text{ min} = l + \frac{4}{3}l = \frac{7}{3}l$ and $l = \frac{3}{7}(315) = 3(45) = \mathbf{135}$ minutes.

12. $d = (1 + 0.10)c = 1.10c$; $c = (1 - 0.25)b = 0.75b$; $a = (1 + 0.50)b = 1.50b = \frac{3}{2}b$ so $b = \frac{2}{3}a$. We need to determine $\frac{a-d}{a}$ as a percentage. Thus, $d = 1.1c = 1.1(0.75b) = 1.1\left(0.75\left(\frac{2}{3}a\right)\right) = 1.1(0.5a) = 0.55a$.

Then $\frac{a-d}{a} = \frac{a-0.55a}{a} = \frac{0.45a}{a} = 0.45 = 0.45 \times 100\% = \mathbf{45\%}$.

13. $|(A + G) - (A - G)| = |2G| = 2|G|$.

$$A = (A + F + G) - (F + G) = 11 - 10 = 1.$$

$$B + C = (A + B + C) - A = 5 - 1 = 4.$$

$$D = (B + C + D) - (B + C) = 7 - 4 = 3.$$

$$E + F = (D + E + F) - D = 11 - 3 = 8.$$

$$G = (E + F + G) - (E + F) = 13 - 8 = 5.$$

Therefore, the desired value is $2|5| = \mathbf{10}$.

14. To get from square 4 to square 32 using only downward motions, one must pass through exactly one of squares 18, 19 and 20. For each of those 3 options, we can determine how many ways lead from square 4 to the square in question, and then how many ways lead from the square in question to square 32; since the ways from square 4 to the intermediate square are independent of the ways from the intermediate square to square 32, the number of ways from square 4 through the intermediate square under assessment to square 32 is the product of those two values. The total count of ways is the sum of those products over the 3 intermediate squares being examined. For square 18 there is 1 way from square 4 (4..8..11..15..18) and 1 way to square 32 (18..23..27..32). For square 19 there are 3 ways from square 4 (4..8..11..15..19; 4..8..11..16..19; 4..8..12..16..19) and 3 ways to square 32 (19..23..27..32; 19..24..27..32; 19..24..28..32). For square 20 there are 2 ways from square 4 (4..8..11..16..20; 4..8..12..16..20) and 2 ways to square 32 (20..24..27..32; 20..24..28..32). Therefore, the total number of qualifying ways from square 4 to square 32 is $1 \times 1 + 3 \times 3 + 2 \times 2 = \mathbf{14}$ ways.

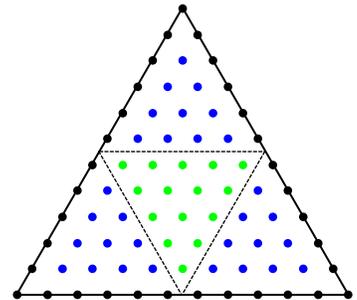

15. We have an uncut length, an uncut width, a shortened length, a shortened width, and a hypotenuse of the right triangular cutoff representing the values 10, 2, 11, 10 and 5 [not in the same order]. Because all values are integers, the cutoff piece sides need to be a Pythagorean triple. The only options for the hypotenuse are 5 (3:4:5) and 10 (6:8:10). A hypotenuse of 5 does not work because there are no two sides differing by 3 and no two sides differing by 4; 10 does work because $11 - 5 = 6$ and $10 - 2 = 8$. Therefore, we have an 11×10 rectangle with a right triangular piece with legs of 6 and 8 removed, so the area of the pentagon is $11 \times 10 - \frac{6 \times 8}{2} = 110 - 24 = \mathbf{86}$ units².

16. The arithmetic mean is the sum divided by the count, so $A = \frac{200}{9}$. The median of 9 values in increasing order is the fifth value. To allow the fifth value to be larger with a fixed sum of 200, let's make the 4 smallest values as small as allowed [nonnegative], namely 0, and the 4 largest values as small as possible, so they should be equal to the fifth value. Thus, we have 4 values of 0 and 5 values that are equal and whose sum is 200. Thus, each of those values must be $\frac{200}{5} = 40$, so $M = 40$ and $M - A = 40 - \frac{200}{9} = \frac{360-200}{9} = \frac{160}{9}$.
17. The base of the pyramid will be the 3 congruent original outer edges of the square, thus forming an equilateral triangle with sides whose length is $\sqrt{2}$ times the length of each dotted segment, for $4\sqrt{2}$ in. The area enclosed by an equilateral triangle with side s is $\frac{\sqrt{3}}{4}s^2 = \frac{\sqrt{3}}{4}(4\sqrt{2})^2 = 8\sqrt{3}$ in².
18. $(x^3 + x^2 - 3x + b)(2x^4 + cx^3 + x^2 - x + 1) = 2x^7 + 8x^6 + x^5 - 4x^4 + 39x^3 + 11x^2 - 10x + 7$.
 Substitute two values for x to be able to solve for a and b —keep the values simple. Two values that are commonly good to use for x are 0 and 1 in such problems:
 $x = 0$: $(b)(1) = 7$, so $b = 7$.
 $x = 1$: $(6)(3 + c) = 54$, so $c = 6$.
 Therefore, $b + c = 13$.
19. $a_0 = 10 = 10^1$; $a_1 = 10^2$; $a_2 = 10^4$; $a_3 = 10^8$; In general, $a_k = 10^{2^k}$.
 Therefore, the product of a_1 through a_n is $10^{2^1} \cdot 10^{2^2} \cdot 10^{2^3} \cdot \dots \cdot 10^{2^n} = 10^{2^1+2^2+2^3+\dots+2^n}$.
 The exponent in the last expression is a geometric series with first term 2, last term 2^n , and common ratio 2, so the sum is $\frac{2-2^{n+1}}{1-2} = 2^{n+1} - 2$. This makes the product to be $10^{2^{n+1}-2}$. Now, 10^k has $k + 1$ digits. Since we want at least 100 digits, the exponent needs to be 1 less. Therefore, $2^{n+1} - 2 \geq 99$, so $2^{n+1} \geq 101$. The powers of 2 in that region are $2^6 = 64$ and $2^7 = 128$, so $n + 1 \geq 7$. The least value that works for n is 6.
20. $1024 = 2^{10} = (2^5)^2 = 32^2 = (2^2)^5 = 4^5$. Thus, there are 32 perfect squares and 4 perfect fifth powers for 1 to 1024, inclusive. Of these, 2 values overlap in the two sets: $1^{10} = 1$ and $2^{10} = 1024$. (A number is both a perfect square and a perfect fifth power if and only if it is a perfect tenth power.) Thus, we start off with 1024 integers, subtract 32 as being perfect squares and subtract 4 more as being perfect fifth powers, leaving 988 to consider. However, in doing so, we have deleted 1 and 1024 twice, so we need to add 2, to make sure any deleted value is deleted exactly once. Thus, there are **990** such positive integers.
21. We would like to be able to use all 10 digits in our number, and the leftmost digit should be a 9, if possible, to achieve the largest qualifying 10-digit number. Let's start with 9. The next digit needs to divide 9 or be divisible by 9—only 3, 1 and 0 work, so try the largest, 3. Then the next digit needs to divide 3 or be divisible by (and not already be used)—only 6, 1 and 0 work, so try the largest, 6. Then the next digit must be 2, 1 or 0, so try the largest, 2. The next digit needs to be 8, 4, 1 or 0, so try the largest, 8. The next digit needs to be 4, 1 or 0, so try the largest, 4. The next digit needs to be 1 or 0, so try the largest, 1. Since 1 divides anything, it will work whatever we have left: 7, 5 or 0, so try the largest, 7. Only 0 and 5 remain, and, of these two, 7 divides only 0, so that must come next. For the last digit, 5 will work, because 5 divides 0. We have successfully completed the largest possible qualifying number: **9,362,841,705**.
22. [1]: $x + y = a$
 [2]: $3x + 2y = a + 15$
 [3]: $4x + 5y = a + 19$
 Notice how adding equations [2] and [3] yields:
 [4]: $7x + 7y = 2a + 34$, in which the coefficients of x and y are equal, just as in [1].
 Let's subtract 7 times equation [1] from equation [4] to yield:
 [5]: $0 = -5a + 34$, so $a = \frac{34}{5}$.

23. There are 5 digits to permute, so $5! = 120$ total permutations, with 13,579 being the 1st and 97,531 being the 120th in increasing order by size of number. The leftmost digit is the one used for comparison first to decide which of two numbers is greater. Once the leftmost digit has been chosen for a given permutation, there are 4 digits remaining to permute, for a total of $4! = 24$ permutations. Thus, there are 24 permutations for each possible leftmost digit. Thus, permutations 1 through 24 start with 1, 25 through 48 start with 3, 49 through 72 start with 5, 73 through 96 start with 7, and 97 through 120 start with 9. Since we want the 100th permutation, that means we start with 9. For each choice of digit we might choose second, we will have $3! = 6$ permutations of the remaining 3 digits. Thus, permutations 97 through 102 start with 91—this includes our desired 100th permutation. We keep iterating this process: permutations 97 and 98 start with 913, while 99 and 100 (which is what we want) start with 915. Then we want the second of 37 and 73, so we end up with **91,573**.

24. Note that each digit A through G occurs once in each of the 1s, the 10s, the 100s and the 1000s. That means for each place value we will end up with $A + B + C + D + E + F + G$, even though not necessarily occurring in that order, addition is commutative and associative. We will get 1000 of these for the leftmost column of digits, 100 for the second column, 10 for the third, and 1 for the fourth. Thus the total sum will be: $(1000 + 100 + 10 + 1)(A + B + C + D + E + F + G) = 1111(A + B + C + D + E + F + G)$. Now, $1111 = 11 \times 101$, with 11 and 101 both prime, so 101 is the larger; the sum of the 7 digit values cannot exceed $7 \times 9 = 63$, so this part contributes no prime factor greater than 101. Thus, the greatest prime factor of the sum of the four numbers must be **101**, regardless the value of each letter representing some digit 0 through 9.

25. The figure shows the 12th triangular number of lattice points, thus $\frac{12(12+1)}{2} =$

78. However, we must read the question very carefully. Only “the lattice points *inside* the triangle” [my italic emphasis added] are to be considered, that is, the blue and green points in the figure. This eliminates the 33 points on the triangle (technically, the definition of a triangle includes only the 3 sides and not the interior, though we often speak loosely of “the area of a triangle”, when we really mean the area enclosed by a triangle). Therefore, 45 points are under consideration for selection. The triangle inequality requires that the longest side of a triangle must have length less than half the sum of the lengths of all 3 sides. In an equilateral triangle the sum of the distances from any one point interior to the triangle to the 3 sides of the triangle equals the altitude of the triangle [Viviani’s theorem]. Therefore, a point is desired if and only if for each vertex of the triangle, the point is farther from the vertex than from the opposite side. This region of points is interior to the triangle formed with vertices at the midpoints of the sides of the original triangle, and the qualifying points are colored green in the figure. The probability is the number of green points divided by the number of points that are blue or green. There are 15 points interior to the new triangle, making the probability $\frac{15}{45} = \frac{1}{3}$. [NOTE: The 4 triangles formed by the 3 auxiliary lines are congruent, so if we were working in continuous space, the probability of any (x, y) point being within the middle smaller equilateral triangle would be only $\frac{1}{4}$; however, we cannot assume with a discrete lattice that the lattice points distribute evenly across the different subregions, even though they might enclose the same physical area.]

26. The circle being tangent to the x -axis at $x = 3$ means that a diameter of the circle is perpendicular to the x -axis at $x = 3$, meaning that the x -component of the circle center is 3, and, when combined with the knowledge that the circle is at or above the x -axis, the y -component is equal to the radius R of the circle. Thus, the equation of the circle is of the form $(x - 3)^2 + (y - R)^2 = R^2$, so $(x - 3)^2 + y^2 - 2Ry = 0$. Substitute a helpful (x, y) coordinate of a known point on the circle to determine the radius: we know $(3; 0)$ is on the circle, but that is not helpful as we need $y \neq 0$ to determine R , so use $(6; 6)$:
 $0 = 9 + 36 - 12R$, so $R = \frac{45}{12} = \frac{15}{4}$, making the circle have the equation $(x - 3)^2 + y^2 - \frac{15}{2}y = 0$. Another point on the circle is (p, p) , so let's substitute p for x and y in the equation and solve for p :
 $0 = (p - 3)^2 + p^2 - \frac{15}{2}p = p^2 - 6p + 9 + p^2 - \frac{15}{2}p = 2p^2 - \frac{27}{2}p + 9$. Before applying the quadratic formula, multiply the equation by 2 to simplify the fractions to be handled: $4p^2 - 27p + 18 = 0$, which has solutions $p = \frac{27 \pm \sqrt{729 - 288}}{8} = \frac{27 \pm 21}{8}$. The $+$ yields 6, which we were already given; the $-$ yields $\frac{3}{4}$.
27. The probability of an integer being not divisible by 3 is $\frac{2}{3}$, of being not divisible by 5 is $\frac{4}{5}$, and of not being divisible by 7 is $\frac{6}{7}$. Over a count of consecutive integers that is a multiple of the least common multiple of 3, 5 and 7, these three probabilities are independent, so the probability that an integer in such a band is not divisible by any of 3, 5 and 7 is $\frac{2}{3} \times \frac{4}{5} \times \frac{6}{7} = \frac{16}{35}$. The least common multiple of 3, 5, and 7 is the product of the three values, so 105. Thus, out of any 105 consecutive integers, exactly $\frac{16}{35} \times 105 = 48$ will fail to be divisible by each of 3, 5, and 7. That means that in the range 1 through $19 \times 105 = 1995$, there are exactly $19 \times 48 = 912$ such integers. Itemize the remaining values and cull out those divisible by 3, 5 or 7:
1996 1997 1998 1999 2000 2001 2002 2003 2004 2005 2006 2007 2008 2009 2010 2011 2012
2013 2014 2015 2016 2017 2018 2019.
There remain 11 values not shaded out, so the answer is $912 + 11 = \mathbf{923}$ positive integers.
28. The only calculator you are allowed to use is the one inside your skull augmented with pencil and scratch paper. The product has many digits (16) but its value is not that hard to determine given the values of the factors. The *hard* part would be to extract the square root of a 16-digit integer, even though it is a perfect square. This is MATHCOUNTS, so if the answer does not say what form to use, it has to be an integer, so if we can make good, easy approximations and get close to an expected form with expected properties and value, then the nearest integer of that form is very likely the answer. As $\frac{1}{9} = 0.111 \dots$, with the 1s repeating forever, so 11,111,111 is close to [slightly less than] $\frac{1}{9} \times 10^8$, while 100 000 011 is close to [slightly greater than] 10^8 , so the product is close to $\frac{1}{9} \times 10^{16}$. The square root must be close to $\frac{1}{3} \times 10^8 \approx 33,333,333$. The last 2 digits of the product come from $11 \times 11 = 121$, thus 21 [and an electronic calculator would be very likely be unable to tell you that]; adding the 4 yields 25, which is compatible with the number whose square root to be extracted having a units digit of 5. An excellent guess is 33,333,335. If you have time to spare, you can enhance your confidence in this guess by noticing your estimate for the left factor is too high by $\frac{1}{9}$, which out of $\frac{1}{9} \times 10^8$ is a relative error of only 1 part in 10^8 . Your estimate of 10^8 for 100,000,011 is 11 too low for a relative error of -11 parts in 10^8 . The relative error of a product is close to the sum of the relative errors of the factors for small relative errors, so you are close to -10 parts in 10^8 . Adding 4 to a 16-digit number has a negligible effect on relative error. Finally, taking a square root cuts the relative error in half to -5 parts in 10^8 . Thus, you expect your answer to be very close to 5 parts in 10^8 too low, which would be $\frac{5}{10^8} \times \frac{1}{3} \times 10^8 = \frac{5}{3}$, so we need to raise our estimated answer of $33,333,333 \frac{1}{3}$ by about $1 \frac{2}{3}$, which results in our predicted **33,333,335**.

29. The triangle is isosceles with base of length 6 and two congruent sides of length 5, so it can be partitioned into two congruent right triangles with the two congruent sides (length 5) being the hypotenuse of the two right triangles and the two halves of the base (length 3) each being one leg of the two right triangles. Thus, the two right triangles are 3:4:5 right triangles, so the height of the dartboard is the length of the second leg, 4. By symmetry we can tell the minimum sum of the squares of the three distances will occur at the centroid of the dartboard, so that the origin of the coordinate system should be put at the centroid of the dartboard. (Note: It is not critical to know to put the origin of the coordinate system at the centroid, but it avoids some completions of squares to solve that slow you down a bit.) To make solving the problem faster we will place the x -axis parallel to and above the base of the dartboard and the y -axis passing through the midpoint of the base. The x -component of the base vertices are -3 and $+3$, and of the apex is 0 . The centroid of a triangle occurs $2/3$ of the way from a vertex to the midpoint of the opposite side; the distance between the apex and the midpoint of the base is 4 , so $2/3$ of that distance (that is, $\frac{8}{3}$) needs to be above the centroid and the remaining distance of $\frac{4}{3}$ needs to be below the centroid. Thus, the two vertices for the base are at $(-3; -\frac{4}{3})$ and $(+3; -\frac{4}{3})$, and the apex is at $(0; +\frac{8}{3})$. The sum of the squares of the distances from a point $(x; y)$ to each of these 3 vertices is:

$$(x+3)^2 + \left(y + \frac{4}{3}\right)^2 + (x-3)^2 + \left(y + \frac{4}{3}\right)^2 + (x-0)^2 + \left(y - \frac{8}{3}\right)^2$$

$$= x^2 + 6x + 9 + y^2 + \frac{8}{3}y + \frac{16}{9} + x^2 - 6x + 9 + y^2 + \frac{8}{3}y + \frac{16}{9} + x^2 + y^2 - \frac{16}{3}y + \frac{64}{9} = 3x^2 + 3y^2 + \frac{86}{3},$$

which is to be less than 30. Thus, $3x^2 + 3y^2 < \frac{4}{3}$, so $x^2 + y^2 < \frac{4}{9} = \left(\frac{2}{3}\right)^2$ and $\frac{x^2+y^2}{(2/3)^2} < 1$, representing the interior of a circle of radius $\frac{2}{3}$ centered at the origin, lying well within the dartboard. This region has area

$$\pi \left(\frac{2}{3}\right)^2 = \frac{4}{9}\pi. \text{ The dartboard's area is } \frac{1}{2}(6)(4) = 12, \text{ of which the circular region is the fraction } \frac{\frac{4}{9}\pi}{12} = \frac{\pi}{27}.$$

30. Hmm! 729 is a peculiar value to be used in a problem like this; 729 happens to be the only 3-digit integer that is both a perfect square and a perfect cube, thus perfect sixth power: $729 = 3^6$. Let's keep that in the back of our mind. First, extend the list of values in the sequence to look for some kind of pattern: 1, 2, 4, 5, 10, 11, 13, 14, 28. [The following sequences show why the excluded values do not work: 1-2-3, 2-4-6, 1-4-7, 2-5-8, 1-5-9, 10-11-12, 13-14-15, 12-14-16, 5-11-17, 10-14-18, 1-10-19, 2-11-20, 5-13-21, 4-13-22, 5-14-23, 4-14-24, 1-13-25, 2-14-26, 1-14-27.] There is a gap between 5 and 10, with 10 being double 5, and between 14 and 28, with 28 being double 14. How about powers of 3 (remembering 729)? Well, $10 = 3^2 + 1$ and $28 = 3^3 + 1$. How about $3^1 + 1 = 4$? Sure enough, we have a gap between 2 (half of 4) and 4—just too short to stand out at first. Since powers of 3 seem to be important, let's try writing the numbers in our sequence using base 3: $1_3, 2_3, 11_3, 12_3, 101_3, 102_3, 111_3, 112_3, 1001_3$. The rightmost place seems to be always 1 or 2; the other places seem to be always 0 or 1. This actually makes some sense. The pattern for the rightmost place in a 3-term arithmetic sequence, using base 3, would be one of 0-1-2, 0-2-1, 1-2-0, 1-0-2, 2-0-1, 2-1-0, 0-0-0, 1-1-1, or 2-2-2. We started off with 1-2 so we do not allow 0 to be generated, and if 0 is never generated we never break out of the cycle of keeping only 1s and 2s. A similar argument holds for the other places with 0s and 1s but is more complicated by carries/regroupings from places to the right. We have not proven that this is the correct pattern (a positive integer is a term in our sequence if and only if its base 3 representation has a 1 or 2 in the rightmost place, and a 0 or 1 in all other places) but for the sake of time during the competition, it seems reasonably plausible, so let's go for it. The endpoint is $729 = 1\ 000\ 000_3$ and is not in our sequence because the rightmost place ends in 0 rather than 1 or 2. All positive integers less than 729 have 6 [or less] base 3 places. [A number like 28 can be represented as $001\ 001_3$ (normally we do not write leading 0s but mathematically nothing forbids us to do so) or we can use $1\ 001_3$ regard the missing 5th and 6th places from the right as blank and implicitly 0.] Each of the 6 place values has 2 options (1 or 2 for the rightmost, and 0 or 1 for the rest) independently of the values in the other places, so the total number of accepted values is $2^6 = 64$.

2020 State Target Round Solutions

1. Joel works 8 hours per day and gets to keep 80% of his \$7.25/h wages. Therefore, to earn and keep \$2400 requires Joel to work: $\frac{\$2400}{8\frac{h}{d} \times 0.8 \times \$7.25/h} = \frac{\$2400}{\$46.40/d} = 51.72 \dots d$, which rounds to **52** days.
2. We have already been given that the output of machine 2 is 3, so we pick up from there. For machine 3, the x input is from the original upper input, 5, and the y input is the output of machine 2, so 3, and we are to divide the x value by the y value to result in an output of $\frac{5}{3}$. For machine 4, the x input is output of machine 3, so $\frac{5}{3}$, and the y input is the output of machine 2, so 3, and we are to add the two inputs and then divide by 2 to result in an output of $\frac{7}{3}$. For machine 5, the x input is from the original upper input, 5, and the y input is the output of machine 4, so $\frac{7}{3}$, and we are to divide the x value by the y value to result in an output of $\frac{15}{7}$. For machine 6, the x input is output of machine 5, so $\frac{15}{7}$, and the y input is the output of machine 4, so $\frac{7}{3}$, and we are to add the two inputs and then divide by 2 to result in an output of $\frac{47}{21}$, which is equal to the mixed number $2\frac{5}{21}$.
3. We need a fraction whose value in standard decimal form is between 0.60 and $0.\overline{6}$. Sixths don't work because $\frac{3}{6} = 0.5$ is too small and $\frac{4}{6} = \frac{2}{3}$ is too large. Sevenths don't work since $\frac{4}{7} = 0.571 \dots$ is too small and $\frac{5}{7} = 0.714 \dots$ is too large. For eighths, $\frac{5}{8} = 0.625$ works.
4. $S_k = 1 + 2 + 3 + \dots + (k - 1) + k = \frac{k(k+1)}{2}$, the sum of the first k positive integers, but this quantity for k iterating from n through $2n - 1$ is always paired with a factor 2, as $2S_k = k(k + 1)$, in P_n . Therefore, $P_n = [n(n + 1)][(n + 1)(n + 2)][(n + 2)(n + 3)] \dots [(2n - 2)(2n - 1)][(2n - 1)(2n)]$, in which we a matching pair of factors in the right factor of one bracket and the left factor of the next bracket, for every bracket except the last. Therefore, $(n + 1)$ through $(2n - 1)$ all occur as squares that can be simplified out of the radical. The only remaining factors are the left factor of the first bracket and the right factor of the last bracket: $n(2n) = 2n^2$, whose square root is $n\sqrt{2}$. Upon simplification 2 is the only portion left in the radical, so $b = 2$.
5. The truth-tellers will correctly state how many truth-tellers there are, whereas the liars will state a wrong count of truth-tellers. The group of truth-tellers will be that group whose answer regarding the number of truth-tellers matches the number of people in the group. The only such match is 11, so the group claiming 11 truth-tellers are truth-tellers and they told the truth when they said there are **61** liars.
6. We work backwards. There's only 1 way to get to \bigcirc from \bigcirc -you're already there! And there's 1 way to get to \bigcirc from each of the spaces adjacent to \bigcirc . We place a blue 1 in each cell to show that there's 1 way to get to \bigcirc from the corresponding cell:

| | | | | |
|---|--|---|---|------------|
| | | Y | 1 | \bigcirc |
| | | | X | 1 |
| | | | | Z |
| | | | | |
| * | | | | |

Next, consider the square with the X. From there, we can take one step right (and then there is 1 way to finish). Or we can take one step up (and then there is 1 way to finish). Combining these, we have $1 + 1 = 2$ ways to finish from X.

Then, consider the square marked Y . From there, we can take one step right (1 way to finish from there), or two steps right (1 way to finish from there-already done!). Combining these, we have $1 + 1 = 2$ ways to finish from Y . The situation at Z is identical to that at Y , except that we are going up instead of to the right. We'll keep exploiting this symmetry throughout this solution! Now, we have

| | | | | |
|---|-----|-----|-----|-----|
| | A | 2 | 1 | ⊕ |
| | | B | 2 | 1 |
| | | | C | 2 |
| | | | | D |
| * | | | | |

From A , we can go one step right (2 ways to finish), two steps right (1 way to finish), or three steps right (1 way to finish). So, there are $2 + 1 + 1 = 4$ ways to finish from A . As with Y and Z above, we use symmetry to see that there are 4 ways to finish from D as well.

From B , we can go one step up (2 ways to finish), one step right (2 ways to finish), or two steps right (1 way to finish). So, there are $2 + 2 + 1 = 5$ ways to finish from B . And a corresponding 5 ways to finish from C .

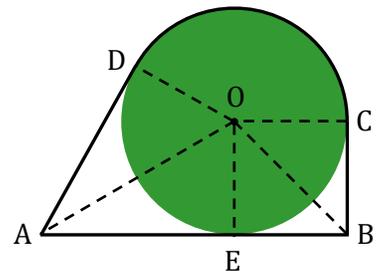

| | | | | |
|---|---|---|---|---|
| | 4 | 2 | 1 | ⊕ |
| | | 5 | 2 | 1 |
| | | | 5 | 2 |
| | | | | 4 |
| * | | | | |

We keep going in this manner. At each square as we work backwards, we find the number of paths from that square by adding all the numbers in the squares directly to the right of that square and all the numbers directly above that square. We use symmetry as above to cut down on the calculations, and we finally find:

| | | | | |
|-----|-----|----|----|---|
| 8 | 4 | 2 | 1 | ⊕ |
| 28 | 12 | 5 | 2 | 1 |
| 94 | 37 | 14 | 5 | 2 |
| 289 | 106 | 37 | 12 | 4 |
| 838 | 289 | 94 | 28 | 8 |

We see that the number sequences of moves to get from \star to \bigcirc is **838** sequences.

7. Let's draw in the figure some more auxiliary lines connecting the center of circle O points of tangency of line segments to O . A radius to a point of tangency is perpendicular to the tangent line, so $\overline{OC} \perp \overline{CB}$, $\overline{OE} \perp \overline{AB}$, and $\overline{OD} \perp \overline{DA}$. Thus, $\triangle OBC$ is a right triangle. The hypotenuse OB is given as $10\sqrt{2}$ cm and radius OC is given as 10 cm, making BC to be 10 cm and $\triangle OBC$ a right isosceles triangle. Similar analysis of $\triangle OBC$ shows BE to be 10 cm as well. With 4 congruent sides and some right angles, we know that $OCBE$ is a square, making the measures of $\angle OEC$ and arc EC be 90 degrees.

Triangles OAD and OAE are right triangles with legs OD and OE , respectively, being half the hypotenuse OA , so the two triangles are 30-60-90, with angles DOA and AOE measuring 60 degrees connecting the respective short leg and the hypotenuse, so the combined angle DOE and corresponding arc DE measuring 120 degrees. When we combine arcs DE and EC into major arc DEC , the resulting measure is 210 degrees.

This is where the rope is *not* in contact with the watermelon. The rope is in contact with the watermelon over the remaining part of the circle O , which is the minor arc DC , which has measure $360 - 210 = 150$ degrees, for $\frac{5}{12}$ of the circumference of O , making an arc length of $\frac{5}{12} \times 2\pi(10) = \frac{25}{3}\pi$ cm. Segment DA is the long leg of 30-60-90 $\triangle AOD$, and thus has length $\sqrt{3}$ times as long as the 10 cm of the short leg OD for $10\sqrt{3}$ cm. Therefore, the total length of the rope is $\left(10 + \frac{25}{3}\pi + 10\sqrt{3}\right)$ cm = 53.5004 ... cm, which rounds to the nearest 0.1 cm as **53.5** cm.

8. We have information about the powers that start with 8, and we want to learn about the powers that start with 9. So, we think about how these powers get produced in Tyrell's list. Each power is double the power before it in the list. We get a number that starts with 8 or 9 when we double a number that starts with 4. That's promising—we found something in common between the powers we know something about (the ones that start with 8) and the ones we want to know about (the ones that start with 9).

We can only get a power that starts with 4 if we are doubling a number that starts with 2. But we don't always get a power that starts with 4 when we double a number that starts with 2! Sometimes we get a power that starts with 5. Hmmm ... And we can only get a power that starts with 2 if we're doubling a power that starts with 1. But sometimes doubling a power that starts with 1 will give us a power that starts with 3.

That's enough working backwards. Now that we have some idea of how we can get a power that starts with 8 or 9 (we need a power that starts with 4), let's take a look at the first several powers of 2 to see if we find anything interesting. We'll group the powers by the number of digits the powers have, since we have a little information now about the patterns we expect as we double numbers starting with a number that begins with 1.

1 digit: 1,2,4,8

2 digits: 16, 32, 64

3 digits: 128,256,512

4 digits: 1024, 2048, 4096, 8192

Right away, we see some of the patterns that we expected. We only have a number that starts with 8 or 9 in groups that have a power that starts with 4. We also see that each group has a power that starts with 1. That's because any k -digit power that starts with a number greater than 1 is double another k -digit power. So, there must be a power that starts with 1 in each group.

Doubling a number that starts with 1 gives a number that starts with 2 or 3, so the second power in each group starts with 2 or 3.

Doubling a number that starts with 2 or 3 gives a number that starts with 4, 5, 6 or 7. So, the third power in each group starts with one of these four digits.

If the third power in the group starts with 4, then there will be a fourth power in the group, and that power will start with 8 or 9. Otherwise, the group only has three powers.

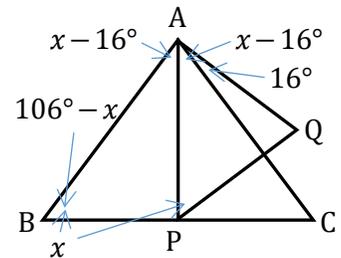

Aha! We now know that every group has three or four powers, and that the powers starting 8 or 9 must be the fourth powers in the four-power groups. We have enough information to tackle the problem now!

Tyrell's list has the first digits of 1001 powers. Because the last power has 302 digits, our group-by-digit approach above produces 302 groups. From the given information about the end of Tyrell's list, we know that the last group has 1 power. The rest of the groups have 3 or 4 powers. Removing that last group, we have 301 groups that together have 1000 powers. Removing the first 3 powers of each group (so that many end up empty), we take away $3 \cdot 301 = 903$ powers, leaving $1000 - 903 = 97$ powers, each of which is the last power in a group of 4 powers. That is, each of these remaining 97 powers starts with 8 or 9. We are told that 52 of these powers start with 8, so the other $97 - 52 = 45$ start with 9. So, 9 appears **45** times.

2020 State Team Round Solutions

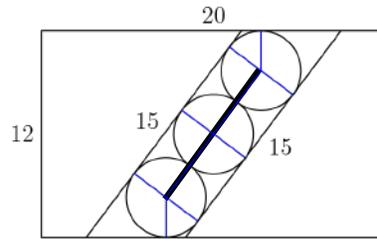

- The leftmost digit must be nonzero and even, and we want that digit as small as possible, which means 2. That leaves a needed sum of 12 for the remaining 4 digits, which has to be split across at least 2 digits. We must not forget that we may now use 0, and may use as many as two of them (remembering we need 2 more nonzero digits to contribute 12 to the sum), so let's make the next 2 digits 00. With the restriction of even and a sum of 12, the only options for the remaining digits are 48, 66 and 84, of which 48 is the smallest. Therefore, our desired number is **20,048**.
- There are $2(20 + 12) - 4 = 60$ posts (subtracting the 4 corners for double counting the 4 corner posts, and, because the posts are placed in the form of a closed figure, there need to be 60 connections between posts for each wire. For each interpost and circumpost pair, $12 + 0.5 = 12.5$ of wire is needed. There are 60 such pairs for each wire and there are 3 wires. Therefore, the total length of wire needed is $3 \times 60 \times 12.5 = \mathbf{2250}$ meters.
- Let t represent the fraction of attempts at field goals worth 3 points; then $1 - t$ represents the fraction of attempts at field goals worth 2 points, since all field goal are in one of those two categories. The average field goal point effectiveness is the sum over the two categories of the product of the point value of the category times the fraction of success for that category time the fraction of field goal attempts in that category: $1.0389 = 2 \times 0.4993(1 - t) + 3 \times 0.3651t = 0.9986 + 0.0967t$, so $0.0967t = 0.0403$ and $t = \frac{0.0403}{0.0967} = \frac{403}{967} = 0.4167 \dots \times 100 \% = 41.67 \dots \%$, which rounds to **42%**.

- The isosceles triangles BAC and AQP are similar, so their base angles (PAQ , APQ , CBA and BCA) are congruent, and it the measure of the first, PAQ , that we are to determine. Let's call its measure x . Since we are given the measure of $\angle CAQ$ as 16 degrees, the measure of $\angle CAP$ is $x - 16$. Now, since \overline{AP} bisects the apex $\angle CAB$, that means that the measure of $\angle CAB$ is $2x - 32$ and each base angle has measure $90 - \frac{1}{2}(2x - 32) = 106 - x$; however, we also set the measure of the base angles to be x . Therefore, $x = 106 - x$, so $2x = 106$ and $x = \mathbf{53}$ degrees.

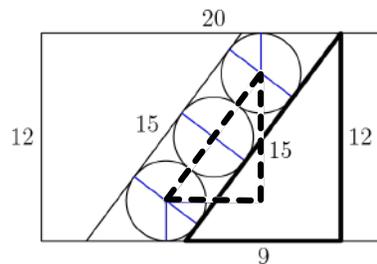

- $(-8x; -8y) = \star(x, y) = (x + 3y; 9x - 5y)$. For both components, the equality implies $9x + 3y = 0$, so $x = -\frac{1}{3}y$ and $\frac{x}{y} = -\frac{1}{3}$.
- When a point is rotated about a second point, the first point maintains a constant distance from the second point through the rotation from the pre-rotation position to the post-rotation. That means the pre-rotation position and the post-rotation position lie on a circle centered at the point about which the rotation is occurring. Therefore, the center point of the rotation lies on the perpendicular bisector of the line segment between the pre-rotation and post-rotation positions. A and A' lie on the line $x = 1$ and their midpoint is at $(1, 6)$, so the perpendicular bisector is $y = 6$. B and B' lie on the line $y = 8$ and their midpoint is at $(11, 8)$, so the perpendicular bisector is $x = 11$. The only point satisfying both equations is **(11, 6)**.

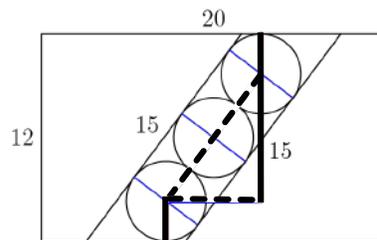

7. Let's call the radius of the circle r , and let's draw in all of the radii that might be useful:

Notice that the segment in the middle connecting the center of the bottom circle to the center of the top circle has length $4r$ and is parallel to the diagonal segments of length 15. And in particular, it is the hypotenuse of a right triangle that's similar to a 9-12-15 right triangle, as shown here:

This means that the dashed triangle has a height of $\frac{12}{15} \cdot 4r = \frac{16}{5}r$.

The total length of the solid vertical lines is $r + \frac{16}{5}r + r = \frac{26}{5}r$. But this must equal the height of the box, so $\frac{26}{5}r = 12$. Solving for r , we get $r = 12 \cdot \frac{5}{26} = \frac{60}{26} = \frac{30}{13}$ feet. (Note that the length of the box was totally irrelevant. As long as the box is wide enough to fit the diagonal stripe, its length doesn't play any role in the solution.)

8. There are 2 ways for the addition of distinct primes to result in 10: $2 + 3 + 5$ and $3 + 7$.
 For $2 + 3 + 5$ we need numbers of the form $2^i 3^j 5^k$ where i, j and k are positive integers. The least such value is 30 and, indeed, all suitable numbers must be appropriate multiples of 30, that is of the form $30m$; m must consist only of factors of 2, 3 and 5 (not necessarily all, or even any, of those), and must be no more than 33 so that we do not exceed 1000. The acceptable values for m are 1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, 16, 18, 20, 24, 25, 27, 30 and 32—a count of 19.
 For $3 + 7$ we need numbers of the form $3^i 7^j$ where i and j are positive integers. The least such value is 21 and, indeed, all suitable numbers must be appropriate multiples of 21, that is of the form $21m$; m must consist only of factors of 3 and 7 (not necessarily both, or even either, of those), and must be no more than 47 so that we do not exceed 1000. The acceptable values for m are 1, 3, 7, 9, 21 and 27—a count of 6.
 Therefore, the total count of integers from 2 to 1000, inclusive, with prime-sum radical being 10 is $19 + 6 = 25$ integers.

9. The tallest cheerleader must go in the middle of the back row. Randomly distribute the remaining 13 cheerleaders in the remaining 13 slots—that is $13!$ possible arrangements. Compare the leftmost cheerleaders in the two rows; there is a probability of $\frac{1}{2}$ that the taller is properly in the back row. Move one file to the right and again compare front and back row cheerleaders, with probability $\frac{1}{2}$ the taller of the two is in back. The same $\frac{1}{2}$ occurs for the third file. We must be careful now for the fourth (middle file), because we have already forced the tallest cheerleader to be in back at this location, so that file is guaranteed to have the taller in back. For each of the fifth, sixth, and rightmost files we have the probability $\frac{1}{2}$ of having the taller in the back row. Thus, we have a probability of $\left(\frac{1}{2}\right)^3 \times 1 \times \left(\frac{1}{2}\right)^3 = \frac{1}{64}$ of a taller cheerleader behind a shorter in each of the files. Now, there are $3! = 6$ arrangements of the leftmost 3 cheerleaders in the back row, with only 1 having the appropriate height drop-off going away from center, the probability of the correct arrangement for the back left is $\frac{1}{6}$. The same is true for the back right. Each of these considerations is independent of the others. Therefore, the number of distinct acceptable arrangements is $\frac{13!}{64 \times 6 \times 6} = \mathbf{2,702,700}$ ways.
10. Because we are dealing with remainders when products are divided by 30 and the count 900 of integers we have in scope is divisible by 30, we learn everything we need from modulo 30 arithmetic and processing only the integers 1 through 30; every other set of 30 consecutive integers behaves identically. Now, $30 = 2 \times 3 \times 5$ and of those prime factors, both 3 and 5 are relatively prime to the desired remainder value 4; if any of the 6 numbers multiplied together have 3 or 5 as a factor, then the product will have 3 or 5, respectively, as a factor, and that just does not happen with a remainder of 4 upon division by 30. Thus, we can throw away all the multiples of 3 or 5 from further consideration and analyze only 1, 2, 4, 7, 8, 11, 13, 14, 16, 17, 19, 22, 23, 26, 28 and 29 (a count of 16 values) rather than all 30 values from 1 through 30. Picking 6 of these 16 values randomly with replacement yields $16^6 = 16,777,216$ possible arrangements of factors that could yield a product leaving a remainder of 4 when divided by 30. The only way to get an odd remainder is if all 6 picked values are odd, which has a probability of $\frac{1}{2^6} = \frac{1}{64}$, so $\frac{16,777,216}{64} = 262,144$ cases can be thrown out, leaving 16,515,072 potential patterns leaving the desired remainder of 4 upon division by 30. However, it is equally likely that a product of 6 values taken (repetitions allowed) from our 16, with at least 1 of the 6 being even, will yield any of our even options—2, 4, 8, 14, 16, 22, 26, 28 as the remainder when dividing the product of the 6 values by 30. Therefore, $\frac{1}{8}$ of the 16,515,072 candidates for a total of 2,064,384 will yield the actual remainder of 4, out of $30^6 = 729,000,000$ total sequences of numbers that can be multiplied. This yields a probability of randomly picking 6 integers from 1 to 30 (or, equivalently, 1 through 900) yielding a product that leaves a remainder of 4 when divided by 30 of $\frac{2,064,384}{729,000,000} = 0.0028318 \dots \times 100 \% = \mathbf{0.283\%}$ when rounded to the nearest 0.001 %.

Problems 1 and 2

Name _____

School _____

DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO.

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.

1. \$ _____

Tawana is purchasing three CDs online for \$6.98, \$7.49 and \$15.63. For shipping, the company charges \$3.00 if the merchandise price is less than \$30.00 or 10% of the merchandise price if the merchandise price is \$30.00 or more. What is the total cost, including shipping, that Tawana will pay for this order?

2. _____ minutes

Three-and-a-half hours ago it was 10:15 a.m. How many minutes is it from now to the next occurrence of noon?

3. _____ A line containing the points $(-8, 9)$ and $(-12, 12)$ intersects the x -axis at point P. What is the x -coordinate of point P?

4. _____ Mike wrote a list of six positive integers on his paper. He chose the first and second integers randomly, but the third integer was the sum of the first and second, and each of the remaining integers was the sum of the two previous integers in the list. He then found the sum of all six integers. What is the ratio of the fifth integer in his list to this sum? Express your answer as a common fraction.

1. _____ The numerals 1 to 8 are arranged in the figure so that no two consecutive integers touch at a side or on a corner. What is the product of the numbers in boxes C and F?

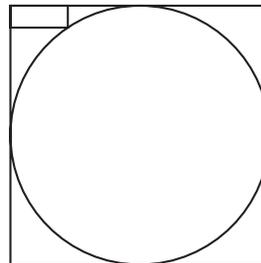

2. _____ The chart shown was generated using the equation $y = ax^2 + bx + c$. What is the value of a ? Express your answer as a common fraction.

| x | y |
|-----|-----|
| -5 | 8 |
| -3 | 5 |
| -1 | 4 |
| 1 | 5 |
| 3 | 8 |

3. _____ If $f(x) = x + 2$ and $g(x) = x^2$, then for what value of x does $f(g(x)) = g(f(x))$? Express your answer as a common fraction.

4. _____ cm In the figure shown, the side lengths of the small rectangle are 5 cm and 10 cm and the lower right vertex of the rectangle is on the circle. What is the radius of the circle?

5. _____ integers How many positive 3-digit integers are palindromes and multiples of 11?

6. _____ miles Zhiyuan and his family are planning to attend a football game. The time it takes Zhiyuan to get to the football stadium is dependent upon the traffic. If traffic is heavy, he will only average 30 mi/h and he will arrive right on time. If traffic is light, he will average 55 mi/h and arrive 1 hour and 15 minutes early. In miles, what is the distance from Zhiyuan's house to the football stadium? Express your answer as a decimal to the nearest tenth.

7. _____ solids Four 1-cm cubes are joined face-to-face in all possible ways to form geometric solids. Two such solids are considered the same if one can be obtained from the other by rotation. How many such solids are possible?

8. (_____ , _____) Triangle ABC with vertices A(1, 2), B(4, 4) and C(5, 1) is translated horizontally to the right 5 units, then translated vertically up 3 units. The triangle is then rotated 90° clockwise about the point (4, 4). What are the coordinates of the image of C after these transformations? Express your answer as an ordered pair.

9. _____ If a and b are positive integers such that $\frac{1}{2} + \frac{1}{a} = \frac{1}{3} + \frac{1}{b}$, what is the sum of all possible values of a ?

10. _____ In square ABCD, each vertex is connected to the midpoints of its two opposite sides, as shown. What is $\frac{QR}{PQ}$? Express your answer as a common fraction.
